The Bristol Iron Company having made a large sale of ore to the Crane Iron Company, of Catasqua, Pennsylvania, have commenced shipping. 1,500 tons have already gone forward, and the output is being daily increased as experienced miners arrive from other mining districts. The Bristol ore being a strictly Bessemer ore, high in iron and low in phosphorus, is being sought after by the large steel companies, especially by those making a specialty of low phosphorus steel, such as the Crane Company. The ore is loaded in cars at the mine, as the short line built by the owners of the mine to connect with the P. P. J. Ry. at Wyman's station is in operation. The C. P. R. takes it from Aylmer to Prescott, the Rome, Watertown & Ogdensburg takes it to Sterling Junction, where the Lehigh Valley Ry. connects and takes it to the furnace. We shall watch the development of the business of this mine with much interest.

Ontario.

We understand that a delegation from the Town Council of Lindsay has waited upon some members of the Ontario Government to urge upon their attention a scheme which aims at developing the iron mines near Kinmount and the extension of the Irondale and Bancroft railway. A public meeting was held in Lindsay last week to discuss the same project, the mayor in the chair, members of the Board of Trade and a number of citizens being present. The project was explained by Mr. Pussey, who said they had the written guarantee of Mr. Dodge, of New York, to provide funds for the extension of the railway. Mr. Witherow, of Pittsburgh, an extensive builder of smelting furnaces, said he had carefully examined the mines and pronounced the ores richer than those of Northern Michigan. He proposed to erect a furnace that would cost \$125,000, that would require 200 cords of wood per day for charcoal, and that would turn out 100 tons a day of charcoal pig iron. The location had no superior in the United States for charcoal iron. He had confidence in the project, and might take \$20,000 in stock in January. Mr. Pussey said they desired a bonus of \$10,000 each from the counties of Haliburton, Peterborough, and Victoria, as these sections would experience direct practical benefit from the opening up, settlement, and development of the mining district. Also they desired to obtain from the Ontario Government a bonus of \$2,000 a mile for the railway, and the right to purchase 30,000 acres of wild land for the iron mines. Mr. Witherow also gave an interesting practical address, in which he referred to the feasibility of establishing iron furnaces in the locality. A resolution was finally moved by Mr. John Dobson, seconded by Mr. Richd. Sylvester, and carried, recommending that the Ontario Government be urged to assist the enterprise.

Surely it is time that the Report of the Mining Commission was in the hands of the public. The Report was promised for the last session of the local legislature, but was not

forthcoming when the House prorogued. We were assured it would be ready for distribution at the recent Meeting of the American Institute, and again we were disappointed. When the Report *does* come out, its value will be very much depreciated on account of this inexcusable dilatoriness on the part of the Commissioners.

The small stamp mill at Flinton was destroyed by fire on Thansgiving day. Loss estimated at \$2,000. A new mill is to be built immediately.

Port Arthur District.

A steady output from the Beaver, Badger, Elgin, Shuniah Weachw, Crown Point and West End mines continues satisfactory.

Iron lands are still eagerly sought after and no little interest is taken in the nickel and gold deposits—splendid specimens of the former being obtained on the north shore of Lake Superior, along the C.P.R. line, not far east of Port Arthur.

Promoters of reduction works are looking after the splendid water power in this neighborhood, as much of this class of work can be cheapest done by electrical appliances. The water powers are both magnificent and numerous.

The Beaver has now attained a depth of 530 feet. Nothing but development work has been carried on at this mine for the past 18 months. They are now about to commence stoping and shipping. They have sufficient mill rock on the dump and in sight in the mine to run their mill for two years, but it is not proposed to start it up until about the 1st of May next. Their first shipment of high grade ore, consisting of 40 barrels, is now ready and will be made within a few days. They have just placed in position at the bottom of the mine an improved diamond drill capable of boring 1,200 feet in depth.

Mr. Oliver Dounais still continues work on his Lake of the Woods properties. Six assays made from the whole vein average nearly \$22 per ton and as these assays are not made from picked specimens, but from the whole vein, and as the ore can be mined and milled for from \$8 to \$10 per ton, there is a handsome profit in prospect.

North-West Territories.

A special general meeting of shareholders of Alberta Railway & Coal Co., will be held at London, England, on 2nd December next. The objects of the meeting are: To ratify an agreement with the Great Falls and Canada Railway Company; to ratify an agreement with the North Western Coal and Navigation Company, limited; To authorize the issue of bonds and shares required under said agreements.

British Columbia.

A recent shipment from the Rock Creek mines of 60 tons to San Francisco averages \$1,100 ounces of silver and \$700 gold per ton. As it cost the company \$100 per ton to pack this shipment to the railway, no further evidence is needed to show that the construction of good roads is an urgent necessity.

The shipments of Texada iron ore were: September, 675; October, 750; Total, 1,425 tons.

The following is a summary of the shipments of coal from the port of Nanaimo for the months of September and October:

Name of Company.	Sept.	October.	Total.
	Tons.	Tons.	Tons.
Vancouver Coal Co.	7,744	12,702	20,446
Dunsmuir & Sons.	19,941	17,933	37,874
East Wellington Coal Co..	4,774	1,858	6,632
Union Colliery Co.	2,450	7,044	9,494
Total.	34,909	39,537	74,446

We understand that negotiations have been completed by Mr. S. M. Robins and Mr. L. Rosenfeld on behalf of the New Vancouver Coal Company, for the bonding and purchase of the extensive coal lands in Cedar District, about five miles distant from this city and nearly contiguous to the present South Field property of the company. The amount of land purchased will aggregate 3,260 acres, and is the same land which the famous Dr. Griffin secured a bonding right thereon, which he so ingloriously allowed to lapse by effluxion of time. The new Vancouver Coal Company is to be congratulated on the successful acquisition of this valuable coal property. Among those who have bonded their land are Mayor Bate, E. Quennell, Charles York, T. D. Jones and T. Wall.

The completion of the sampling works in connection with the Revelstoke Smelter and the announcement that the company owning the same is now prepared to purchase all ores that may be offered for sale, are matters of satisfaction to every one interested in the welfare of the province. Although the works are not yet in a condition for actual smelting, the company are prepared to sample and buy ores, so that the miners are now assured of a market. Great credit is due to the company and its management for the progress made, and it is to be hoped that the financial results will be all that the energetic promoters expect.

Quantity of Steel in the Forth Bridge

—The Firth of Forth bridge at Queensberry, Scotland, will use 50,000 tons of the finest steel, and one of its cantilevers, if placed on end, would be nearly as high as the Eiffel tower. The latter contains 7,500 tons of iron.

A Large Cable Hoisting Machine.

The Trenton Iron Co., of Trenton, N. J., has completed a tramway in the Blackington Farm quarry, of Rockland, Conn., which has one of the longest stretches of cable and is one of the biggest plants of its kind in this country. The cable is 1½ inches thick, of cast steel with a steel centre, and is 1,255 feet long. The weight of the wire on its reel was 10,000 pounds. The anchorage weight, at the lower end, is 75 tons, while the weight of the wire, with its pulleys, cars, etc., is 36 tons. The breaking strain of the wire is 110 tons. The cable is passed over towers 42 feet high, and the wire in the sag is 125 feet above the quarry floor. The hoisting apparatus consists of a travelling car, which goes back and forth on the wire, never leaving it, and 19 trolley blocks which support the wire that controls the fall block, which lowers the drag or bucket into the quarry. The apparatus allows the drag or bucket to be lowered and hoisted from any point on the quarry floor the entire length of the wire.

The Sudbury Mines and Works.

(Continued from last issue.)

Dr. PETERS—Pyrrhotite does not contain cobalt. I have made some experiments with phosphorous and nickel but they have been very unsatisfactory. Grenier in Germany has made some announcements of finding very valuable alloys with nickel and phosphorous, and is going to make them public. What Dr. Raymond said about sweeping away the cobwebs around the metallurgy of a few years ago, is one of the truest remarks I have heard, and he has put it in the happy way that is characteristic of most of his remarks. I could name half a dozen different things, if I had time, but one thing is the steep, the mixture that the furnace bottom is made of. I have sat for hours listening to the proper proportion of charcoal. I think there were three lectures at Freiberg on the steep; but I got rid of steep very quickly when I got into smelting. At Elt they used it, but we smelt right against the water jackets of the furnace. Another matter was the length and shape of the nose of the furnace. I mean the prolongation of the inside or tuyere holes. In our ancient metallurgy it had to be just so, but now all we do is that once an hour a man goes around and knocks the little acretia off. As regards salamanders, which were the bane of metallurgy, they made me once swear I would never start a blast furnace. I have not seen a pound of wrought iron in a furnace for ten years—never since we have used these wells in front. I will tell you a short story which I gave once in Boston. The audience sat so gloomy that I wrought in this story, not to enliven them altogether, but as a matter of instruction to some member to whom it might prove useful as a warning. It was when I first began smelting in Colorado, and it was while running that furnace I first met Dr. Raymond. I was just starting out and was very young—just twenty years old—and it was the first opportunity I had of showing what I was worth. In those days failure was so common in all those smelting enterprises that nobody expected anything else in my case—except perhaps the people immediately concerned with the enterprise. Every smelting operation had failed, except Prof. Hill's, and that was the one star that relieved the darkness which enshrouded Colorado for a good many years. Just as soon as our company started putting up furnaces everyone felt it would fail. That was a foregone conclusion. We started putting up this furnace in South Park, and as I felt my whole future depended on how it should run, I took more pains with it than I have ever taken since. I fairly made myself sick over the work. I got the furnace built and spent hundreds of dollars in sampling ores. I had a chemist there. I took the greatest pains to get every kind of flux down to sulphate of soda—which was not needed however. I made all arrangements to start up, for the ladies were beginning to come over there and nearly all our directors came out. It was the Moose Mountain Smelting Company, and our directors nearly all came out with their wives, and sisters, and cousins, and aunts to see the furnace start (laughter). It would be the making of the district if it should run, because it would afford a market for custom ore. No person, however, had any confidence in my success, except those perhaps around me. Some of them felt uncertain. To make a long story short, we started up with charcoal—miserable soft stuff—and I took the greatest pains to have the most fusible ores with plenty of lead in them, and everything as nice as could be. I felt nervous about it, as it was my first attempt. We started by putting in a small charge of slag and gradually increasing it, replacing one shovelful of slag by one of ore, and so on until it was time to leave the feeding floor and look in at the tuyeres, in order to see how my noses were getting on. Instead of seeing what I expected, I saw long ropes hanging down like icicles. I thought the fire brick lining was beginning to melt. In about ten or fifteen minutes these tuyeres were stuck up completely and in about an hour the furnace was stuck up too. I tore it out and my directors looked a little long in the face when I started up again. I could not vary my charge much. I had figured it out exactly, but I made it still more basic than before, but by midnight it was frozen solid and worse than before. If there was ever a desperate man it was me. The directors, however, treated me kindly. They said:—"Here you are played out; go up to the house and lie down, you will feel better to-morrow." I went up with the feeling that my whole professional career was blasted. I had lost my faith in natural laws. I knew some such combination of iron slag and limestone must smelt; but it would not (laughter). You can imagine how I felt at the time. I looked down the muzzle of my Colchester for ten or fifteen minutes at a time, but did not have nerve enough to use it. Finally I fell asleep. In the morning the secretary of the company came to my door and entered with a smiling face, holding in his hand a cocktail, which Mrs. Dudley had the faculty for making. I said:—"You look pretty happy for a director whose furnace has come to grief" and

took the cocktail—as a medicine (laughter). He said:—"Oh, come down and see it. It has run out half a car-load of bullion since midnight. It is running all right." I put on my clothes and went down and found what he said to be true. They had taken out \$6,000 or \$7,000 worth during the night. The truth of the matter was this:—I had with me an old Mexican metallurgist, an old smelter with a practical knowledge of the business. He knew my charge must have been correct, and could rely on that. He went up to investigate, and found the charcoal was full of gravel and stones. The burners had been covering their charcoal with gravel, and the result was that the more charcoal I was using the more infusible a charge I was getting. That was no secret. (Applause).

Gold Milling in the Black Hills.

(H. O. Hoffman, Rapid City, Dakota.)

(Continued from September issue.)

2. In the Golden Star mill, the power is transferred from a small main shaft to two line-shafts on the cam floor, the main shaft being nearly on the same level. This arrangement is favoured by builders on the Pacific coast. It is shown in Providence mill, Nevada City, Cal., for description and drawing of which, see the paper of Mr. F. D. Browning on "Gold Chlorination in California, in the *School of Mines Quarterly* for 1884, also printed in the *Scientific American Supplement*, No. 445, July 12, 1884.

3. In the Highland mill, (see Plate), the small main shaft is placed between cam-floor and battery-floor, and is connected with two line-shafts, placed on the battery sills, behind the mortars.

THE HOMESTAKE MORTAR AND STAMP

Both of these mills have two line-shafts, which is probably necessary considering the power that is required for a 120-stamp mill. The disadvantage is that the pull of the belt, on one side only of the shaft, has a tendency to draw it off the line, and also causes great wear and tear. As to placing the line-shafts in front of the batteries on the cam-floor, or behind

them on the battery-floor, there is a diversity of opinion. The former arrangement, as at the Golden Star mill, gives the best light in the mill and makes the shafts easily accessible. The power from the engine-shaft is transmitted to the line-shafts, and from these to the cam-shafts, by long belts, which are nearly horizontal. They require no tighteners, and last longer than those of either the Homestake or Highland mills. On the other hand, the boxes of the line shafts rest on transverse sills on the cam-floor, which, although braced and strengthened in various ways, cannot furnish the same sure foundation as that at the Homestake and Highland mills. Experience has shown, however, that this disadvantage is more than counterbalanced by the smaller consumption of belts and the easy accessibility of the line shafts. The Highland mill has the line-shafts on the sure foundation of the battery-sills; but the darkness and the exposure of the line-shafts, thus placed just behind the mortars, to the trickling of water and fine ore, are serious disadvantages. Again, the belts from the main shaft down to the line-shafts, and from these up to the cam-shafts, are short and steeply inclined, requiring powerful tighteners, which cause an increased consumption of belts. The mill, however, like the Homestake, is so arranged as to leave the battery, with the apron and sluice plates, free from any superstructure.

The relation of the horse-power of the engine to each stamp averages for the seven mills about 1.7:1. This low figure is due to the large number of stamps in each mill (80 to 120), which is much higher than the common average in gold-mills.

Supply of Water and Fuel.—A regular supply of water is a prime necessity in milling. In this district it is chiefly furnished by two companies, at prices varying from 50 to 57 cents per stamp per day, the supply being brought in ditches. In winter water becomes scarce, and then the mills of the Homestake management are supplied in part by pumping from the Homestake and Deadwood-Terra mines. This water otherwise runs to waste. The big Highland mill would be obliged to stop four months each winter if the tailings of the Homestake; Golden Star and Highland Mills were not settled, and the clear water pumped back into the supply-tank. The method by which this is done is simple and effective. The tailings of the three mills are discharged together into the creek, called Gold Run. A little way further down, this broadens, and is closed by two dams, one below the other, forming two reservoirs. The upper overflows into the lower, which is four times its size, and this, in turn, has its overflow in the bed of the creek. The dams consist of cribbing, filled up solidly with waste rock. On their upper sides they are lined with water-tight planking. Down the middle of this, runs a wooden box, three sides of which are made of solid plank, the fourth being left open. When the reservoir is to be filled, this box is closed by pieces of heavy plank placed transversely. As far as the mere filling of the reservoir is concerned, the box might as well be closed by one solid piece, but the object of a number of pieces is to discharge the water gradually. This is done by removing the pieces, one after another, as the water is lowered, that the sands may be kept in suspension and carried through the culvert. Were the box opened at the bottom or to its full height at once, the sands would be carried into the culvert in such a quantity as to clog it. This culvert, in which the box ends, passes through the dam and under the lower reservoir and lower dam to the bed of the creek below. The

lower dam is arranged in the same way. When the reservoirs are not in use, the water of the creek passes off through the culvert. When they are to be filled, the boxes are closed. The water accumulates in the upper reservoir, until, after six hours, it overflows, leaving all the coarse sands in the upper reservoir, and carrying with it only the finer slimes, which settle in the lower one. From this the clarified water is pumped, at the rate of 60 cubic feet per minute, into the Highland tank, 200 feet above. The coarse sands are removed from the upper reservoir every twenty-four hours. In order to do this, the transverse planks closing the discharge are removed, one after another, and the water passes off, carrying the sands with it. As this process takes four hours, and the filling six, there are fourteen hours of overflow into the lower reservoir, where the slimes settle. These are removed once in two months, in the same way.

E = No. 5 Blake Rock Crusher. F = No. 6 Gates Rock Crusher. G = Rubber. H = Leather.

The fuel for the mills under the Homestake management is supplied by the "Black Hills and Forte Pierre Railroad Company." This

road, with about thirty miles of 3-ft. gauge track, runs along the divide between Gold Run and City creek, terminating at a point about fourteen miles south of Lead City. The whole section was originally heavily wooded, but has been quite denuded by the constant demands made upon it. The railroad is very winding and is quite a feat of engineering. It runs down the slope into Whitewood Creek, and up the opposite height, until it finally reaches the point where timber is still to be obtained. This

down the slope of the mountain. The chutes, 25 in. broad by 12 in. deep, are made of 4-in. plank. The bottom and 9 inches of the sides are lined with ¼-in. iron. The fall of the chute is 6 in. to the foot until the curve begins, when it is 4½ in. This continues to the nozzle which is elliptical. When the chute is in use, a small current of water is passed through it to prevent the iron from becoming too hot, and also to act as a lubricator. The cord wood, unloaded into the top of the chute, passes down the incline

THE HOMESTAKE MORTAR AND STAMP.

road, as soon as spring opens, is employed in transporting the wood and timber which have been cut and stored along its line, and is in constant use until the heavy snows block it for the winter, generally from January till April. It has three branches, towards the three towns where the mills are situated, and communicates directly with these by means of long wooden chutes, down which the wood is discharged. These are from 700 to 1500 ft. long, running

with great velocity. At the nozzle it is deflected from its course, and, through the momentum obtained in its downward passage, shoots up into the air and drops some distance off on the wood pile. In order to discharge the wood on a somewhat large area, the nozzle is made movable. The Caledonia mill has its wood hauled by teams, but is making experiments with soft coal, as the price of a cord of wood in the district is six dollars.

Auxiliary Arrangements.—As the thermometer often sinks to forty and fifty degrees below zero (Fahrenheit), the mills and the water used in them have to be warmed. This is generally done by the use of steam. Along the ground-floor, in front of the apron plates, there runs a sheet-iron drum, 18 inches in diameter, through which the waste steam of the engine is conducted. The battery-water is prevented from freezing by steam coils passing through the supply-tanks.

Fire-plugs, with the necessary hose attachments, are placed at regular intervals, to be used in case of accident.

To reduce the cost of repairs and renewals, which is so large a part of the expenses of gold-milling, the Homestake company has a foundry, where the rock-breaker shoes and dies, pitmans and toggle-plates, mortars and dies, boss-heads, tappets, thimbles for props, cams and hubs of cam-shaft pulleys, and all shaft-boxes, are cast, from No. 1 and No. 3 foundry iron and worn-castings. These are also sometimes bought at one cent a pound. The casting is all done in sand, with the exception of the rock-breaker shoes and dies and the faces of the battery-dies, which are chilled.

In the machine shop, which is a very complete establishment, all the necessary repairs are made. This is the only good shop in the district, and does the necessary work for outside companies also.

V. THE MILLS IN DETAIL.

The six mills under the Homestake management (that is, all the mills here described, except the Caledonia) have the same patterns for all parts needing frequent renewal. This greatly reduces the amount of material kept on hand and the labor and cost of repairs.

Grizzlies.—These are coarse screens, upon which the ore, arriving from the mine, is dumped and separated, the screened fines dropping directly into the bins. This relieves the breaker of ore that does not need to be crushed, and only the coarse ore has to be shovelled into it. They are 3 to 4½ feet wide, 10 to 14 feet long, and set at an angle of about 40 degrees, representing a rise of ¼ inches per foot. They are made generally of wrought iron bars, 1 inch wide and 2 to 4 inches deep, held in place, 1½ to 2 inches apart, by three or four, sometimes five, 1-inch iron rods, provided with washers at the proper intervals. Mr. Bowie gives 2,040 pounds as the weight of a grizzly at the Father de Smet mill, 4½x12 feet in size, with 24 bars, 1 inch wide by 2 inches deep, and 1½ inches apart. The grates last about four years. In some instances old wrought-iron rails, with base turned up, take the place of the standard rectangular bars; but they do not last much over one year.

Rock-Breakers.—All the Homestake mills use the Blake. The coarse ore, rolling down from the grizzlies, collects on the crusher-floor, and is fed by hand into the mouth of the breaker on the same level. From the crusher, it passes into the bins which have already received the fine ore from the grizzlies. The No. 5 breaker used (the largest pattern in the market) has a receiving capacity of 9 by 15 inch, is set to crush from 1½ to 1¾ inches, and is run twenty hours out of the twenty-four, each crusher being calculated to serve twenty stamps. The amount crushed per day is not known, as there is no easy way of determining how much of the ore in the bins has passed through the crusher. If one-fourth of the ore (a probable proportion in view of the slaty character of the ore) passes through the screens, escaping the breaker, and if 20 stamps crush 90 tons of Homestake ore in

24 hours, the amount crushed in 20 hours by one crusher is 67½ tons, or 3.4 tons per hour. This small figure, as compared with the capacity of the crusher, which is given at 7 tons, is due to the smallness of the mouth of the crusher, which necessitates the breaking up of the ore—a serious matter occasioning much delay. No part of the mill-work is so laborious as this breaking and feeding of the ore, which has to be done by hand.

The wear and tear of material in a crusher is comparatively small, a shoe lasting two months, a die four months.

The small receiving capacity of the No. 5 Blake is a marked disadvantage to it, in comparison with the Gates crusher, lately introduced at the Caledonia. The ore of the Caledonia mine breaks rather coarse (that is, it does not show much of the slaty character of the Homestake ore), and is dumped immediately into the hopper of the crusher without use of the grizzly. With about the same horse-power as three No. 5 Blakes, and set to the same size, one No. 6 Gates crusher (with three receiving openings, each 12 by 18 inches), attended by one man only, crushes 200 tons in ten hours. When the three Blakes were in use, it required 20 hours and 5 men to produce the same result. Mr. T. L. Skinner, the superintendent, says in his last report that this new crusher saves him \$27 a day. In order to make the iron head last longer, he uses three sets of concaves of graduated thickness, the thinnest first, and so on. When, after some time, the head and first set of concaves have become so worn away as to increase the width of the discharge above 1½ in., the second set is introduced; and, when they in turn wear thin, the third. By the time these are worn down (after about five months), it becomes necessary to replace the head. The disadvantage of the Gates crusher is its enormous weight (No. 6 weighs 30,000 lbs.), and the consequent difficulty of transporting it, especially in some mining regions.

The best arrangement for a large mill seems to be to use a still larger Gates crusher (No. 8, with receiving openings 18 by 48 in.), set to crush coarse, and discharging into two No. 6 crushers, set to crush fine. Thus the largest pieces of rock any man could handle would pass directly into the crusher, and the breaking by hand in mine and mill would be reduced to a minimum.

The smaller Gates crushers, with correspondingly small mouths, are not to be preferred to the Blake crushers.

Ore-Bins.—These receive the ore from the grizzlies and crushers, directly over them, and discharge it through chutes into the hoppers of the feeders. They are triangular, with one vertical side, facing the battery and reaching down to the cam-floor. Just above the latter, are the openings (one for each feeder) through which the ore passes downward into the chutes, terminating in the hoppers of the feeders. The quantity of the discharge is regulated by a sliding door. In a double mill, the inclined bottoms of the two bins diverge, leaving an open space between them which has the shape of an inverted V. This arrangement of bins is common to all the mills except the Father de Smet.

The bottoms of the bins, 3 inch thick, are made of 1 inch board, running lengthwise, with 2 inch plank, placed at right angles upon it crosswise. The bottom and sides are carefully braced with strong beams. There are no separate compartments or special arrangements for directing the ore towards the discharge-openings. The descending ore soon wears out such contrivances. It is advisable to line with

iron the upper part of the bottom, on which the ore drops from the grizzlies and crushers. Otherwise, it wears out much faster than the middle and lower parts, which lasts five to six years.

It is best to make ore-bins as large as practicable, so that, in case of accident in mine or at rock-breakers, the mill need not stop. The capacity ought never to be less than one full day's supply. By multiplying in each of the three double mills, the horizontal distance between the two sets of batteries into the vertical distance between crusher-floor and cam-floor, the comparative size of their ore-bins can be approximately estimated. The following table shows the result. It is assumed that the distance between front of bin and battery, as well as the incline of the bin, is about the same in all.

TABLE IV.—Comparative Capacity of Ore Bins.

Name of Mill.	Horizontal distance.	Height.	Product.
	feet.	feet.	square feet.
Homestake	44.5	14.25	634
Golden Star	36.0	23.75	855
Highland	46.0	22.75	1046

This would show that, of these three double mills in which the batteries are arranged back to back, the Highland has the largest bin-capacity. In the Father de Smet, where the batteries discharge towards the centre, the bins, built entirely above the batteries, and extending to the side-walls of the building, have a still larger capacity, the figures, corresponding to the dimensions given above, being 57 feet by 30 feet, or 1,710 square feet. There are, however, decisive objections on other grounds to this arrangement. The apron-plates are so overshadowed by the inclined bottoms of the ore-bins above that the facility of supervision, claimed as one advantage of this plan, is largely neutralized by the prevailing darkness, even at noonday.

Feeders.—The working capacity of a battery, and its exemption from unnecessary wear and tear, depend greatly on regular and equal feeding of ore. This used to be done by hand, but is now generally accomplished by automatic feeders, placed at the back of the batteries, and discharging either directly into the feed-opening of the mortar (the lip of the feeder reaching into the mortar-feed), or, as at the Caledonia, upon a small inclined iron-lined apron which leads to the mortar. By the latter arrangement a little more room is left between feeder and mortar, and the feed-opening can be narrower and longer, and the ore more uniformly distributed under the stamps. Thus, the Homestake mortar feed-opening is 24 in. long and 4½ in. wide, while that of the Caledonia, occupying the entire length of the mortar, is 52 in. long and only 3 in. broad.

The two ore-feeders, used in the district, are the "Heady Challenge" and the "Tulloch Automatic." Each has a well-earned good name, the Challenge being, perhaps, more desirable for wet ores. Both right-hand and left-hand feeders are used, the bumper-rod standing between stamps 1 and 2 or 4 and 5. The Challenge feeders, introduced with the new 20 stamps of the Caledonia mill, are central feeders, the bumper-rod being placed next to the central stamp. The rod is guided from the cam-floor,

to which a piece of board, with suitable hole for the rod to pass through, is fastened.

The comparative advantages of the two feeders may be summed up by saying that, while the sheet-iron plate below the hopper of the Tulloch wears out quickly (with Homestake ore in two years), it is cheap and can be patched or renewed by any blacksmith; while the circular cast-iron carrier table of the Challenge lasts seven years with the same ore, but is costly, and, if anything is out of order with the gearing, it requires a shop and a machinist.

Battery-Foundations, Frames and Guides.—The essential importance of a good foundation is well known. In preparing it, a rectangular pit, from 11 to 14 ft. deep, is first dug to receive the mortar-block. It is made sufficiently long and wide (4 by 6½ ft.) to leave a space of about 24 inches all around the block. The bottom is then carefully levelled and some sand tamped down. On this are placed two layers of 2-inch plank, spiked crosswise to each other, and then the planks which form the mortar-block. The latter used to be placed directly on the bottom of the pit, the uneven tops being sawed off afterward. Now, care is taken that this 4-inch wooden floor shall be accurately horizontal, and that the distance between it and the bottom of the mortar shall have the length of the mortar-block. The top of the block is only planed off, which saves time. By the use of this flooring, the time required for replacing a mortar-block is reduced from six or seven days to five. The mortar-block consists of planks, from 11 to 14 ft. long (according to the depth of the pit), of varying breadth, and not more than 2 or 3 in. thick, as it is difficult to find wood of greater thickness which is sound throughout. They are spiked together, and are fastened above and below with binders, bolted to each other by transverse rods, the upper binders (8 by 12 in.) being even with the top of the mortar-block, and the lower binders (12 by 12 in.) 3 ft. lower down. The space around the mortar-block is then carefully filled and tamped with rock tailings up to the level of the mud sills, which are about 4 ft. below the bottom of the mortar. When the top of the mortar-block has been planed off and levelled, a sheet of rubber cloth, ¼ in. thick, is placed over it, and the mortar put in place. Through the four holes in the flanges on each side pass eight bolts, from 3 ft. to 4 ft. 6 in. long, and from 1½ to 1½ in. in diameter, with which the mortar is fastened to the block.

In placing the planks forming the mortar-blocks, and in adjusting the bolts that hold down the mortar, a decided improvement has lately been made at the Homestake mills. The planks which always stand upon end were formerly so spiked that their width was parallel to the short side of the mortar. The holes for the eight bolts were then bored into the mortar-block from above; at a suitable distance below, recesses were chipped out to receive the nuts which secure the lower ends of the bolts. Now the planks are so placed that their width is parallel to the long side of the mortar. The bolts have only at their upper end a thread, and end in a loop at the bottom. Through these loops and through the mortar-block, pass horizontally 2-inch iron rods. The planks, on the two sides of the block, where the bolts pass down, are cut out to receive them. The advantages of this arrangement are apparent. In addition to the mortar being more securely and evenly tied to the block, it is easier to renew the mortar-block if necessary. The pit need only be dug in front of the mortar, and when the front binders have been removed, it is easy to tear out the planks, one after another, with

pick and adze. In putting in the new block, the two outside rows of planks, with places cut to receive bolts, are kept ready, so that only four horizontal 2½-inch holes for the rods need be bored when the planks have been spiked together. With the old method, two trenches had to be dug, instead of one, if a mortar-block was to be exchanged. Then the planks had to be chipped out in pieces until room enough had been made for them to be torn off. This cost much labor and time.

Battery Frames.—These are generally 12 by 24 inches in size, with recesses for the boxes of the cam-shaft. They are placed on the short sides of the mortar, and are independent of the mortar-block, standing on the cross-sills (which are placed on top of, and at right angles to, the mud-sills), and tied by the upper and lower guide-timbers, and, at the foot, by two longitudinal beams, bolted to them, and let into the cross-sills. The frames are braced either from the back or the front of the battery, according to the way in which the power is transmitted to the cam-shaft. In the Homestake, Highland, Golden Terra and Father de Smet mills, where the line-shafts are at the back of the battery, the frames are braced by posts, generally placed on an incline between frame and cross-sill, leaving the entire front of the battery unobstructed. In the Golden Star and Caledonia mills, the cam-shafts receive their motion from line-shafts placed on the cam floor, and the frames are braced against the cross-beams to which the boxes of the line-shafts are bolted.

Guides.—The stamps are held upright by two sets of guides, fastened to the guide-timbers which tie the battery-frames. The upper guides are above the tappets, the lower ones between the cam-shaft and the top of the mortar. At the Homestake mill, the center of the lower guides is 17½ inches above the top of the mortar, and the cam-shaft, revolving between the two sets of guides, is 3 ft. 10½ in. below the center of the upper, and 4 ft. above the center of the lower guides, making the total distance between the two sets 7 ft. 10½ in. At the Caledonia mill, the distance from top of mortar to center of lower guides is 16½ in.; from these to center of cam shaft, 3 ft. 4½ in.; from this to center of upper guides, 4 ft. 2½ in.; total, 7 ft. 6¾ in.

Each set of guides consists of two pieces of 4-in. pine plank, 16 in. deep, having semi-circular grooves, through which the stems of the stamps pass. Between the two parts of the guides, when new, are inserted small pieces of wood to hold them slightly apart. When the grooves are somewhat worn, these slats are removed, and the guides brought nearer each other. Later on, the faces are planed off to diminish the size of the grooves, so that the stamps may not be held too loosely. Each set of guides is secured to the guide-timber with eight ¾-in. bolts. The grooves in the guides are lubricated with a preparation of black lead and linseed oil, mixed warm in such proportions as to form a soft paste. Oak guides last eighteen months; pine, only four months.

Mortars.—Two kinds of single discharge mortars are used in the district. Each consists of one solid casting. The bottom and sides are so thick as not to need any lining, this thickness decreasing very considerably as the feed is approached. The outside walls are vertical, with the exception of the discharge, which projects somewhat. The top is closed by two pieces of 2-in. plank, which rests on logs, ¾ in. wide, cast in the mortar, 2 in. below the top. These planks have each five semi-circular recesses which, when placed together, form holes

for the passage of the stems. In addition to these five large holes, two smaller ones are bored for the two 1-in. water-supply pipes, placed between stamps 1 and 2 and 4 and 5. Two mortars are placed close together as the stamps of both are set in motion by one cam-shaft. In order to reach the mortars, etc., a passage-way is left between every two pairs of batteries. The water-supply is derived from a 3-in. main, running along the front of the batteries. From it passes upward a 2-in. pipe between each pair of batteries. With this is connected a 2-in. horizontal pipe, from which four 1-in. pipes branch off at right angles, two for each mortar. In addition to this water-supply, there is a 1-in. pipe at each passage-way, close to the mortar, coming from the 3-in. main. A hose is attached to clean the apron-plates and for other purposes.

The points of difference between the two mortars lie in the inside dimensions of the lower part of the mortar and in the arrangement and number of the inside amalgamated copper plates,

1. The Homestake mortar (Figs. 1, 2 and 3), weighing 5400 pounds, is 54½ in. high and 54¾ in. long. The feed-opening, beginning 6½ in. below the top, is 24 in. long, 4½ in. wide and 7 in. deep. On entering the mortar it remains 24 in. long and 7 in. deep. At the bottom of the feed, forming the continuation of the incline over which the ore passes into the mortar, is a lip, 4¾ in. wide and 1¼ in. thick, designed to discharge the ore against the upper half of the stamp-head. The lower edge of the lip is 14 in. above the inside bottom of the mortar. As the lip wears out fast it might be well to cast it thicker, as has been done in the Caledonia mortar. Taking the front view of the mortar, we find, 15½ in. from the bottom, the discharge-opening 48½ in. long and 21¾ in. high. The frame is inclined outward about 10 degrees from the vertical. On the short side of the discharge-opening, are grooves to receive the chuck-block, screen-frame and curtain, which are held in place by keys and sockets. The chuck-block is also fastened at the bottom by two horizontal keys, supported by lugs on the outside lip of the mortar below the discharge. Viewing the mortar in cross-section, we first have the two bottom flanges, 3 in. high and 5 in. broad. The bottom of the mortar (the mortar-bed) is 7½ in. thick, the sides, at the foot of the dies, 3½ in. The inside dimensions are: Width at the bottom, 10½ in.;* length, 50 in.; height to issue of mortar (not of pulp), 8¾ in.; width at this point, 13½ in.; at the top of discharge opening, 20 in.; at the top of mortar, 16 in.; total inside height, 47 in. The casting is ¾ in. thick, from the top down to the feed-opening, on three sides, the back being a little thicker.

A mortar lasts four years, wearing pretty uniformly at the sides and back.

2. The Caledonia mortar weighs 5,700 pounds, is 57½ inches high and 54 inches long. The feed-opening, beginning 15½ inches from the top, is 3 inches wide, 11 inches deep and extends the entire length of the mortar, having a strengthening rib in the centre. At entering the mortar, it is 50½ inches long and 7½ inches deep. Here the lip, 2½ inches thick and 8 inches wide, measured on the incline, begins. The bottom of the lip is 15 inches from the foot of the dies. As in the Homestake mortar, the ore is discharged towards the head of the stamp. The lip serves also as a protector to the amalgamated copper plate below it. The discharge-opening in front, 50 inches long by 17 inches high, begins 20 inches above the bottom of the flange.

*Formerly the width was 14 inches, but in order to increase the crushing capacity, it was reduced.

Its frame is also inclined outward about 10 degrees from the vertical. The grooves on the sides, receiving only the screen-frames and the curtain, are simpler in construction than those of the Homestake mortar. The lugs for the horizontal keys are the same. Taking the cross section, we find the flanges 3 inches thick and $4\frac{1}{2}$ inches wide. The mortar-bed is 7 inches thick, the sides, at the foot of the dies, $4\frac{1}{2}$ in. The inside dimensions are: Width at the bottom, 10 in.; length, $50\frac{1}{2}$ in.; height, 14 in. to the issue of mortar and pulp, where the width is 16 inches. This increases to 19 inches at the top of the discharge. The top of the mortar is $13\frac{1}{2}$ inches wide, and the total inside height $50\frac{1}{2}$ inches. The casting, from the top down to the feed-opening, is $\frac{3}{4}$ inch thick.

A mortar lasts six years, and wears out more on the short sides than at the back.

In comparing the two types, we see that they differ in the feed-opening, as already discussed. The feeding-lip also differs, that of the Caledonia mortar being thicker and wider than the other. The increase of width is necessitated by the presence of the amalgamated copper-plate below the lip; the mortar itself is also wider at the issue for the same reason. The depth of the Homestake mortar is $8\frac{3}{4}$ inches, and that of the Caledonia mortar 14 inches.

SEALED TENDERS addressed to the undersigned, will be received at this Office until Wednesday, 4th December, for the Clearing and Removal of Snow, &c., from the Parliamentary and Departmental Buildings and Grounds, Ottawa, for the clearing and removal of snow from the Langevin Block, Museum, Printing Bureau, &c., Ottawa, and also for the removal of snow, &c., from the roofs of buildings, out-buildings, walks, avenues or roads, &c., &c., at Rideau Hall.

Forms of Tender and Specifications can be had at this office, where all necessary information can be obtained.

Separate Tenders will be required for each work, and must be endorsed "Tender for Removal of Snow, Parliamentary Buildings," "Tender for Removal of Snow, Langevin Block, &c.," and "Removal of Snow, Rideau Hall," respectively.

An accepted bank cheque payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 26th Nov., 1889.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fusc, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

PROVINCE OF NOVA SCOTIA.

Leases for Mines of Gold, Silver, Coal, Iron, Copper, Lead, Tin

— AND —

PRECIOUS STONES.

Titles given direct from the Crown, Royalties & Rentals moderate

GOLD AND SILVER.

Under the provisions of chap. 7, Revised Statutes, of Mines and Minerals Licenses are issued for prospecting Gold and Silver for a term of six months, which can be extended by renewal for another six months. Mines of Gold and Silver are laid off in areas of 150 by 250 feet, any number of which up to one hundred can be included in one License, provided that the length of the block does not exceed twice its width. Up to five areas the cost is 50 cents per area, for every area in addition 25 cents. Cost of renewal one half the original fees. Leases of any number of areas are granted for a term of 21 years. These leases are forfeitable if not worked, but advantage can be taken of a recent Act by which on payment of 50 cents annually for each area contained in the lease it becomes non-forfeitable if the labor be not performed.

Licenses are issued to owners of quartz crushing mills who are required to pay Royalty on all the Gold they extract at the rate of two per cent. on smelted Gold valued at \$19.00 an ounce, and in smelted Gold valued at \$18.00 an ounce.

Applications for Licenses or Leases are receivable at the office of the Commissioner of Public Works and Mines each week day from 10 a.m. to 4 p.m., except Saturday, when the hours are from 10 to 1. Licenses are issued in the order of application according to priority. If a person discovers Gold in any part of the Province he may stake out the boundaries of the area he desires to obtain, and this gives him one week and twenty-four hours for every 15 miles from Halifax in which to make application at the Department for his ground.

MINES OTHER THAN GOLD AND SILVER.

Licenses to search for twelve months are issued, at a cost of twenty dollars, for Minerals other than Gold and Silver, out of which one square mile can be selected for mining under lease. These leases are for four renewable terms of twenty years each. The cost for the first year is fifty dollars, and an annual rental of thirty dollars secures each lease from liability to forfeiture for non-working.

All rentals are refunded if afterwards the areas are worked and pay royalties. All titles, transfers, etc., of minerals are registered by the Mines Department free of charge, and provision is made for lessees and licensees whereby they can acquire promptly either by arrangement with the owner or by arbitration all land required for their mining works.

The Government as a security for the payment of royalties makes the royalties a first lien on the plant and fixtures of the mine.

The unusually generous conditions under which the Government of Nova Scotia grants its minerals have introduced many outside capitalists who have always stated that the Mining Laws of the Province were the best they had had experience of.

The royalties on the remaining minerals are :—Copper, four cents on every unit ; Lead, two cents upon every unit ; Iron, five cents on every ton ; Tin and Precious Stones, five per cent. ; Coal, 7½ cents on every ton sold.

The Gold district of the Province extends along its entire Atlantic coast and varies in width from 10 to 40 miles, and embraces an area of over three thousand miles, and is traversed by good roads and accessible at all points by water. Coal is known in the counties of Cumberland, Colchester, Pictou and Antigonish, and at numerous points in the island of Cape Breton. The ores of Iron, Copper, etc., are met at numerous points, and are being rapidly secured by miners and investors.

Copies of the Mining Law and any information can be had on application to

THE HON. C. E. CHURCH,

Commissioner Public Works and Mines,

HALIFAX,

NOVA SCOTIA.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector, stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained, shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

NOTICE

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs,
Ottawa, 11th May, 1889.

Intercolonial Railway OF CANADA.

The direct route between the West and all points on the Lower St. Lawrence and Baie des Chaleurs, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward and Cape Breton Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal and Halifax daily (Sunday excepted) and run through without change between these points in 30 hours.

The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive, thus greatly increasing the comfort and safety of travellers.

New and Elegant Buffet Sleeping and Day Cars are run on all through Express Trains.

CANADIAN EUROPEAN MAIL AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Friday morning will join Outward Mail Steamer at Halifax the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

G. W. ROBINSON,
Eastern Freight and Passenger Agent,
136½ St. James St., MONTREAL.

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein, either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place, shall not exceed forty acres in area. Its length shall not be more than three times its breadth, and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench, creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

ONTARIO

Mining Regulations.

The following summary of the principal
provisions of the General Mining Act of
the Province of Ontario is published for
the information of those interested in
mining matters in the Algoma District,
and that part of the Nipissing District
north of the Mattawan River, Lake Nipis-
sing and French River.

Any person or persons may explore for
mines or minerals on any Crown Lands
surveyed or unsurveyed, not marked or
staked out or occupied.

The price of all lands sold as mining
locations or as lots in surveyed townships
is two dollars per acre cash, the pine timber
being reserved to the Crown. Patentees
or those claiming under them may cut and
use such trees as may be necessary for
building, fencing or fuel, or for any other
purpose essential to the working of mines.

Mining locations in unsurveyed territory
shall be rectangular in shape, and the
bearings of the outlines thereof shall be due
north and south, and due east and west
astronomically, and such locations shall be
one of the following dimensions, viz: eighty
chains in length by forty chains in width,
containing 320 acres, or forty chains square,
containing 160 acres, or forty chains in
length by twenty chains in width, con-
taining 80 acres.

All such locations must be surveyed by
a Provincial Land Surveyor, and be con-
nected with some known point or boundary
at the cost of the applicant, who must file
with application surveyor's plan, field notes
and description of location applied for.

In all patents for mining locations a
reservation of five per cent. of the acreage
is made for roads.

Lands patented under the Mining Act
are free from all royalties or duties in re-
spect to any ores or minerals thereon, and
no reservation or exception of any mineral
is made in the patents.

Lands situated south of the Mattawan
River, Lake Nipissing and French River
are sold under the Mining Act at one
dollar per acre cash.

Affidavits showing no adverse occupa-
tion, improvement or claim should ac-
company applications to purchase.

A. S. HARDY,

Commissioner.

Department of Crown Lands, Toronto.

FIRE FELT

is a new Non-Conducting material, made into sections to fit any size of pipe, and into rolls and sheets for large surfaces. It is a flexible felt-like fabric, made of pure Asbestos. It has been demonstrated by the U. S. Navy and others to be superior to hair felt as a non-conductor, and is indestructible by heat. Covering your Steam or Hot Air Pipes will save from 10 to 40 per cent. in fuel and give dry steam at long distances.

SOLE MANUFACTURERS

The Chalmers-Spence Co.,

Largest Consumers of Asbestos in the World.

419 to 425 E. Eighth Street, NEW YORK.

DODGE PATENT

Wood Separable Split Pulleys

Best Belt Surface, Lightest, Strongest, Best Balanced and Most Convenient Pulley in the World.

WITH OUR PATENT BUSHING SYSTEM

In Comparing Prices of Pulleys please note carefully the following:

1. Our list is lower than most others.
2. Every Pulley is a Split Pulley.
3. Every Pulley is guaranteed to transmit from 25 to 60 per cent. more power than an iron one with same tension of belt.
4. Our Pulleys are 70 per cent. lighter than iron pulleys.
5. The fastening does not mar the shaft.
6. They are perfect in Balance.
7. They can be used on many different sizes of shafting.
8. They are the most thoroughly made wooden pulleys in the world.
9. And the handsomest pulley on the shaft.
10. No chances to take. Every pulley as represented or no sale.

Order a Sample Pulley, after which you will have no other.

EVERY PULLEY IS A SPLIT PULLEY
Made in any size from 9 inches to 16 ft. diameter with original bores of 3 and 3½ inches, bushings to be used for intermediate sizes; larger ones bored to order.

WE ALSO MANUFACTURE
WOODEN GROOVED PULLEYS FOR THE TRANSMISSION OF POWER
BY MANILLA ROPE,

Under the Dodge Patent System from 5 to 500 h. p. State power to be transmitted, speed of shafts, relative position of shafts, distance between shafts, and we can furnish a clear estimate.

EVERY PULLEY WILL FIT.
22 or more sizes of Shafting.
200 of our Pulleys and an assortment of bushings represent as many as 4,000 iron pulleys, a great advantage to dealers carrying stock.

Apply for particulars to **THE DODGE WOOD SPLIT PULLEY CO., TORONTO.**

Vol. VIII. DECEMBER, 1889. No. 12.

The Phosphate Season of 1889.

The year 1889 will be a memorable one in the annals of the Canadian phosphate industry as having witnessed the first considerable awakening of foreign interest on its behalf. In December, 1888, Mr. Hermann Voss read a paper, in London, before the Chemical Manure Manufacturers' Association, entitled "Our Supply of Phosphates." This aroused considerable interest in the subject, and in January articles appeared in the *Times* and the *Morning Post* calling attention to the importance of the Canadian apatite deposits. The *Times* said: "In view of the scarcity of and increasing demand for phosphates, it may be well to point out that in our nearest large colony we have a source of supply which ought to be worked by British capital for the benefit of British agriculture." Nitrate had acquired great notoriety both as a fertilizer and as a means of making money, but an eminent authority made the statement that the nitrate used alone as a fertilizer was too stimulating and ephemeral in its effect, and it needed to be combined with phosphate in the ratio of two or three parts of phosphate to one of nitrate. The article in the *Times*, comparing the two, used these words: "To adopt a homely simile, the nitrate is like a glass of spirits, while the phosphate may be compared to a plate of beef." This struck the British imagination and phosphate was soon "the talk of the town." The agricultural papers, as well as the daily press, repeated the illustration until it became widely known. Col. North's nitrate mines and associated schemes had created such great fortunes that nitrate had become a household word, but now it became the fashion for every "city man" to say: "Nitrate is very well as a fertilizer in its place, but after all it is only a glass of spirits whereas phosphate is as a plate of beef." Financial men now began to say: "If money can be made in nitrate, why not in phosphate, which is required by the soil in threefold quantities?" Cables began to pour into Canada asking for offers of lands, and in a little while a good portion of the phosphate district was for sale on the London market. Some of our leading mine owners and several business men went to the scene of the excitement. Even eminent statesmen started for England with bonds of lands in their trunks, though the reporters were told to announce in the newspapers that the visit was "purely a pleasure trip." Prospectuses were soon drawn up offering Canadian lands to the public at from two to five times the price asked by the holders, which was generally quite the full value to begin with. The *Star*, the Radical evening daily, attacked these

schemes, exposing the inflation; and the issues fell flat. One scheme that asked for £150,000 only got £7,500 subscribed, and it was found that the British public were not enthused about phosphate investments. The summer holidays came and the boom collapsed, to the sorrow of many land owners, who had repeatedly been told by letter or cable: "The thing is done;" "The scheme is placed;" "Your lands are sold;" "The company is fully underwritten;" "It is certain to go." But out of hundreds of thousands of ones that were offered not one was sold, except that one private enterprise, the Foxton mine, which was taken up with Canadian and English capital on a comparatively snug basis. But the talk and excitement had made people acquainted with phosphate and with the Canadian deposits. In the fall, several visitors came across to make return "pleasure trips," and finding local prices so much lower than those of the London company promoters, they in a few cases bought lands, and in others bonded properties, intending to try the public again with them at more tempting prices. Several schemes are now in hand of this nature, and another trial of the sentiments of the investing public will soon be made. All these efforts have merely been for the purpose of speculating in lands, but it is pleasant to notice that now some enterprises are being undertaken that are based on genuine intentions to make a profit out of mining. The success of some of the properties that have been worked this year has demonstrated that "there is money in it," and we confidently predict that a great impetus is to be given to Canadian phosphate mining. It is well that the inflated schemes have failed, as they could only have led to disappointment, the capital being, in most cases, entirely out of proportion to any possible profits; but lands taken up on a legitimate basis and a large working capital being applied to the mining, instead of to the coffers of promoters, will doubtless produce results that will secure a permanent prosperity to the industry and a vast increase in phosphate production.

In our last issue we estimated the year's output of phosphate as being 32,466 tons, the largest annual production yet reached. Since then additional returns have been received, which increase the total yield to a little over 33,000 tons. Compared with the yield of other countries this is a small figure, as South Carolina alone produces over half a million tons yearly. But the Canadian industry has only just fairly got on its feet. Years of effort and much money have been spent in learning how to mine it profitably. The deposits are confessedly irregular and uncertain in occurrence, and those who have worked in a small way on single seams for a limited time, as has been usually the case, have not often been rewarded. It has been learned that large operations are essential to success; that it pays to break ground extensively, thus discovering many "bunches" that would have

been passed by if a single vein had been narrowly followed; that the true economic method of mining is to work a large number of pits simultaneously, for when one is "pinching" another will be "coming in," and the average output will be maintained. We hope soon to see a large amount of capital put into the working of these mines.

A few features of the season's business call for remark. Prices have steadily advanced and the prospect is favourable for still higher figures. The old standard of 1s. 3d. for 70 per cent. is still a long way out of sight, but there are those who predict that it will be again attained in the near future. The price has been as low as 7½d, but it got up this year to 10d. and a higher rate is now asked. Carolina phosphate of 55 per cent. quality has in the past commanded the same price as Canadian 70 per cent. This has been owing partly to difficulties arising from lack of knowledge how to treat the newer article and partly from the weakness and lack of accord of Canadian sellers. Time and experience will doubtless remedy these defects.

The export to the United States of 4,176 tons is a very encouraging feature, especially as it consisted of low grade phosphate that was formerly thrown away. Some progress is being made in the use of this on the soil in the crude state, without a mixture with acid, and this promises to create a large demand. It is also a very favourable feature that the English market is now calling for these low grades, and whereas two or three years ago it was difficult to sell anything below 80 per cent. in quality, there has this year been a good demand for 60 per cent. phosphate. This greatly helps our mines, as what is obtained from this grade is nearly all clear gain, it having to be mined in any event with the higher class rock.

Freights were fairly plentiful early in the season, and much room could have been had all midsummer for low figures, but the low water in the Lievres River prevented shipments to Montreal in time to avail fully of the opportunities. The too long deferred completion of the locks at Little Rapids is now eagerly looked for in another year. In the fall, cargo rates being high and vessels scarce, rates for phosphates rose to a prohibitory figure. About 1,200 tons had to be carried over the winter at Montreal, and 3,000 or 4,000 tons more at the mines, besides large quantities of second quality phosphate that awaits grinding by the mills. 7s. per ton was the prevailing rate, though as low as 5s and as high as 12s. was paid.

The railways projected or building in Ontario and Quebec will prove of great assistance for the transport of phosphate. The railroad will be completed next season from Westport across Bob's Lake giving access from that district to the Grand Trunk Railway at Brockville and the Canadian Pacific Railway at Sharbot Lake. The Kingston and Smith's Falls road will also benefit a

large tract of phosphate country. The Ottawa and Gatineau Valley Railway, now in course of construction, has been graded as far as the Pêche, and when finished will open up a very extensive belt of phosphate and other mining lands, now undeveloped, mainly owing to scarcity of transportation.

With the continued working of the present mines and new enterprises now starting and the good commercial outlook, it seems safe to predict that Canada's best phosphate year will be surpassed by a better one in 1890.

The Duty on Mining Machinery.

We notice that the *Globe* and other papers have been publishing a statement announcing that the Dominion Government had at last decided to remove the duty on imports of mining machinery. The statement is premature, as the following letter from the Hon. M. Bowell shows:—"I have your favor of 9th inst., and cannot understand how the "*Globe*" obtained the information which it purports to give respecting the duty on mining machinery, as the Government has come to no decision in the matter. Even if it had, an intimation of that kind, as you are aware, would not be given until it had been laid before Parliament."

Canadian Iron Ore and New England Furnaces.

Our attention has been drawn to the following letter by a Mr. A. Evans, Jr., which appears in the *Bulletin* of the American Iron and Steel Association:

"I spent nearly three months of the summer of 1888 in the provinces of New Brunswick and Nova Scotia, and was part of that time in charge of the blast furnaces of the Londonderry Iron Company, at Acadia Mines, Nova Scotia. I did not find a single furnace in blast in either of these provinces, except one of the two stacks of the Londonderry Iron Company, and this furnace the company was only enabled to run on account of having a demand for the larger part of the iron at its own works, which consist of a pipe foundry, a rolling mill and an axle forge. As the Londonderry Iron Company could not successfully compete in the open market with imported pig iron, even with the \$4 protection, and \$1.50 of bounty at that time allowed by the Canadian Government, it built its pipe foundry under an especial concession, the government giving the company, if my memory serves me correctly, \$12 per ton on pipe, as an inducement to start a foundry of that kind in Nova Scotia.

Another reason for the company not running its idle stack, even if its own necessities required the pig iron, was that it was hard pushed to procure enough iron ore for the furnace then running, although Mr. John Sutcliffe, the general manager of the company, had travelled all over the province endeavoring to secure an additional supply. Indeed, while I was there, Mr. Sutcliffe took a two weeks' trip to Newfoundland in search of a supply of iron ore from that country, but failed to secure it. The ore the company was using would not have been used by any furnace in this country, as you will see from the analyses given below, which were taken from a lot of ore of better quality than the average output of the mines. The following analysis of a specimen of calcareous limonite ore, taken from the Totten mine, at Londonderry, will give a very fair idea of the richness of the ores the company was using:

	Per cent.
Insoluble matter	5.48
Ferric oxide	54.88
Ferrous oxide	2.39
Alumina	2.81
Manganese	1.36
Lime	22.80
Magnesia	4.40
Average metallic iron	31.00

An analysis of a specimen of limonite ore, called hematite, taken from the West mine, gave the following results:

	Per cent.
Silica	16.00
Alumina	0.86
Magnesia	0.46
Phosphoric acid	0.57
Metallic iron	40.00

The coal received for the manufacture of coke was very poor, and all of it contained a great deal of slate, although the miners declared that they had taken especial care in its preparation and loading. The analyses given below were made from coke manufactured from the best coal received, we rejecting as high as twenty car loads in a single month as totally unfit for coking purposes. The coke made from coal taken from the west slope of the Spring Hill Company analyzed as follows:

	Per cent.
Ash	19.48
Sulphur	1.01

A sample of coke made from coal from the Albion mines analyzed as follows:

	Per cent.
Ash	18.38
Sulphur	0.87

This showing would undoubtedly condemn any property producing such coal and coke in any part of the United States.

Before returning to the States, I visited the output of the iron ore mine at Digby Bay, a deposit represented to be the largest and best in the province, and found it entirely unsatisfactory. I could see no indications of the existence of a large quantity of ore, and the specimen I brought away (a carefully selected sample) contained less than 40 per cent. of metallic iron, and was very high in silica, I think 21 per cent. It will be much cheaper for the New England furnace-men to use American iron ores, which are higher in metallic iron and lower in objectionable acids, or even to import Spanish, Cuban or Elban ores, paying the duty of 75 cents per ton, than to attempt to use any of the iron ores mined in the eastern Canadian provinces. And this applies to fuel also, for they will find that one ton of Pennsylvania coke, or $1\frac{1}{4}$ tons of anthracite coal, is worth two tons of any coke they can procure from the Canadian provinces."

It is very apparent that the author of this remarkable letter has been inspired by a desire for political effect rather than for a fondness for speaking the truth. It would be easy to find in many parts of the world a tract of country as large as New Brunswick not adapted for the manufacture of iron, and the fact that this article is not produced there can hardly be called an argument against any proposal to take the duty off Canadian iron ore. The question of costs, of tariff protection, and special bonuses, may be passed over here, as reference is now intended more particularly to the supply of ore. The analysis given of calcareous limonite ore is certainly a curiosity, as it is the first time the public have heard of an iron ore containing free lime. The Londonderry ore has never laid any claim to be of high grade, the average metallic per cent. of the furnace supply varying from 40 to 45. The coke is silicious, running about 5 per cent. over the average Connellsville, but apart from this it is of excellent quality, and better cokes could be secured. Small supplies of excellent ore have been drawn from Picton and Brookfield, and enough Bessemer ore to run both furnaces could have been procured from Picton county, but for the fact that the owners of the deposits have seen their way to do better than sell or lease to the Londonderry people. At present a railway is in course of construction from the Picton coal field to the iron ores of that county, and preparations are being made for building furnaces, etc. There

are also in Guysboro county, and in several parts of Cape Breton ample supplies of first class ore.

The writer speaks of visiting "the output of the iron ore mines at Digby Bay, a deposit represented to be the largest and best in the province." As a matter of fact a small quantity of charcoal iron was made here a number of years ago, but, without any prejudice to the present or future values of these deposits, they have never been publicly represented as the "largest and best." As another matter of fact it is known that at numerous points in Digby and Annapolis counties there are iron ores practically pure and running from 60 to 65 per cent. of iron. The general tenor of the letter would imply that the writer after a very short stay in Nova Scotia, has desired to mendaciously condemn the iron ores of the province in general, and the Londonderry works in particular, and to conceal this motive under a specious cloak of political patriotism. He apparently forgets that if the United States takes the duty off iron ore, the Nova Scotian ore would have to compete with those from Cuba, Algiers, etc., and that curiously enough he is arguing against the best interests of those he pretends to be putting on their guard.

The attitude of the iron ore owners in the Maritime Provinces is one of indifference as to the adoption by the United States of the policy of removing the duty on iron ore. If they do not see their way now to ship their rich ores to the States in competition with other foreign ores, they would be on exactly the same footing if the duty were remitted, the only difference being a gain to the United States furnace man who is now handicapped by the native ores being regulated in price to compete with the foreign ore paying a duty.

The Promotion of Joint-Stock Companies.

Advices from England indicate that the promotion of public companies to operate industrial and mining enterprises has experienced a check owing to the losses sustained by the associations whose business it is to underwrite working capital, and the expenses of floating such companies. The stock of several recent enterprises has not been absorbed or taken up by investors to the extent expected, in some cases only from 5 to 10 per cent being subscribed, leaving a large amount of cash to be provided by the underwriters who are practically guarantees for the public to the vendors. As everyone knows, the floating of a company is attended with a great deal of expense, frequently as high as £4,000 Sterling being incurred. It can readily be understood, that a few losses to that amount, besides the difficulty and trouble of working off the stock, must render underwriters rather chary of assuming new obligations, for a time at least. The recent increase in the rate of discount by the bank of England and the larger

rate of interest now obtainable for money has also had a cooling effect, and a large amount of cash lately available for speculative enterprises has thus been withdrawn from circulation. With the opening of the new year, and the distribution of dividends, some improvement however, may safely be anticipated.

The Phosphate Trust (Limited.)

Just as we go to press, an occasional correspondent has handed us a most remarkable document which purports to be the Prospectus of a new concern on the eve of being submitted to the English public under the pretentious title of "The Phosphate Trust (Limited.)" The authorised share capital of this prodigious scheme is placed at £1,000,000 sterling, divided into 99,500 ordinary shares of £10 each, and 500 Founders' shares of £10 each. The acreage proposed to be acquired consists of 38,556 acres as follows:

ONTARIO.	
County of Lanark	5,237 acres.
" Renfrew	450 "
" Frontenac	9,695 "
	15,482 "
QUEBEC.	
Township of Templeton	4,698
Gore of Templeton	3,210
Township Portland East	2,583
" " West	1,317
" Wakefield	2,400
" Hull	730
" Derry	200
" Buckingham	2,446
" Bowman	4,496
	23,074

We know nothing about the economic value of this extensive area of so called phosphate lands, and the highly colored prospectus (on green tinted paper) fails to enlighten our ignorance, further than to quote brief excerpts from the reports of the following illustrious mining experts: *H. Loken, C. Davenny, Peter Powers, Thos Dowsley, J. F. McAndrew and E. Newton*, men, we need not say, wholly unknown to us or to the profession as mining engineers, or with any reputation as such. In addition to these celebrities, there are published portions from reports on other lots, written by the owners themselves, and these, very naturally, are most flattering and highly eulogistic. In such an extensive area, within the phosphate belt, there should be properties which, if systematically worked and judiciously capitalized, would amply repay investment, and that such may exist in the proposition before us, is suggested by quotations from the reports of Dr. Sterry Hunt, Prof. B. J. Harrington, Mr. Lanson-Wills, Mr. John D. Frossard, and a few others eminent in the profession, but these, we surmise, do not cover one-third of the mining lands to be submitted to the public. In conclusion, we cannot help thinking that the promoters will require something more than an indiscriminate collection of reports, something more specific and definite as to the ways and means by which such an enterprise is to be made to pay, before their scheme can be thought worthy of consideration by thoughtful

men and the investing public. For the credit of the Canadian phosphate trade, we trust the proposal, as it at present exists, will not be put to the public.

LETTERS TO THE EDITOR.

Halifax, Dec. 10th, 1889.

The Editor

THE CANADIAN MINING REVIEW:

SIR,—Under the head of Rockingham in your last issue you report the late discovery of gold near Princes Lodge, Nova Scotia, and state "but a close examination of the lodes as yet stripped fails to discover any gold in them." This statement is deliberately false, as the leads show gold, and we are prepared to show the same to anyone who may come to us and ask an examination. . . . There is no intention of putting a mill on the property until the work of development has been sufficiently advanced to warrant the same. The prospects so far are most encouraging.

Yours, &c.,

HENRY ARCHIBALD,
W. J. MORRISON,
W. G. COOMBS.

[The statement published in our last issue came from a thoroughly reliable source. However, our correspondent may have been misinformed, and we insert the above with pleasure.—EDIT.]

Stormy Meeting of the British Columbia Smelting Company.

A meeting of the shareholders of the British Columbia Smelting Company, limited, was held on Thursday, 21st ult., at Winchester House, Old Broad Street, London, Mr. W. J. Steele presiding.

The Chairman said that that was an adjournment of the meeting held on September 2nd. The shareholders had expressed a very natural wish that the report of Mr. Juddins should be printed and circulated. That had been done, and the accounts in London had been made up to September 30th, and had been audited by Messrs. Turquand, Youngs & Co., and had been found correct. Appended to the London accounts was a statement of receipts and expenditure at Vancouver. That statement had been signed by the local directors and the secretary, but was not audited; and, on submitting it to Messrs. Turquand, Youngs & Co., they most properly, in his opinion, refused to deal with it. In fact, the accounts were in such a shape that they could not possibly be audited. The board immediately wrote to the local secretary, instructing him to have those accounts audited on the spot. As soon as these, properly audited, were received from Vancouver, they would be incorporated with the London accounts, and a balance-sheet would be drawn up and audited by Messrs. Turquand, Youngs & Company, and issued to the proprietors. The sum due to the Bank of British Columbia was as nearly as possible £7,600, which was carrying five per cent. interest, and the board had received a telegram during the last few days to the effect that, if the interest to the 31st inst. was not paid, proceedings would be commenced under the mortgage. He considered that the bank had treated the company with great indulgence in this matter, as the notice of foreclosure expired on September 10th, and since that date they had taken no action against the company under the mortgage. They could not, however, expect them to wait an indefinite time for their money, even if they had ample security. There was a suggestion made at the last meeting that about £2,000 would be sufficient for the purposes of the company; but the directors were advised that any attempt to spend a couple of thousand pounds on the works would be so much money thrown away, and they could not recommend any such course. The board strongly recommended the shareholders to immediately subscribe a sufficient amount to pay off the mortgage to the Bank of British Columbia, so that the property might be kept intact until arrangements could be made for carrying on

active operations next spring. The directors recommended that the advances made by the shareholders for this purpose should be secured by debentures, and that the existing mortgage in favor of the bank should be transferred to a trustee for the debenture-holders. That would secure the redemption of the advances. The local directors had sent a very long statement to the board to complain of the remarks made at the last meeting, and resigning their seats. While the directors regretted that they would lose the services of gentlemen holding responsible positions in Vancouver, they could not withdraw from the position that they had taken up—that the company owed its present position to bad management at Vancouver, and improper management at the mine. The Chairman then read a long letter that had been received from the local committee at the mine, setting forth the position of affairs there. As early as December last the board had a very strong suspicion with regard to the state of affairs at the mine, and on January 14th a telegram was sent to the local directors telling them if they could not proceed with the smelting to shut down the works. That telegram was disregarded. Had they paid attention to it the company would have been saved a very considerable expense. He concluded by remarking that what was before them was the question, how to raise money to pay the Bank of British Columbia.

Mr. Oscar Reumen (interrupting): I wish to know, sir, why a letter, dated July last, numbered 54, was not produced when you had it in your hands at the last meeting? I want to ask you that question straight and point blank. There was a letter in your possession, and that letter was not produced at the last meeting.

Mr. James (a director): I don't quite understand, sir, the nature of your remark. What letter is it you refer to? and may I ask how you come to know of the number of the letters sent to us?

A Shareholder: Let the chairman answer.

Mr. James: Sir, I don't stand here to be dictated to.

Mr. Reumen: Mr. Chairman, there is a simple question about a letter; cannot we have an answer? ("Hear, hear.") This letter was in your hands, and you must have known of it at the last meeting. I want to know all about it. ("Answer, answer, answer.")

Mr. James: You ask a question which I am not prepared for the moment—"Answer, answer."—I will ask the secretary. ("Sit down; let the chairman answer.") If any gentleman here professes to recollect any letter, I confess that I have not that capability. (Uproar and cries of "Sit down.") I go further and say this—(Uproar, and "Answer the question.")

Mr. Reumen: Mr. Chairman, I have asked a question and I insist upon an answer. I do not want any outsiders to answer me. ("Hear, hear.")

Mr. James: I am not an outsider. (Laughter.)

Mr. Reumen: I am addressing the chairman, and I want to be answered by the chairman. ("Hear, hear," and noise.)

The Chairman: I will give you an answer. ("You?")

The Chairman: The question of producing that letter was not considered. ("Oh, oh.") There was no discussion by the Board in any way, and that Board had no object, directly or indirectly, in not referring to that letter at our last meeting; and if that letter had been asked for at the last meeting, it would instantly have been produced. We have no object in keeping back that letter. I can only say, however, that the letter is in direct disagreement with the letter of February, 28.

Mr. Reumen: I say that the last meeting was adjourned for the purpose of introducing that letter, and it would not have been adjourned if that letter had been produced. ("Hear, hear.")

The Chairman: I think you are making a mistake. ("No, no. There was no mistake.") The meeting was not adjourned for the purpose of producing that letter.

Mr. Birkin: I wish the chairman to read my letter to him tendering my resignation as director.

The chairman read the letter, which stated that Mr. Birkin resigned his position on the Board in consequence of language used at the last meeting, imputing to the Board "scandalous, disgraceful and sinister motives." That language was reproduced in the *Financial News* and the *Financial Times* of the following day.

Mr. Birkin then stated that he had done a great deal for the company and spent a lot of time in its promotion. They were in difficulties and he wrote a cheque for £500, and subsequently for £250, in order to help them out of those difficulties. He had every confidence in the Board and did not feel inclined to give his valuable time as a director when that gentleman stood up and accused them of being influenced by "scandalous, disgraceful and sinister motives." He was a larger subscriber than most men here, and he thought it was certainly discreditable that gentlemen made such remarks without foundation. ("Hear, hear.") He ought to have had some knowledge to justify an assertion of that kind. ("Hear, hear.")

Dr. Jones said that, as he was accused of having made those remarks, he was entitled to reply. His reply was that at the last meeting the chairman stated that unless they subscribed sufficient money amongst them within six or seven days their property would be lost. He (the

speaker) got up and asked when that information was received. The chairman replied that they had received it a month before.

Mr. Reumen : Six weeks.

Dr. Jones : Six weeks or a month ! And, although they received that important information, they did not convene a meeting, and they only gave it to the shareholders when the meeting was convened. They never informed them that the mortgagees intended foreclosing. He (the speaker) took into consideration that if they had that notice fully six weeks beforehand, they ought to have called a meeting of the shareholders together, or, at any rate, some of the larger shareholders, and give that information, so that they might have had time to protect their interests and their property. ("Hear, hear.") He appealed to the shareholders present whether, under the circumstances, he was not entitled to make that remark. ("Yes, undoubtedly.") There was one thing he wished to say with regard to Mr. Birkin; he felt extremely sorry that that gentleman had resigned his position on the Board. He looked upon Mr. Birkin as the only member of the board who had their confidence—"Hear, hear"—and he felt that now that Mr. Birkin had resigned their case was hopeless, unless they had a complete change in the directors. ("Hear, hear.") With regard to Mr. Birkin, himself, he (the speaker) exonerated him from anything in connection with the bad management of the company, and extended to him the hand of fellowship. His remarks were directed to other members of the Board. ("Hear, hear," and uproar.)

Mr. Birkin replied that he did not wish to separate himself from his brother directors as regarded any responsibility attaching to the Board.

Mr. James : I say for myself that it is a deliberate lie if anyone accuses me of sinister motives. If anyone said it to me personally I should know how to deal with him. (Uproar.)

The Chairman : I can only endorse every word that Mr. James has said.

Mr. Curtis Hayward then addressed the meeting at considerable length, and, in the course of his remarks he was interrupted by

Mr. James : I cannot afford to sit here all the evening. ("Order, order.") Gentlemen, you cannot yell me down, and I won't be yelled down. ("Chair, chair.") I cannot sit here—(uproar)—I won't and will not sit down." He is not touching upon the business of the meeting. (He is, sit down.) I beg your pardon, he is not. ("Chair, chair.") Any gentleman who is at all acquainted with public meetings—(uproar, and cries of "Sit down")—is perfectly well aware—"Chair, chair"—that at an extraordinary meeting of a company, no other business can be brought forward except that for which it is convened. ("Why don't you sit down?")

Mr. Reumen : I shall move directly that this meeting is illegal. (Laughter.)

A Shareholder (to Mr. Reumen) : Give some one else a chance, old man.

Mr. Reumen : I shall move that this meeting is illegal.

Mr. James proceeded to speak amidst great uproar and cries of "Sit down." He said : I'll not sit down for an everlasting noise ; gentleman, I will leave you, I'll have nothing further to do with you. I call upon the chairman to close the meeting unless you—(Uproar.)

The chairman : I think, gentlemen, it will be very much better for us to adjourn this meeting ("No, no,") I for one will not remain here to be spoken to in this way. (Noise.) We can adjourn this meeting till next week if you like. ("No, no.")

Mr. Reumen : But you would remain if you had had your own way. (Laughter.)

Mr. James here put on his hat to leave.

A Shareholder : Take off your hat.

Mr. James : I will not take off my hat ; when I meet gentlemen I take off my hat.

The Shareholder : Why don't you take off your hat ?

Mr. James : I will not sit here to listen to men who insult gentlemen—(Uproar.)

Mr. Curtis Hayward : You don't like to hear the truth

Mr. James : I say, as far as I am concerned, that is a deliberate lie—(a great uproar)—a deliberate lie, sir.

The Chairman (to Mr. James) : Resign ! resign !

Mr. James : I shall not resign.

A Shareholder : Resign !

Mr. James, No, I shall not resign. (Uproar.)

The Chairman : I think this meeting ought to be adjourned. ("No, no.")

Mr. James : Why this interruption, Mr. Chairman ?

Mr. Reumen : Because you are not willing to hear the truth.

The Chairman : We are quite willing to hear the truth.

Mr. James : I think you should listen. (Sit down.)

The Chairman : Will you adjourn the meeting till this day week ? (No, no.)

A Shareholder : I hope Mr. Hayward won't take up the time of the meeting. (Sit down, sir, sit down ; where's the chairman ?)

A Shareholder : I beg the chairman to stop the meeting. (Great uproar.)

Mr. James : I cannot wait here, it is a waste of time.

A shareholder : Good-bys, good-hye ; why did you come at all ?

Mr. James then left the room.

Mr. C. Hayward said he was certain that all those who had subscribed to the capital of the company did so on the faith of the statements in the prospectus, believing that the affairs of the company would be managed by competent men, and that due attention would be paid to reports coming from the other side. This, he considered, had not been done. He held that it was not necessary to have a highly paid secretary out in Vancouver, and that a clerk at £200 a year would be able to do all that was necessary. He concluded his remarks by moving that a letter should be sent from London to the local committee, to the effect that the meeting was of opinion that the statements made by the directors did not afford grounds for concluding that the local directors in British Columbia were responsible for the mismanagement of the company's affairs, and requesting the local directors to withdraw their resignations, and continue to act in that capacity.

The motion was seconded, and after some further heated discussion, carried.

Meeting of the New Vancouver Coal-Mining and Land Company, Limited.

A General Meeting of this Company was held on Tuesday, 19th ult., at 12, Old Jewry Chambers, London, E.C., Mr. John Galsworthy presiding.

The Chairman, in moving the adoption of the report and accounts, said the reconstruction was completed in March last, when the present Company took over all the property of the old. He congratulated the shareholders on the fact, because he considered they had benefited very considerably in their position. In the first place, they got rid of the inequality on their shares, and at the same time they got rid of the liability existing on a certain portion of the shares. They also got the advantage of a rearrangement of the balance-sheet. Further, they got more ample powers. Previously they were in a very cramped position with regard to their powers, because the articles were framed a very long time ago, and they found themselves often in a difficulty with regard to their powers. The reconstruction, however, had given them more elastic powers, and in all respects more satisfactory to the directors. As to what they had done since the reconstruction, for the four months since that period they had made a net profit of £4,995, and from the balance-sheet which the liquidator had sent them they would see that from last December to June they made £8,157 ; thus, for the twelve months together, the net profit was £13,152. That profit contrasted very unfavorably, he must admit, with the profits made in the six months from June, 1888, to December, 1888, which was a period of extreme prosperity for the Company. But for that prosperity they would have found themselves in an awkward position, but in consequence of that great profit, they were in an extremely satisfactory position. At the meeting in May he foreshadowed that they would have not such good prices, and it was partly that which induced him to press the adoption of the contract with Messrs. Rosenfeldt upon their consideration. That prognostication had been realized, for whereas in the six months ended when he was speaking they made a profit of \$4.50 per ton during the period ending June, 1889, the price had only been \$3.50. The profit from coal for the half year had been very small, owing to the bad range of prices at San Francisco. The output for the four months had been 58,000 tons, and for two months 47,000, making together 105,000. This was a very large output, and ought to have yielded much more profit, no doubt. There had been issued the same number of debentures as before ; all had been taken up, and they had not had one dissident, either from a shareholder or debenture holder, in carrying through the reconstruction. With regard to the state of the works, that was given very fully in the report ; but that day they had received a telegram from Mr. Robins, which carried that matter a little further. It was as follows :—"East Field Mine : No. 1 level (canal) continues in good coal 6 ft. thick. No. 3 level : No change. No. 3, South Field mine, in good coal, but working approaching two barren districts pierced by No. 4 slope. No. 2 South Field slope, stopped by fault, driving two drifts across lode No. 1 ; slope in fairish coal. North Field Mine : Driving four levels all in good coal, 4½ feet thick ; railway nearly graded ; began laying rails ; expect to ship cargo this year." The board had declared a dividend of £2 10s. per cent., making with the dividend paid in June, 5 per cent. out of the amount of profit transferred from the old company. The dividend did not affect the profits made by the new company ; that was hardly sufficient for them to expend in that way, looking to the fact that they had

had to spend so large an amount of money on capital works for the last year.

Mr. Joseph Fry seconded the motion, which was carried.

In reply to Professor Lambert, Mr. Tendron (another director) said that the amount that had been written off under the reconstruction scheme was £44,549.

Professor Lambert : That means we are £44,000 to the good.

Mr. Tendron : That is a very safe shot ; we are that or something more.

The Chairman then moved a vote of thanks to Mr. Samuel M. Robins, the Company's Superintendent, for the zeal and ability he had displayed in the management of the Company's affairs during the last half year.

Mr. Tendron, in seconding, spoke of Mr. Robins efforts in promoting the interests of the Company as indefatigable. The duties he discharged were multifarious. The only fault he (Mr. Tendron) had to find with him was that, having so many duties to discharge, and knowing the extreme confidence they placed in him, Mr. Robins thought that was sufficient for them as directors. Let him, however, say that their duties as directors could not be devolved, and he must obtain their counsel and sanction before certain matters were carried out. They trusted that he would enter fully into their views, and that they would not have to again make this the only complaint that could be urged against him.

Mr. Blundell seconded the resolution, which was carried without dissent.

Votes of thanks to Mr. McGregor, the mining engineer ; Messrs. Rosenfeldt, the agents at San Francisco ; and, finally, to the chairman and directors, terminated the proceedings.

The Production Of Coal In The British Colonies and Possessions—From

the annual Mineral Statistics just issued, it appears that the output of coal at the Cape of Good Hope during the year 1887 was 20,014 tons, of £56,047 value, while 5,600 tons were raised in metal, valued at £3,465, giving a total output for Africa of 25,614 tons. In India a total of 1,560,393 tons is given as the production, but the returns are stated to be incomplete. Of the total output of 3,750,459 from Australasia, New South Wales contributed 2,922,467 tons, as against 2,830,175 in the previous year ; New Zealand 558,620 tons, as compared with 534,850 tons in 1886 ; Queensland 238,713 tons, as against 228,656 tons in 1886 ; Tasmania 27,663 tons, as against 10,391 tons in 1886 ; Victoria 3,226 tons, as against 86 tons in 1886. Canada produced 2,115,031 tons, an increase on the previous year of 759 tons.

Dangers of Afterdamp.—The following

very valuable explanations and cautions are given by Mr. W. N. Atkinson, one of Her Majesty's inspectors of mines, in his report on the Hyde Colliery explosion, which occurred on the 18th January last. "It may not be out of place here to say a word of warning to persons who, without experience of large explosions, are called upon to enter a mine after an explosion has taken place. They should bear in mind that the resulting afterdamp is of an extremely poisonous nature, and that it may be fatal to men when its presence cannot be detected by the lamps, or directly by any of the senses. It frequently occurs that men proceed into the workings before the ventilation is restored, and are not aware of the poisonous nature of the atmosphere, until they are so far overcome as to be hardly able to retrace their steps into purer air, and sometimes they perish. It is probably carbonic oxide which poisons them. A minute proportion of this gas in the air is fatal to animal life. It is invisible, and has very little odour. The lamp, on which the miner chiefly depends for information as to the state of the air, is useless to warn him that carbonic oxide is present, even when in such proportion as to be rapidly fatal."

Memo. of Quartz Crushed and Yield of Gold by Nova Scotia Mines from July 1st to November 30th, 1889, as per Returns received to date by the Department of Public Works and Mines.

September	1,428 " 4 "	Total	9,167 ozs. 6 dwts.

NOTE.—The returns for November are not yet complete, there still being some fourteen or fifteen mills to hear from. The value of the gold yield for these months is estimated at \$18 per ounce; or \$165,011.40.

PHOSPHATE.

In General.

"It is most satisfactory," says the *Trade Review*, "to notice the increased attention that is being paid to Canadian phosphates on both sides the Atlantic. Ultimately Canada must become the great source of supply, but, as we and others have repeatedly pointed out, there are too many interested people who insist upon making bonanzas out of the properties, or the enterprises with which they are connected. This has, very naturally, had a repellent, if not absolutely destructive effect, as capitalists who would be investors are not prepared to give the whole earth or its equivalent, for the few acres of apatite which these greedy persons control. The fact cannot be disguised or denied that several promising Canadian investments have been neglected for this very reason, but despite this, their intrinsic attractions are such as to have rivetted attention upon them and, through them, upon numerous other Canadian ventures of the same class."

A statement recently issued from the Comptroller-General's office of South Carolina, shows that the receipts by the State from phosphate royalties for the year ending Aug. 31, 1889, were \$206,805.91, with \$14,010.01 still due the State. The receipts for the previous year were \$186,993.87, showing an increase from that source of income of \$16,912.04.

The many friends of Dr. Penrose, lately connected with the phosphate industry of Canada, and now on the Geological Survey of the State of Arkansas, will be interested to hear of his movements. He writes from San Francisco, Nov. 29th:—"On my return to Little Rock in October I received orders to make a general report on the manganese ores of the Rocky Mountains and the Pacific coast. I had already made a report on the manganese of the Atlantic slope from the Gulf of St. Lawrence to the Gulf of Mexico, and had explored deposits in New Brunswick, Nova Scotia, Georgia, Arkansas and elsewhere. I left Little Rock the latter part of October and went first to Colorado and thence to Utah and Nevada. Then I came to California and after I have finished this State will go to Oregon, Arizona and Texas. For almost a month I was in the great deserts of Nevada, Utah and Western Colorado, which is one of the most dismal regions I ever travelled in." He gives a most graphic description of the weird scenery and the hardships of travel in a district where there had been no rain for three years. His indomitable energy seems to have found a sphere for its abundant exercise.

Templeton District.

We understand that the Blackburn mine has passed into the hands of an English syndicate, but the purchase price is not stated. The drift cut into the side of the big pit struck phosphate on the 15th of November, and is continuing a daily output of the finest ore. All the other "shows" are yielding large quantities, and are improving as the work progresses.

Kingston District.

The Foxton mine continues a steady output of 300 tons per month, its total production since the Foxton Mining Company purchased the property being officially stated at 1,600 tons. More

powerful machinery is now being fitted up at the mine, and more steam drills are to be put to work.

Perth District.

The Anglo-Canadian Phosphate Company continues its system of contract mining at Otty Lake and Bob's Lake. At the Otty Lake mines the "shows" are reported to be better than they have been for years, and fourteen new contractors have gone to work. At Bob's Lake a great number of productive seams are now opened and wait an enlargement of work that is soon expected to be made. The contractors continue to secure a very large output in proportion to the men employed, and the phosphate is found to be of a rich green color and of the highest quality as the work gets away from the surface.

Du Lievre District.

Mr. F. Stacey Shirley, New Bedford, Mass., proprietor of the grinding mills at Basin-du-Lievre, writes that he has perfected arrangements for doing a large business next season on his property. He says: "I find the interest in Canadian phosphate has become general, and I am thoroughly convinced that the crude rock itself, when finely pulverized, is a first class fertilizer, but we shall proceed to put it into form for immediate assimilation in the soil. I am already assured of sufficient sales to induce me to put in two new grinding mills, and if I can arrange for a supply of rock at reasonable rates, I intend to fit up the mill so as to produce from 50 to 80 tons per day. A chemist I am associated with has perfected a process for producing a cheap acid from waste products, which (if it proves as big a thing on a commercial scale as it does in laboratory tests) will create quite an industry in your section, and prove a valuable aid in furthering the success of my enterprise. I feel the time has come to create a business there, and mean to be one of the first in the new field."

Just as we go to press we learn of an unfortunate accident at one of the pits at the North Star, by which a couple of miners have been severely injured by a fall of timber. At time of writing it is not known whether the injuries are fatal.

There is nothing new to report from the other mines, at which work will be suspended as usual for a day or two during Christmas week.

Shipments, 1889.

Since our last report we have been advised of the following additional shipments of ground phosphate from Ottawa Valley mines to United States:

Buffalo, 200 tons.....	Value \$2,000
Chicago, 50 "	500
250 "	\$2,500

There have also been 480 tons shipped from the Lievrés district to Capleton for home consumption.

In our shipments to Europe under date of Nov. 9th, an omission of two tons in Messrs. Millar & Co.'s export was made.

The following shipments include the whole shipments to 18th December and an estimate of the total production from Canadian mines for the year 1889:

	Tons.	Bags.	Bbls.
Exported to Europe.....	23,542	132	2
Exported to United States.	4,176	—	—
Home Consumption.....	480	—	—
Estimated quantity held over at mines.....	5,000	—	—
Total production 1889....	33,198	134	2

MINING NOTES.

Nova Scotia.

In our August issue we published details of the gold production of the Province for the half year, ended 30th June, and in another portion of this issue, our readers will find details of the gold yield for the five months subsequent to that date. As will be seen, the returns for last month are not quite complete, some twelve or thirteen mills having yet to send in their returns, but it is apparent that the total yield for the year will be greater than 1888. We are much indebted to the Commissioner of Mines, and to his accountant, Mr. R. H. Brown for these interesting statistics.

Mr. R. G. Leckie, formerly Managing Director of the Cumberland Railway & Coal Company, has we understand, accepted the position of manager of the Londonderry Iron Co., taking office in the beginning of the year.

New Brunswick.

The Pope Manganese Company has made application for Letters Patent of Incorporation. The capital stock actually subscribed is \$75,000. The chief place of business is at Markhamville. The applicants are: Charles H. Converse, of Newton, Mass., merchant; William Pope, of Boston, Mass., merchant; Alexander Pope, of Boston, Mass., artist; William C. Pope, of Boston, Mass., merchant; Francis Ware, of Boston, Mass., merchant. Charles H. Converse, Alexander Pope and William C. Pope, three of the above named applicants, are to be the first or provisional directors.

Quebec.

Notice of application for incorporation has been made on behalf of the Canada Iron Furnace Co., Montreal. The capital is to be \$200,000, in 2,000 shares of \$100 each. The applicants are: P. H. Griffin, Buffalo, car wheel manufacturer; Robert Schott, Sheffield, England, steel manufacturer; George Edward Drummond, James T. McCall, Thomas J. Drummond, Montreal, metal merchants, and William John White, of Montreal advocate; of whom the said Patrick Henry Griffin, Robert Schott, George Edward Drummond, James T. McCall and Thomas J. Drummond shall be the first and provisional directors, the majority of whom are residents in Canada.

The United Asbestos Company, limited, of London, who own all the asbestos mines in Italy, have recently purchased the Frechette-Douville asbestos mining property at Black Lake. This property is well known for its excellent quality of asbestos, and has very greatly improved during the last season, at least two-thirds of the asbestos mined having been of No. 1 grade, of a quality not inferior to the best obtained from the Thetford mines. We understand that the United Asbestos Company's manufactures principally consist of the Italian fibre, which they claim to be superior to that found in Canada for many purposes, but they use also a certain quantity of Canadian asbestos, and the recent advance in the price has induced them to purchase a mine of their own. Seeing that they are the oldest manufacturers in Europe, this policy will place them in a very

strong position to meet the demand for all classes of material. We understand that, although the company has given some extensive orders for machinery to enable them to vigorously work their property, they will not have very much asbestos from their Black Lake mine for disposal to other manufacturers, and those therefore who require supplies should make early application. Mr. John J. Penhale, of Black Lake, has been appointed the manager. The chief offices of the company are at 161 Queen Victoria street, London, E. C.

Ontario.

"The Provincial Natural Gas and Fuel Company of Ontario" has made application for incorporation under the provisions of the Companies' Act (Rev. Stat. of Canada, 1886, Chap. 116.) The objects of the new concern are to utilize natural gas, oil and salt in the counties of Lincoln and Welland. The chief places of business will be at Welland and at Toronto. Capital \$500,000 in \$100 shares. The applicants are:—Peter McLaren, lumberman, Perth; John Fisher Wood, M.P., barrister-at-law, Brockville; Napoleon Alexander Coste, civil engineer, Amherstburg; Eugene Marius Antoine Coste, mining engineer, Toronto; Loftus Cuddy, banker, Amherstburg; Donald McGillivray, merchant, Port Colborne; Joseph Kavanagh, merchant, Ottawa; Hon. John Graham Haggart, Postmaster General, Ottawa; Edward Andrew Smyth, gentleman, St. Catharines; John Gale Dickson, gentleman, Niagara; Richard Harcourt, M.P.P., barrister, Welland; William Henry Curtis, contractor, Olean, N.Y.; James Morris Balderson, barrister, Ottawa; O'Brien Joseph Atkinson, barrister, Port Huron, Mich; Michael Andrew McHugh, barrister, Windsor; William McGregor, general dealer, Windsor; Maurice Bartholomew Twomey, merchant, Amherstburg; Auguste Emile Rondot, merchant Amherstburg, and Thomas John Watters, accountant, Ottawa. Peter McLaren, John Fisher Wood, Napoleon Alexander Coste, Eugene Marius Antoine Coste, Loftus Cuddy, Donald McGillivray and Joseph Kavanagh, are to be the provisional directors of said company.

Reduction Works, capable of smelting 70 tons per day, and crushing 150 tons, are at present in course of construction at Rat Portage.

Amongst the companies lately registered in London was the Murillo Silver mine, limited, registered by Granville, Smith & Co., Leadenhall street, E. C., with a capital of £60,000 in £1 shares. Object, to carry into effect an agreement for the sale to the company of certain freehold lands, containing in all about 80 acres more or less, together with the mines and mining claims or rights thereunder, lying in the territory of Thunder Bay, known as the Murillo Silver Mines Estate, and certain building, machinery, plant and effects.

The natural gas wells recently discovered at Welland are being energetically opened up. The pressure of the two wells, it is stated, is sufficient to allow the gas to be piped 100 miles.

* The Sydenham Mica and Mining Co. operating in the Township of Loughboro, is now employing some 50 miners in mining and preparing its mica for the market. The mines are furnished with an excellent plant. The output for the year has been fully up to expectations.

Port Arthur District.

Operations at the principal silver mines continue pretty much as usual with the exception

of the Badger, where a large reduction has been made in the force, owing to the closing down of the Stamp mill. The supply of water is very limited, and during the severe cold of mid-winter it cannot be operated to advantage. It is not likely that further shipments will be resumed until the railway reaches the mine.

The Beaver mine keeps steadily in full force, and the district at large will benefit much from the enterprise of the management in securing a diamond drill, which has already produced evidences of rich ore bodies at a great depth below the present workings. It is the intention to test the formations to a depth of 1,200 feet.

The Shuniah Weachu mine has been shipping another rich carload of ore to England, and at least one hundred tons equally as good will be ready in spring for the railroads. The last shipment realized nearly \$100 more per ton than was estimated. They are getting rich ore from the different points in the mine.

The West End management have just returned from Denver, Col., well pleased with the result of the sale of the last carload shipment.

Progress is being made at various other mines and prospects. The Crown Point mine is reported to have made a good sale of its first carload shipment, and good results are obtained at the Elgin mine. Work is also in progress in the Wolverine, Mink Mountain, Medicine Bluff and other good prospects.

Owing to the favorable open season good progress has been made on the Port Arthur, Duluth and Western Railway. The contractors, accompanied by W. H. Howland, ex-Mayor of Toronto, and others are going out to the end of the track at the Kammistiquia River, and from thence will take a trip through the mining region as far west as Silver Mountain. Some American capitalists have secured the famous Kakabeka Falls property, and are laying out a town site and making extensive preparations for smelters, pulp mills, and other factories—in which electricity produced from a water-power at least three times as great as Minneapolis can boast of—will play an important part. A branch line of railway to connect with the P. A. D. and W. Railway is now being located.

A smelter in such close proximity to the extensive silver, lead and iron deposits in this neighbourhood will fill a long-felt want.

What we want next is for the Government to permit the free entry of such mining machinery as is required in the district and not manufactured in Canada.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,

Halifax, N.S.

The delay in issue of Patents by the Ontario Government for lands in Hunter's Island in the Rainy River District is causing a great outcry amongst those Americans who invested heavily there years ago. No surveys are permitted there at present by the Government under the mistaken impression that valuable timber limits might go astray under the heading of mining lands. The boundary between the Thunder Bay and Rainy River districts should be surveyed at once to prevent conflicting claims.

About twenty-four miles south-west of Port Arthur, in the Township of Crooks, a valuable deposit of native copper has been located, and considerable prospecting and developing is now going on. The fact that the ore averages from 8 to 10 per cent. of copper and is readily accessible to a good harbour on Lake Superior gives the find unusual attraction, and enquiries from capitalists are already numerous.

Manitoba and North-West Territories.

The Saskatchewan Railway and Mining Company will ask for an extension of their chartered line from its present terminus at Saskatoon, crossing the South Saskatchewan river and running north-easterly to Fort a la Corne, thence to the crossing of the Saskatchewan River at Grand Bend, thence north-easterly by the most favorable route to a junction with the Hudson Bay Railway (projected); also from the terminus in a northerly direction, crossing the North Saskatchewan, thence northerly to Green Lake, crossing Beaver River to Water-Hen River onward.

The London *Morning Post* had an interesting article the other day on the anthracite coal mines which the Canadian Anthracite Coal Company has been exploiting in the heart of the Rocky Mountains. In the course of its remarks it says: "Previous to November last the Admiralty employed upon the Pacific coast the bituminous coal of Vancouver Island, with the result that British men-of-war could be tracked by means of the black smoke for a distance of as much as 70 miles at sea. The advantage to our Pacific coaling stations of there being large deposits of smokeless anthracite within two days' railway journey of the coast is obvious. Moreover, the anthracite coal crops out in places along the mountain side, so that it is largely worked by horizontal tunnels, which are comparatively inexpensive in relation to vertical shafts, and the fact that the mines are close upon the main line of the Imperial Inter-Oceanic route of the Canadian Pacific Railway is another circumstance of prime importance. But the value of these Canadian anthracite fields is not based upon Imperial grounds alone, for as the ocean traffic between Vancouver and Australia, India, China and Japan undergoes its inevitable development, there is bound to arise a great and increasing demand for the smokeless fuel of which such large deposits exist in the Pacific territory of the British Empire. To this must be added the ever growing need for industrial purposes, a need that will make even Chicago, St. Paul and Minneapolis consumers of the Canadian anthracite. The United States Government is fully alive to the value of smokeless fuel in the naval marine, and it recently chartered two vessels to carry 5,000 tons of anthracite coal to the harbor of Pago Pago, in the Samoan Islands, which it is proposed to use as an American Government coaling station for vessels cruising in Pacific waters."

Apropos of the above, Mr. Macleod Stewart, president of the Anthracite Coal Company, wires to a member of the company from St. Paul, denying the telegram from Eau Claire which states that the deal with the English capitalists is off. Mr. Stewart recently returned from England with a modified cash proposition for the entire property. To the new terms the American stockholders unanimously agreed, and an option was granted Messrs. Stewarts, giving them control of the property. Negotiations are being rapidly closed with the English syndicate, whose capital is stated to be one and a half millions.

British Columbia.

The coal trimmers of Nanaimo have formed a union for the express purpose of keeping this work among themselves and to meet all the requirements of vessels arriving in that port, so that there will now be no delay in obtaining trimmers, as has very often happened. Recently there has been a number of miners, who, not being satisfied with working in the mines, are very often to be found seeking the trimming work. The trimmers are also endeavoring to obtain the right of trimming at the Bay, where the Chinamen now receive 50 cents an hour for mail vessels and 40 cents for other boats. A building will be erected near the wharf, so that the men can be on hand at a moment's notice, both night and day.

There is some talk of the erection of another smelter in Kootenay, so located as to suit the mines at Golden and Donald. Mr. McCarthy of Calgary, is the moving spirit.

Gold Commissioner Crimp of Cassiar, reports that the season just closed has been most satisfactory. The Bonanza on Dease creek, has done the best, panning out from \$7,000 to \$8,000. On the Tibbet creek the McVicar & Foster Company's claim has also done well, while Quartz creek has fully justified expectations. In all, Cassiar has produced between \$12,000 and \$13,000 worth more gold than last year. Had it not been for the rain and freshets which washed out the low lying claims, the returns must have been very considerable.

Messrs. Dunsmuir & Sons, proprietors of the several Wellington collieries, are most energetically prosecuting exploratory work at the coal lands purchased by them from Messrs. Horne and Sabiston, and situated between the East Wellington colliery and this city. It will be borne in mind that several years ago Messrs. Horne and Sabiston, together with Messrs. John Dick and Jacob Blessing, opened up a seam on this property and several hundred tons of coal therefrom were sold in this city. Then Messrs. Dunsmuir & Sons purchased the coal rights, amounting to between 500 and 600 acres. For some short time past the new proprietors have been running a tunnel or drift to strike the main seam of coal. They have already reached the main seam, and expect in the next 100 or 150 feet to strike the main seam. The work is under the immediate superintendence of Mr. Adam Ross, an experienced miner and overman. In a few months, at the outside, it is expected that this property, which has been facetiously styled "Jingle Pot," will be in a position to add materially to the general output of the Wellington collieries.

The following were the shipments of coal from Nanaimo for the month of November:

The New Vancouver Coal Co....	15,223	tons.
Dunsmuir & Sons.....	22,102	"
East Wellington Colliery.....	5,506	"
Union Colliery Co.....	4,300	"
	47,131	"

The shipments from the two camps at Kootenay Lake last summer were:

	Tons.	Silver per ton.
Number One.....	130	85 oz.
Little Donald....	66	95 "
Spokane.....	44	35 "
Della.....	16	105 "
Sky Line.....	12	225 "
Gallagher.....	13	126 "
Krao.....	11	90 "
Silver King.....	60	300 "

These values do not include the lead, which, of course, will enhance values considerably. This return may appear very small, but when it is considered that the claims are being worked, as yet, only in a small way for development, and that only 10 per cent. of it can be shipped owing to the cost of transportation, these figures, after all, are very suggestive. Transportation to the lake is quite expensive, the means being by pack train.

Mining in the immediate vicinity of Barker-ville has been good during the year, though scarcity of water has prevented better returns, but it is expected that the gold yield for the district generally will not be less than that of 1888. The test works are not yet completed in all details, but the balance of the material for the chlorination plant has arrived, and by this time will be in position.

Cheaply Mined Iron Ore.—The Dunn Florence and one or two mines in addition to these, being wrought on the ranges south of Ishpeming, are doing excellent work. At the Florence, ore is sold in the cars for \$2.25 per ton, and it is said the company netted about \$100,000 from its last year's product. The mine is a non-Bessemer, producing an ore that is liked by furnace-men. It possesses a large deposit of ore which thus far, by reason of its nearness to surface, has been very cheaply extracted. As the mine grows in depth, the cost of production will increase considerably and profits will be reduced from what they now are, but still there will be a fair margin of profit, as the property possesses a wonderful amount of ore. The Dunn is making a splendid record, and has a magnificent storehouse to draw from.

Iron Ore in Great Britain.—Iron ore is produced in 29 counties of England and Wales, 12 counties of Scotland, and in one of the counties of Ireland. The production has fallen off seriously during recent years, and some of the older centres of production are becoming extinct, if they are not so already. Over 30 per cent. of the British ore requirements is now supplied from foreign sources, and the iron industry flourishes, though the ore is admitted free of duty.

South African Gold Production.—South Africa is fast looming up as a source of gold supply. The exports from the Cape and Natal for the eight months ended with August, aggregated \$4,695,000 against \$3,225,000 for the like eight months of 1888. The crushings for the Witwatersrand mines for third quarter of present year aggregated 64,387 ounces worth say, \$1,125,000, the increase averaged \$1,250,000 last month.

Gold Milling in the Black Hills.

(H. O. Hoffman, Rapid City, Dakota.)

(Continued from November issue.)

The latter corresponds with the height at which the issue of the pulp occurs. In the Homestake mortar the issue is raised by the insertion of the chuck-block 16½ inches above the foot of the dies, thus giving, with a shallower mortar, a deeper issue of pulp than the Caledonia mortar.

Dies.—The Homestake management casts its own dies. The quality of iron used is between gray and mottled, the top of the cylindrical part being chilled. The foot-plate has bevelled corners, and is 10 inches long, 10½ inches wide and 1½ inches thick. The cylindrical part or "boss" is 9 in. in diameter and 5 in. high. The level of the die is 10 in. below the discharge which takes place over the chuck block. The die weighs 121 pounds (one-seventh of the weight of the stamp) and lasts about six weeks, crushing 189 tons. By that time the cylindrical part has become slightly convex, and is worn down to 2 in. from the foot-plate. Its weight has then been reduced to about 30 pounds; thus 48 pounds of iron are consumed for every 100 tons of rock that are crushed.

The Caledonia mill buys its dies outside. They are of chilled white iron. The foot-plate has also bevelled corners, is 10 in. wide by 9½ in. long and 1½ in. thick. The cylindrical part is 8 in. in diameter and 5½ in. high. While the dies in the Homestake mortar fill its bottom completely, those of the Caledonia fit perfectly in the width only, there being a 3-in. space in the length that has to be divided up between the five dies. The distance from bottom of screen to top of die is 6 inches. The die weighs 160 pounds (about one-fifth of the weight of the stamp) and lasts three months, crushing 300 tons of hard rock. The cylindrical part is then worn down within 1 in. of the foot-plate. The worn-out die weighs 38 pounds, making the consumption of iron 40 pounds for every 100 tons of rock.

Amalgamated Copper Plates are placed along the entire length of the mortar. In the Homestake mortar, one plate is set to the discharge opening; in the Caledonia mortar, there are two plates; one under the discharge, the other beneath the lip of the feed opening.

The Homestake mills use the so-called chuck-block (half elevation, Fig. 2 and Fig. 3), placed against the lower flange and the two side-flanges of the discharge. The chuck-block consists of a 2-in. plank, bolted to the back of a 1½ in. board, and extending from 2 to 2½ in. above it. Its inside upper edge is rounded off, and over this, and along the inside face, a 3-16 in. copper plate is fastened with iron screws. The recess formed on top of the front board, 1½ in. wide and from 2 to 2½ in. deep, is taken up by the lower part of the screen-frame. Between this and the front board is placed a strip of carpet to form a tight joint. The frame is held in place by a vertical piece of flat iron bolted to the centre of the front board, a horizontal wedge being driven between the two. The front board has an iron facing along its lower half, and two vertical strips towards the ends, to protect the wood against the two horizontal and the two vertical wedges with which it is fastened to the mortar. To the back (beneath the 2 in. plank having the sheet copper), is tacked a strip of rubber cloth, which helps to make a tight joint between wood and flange of mortar. Two chuck-blocks, of different heights are in use. When the dies are new, a chuck-block 7 in. high is inserted; when they have

worn down 2 in., another chuck-block, 5 in. high replaces it. Thus the height of discharge is kept nearly uniform. The distance between the face of the shoe and the chuck-block (2 in.) is rather small. The violent motion of the battery-water drives the sands against the copper plate and scours off amalgam that has been caught on it. Thus comparatively little amalgam can settle on the plate. Wooden chuck-blocks last six months. After this time the coppers have to be removed and put upon new blocks, or they are scraped very carefully, put aside, melted and sold. Mr. R. Graham, the millwright of the Homestake mill, has therefore replaced, in his mill, the 2-in. plank, to which the copper plate is screwed, by $\frac{3}{4}$ in. iron, to which the 3-16 in. copper plate is rivetted with copper rivets. The face of the $1\frac{3}{4}$ -in. wooden front board is covered with $\frac{1}{4}$ in. iron; thus the distance between face of shoe and Graham chuck-block is $3\frac{5}{8}$ in. instead of 2 in. This iron chuck-block lasts as long as the mortar, and more amalgam collects on it than on the wooden one. Of the free gold recovered, 55 per cent. is caught on this inside plate.

The reason that the Caledonia mill has amalgamated copper plates at both front and back is that the ore milled is not oxidized at all, which makes it harder to extract the gold. The aim is to keep the pulp longer in the battery and thus counteract the refractory character of the ore. The plate in front is 5 in. broad, the one at the back 8 in. Both are made of $\frac{3}{16}$ in. copper and are simply bolted to the mortar, the lower edge of the plates being 9 inches above the foot of the dies. Of the free gold recovered, 60 per cent. is caught on these inside plates.

Screens.—Both diagonal-slot and wire screens are used in the district. With the exception of the Father de Smet mill, which uses partly No. 30 brass-wire screens, all Homestake mills use diagonal slot screens made of heavy Russia iron. The needle number is 7, corresponding to a 30-mesh wire screen, the width of the slot being 0.024 in. The thickness of the iron is $2\frac{1}{2}$ (American wire-gauge) and its weight 0.987 lbs. per sq. ft. The slots are $\frac{1}{2}$ in. long and there are eight (formerly only seven) to the inch. The punched surface of the screen is 48 x 7 in.; there is a margin of 1 in., making the entire screen 50 x 9 in. A screen lasts two weeks. The wooden frame is 4 ft. 4 in. long and $11\frac{1}{2}$ in. deep, and has a strengthening rib, $6\frac{1}{2}$ in. long, down the centre. In fastening the screen to the frame, the lap is first tacked on, to hold it in place, then a piece of rubber cloth, 2 in. wide, is placed over it, small holes are punched through rubber and lap of screen and both are nailed to the wooden frame. The screen is placed on the frame with the rough side facing the mortar. On the outside of the frame are fastened, by means of two screws, three iron facings, $\frac{1}{2}$ in. x 9 in. and $\frac{1}{8}$ in. thick, which protect the wood from the one horizontal and the two vertical keys that serve to wedge the frame against the chuck-block and the planed flanges of the discharge.

Some time ago experiments were made with screens of aluminium-bronze, which proved extremely satisfactory. The bronze contains, according to a letter from the Cowles Electric Smelting and Aluminium Co., 5 per cent. aluminium, 95 per cent. copper and a trace of silicon, and is furnished in unperforated sheets at 45 cents per pound. When new it has a golden color, which it loses with use. The width and length of the slots are the same as in the ordinary screen, but there are nine slots to the inch instead of eight. The sheet is 0.035 in. thick. This screen lasts six months

and does not break (while the Russia-iron screen breaks in two weeks). The wear is uniform over the entire surface, the slots enlarging to No. 5 $\frac{1}{2}$ needle. The screens are then past use. The bronze, however, is not lost, but can be melted down and made into new screens. It is the intention of the Homestake management to introduce this screen throughout all its mills. This would have been done already, had not the contracts for Russia-iron screens been made before the bronze screen was tried.

GOLD-MILLING IN THE BLACK HILLS.

TABLE II.—Dimensions, Power, Batteries, and Product.

Mill.	Engines.			Boilers.		Dimensions.			5-Stamp Batteries.			Product.		
	Type.	Cylinder.	Stroke.	Number.	Cords of wood per 24 hours.	Length.	Width.	Vertical dist. of crusher-floor above bottom of ore bin. Ft.	Distance between dies. Feet.	Weight of stamps. Lbs.	Drops. Inches.	No. of drops per minute.	Tons crushed per stamp in 24 hours.	Tons milled in one year.
Homestake,	A	20	42	2	11	100	80	14 $\frac{1}{4}$	44 $\frac{1}{2}$ ^a	850	9	85	4.5	96,790 ^c

Caledonia,	D	20	30	2	11	84	46 $\frac{2}{3}$		k	850	12	74	3.3	\$4,020 ⁱ

The Caledonia mill uses No. 24 brass-wire screens, the thickness of the wire being No. 26, and the screening surface 48 x 53 $\frac{1}{2}$ in. The screen lasts one week. It is fastened to a simple wooden frame, 53 x 12 $\frac{1}{2}$ in., the horizontal sides being 3 $\frac{1}{2}$ in. wide, the vertical sides 2 $\frac{1}{2}$ in. Three wooden ribs, 1 in. wide, divide the screen-surface into four panels and thus prevent it from bulging out. The fastening of the screen to the frame and the wedging of this against the mortar are done as at the Homestake, except that there the screen-frame is placed on the chuck-block, and here it is keyed against the

lower rim of the mortar discharge. The Caledonia uses wire screens because, although its stamps drop 3 in. farther than those of the Homestake mills, the splash is not so great, by reason of the greater width of the mortar and the space taken up by the amalgamated copper plate below the feeding-lip. The force of the splash in the narrow Homestake mortar is thrown entirely against the screen; that of the wider Caledonia mortar is divided between the screen in front and the recess at the back. Thus the slot-screen would clog, while the wire screen allows the pulp to pass through free.

The upper part of the discharge of both classes of mortars, above the screen-frames, is closed either by an inch board or by a canvas curtain, or piece of old belting, suspended from a lath. This curtain or belt hangs down and meets the screen in the mortar. It has the advantage over the board in that the amalgamator can readily pass his hand into the mortar and remove any chips of wood, etc., floating on the water or adhering to the inside of the screen.

We have have seen that in the Homestake mortar the pulp is driven with some force against the screens. In order to break its fall upon the apron-plate, a splash-board is fastened to the frame of the latter, thus preventing any amalgam collected there from being washed away. The Caledonia motion has no splash-board, as the pulp does not pass the screens with sufficient force to endanger the amalgam collected at the head of the apron-plate.

Stamps.—The stamps (Figs. 1, 2 and 3) used by both companies are of the ordinary pattern. They weigh 850 lbs., about 16 lbs. to the sq. in. of crushing-surface, and their centers are 9 $\frac{3}{4}$ to 10 in. apart. For dimensions and other particulars as to the different parts, see the table already given.

The stem tapers 6 in. at both ends, so that when it breaks, usually where it enters the head, it may be reversed. At the Homestake mills, a stem lasts about three years before new ends have to be welded to it. The Caledonia mill requires for its 60-stamp mill five stems yearly.

The tough cast-iron head is without the wrought-iron rings which are often used at the upper or lower end. It has the usual keyways for the removal of stem and shoe. These are parallel instead of being at right angles, as is usual. To fasten the head to the stem, the latter is let down through the guide holes and the socket of the head placed directly beneath it. The stem is lifted and dropped and driven with a hammer, if necessary. Then the stem and head together are dropped several times on a piece of timber placed beneath, until they are quite firm. At the Homestake mills, a head lasts five years, after which the socket has become so enlarged that the stem cannot be securely fastened in it any longer. The Caledonia mill requires one head a month.

Both managements buy their shoes from outside foundries. To fasten the shoe to the head, the shank is surrounded by small wooden wedges tied around it with a string; the shoe is put in place; and stem and head are allowed to drop. Thus the shank is wedged into the recess of the head, and by raising the whole and allowing it to drop several times, the shoe becomes thoroughly fastened in. To prevent it from injuring the die, a piece of planking is placed on the latter. At the Golden Star mill, a very neat arrangement is in use for fastening the wooden wedges to the shank of the shoe. After the wedges have been placed around the shank, a strip of canvas is wound around them and tacked to each wedge, forming a sort of collar,

which can be easily slipped over the shank of a new shoe. This simple arrangement saves a great deal of time and labor on clean-up days, when a good many shoes have to be replaced.

After being some time in use in the battery, a shoe becomes slightly concave at the base, but wears, on the whole, more evenly than the die. At the Homestake mills, a shoe lasts two months, crushing 270 tons of rock. It is then worn down to two inches from the base of the shank and weighs 40 pounds. This corresponds to a consumption of 37 pounds of iron for every 100 tons of rock crushed. At the Caledonia mill, a shoe lasts three months and crushes 300 tons. It is replaced when worn down to one inch and weighs 35 pounds, which corresponds to a consumption of 35 pounds of iron for every 100 tons of rock. It may be asked why the Caledonia mill, which buys both its shoes and dies, does not use steel, which is so much more durable, and consequently cheaper, especially if the heavy freight charges are taken into consideration. The answer is that because steel lasts so much longer than iron, steel shoes and dies would continue in use after they had become uneven. This would reduce the crushing capacity of the battery, and thus in the end there would be no saving at all.

In order to secure the tappet to the stem, the wrought-iron gib is first put into the recess. The tappet is then slipped over the stem, and when it has reached the desired place, is secured by keys which pass at right angles between the gib and the iron shell of the tappet surrounding the stem. All the tappets of the Homestake mills have two keys; those at the Caledonia have some two and some three.

Both faces of the tappet are used as working faces. In wearing down they become uneven and ridges are formed. The tappet then has to be removed and planed off on a lathe before it is fit for further use. Once in three years, when the two faces have worn down $1\frac{1}{2}$ inches, the tappet is replaced by a new one. A tappet rarely splits. Case-hardened tappets and cams have been tried at the Homestake mills in the expectation that the hardened working surfaces would last longer; but the tappets cracked and became useless, as they could not be well planed off. Steel tappets and cams have not been tried. It takes from six to eight hours to change the tappets and cams of one battery.

At the Homestake mills, the drop is 9 in., the number 85 per minute, and the order 1, 3, 5, 2, 4. At the Caledonia mill the height is 12 inches, the number 74, the order 1, 3, 5, 2, 4 and 1, 4, 2, 5, 3. The Caledonia mill has such a hard rock to pulverize that it is forced to have a higher drop and consequently a smaller number of drops per minute. That the Caledonia mill has two different orders of drop is quite unimportant, as they both comply with the same requisition, viz., that no stamp shall be immediately followed in falling by either of those next to it.

Cams and Cam-Shaft.—The stamps are lifted by cams fastened to a shaft which rests in boxes. These are supported by shoulders in the front of the battery posts to which they are bolted. Ten cams are keyed to one cam-shaft, which is set in motion by the cam-pulley.

The cams are double-armed. They are of tough cast-iron and have the form of the involute of a circle (slightly modified at the end), the radius of which is equal to the distance from the center of the cam-shaft to the center of the stamp. The hub of the cam, which is on the off-side of the stem, is not strengthened with the wrought-iron band shrunk on it, which is often used, but is cast sufficiently thick to stand

the strain. At the Homestake mills the cams have a working face 2 inches wide and $3\frac{1}{2}$ inches deep. The strengthening rib, beginning at the end of the cams, gains in depth towards the hub, where it is $9\frac{1}{2}$ inches deep. The hub itself is $3\frac{1}{2}$ inches thick. The distance from centre of hub to end of cam is 17 inches. A cam lasts three years. The cams of the Caledonia mill differ only slightly from those of the Homestake mills. The face is $2\frac{1}{2}$ inches wide 2 inches deep, the strengthening rib at the hub $10\frac{1}{2}$ inches deep, the hub $3\frac{1}{2}$ inches thick, the distance from centre of hub to end of cam 19 inches. The cams, being made of car-wheel iron, last over four years. From ten to fifteen a year are required.

The cam-shafts are of tough wrought-iron, turned down in a lathe. They have one longitudinal key-seat. The keys with which the cams are fastened to the shaft are of steel and are hand-fitted. Wrought-iron keys lose their shape too quickly, and machine-fitted keys get loose very easily; a great disadvantage. It takes ten hours to replace a broken cam-shaft, supposing that the keys have been already fitted. This ought always to be done, as the fitting of each key-seat takes about one hour. A well-appointed mill always has on hand several cam-shafts, with the necessary cams and keys ready for use. The cam-shafts of the Homestake mills were formerly made $4\frac{1}{2}$ and $4\frac{3}{4}$ in. in diameter and lasted about five years. Now the tendency is to make them stronger. The largest in use at present are $5\frac{3}{8}$ in. in diameter, and good for ten years. The distance between centres of cam-shaft and stem is $5\frac{1}{2}$ in. The cam shaft of the Caledonia is $4\frac{1}{8}$ in. in diameter and its centre is $6\frac{1}{2}$ in. distant from the centre of the stem.

The cam-shaft pulleys, at the end of the cam-shafts, vary slightly in the different mills. At the mills of the Homestake they are 6 ft. and 7 ft. 5 in., at the Caledonia mill 7 ft. 4 in. in diameter; the face is usually 15 in. wide. The pulleys are of wood. Iron could not stand the continuous shocks caused by the dropping of the stamps, and would also be too heavy. The pulley is built on a cast iron hub with flanges, and keyed to the cam-shaft. When put in place, the shaft is made to revolve and the face of the pulley turned off to the desired form, that it may be perfectly true. The cams are lubricated with axle-grease. To prevent any of this from dropping on the apron-plates, hindering amalgamation, a curtain is stretched out beneath the cams to catch any particles of grease that these may throw off while in motion.

Crushing Capacity.—The crushing capacity of a battery depends on the efficiency of the stamp (that is, the number of foot-pounds developed), the character of the rock under treatment and the discharging capacity of the mortar (that is, the height and size of the discharge, the character of the screen and the width of the mortar at the discharge). The Homestake stamp weighs 850 lbs. and drops 9 in. 85 times per minute; thus it develops 78,030,000 foot-pounds in twenty-four hours crushing $4\frac{1}{2}$ tons of rock, or one ton for every 17,340,000 foot-pounds developed. The Caledonia stamp weighs 850 lbs. and drops 12 in. 74 times per minute, developing 90,576,000 foot-pounds in twenty-four hours, crushing 3.3 tons of rock, or one ton for every 27,447,272 foot-pounds developed. Thus, although the efficiency of the Caledonia stamp is greater than that of the Homestake, it crushes lessore. There are several reasons for this. First, the character of the rock, which is much harder than that at the homestake; second, the width of the mortar at the discharge (16 in.

against $13\frac{1}{2}$ in.); third, the 2-in. recess for the 8-in. amalgamated copper plate below the feed, which is absent at the Homestake mortar. From the lower discharge of the Caledonia mortar (6 in. against 10 in.) a greater crushing capacity would naturally be expected than from the Homestake mortar. The above reasons will explain why this fails. The smallness of the Caledonia screen (258 sq. in. against 376 sq. in.) may be assumed to be counterbalanced by its character (Caledonia No. 24 wire against Homestake No. 7 slot, which corresponds to No. 30 wire). The Caledonia Co. claims that more gold is recovered by its slow method than by the more rapid one of the Homestake. This point could only be definitely settled by exact tests.

Apron-Plate, Mercury-Traps, Sluice-Boxes.—In order to save the fine particles of gold that have not been caught on the inside copper plates and to collect any amalgam and quicksilver that have passed through the screens, an amalgamated copper plate, the apron-plate, is placed in front of the mortar. The motion of the battery-water, caused by the dropping of the stamps, throws with the drop of each stamp some pulp against and through the screen. This, passing over the lip of the mortar, flows in small waves over the apron-plate. During the slight interval between these waves any heavy particles of the pulp (quicksilver, amalgam or fine gold) passing over the amalgamated plate have a chance to settle upon, adhere to, and combine with it. The plate consists of one sheet of copper, nearly as wide as the discharge of the mortar, fastened with iron screws to the inclined wooden table beneath it. In all the Homestake mills (except the Deadwood and Golden Terra, where it is 12 feet long) the copper plate, $\frac{3}{8}$ in. thick, is 10 feet long, falls 2 in. to the foot, and discharges into a copper-lined trough, leading to the mercury-trap. The apron-plates of the Caledonia are 8 feet long, $4\frac{1}{4}$ ft. wide, and the copper is $\frac{1}{8}$ in. thick. They have the same fall. The wooden table extends 4 feet beyond the end of the copper plate, at the same time narrowing to a width of 4 feet. It has a 1-in. rib down the centre and is overlaid with two blankets, 5 ft. wide and 22 in. long, the upper overlapping the lower. On these the heavy sands collect. Each is washed every half hour in a tank. These blankets last six months. Carpets were tried, but they frayed and had to be thrown out after one month. The pulp from the blankets flows into the mercury-traps, one being placed in the middle of the discharge for every plate.

The plates are of Lake copper, furnished to the mills ready for use, and do not require any annealing to make them porous. They have, however, to be flattened with wooden mallets to make them lie smoothly on the wooden table and to remove any inequalities produced during transportation. At the Homestake mills they are first scoured with sandpaper, followed by emery cloth or with tailings and a wooden block 4 inches square, or with a grindstone, until the face is perfectly bright. If necessary, the sand is moistened with a weak solution of potassium cyanide, and spots are often removed with dilute nitric acid. The surface of the pure metallic copper receives a solid coat of potassium cyanide, which is applied repeatedly as a strong solution by means of a soft paint brush. After two days the mercury is sprinkled on this cyanide coat and rubbed into the plate with a moist cloth and tailings. When the plate is thoroughly amalgamated it is put into place and is ready for use. More than the usual amount of mercury is added to the mortar, that the new plate may become normal. This takes from two

to four weeks, during which time the plates are continually discolored by copper salts. To get these into solution, potassium cyanide or ammonia is added to the battery-water. At the Caledonia mill the procedure is similar, only more care is taken to saturate the plate with mercury before it is put into use. Only the ordinary quantity of quicksilver is then added to the mortar with a new plate. In none of the mills are the plates coated with amalgam before they are put to use, nor are there any silver-plated copper-plates used in the district.

The mercury-traps, through which the pulp passes on leaving the apron-plates, save amalgam and quicksilver not collected on the apron-plates. There are additional traps at the termini of the sluice-plates outside. At the Homestake mills, until about three years ago, the pulp flowed from the apron-plates directly over the sluice-plates into the waste flume. Then the traps were introduced. How important this simple contrivance is, can be seen from the fact that in the Homestake 80-stamp mill there are recovered every month, by the inside traps, 80 oz. of amalgam and 144 of quicksilver; by the outside traps, from 10 to 12 oz. of amalgam and 40 of quicksilver. These traps are emptied only once a month—on the fifteenth. If they were emptied twice a month, on clean-up days, a still better showing could perhaps be made. At the Caledonia the traps are emptied daily, when the apron-plates are being dressed; this is done because of the accumulation of concentrates.

At the Homestake mills the inside trap consists of a wooden box, with copper-lined bottom 14 in. long, 17 in. wide and 24 in. deep. It contains three sliding wrought iron plates, parallel with its short sides. These are placed $2\frac{1}{4}$ in. apart, the centre one extending to the bottom of the box, the others to 3 in. above it. The pulp flows under the first, over the middle one, and again under the third. The outside trap is larger. The wooden box is 48 in. long, 14 in. wide and 48 in. deep. It has three partitions set $10\frac{1}{2}$ in. apart, reaching from the bottom of the box up to $1\frac{1}{2}$, 3 and 4 in. below the level of the inlet, the outlet being 6 in. below this. In the middle, between two wooden partitions, is let down a sliding wrought-iron plate $\frac{3}{8}$ in. thick, reaching to 3 in. from the bottom of the box. The Caledonia traps are much smaller, since there is one for each apron-plate.

The sluice-boxes, receiving the pulp from the inside traps, are simple wooden troughs with copper lined bottoms. At the Homestake mills, they are from 8 to 10 ft. long, 18 in. broad and have a fall of 1 in. to the ft. The copper used is $\frac{1}{8}$ in. thick. At the Caledonia mill they are 8 ft. long and only 8 in. broad as less pulp passes through them. The main sluice into which they discharge is 2 ft. square.

Steam-Stamps.—The Homestake Co. has just erected an improved ball stamp. This is a new experiment in gold milling. The steam-stamp is successfully used for crushing native copper-ores at Lake Superior, and sulphide copper ores at the Anaconda mine, Montana. The results of its application to gold ores may be given in a future paper.

VI. LABOR IN THE MILLS.

All the heads of the different departments are responsible to the superintendent. The mill proper is in charge of a foreman, thoroughly acquainted with every detail of work. One foreman often has the general charge of several mills, as with the Homestake and Deadwood Terra companies. Next comes the millwright, who sometimes has, as in the Homestake mill,

an assistant called the pipe-fitter. The millwright combines the trades of carpenter and machinist. His duty is to make the guides, put them in place and keep them in order; to exchange cams and cam shafts, fasten any cams that have become loose, make and replace screens, make and repair chuck-blocks, to reserve and exchange shoes and dies of crushers and to look after all the piping in the mill; in one word, to erect and keep in order every part of the mill for which any mechanical knowledge is required. One of his duties, for example, consists in lining all the shaftings and in babbitting their boxes.

In this connection might be mentioned a method of lining shafts which originated with Mr. R. Graham, the millwright of the Homestake Company, and which has proved to be quick and effective. When a shaft is to be lined, the boxes are placed so as to be approximately in line. The lower bearing, which is to receive the shaft, is loosely packed with clay and a wooden center pressed into it. This consists of a semi-cylindrical piece of dry wood having the same diameter as the shaft and about the length of the box. The wooden centers of two or more boxes are now carefully lined and the clay packed tightly around them. When in line the centers are removed, one after another, and the clay cut out crosswise in the middle of each box. The centre is then replaced and the hollow space filled by pouring in babbitt (in the middle of each box) is placed the shaft, which is now accurately in line. Finally the space left is filled with babbitt. In this way the shaft can be quickly and accurately lined, the bearings will be absolutely true and the lining from $\frac{1}{2}$ to $\frac{5}{8}$ inches thicker than the ordinary $\frac{1}{4}$ -inch lining, consequently the shaft itself will last longer.

After the millwright comes the machinist. The Homestake Company having a large shop, all repairs are made there. At the Caledonia mill the foreman is also a machinist, and any extensive repairs are made by the Homestake Company.

As the mills are driven by steam, each one has two engine-men, who are responsible for their firemen. To guard against fire or any other accident, there is generally a night watchman for every mill. These men are directly responsible to the foreman.

The man who has immediate charge of the running of the mill is the head amalgamator. He also stands directly under the foreman, and is responsible for his assistants, the amalgamators, crushermen, oilers, feeders and day-laborers, if there are any. As, in addition to running the mill, he has charge of the collecting and safe-keeping of the amalgam, he must be thoroughly trustworthy as well as capable.

The amalgamators feed quicksilver, regulate the water-supply, set tappets, renew shoes, dies, screens and chuck-blocks, and look after the running of the battery in general. Quicksilver is fed by hand every half-hour with a little wooden spoon, similar to a mustard spoon. The quantity required in twenty-four hours ranges from $\frac{1}{4}$ to $\frac{1}{2}$ lb. for every battery, according to the character of the ore, which varies a good deal. The correct amount is found out by the "feel" of the amalgam collected on the apron-plates. If this be hard and crumbly, there is danger of amalgam being carried off by the pulp, and more quicksilver is added. On the other hand, if too much quicksilver is fed into the mortar, the plates become too soft and slippery, less amalgam collects on the inner plates, and there is danger of liquid amalgam rolling off the apron-plates. Two methods of adding quicksilver are in use. At the Home-

stake mills, all the quicksilver required is added in the mortar, and the amalgam obtained is of medium hardness. At the Caledonia mill it is the aim, by adding only part of the quicksilver in the mortar, to make the amalgam on the inside plates as hard as may be, and to add the rest to the apron-plates, keeping these somewhat softer than those of the Homestake mills. Each management is satisfied with its own way of feeding the quicksilver, and it would be difficult to decide in favor of either method. Perhaps the fact that the Caledonia ore has, on the whole, coarser gold than the Homestake ore, may explain this difference in feeding.

The entire loss in quicksilver incurred by the Homestake management per year per stamp is 5.27 pounds, or, according to the tons of ore milled by the Homestake and Golden Star mills, 0.0044 pounds per ton of rock crushed. The entire loss incurred by the Caledonia mill is 7 pounds per year per stamp, or 0.0011 pounds per ton of rock crushed. Of course, with the hard and strongly-mineralized rock the Caledonia mill has to crush, more quicksilver will be floured per stamp than with the Homestake rock; and on account of the smaller quantity of rock crushed per stamp, less quicksilver is consumed per ton.

The amount of water required will vary according to the specific gravity of the rock, the percentage of sulphurets and the incline of the apron-plates. An excess of water will make the pulp in the mortar too thin (thus preventing an intimate contact of gold and quicksilver), will assist coarse crushing and will hinder the settling of amalgam on the apron-plates. Too little water will assist amalgamation, but will hinder pulp from passing the screens and will not carry that which has passed through them. As a rule it is better to use too little water than an excess. The right amount will just carry the pulp evenly over the apron-plates. The Homestake mills use in twenty-four hours 1 inch of water per battery, the Caledonia mill $1\frac{1}{4}$ inches.

The setting of tappets is necessary that the stamps may always have the same height of drop, whether the shoes and dies are new or somewhat worn down. To accomplish this, the stamps are hung up, the mortar opened, the stamps then lifted up by means of an iron bar, used as a lever, and a block of wood, 1 inch higher than the desired drop, placed between shoe and die. The tappet is then loosened, allowed to fall on to the prop and again keyed fast. As the prop and the block of wood, placed between shoe and die, are both 1 inch higher than the required drop, on removing the blocks, the stamps will all have the desired uniform height of drop, while the different levels at which the tappets are keyed to the stem, will indicate how much the shoe and die are worn down.

The crusher-men, in addition to looking after the grizzlies, breaking the coarse rock and feeding the crushers, have to watch for any pieces of wood and iron found amongst the ore, take it out and throw it aside. This is the only way in which the amount of chips of wood entering the mortar can be reduced to a minimum. All small pieces of wood that pass through the grizzlies are finally found in the mortar, where they are periodically removed by the amalgamators, if not previously taken out by the ore-feeders, when the ore passes from the trough of the automatic feeder into the mortar.

The oilers have to keep all wearing iron parts of the mill lubricated and have to be especially careful not to use any excess of grease at parts where it might drop into the mortar or upon the apron-plates.

The feeders attend exclusively to the regular and uniform feeding of the ore. The principle followed is to "low." The height of ore between shoe and die should never be more than 1 inch and as much less as is possible without the stamp beginning to pound, or, as Mr. Adams* expresses it, "let iron almost wear on iron."

One or two day-laborers are generally found around a large mill, because there is apt to be constant need of extra work which does not fall within the province of the regular hands.

The shafts in the mills are changed monthly. Table V. shows the amount and kind of labor in mills of 60, 80, 100 and 120 stamps.

From the foregoing table it will be seen that the Caledonia mill employs fewer men than any of the other three mills. In comparing the 80 and 120 stamp mills of the Homestake Company, located next to each other and working on the same ore, we see that only three more men are required in the latter than in the former, although the product is half as much again. From this it can be seen that a large number of stamps is very profitable, as greatly increasing production without necessitating commensurate outlay of labor.

Daily Collecting of Amalgam and Dressing of Platss.—The amalgam which has collected on the apron-plates during the previous twenty-four hours is removed every morning when the day-shift begins. At the Homestake mills the head-amalgamator, at the Caledonia the day-amalgamator, each with an assistant, has charge of the operation. Every amalgamator has his own way of managing the details of this work, although the general outline is always the same. The method of the Golden Star mill will serve for illustration.

When the plates are to be cleaned, the water supply of the one battery is shut off, the stamps are hung up and the splash-board removed and washed at the head of the apron plate with water through a lose. It is then placed at the lower end of the plate and the hose is turned on to the screen and apron to remove all the sands that have collected there. The plate, if normal, is now clear and bright, except for occasional spots, so-called blisters, resulting from iron and copper salts. These are removed with a scraper (a blunt, double-edged chisel). Then the two men loosen the amalgam with heavy whisk-brushes, beginning at the top and working downward. When this is done the amalgam is swept in the opposite direction and collected at the head of the apron. There it is brushed into the amalgam-scoop with a rubber scraper (a small, sharp-edged piece of belting) and emptied into a small iron receiver. After this the plates are brightened by brushing them with a whisk-broom, using tailings brightened with a dilute solution of potassium cyanide, the men working from the head of the plate downward. If necessary a little quicksilver is sprinkled on the plate from a bottle over the neck of which a piece of canvas is securely tied. After being brightened, the plates are smoothed with soft paint brushes passed transversely over them, beginning at the bottom. This finishes the operation, which requires four hours for the twenty-four plates.

The amalgam obtained is contaminated with impurities. To remove these it is placed in a Wedgwood mortar and diluted with quicksilver. The amalgamator then adds water and works the amalgam to bring all impurities to the surface. These are in part washed off (the sands) with a hose, in part removed with a sponge or wet cloth (the base-metal amalgam) until the amalgam is perfectly bright. It is then passed through a small strainer and the residual paste

amalgam is transferred to a piece of linen, where the excess of quicksilver is pressed out by wringing. The ball of hard amalgam obtained is locked up in a safe and kept until the next clean-up. All the sands are returned to the battery; the waters go to waste, and the quicksilver goes back to the main stock.

The Clean-up.—Twice a month the gold amalgam adhering to the inner plates is removed, when the necessary repairs in the mill are also made. At the Caledonia mill the operations are the same at the first and fifteenth of the month and similar to those of the first of the month at the Homestake mills. At the latter the clean-up in the middle of the month differs from that at the beginning. At the first of the month the entire mortar is emptied, and the shoes and dies are changed, if necessary.

* With the 20 additional stamps the Caledonia mill will require only one extra man, a carman, at \$2.50 per shift, to transport the ore. A chute from the main ore bin to the bin of these two new stamps would not have enough fall for the ore to be discharged automatically.

At the Golden Star mill the clean-up at the first of the month is carried on in the following way: It begins at seven in the morning. The feeding of the battery is stopped a quarter of an hour beforehand. The stamps are made to drop slowly, so that at seven o'clock no more ore may be found in the mortar above the screen-frame. The splash-boards are removed, the stamps are hung up, the water is shut off and the engine is stopped. The mortars on one side of the mill are then opened by removing the curtains, screens and chuck-blocks. The curtains and screens are first roughly washed by playing a hose over them. They are put aside to be more carefully cleaned later on. The six chuck-blocks from the batteries facing that side of the mill which is being cleaned up are placed

on two apron-plates, at each of which are four men to remove the amalgam under the supervision of the head amalgamator. This is done by scraping the plates with a chisel, when the hard amalgam drops off on the apron-plate beneath. As much amalgam is removed as is possible without exposing the copper. Then quicksilver is sprinkled on the plate, to dilute the hard amalgam somewhat. This is then divided evenly over the plate and brightened by scouring with a whisk-broom and tailings, and finally smoothed with a soft paint brush. The amalgam that has dropped on the apron-plate from the three chuck-blocks is collected at the head and put under lock and key by the head amalgamator. Thus the chuck-blocks of the entire mill are scraped and cleaned in four sets of six each. In the meantime another set of men scrape and wash the rim and flanges of the mortar and collect the amalgam. They also remove the plate amalgam which has settled during the past twenty-four hours. This is then also taken in charge by the head amalgamator. The dressing of the plates does not take place as yet. In order to keep them soft, a little quicksilver is sprinkled over them and evenly distributed with the brush. A third set of men begin with the work on the mortar as soon as the amalgam from the apron-plate has been removed. Two small platforms are placed at its head on the wooden frame for the men to stand on. They then remove the water, still remaining in the mortar, and shovel out the sands above the dies into a heap on the apron-plate (as the sands consist simply of coarse ore and do not contain any amalgam, they are returned to the battery after the dies have been put again in place). Before the die can be taken out the stamp has to be raised higher. Formerly block and tackle were used for this purpose. Now a piece of timber is placed crosswise on the rests of the splash-board, serving as a fulcrum for an iron bar with which the stamp is raised. It is kept in this position by placing a 4-inch piece of wood on the prop of the stamp and allowing the tappet to rest on it. The dies are pried up with the iron bar, lifted out and roughly cleaned. Those which are to be exchanged are taken away and piled up to be carefully scraped and washed in due time.

GOLD AND SILVER.

Under the provisions of chap. 7, Revised Statutes, of Mines and Minerals Licenses are issued for prospecting Gold and Silver for a term of six months, which can be extended by renewal for another six months. Mines of Gold and Silver are laid off in areas of 150 by 250 feet, any number of which up to one hundred can be included in one License, provided that the length of the block does not exceed twice its width. Up to five areas the cost is 50 cents per area, for every area in addition 25 cents. Cost of renewal one half the original fees. Leases of any number of areas are granted for a term of 21 years. These leases are forfeitable if not worked, but advantage can be taken of a recent Act by which on payment of 50 cents annually for each area contained in the lease it becomes non-forfeitable if the labor be not performed.

Licenses are issued to owners of quartz crushing mills who are required to pay Royalty on all the Gold they extract at the rate of two per cent. on smelted Gold valued at \$19.00 an ounce, and in smelted Gold valued at \$18.00 an ounce.

Applications for Licenses or Leases are receivable at the office of the Commissioner of Public Works and Mines each week day from 10 a.m. to 4 p.m., except Saturday, when the hours are from 10 to 1. Licenses are issued in the order of application according to priority. If a person discovers Gold in any part of the Province he may stake out the boundaries of the area he desires to obtain, and this gives him one week and twenty-four hours for every 15 miles from Halifax in which to make application at the Department for his ground.

MINES OTHER THAN GOLD AND SILVER.

Licenses to search for twelve months are issued, at a cost of twenty dollars, for Minerals other than Gold and Silver, out of which one square mile can be selected for mining under lease. These leases are for four renewable terms of twenty years each. The cost for the first year is fifty dollars, and an annual rental of thirty dollars secures each lease from liability to forfeiture for non-working.

All rentals are refunded if afterwards the areas are worked and pay royalties. All titles, transfers, etc., of minerals are registered by the Mines Department free of charge, and provision is made for lessees and licensees whereby they can acquire promptly either by arrangement with the owner or by arbitration all land required for their mining works.

The Government as a security for the payment of royalties makes the royalties a first lien on the plant and fixtures of the mine.

The unusually generous conditions under which the Government of Nova Scotia grants its minerals have introduced many outside capitalists who have always stated that the Mining Laws of the Province were the best they had had experience of.

The royalties on the remaining minerals are:—Copper, four cents on every unit; Lead, two cents upon every unit; Iron, five cents on every ton; Tin and Precious Stones, five per cent.; Coal, 7½ cents on every ton sold.

The Gold district of the Province extends along its entire Atlantic coast and varies in width from 10 to 40 miles, and embraces an area of over three thousand miles, and is traversed by good roads and accessible at all points by water. Coal is known in the counties of Cumberland, Colchester, Pictou and Antigonish, and at numerous points in the island of Cape Breton. The ores of Iron, Copper, etc., are met at numerous points, and are being rapidly secured by miners and investors.

Copies of the Mining Law and any information can be had on application to

THE HON. C. E. CHURCH,

Commissioner Public Works and Mines,

HALIFAX,

NOVA SCOTIA.

DEPARTMENT OF Inland Revenue.

AN ACT RESPECTING AGRICULTURAL FERTILIZERS.

The public is hereby notified that the provisions of the Act respecting AGRICULTURAL FERTILIZERS came into force on the 1st of January, 1886 and that all Fertilizers sold thereafter require to be sold subject to the conditions and restrictions therein contained—the main features of which are as follows:

The expression "fertilizer" means and includes all fertilizers which are sold at more than TEN DOLLARS per ton, and which contains ammonia, or its equivalent of nitrogen, or phosphoric acid.

Every manufacturer or importer of fertilizers for sale, shall, in the course of the month of January in each year, and before offering the same fertilizer for sale, transmit to the Minister of Inland Revenue, carriage paid, a sealed glass jar, containing at least two pounds of the fertilizer manufactured or imported by him, with the certificate of analysis of the same, together with an affidavit setting forth that each jar contains a fair average sample of the fertilizer manufactured or imported by him; and such sample shall be preserved by the

Minister of Inland Revenue for the purpose of comparison with any sample of fertilizer which is obtained in the course of the twelve months then next ensuing from such manufacturer or importer, or collected under the provisions of the Adulteration Act, or is transmitted to the chief analyst for analysis.

If the fertilizer is put up in packages, every such package intended for sale or distribution within Canada shall have the manufacturer's certificate of analysis placed upon or securely attached to each package by the manufacturer; if the fertilizer is in bags, it shall be distinctly stamped or printed upon each bag; if it is in barrels, it shall be either branded, stamped or printed upon the head of each barrel or distinctly printed upon good paper and securely pasted upon the head of each barrel, or upon a tag securely attached to the head of each barrel; if it is in bulk, the manufacturer's certificate shall be produced and a copy given to each purchaser.

No fertilizer shall be sold or offered or exposed for sale unless a certificate of analysis and sample of the same shall have been transmitted to the Minister of Inland Revenue and the provisions of the foregoing sub-section have been complied with.

Every person who sells or offers or exposes for sale any fertilizer, in respect of which the provisions of this Act have not been complied with—or who permits a certificate of analysis to be attached to any package, bag or barrel of such fertilizer, or to be produced to the inspectors to accompany the bill of inspection of such inspector stating that the fertilizer contains a larger percentage of the constituents mentioned in sub-section No. 11 of the Act than is contained therein—or who sells, offers or exposes for sale any fertilizer purporting to have been inspected, and which does not contain the percentage of constituents mentioned in the next preceding section—or who sells or offers or exposes for sale any fertilizer which does not contain the per-

centage of constituents mentioned in the manufacturer's certificate accompanying the same, shall be liable in each case to a penalty not exceeding fifty dollars for the first offence, and for each subsequent offence to a penalty not exceeding one hundred dollars. Provided always that deficiency of one per centum of the ammonia, or its equivalent of nitrogen, or of the phosphoric acid, claimed to be contained shall not be considered as evidence of fraudulent intent.

The Act passed in the forty-seventh year of Her Majesty's reign, chaptered thirty-seven and entitled, "*An Act to prevent fraud in the manufacture and sale of agricultural fertilizers*," is by this Act repealed, except in regard to any offence committed against it or any prosecution or other act commenced and not concluded or completed, and any payment of money due in respect of any provision thereof.

A copy of the Act may be obtained upon application to the Department of Inland Revenue, as well as a copy of a Bulletin which it is proposed to issue in April, 1888, concerning the fertilizers

E. MIALL,
Commissioner.

January, 1889.

NOTICE

Is hereby given that all communications in respect to matters affecting the Department of Indian Affairs should be addressed to the Honorable E. Dewdney as Superintendent General of Indian Affairs, and not as Minister of the Interior, or to the undersigned. All Officers of the Department should address their official letters to the undersigned.

L. VANKOUGHNET,
Deputy Superintendent-General
of Indian Affairs.

Department of Indian Affairs,
Ottawa, 17th May, 1889.

Intercolonial Railway OF CANADA.

The direct route between the West and all points on the Lower St. Lawrence and Baie des Chaleurs, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward and Cape Breton Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal 11 H. 15 A.M. daily (Sunday excepted) and run through without change between these points in 30 hours. The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive, thus greatly increasing the comfort and safety of travellers.

New and Elegant Buffet Sleeping and Day Cars are run on all through Express Trains.

CANADIAN EUROPEAN MAIL AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Friday morning will join Outward Mail Steamer at Halifax the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

G. W. ROBINSON,
Eastern Freight and Passenger Agent,
136½ St. James St., MONTREAL.

E. KING,
Ticket Agent,
27 Sparks Street,
OTTAWA.

Mining Regulations

TO GOVERN THE DISPOSAL OF

Mineral Lands other than Coal Lands, 1886.

THESE REGULATIONS shall be applicable to all Dominion Lands containing gold, silver, cinnabar, lead, tin, copper, petroleum, iron or other mineral deposits of economic value, with the exception of coal.

Any person may explore vacant Dominion Lands not appropriated or reserved by Government for other purposes, and may search therein either by surface or subterranean prospecting for mineral deposits, with a view to obtaining under the Regulations a mining location for the same but no mining location or mining claim shall be granted until the discovery of the vein, lode or deposit of mineral or metal within the limits of the location or claim.

QUARTZ MINING

A location for mining, except for iron on veins, lodes or ledges of quartz or other rock in place shall not exceed forty acres in area. Its length shall not be more than three times its breadth and its surface boundary shall be four straight lines, the opposite sides of which shall be parallel, except where prior locations would prevent, in which case it may be of such a shape as may be approved of by the Superintendent of Mining.

Any person having discovered a mineral deposit may obtain a mining location therefor, in the manner set forth in the Regulations which provides for the character of the survey and the marks necessary to designate the location on the ground.

When the location has been marked conformably to the requirements of the Regulations, the claimant shall within sixty days thereafter, file with the local agent in the Dominion Land Office for the district in which the location is situated, a declaration or oath setting forth the circumstances of his discovery, and describing, as nearly as may be, the locality and dimensions of the claim marked out by him as aforesaid; and shall, along with such declaration, pay to the said agent an entry fee of FIVE DOLLARS. The agent's receipt for such fee will be the claimant's authority to enter into possession of the location applied for.

At any time before the expiration of FIVE years from the date of his obtaining the agent's receipt it shall be open to the claimant to purchase the location on filing with the local agent proof that he has expended not less than FIVE HUNDRED DOLLARS in actual mining operations on the same; but the claimant is required, before the expiration of each of the five years, to prove that he has performed not less than ONE HUNDRED DOLLARS' worth of labor during the year in the actual development of his claim, and at the same time obtain a renewal of his location receipt, for which he is required to pay a fee of FIVE DOLLARS.

The price to be paid for a mining location shall be at the rate of FIVE DOLLARS PER ACRE, cash, and the sum of FIFTY DOLLARS extra for the survey of the same.

No more than one mining location shall be granted to any individual claimant upon the same lode or vein.

IRON.

The Minister of the Interior may grant a location for the mining of iron, not exceeding 160 acres in area which shall be bounded by north and south and east and west lines astronomically, and its breadth shall equal its length. Provided that should any person making an application purporting to be for the purpose of

mining iron thus obtain, whether in good faith or fraudulently, possession of a valuable mineral deposit other than iron, his right in such deposit shall be restricted to the area prescribed by the Regulations for other minerals, and the rest of the location shall revert to the Crown for such disposition as the Minister may direct.

The regulations also provide for the manner in which land may be acquired for milling purposes, reduction works or other works incidental to mining operations.

Locations taken up prior to this date may, until the 1st of August, 1886, be re-marked and re-entered in conformity with the Regulations without payment of new fees in cases where no existing interests would thereby be prejudicially affected.

PLACER MINING.

The Regulations laid down in respect to quartz mining shall be applicable to placer mining as far as they relate to entries, entry fees, assignments, marking of localities, agents' receipts, and generally where they can be applied.

The nature and size of placer mining claims are provided for in the Regulations, including bar, dry, bench creek or hill diggings, and the RIGHTS AND DUTIES OF MINERS are fully set forth.

The Regulations apply also to

BED-ROCK FLUMES, DRAINAGE OF MINES AND DITCHES.

The GENERAL PROVISIONS of the Regulations include the interpretation of expressions used therein; how disputes shall be heard and adjudicated upon; under what circumstances miners shall be entitled to absent themselves from their locations or diggings, etc., etc.

THE SCHEDULE OF MINING REGULATIONS

Contains the forms to be observed in the drawing up of all documents such as:— "Application and affidavit of discoverer of quartz mine." "Receipt for fee paid by applicant for mining location." "Receipt for fee on extension of time for purchase of a mining location." "Patent of a mining location." "Certificate of the assignment of a mining location." "Application for grant for placer mining and affidavit of applicant." "Grant for placer mining." "Certificate of the assignment of a placer mining claim." "Grant to a bed rock flume company." "Grant for drainage." "Grant of right to divert water and construct ditches."

Since the publication, in 1884, of the Mining Regulations to govern the disposal of Dominion Mineral Lands the same have been carefully and thoroughly revised with a view to ensure ample protection to the public interests, and at the same time to encourage the prospector and miner in order that the mineral resources may be made valuable by development.

COPIES OF THE REGULATIONS MAY BE OBTAINED UPON APPLICATION TO THE DEPARTMENT OF THE INTERIOR

Vol. IX. JANUARY, 1889. No. 1.

Mining as an Investment.

There is perhaps no better time to call attention to the value of mines as investments than at the beginning of a new year, when men's minds are yet occupied with the profits and losses of the year just closed. In many ways the year 1889 was a notable one for Canada in the way of mineral development. The development of the large copper and nickel mines at Sudbury, and the highly successful campaign of the large blast furnaces there have given evidence of what skill and capital combined can do to make mining a safe and lucrative investment. The increased activity in the Port Arthur silver region, the large shipments from the phosphate country, the increased production of the gold fields of Nova Scotia, together with the many incorporated schemes looking to the development of our large iron deposits have drawn many eyes and turned many minds to the consideration of the value of mines and metallurgical works as a source for profitable investments.

In the United States the past year has been a very prosperous one for the mineral industries. We have taken a list of thirty-one prominent mines in that country, whose shares are openly dealt in upon the market, and therefore whose records are open and available, and the results, summarized are as follows:—

Total share or nominal capital of 31 companies.....	\$158,955,000
Total market value of capital of 31 companies.....	78,111,000
Total dividends paid in 1889 upon above capital.....	9,472,000
Total dividends paid to date by 31 companies.....	88,457,145

These figures show that the actual value of the mines as deduced from the daily quotations in open market was 50% of the nominal capital. Also that the dividends paid last year realized 12% on the market value, or about 6% on the share value. Furthermore that that these thirty-one mining companies had paid in dividends since their inception 113% on their present value, or nearly 60% on their nominal share capital.

Such figures as these are the best answer to the statements so frequently made that "to put money into mines is to gamble." Mining is a legitimate business when it is conducted in the same manner and on the same principle as other legitimate businesses, and its profits often are very much greater.

That mines are but too frequently made to serve the purpose of unsuccessful speculators is unfortunately true, but the victims are to a large extent responsible for being thus deceived, as it is not at all an impossible thing to deter-

mine the actual present value of a mine—a mine has no mystery necessarily. Now a days there is a sufficiency of honest and competent mining experts who can and will give an honest and reliable valuation of any mining property that may be offered to investors, and it is only upon such demonstrated value that an investment should be made; what the promoter thinks likely or possible, or *believes* will be found afterwards, in depth, or in the future, offers a foundation for nothing but gambling.

Were the same principles of ordinary business prudence used in making investments in mines that are used (by the same investors it may be) in making investments in real estate, railroad securities, or bank stocks, there would be fewer failures and a very different moral feeling towards mining and those engaged therein.

To make mining profitable as an investment then (1) the price paid for the property must be proportioned to its actual demonstrated value, as determined by an honest and competent expert; (2) an amount of working capital sufficient to put the property upon a self-sustaining basis must be supplied; (3) the person or persons entrusted with the management must be honest, skilful, and last, but by no means least, economical.

Profits coming from the legitimate working of mines benefit the industry by inducing further investments of capital, but the speculator who sells a prospect for ten or a hundred times its value, is no benefactor.

It is only by making mining profitable to those whose money is invested in the *actual working of the mines* that a healthy and legitimate growth of the mining industry can be attained.

The Mining Industry of Nova Scotia in 1889.

The year 1889 was a very prosperous one for the mining interests of Nova Scotia. The coal iron and gold mines were all active and labor was in demand. The total output of coal for the province was in round numbers, 1,760,000 tons, and the shipments aggregated 1,560,000 tons against 1,576,691 tons in 1888. This decrease of 16,500 tons is but little more than 1% of the sales, and is trifling, and the year shows an advance of nearly 3% over 1887 and 12% over 1886. The decrease of 16,500 tons is principally from Pictou, three mines there (the Drummond, Albion and Vale) aggregating a decrease of 46,000 tons. Cumberland county almost held its own, both Springhill and Chignecto collieries showing an increase, but the Joggins has a large falling off of over 5,000 tons. The increase in Cape Breton is remarkable in two mines, the International and Victoria, the two aggregating an increase of 40,000 tons; all the other Cape Breton collieries, excepting Bridgeport, report decreased sales.

The yield of gold in round numbers was 25,000 ounces, an increase of 2,500 ounces over

1888, and, with the exception of the three years, 1865-6-7, the largest product of any year since discovery. It was confidently expected in July that the year's yield would exceed any year in the history of the province, as the product for the first six months was 13,623 ounces, but the sudden falling off of the yield in the Caribou and North Brookfield districts, coupled with the transfer of the Central Rawdon property in September, make the yield for the second six months less than 12,000 ounces. The new management at Central Rawdon wisely curtailed production until the mine was put in shape to handle the ore more economically. Some of the older districts have fallen off during the year, due probably to the inevitable lean spots which occur in the history of every paying lode, among these are Salmon River, Oxford and Caribou. Rawdon has not been a producer during the year.

There were five districts having a production exceeding 2,000 ounces, viz:—Molega, 2 producing mines, Oldham, 1 mine, Whiteburn, 2 mines, Central Rawdon, 1 mine, Salmon River, 1 mine; and the aggregate of their production will exceed \$250,000, or more than one-half of the total yield.

The outlook for this present year is very bright. Central Rawdon, Molega, Whiteburn, Oxford, and Salmon River will be steady and heavy producers. Sherbrooke and Mt. Uniacke will exceed last year's record, and Chester Basin is expected to be a regular producer. North Brookfield and Oldham will probably show a decrease, and perhaps also Stormont. Montagu is uncertain, but will probably increase its production.

The iron industry received quite an impetus during 1889 through the various schemes which were set on foot to develop the resources of the East River of Pictou. The Nova Scotia Coal, Iron and Railway Co. had a force of miners at work in the latter part of the year developing one of the deposits leased by them, and considerable ore of good quality has been mined.

Another company, called the Nova Scotia Midland Iron and Railway Co. has commenced to build a railroad from its property to New Glasgow, a distance about 18 miles.

The output of the Londonderry mines is not known at date of writing, but the works have been kept busy all the year, and have had a big run on contracts to supply cast iron pipes. The mines are heavily handicapped by the heavy expense entailed in timbering, but it is confidently asserted that the new company and new management will bring up the industry to its proper position.

The re-adjustment of prices for copper, consequent upon the collapse of the French Syndicate, has been steadied, and has brought up the price again to a point at which the Coxheath mines in Cape Breton can probably produce at a profit.

The minor industries of Antimony and Manganese were not in a flourishing condition last year; the sudden and abnormal rise in antimony may however stimulate the owners of the Gore property into reviving the work at their undoubtedly valuable property.

British Investments in 1889.

During last year there were registered in England 2,560 new companies involving a total capital of £222,658,000 sterling. These figures show an increase of 70 new companies, but a decrease in capitalization of £123,061,000 sterling compared with 1888. It would appear, therefore, that the past year has been prolific in small enterprises, due, no doubt, to the rapid conversion of small private concerns into joint stock companies. Of the above companies it is interesting to observe that 370, with a capital of £35,000,000, were mining undertakings.

LETTERS TO THE EDITOR.

Phosphate Analysis.

New Broad Street House, London, Eng.,
20th Dec., 1889.

The Editor,

SIR,—I have read with a considerable amount of interest the letter of my friend Captain Adams which appeared, under the above heading, in your November issue, and none the less so that I had only a short time previously met with the Report of the British Consul for Rochelle, which in part relates to the English trade in fertilizers with France. Naturally looking at the matter from a different point of view, it yet appears in no degree surprising that, under the circumstances, the Consul should arrive at the conclusion that if such measures as those advocated by Captain Adams are not adopted by the manufacturers in England, their continental trade, which is one of immense importance, will be irrevocably lost.

The Consul, after speaking of the immense proportions and growing importance of the trade in fertilizers, states that whilst English manufacturers have hitherto had a practical monopoly of the trade, they are now rapidly losing it, if they have not already lost it; and that this untoward result is brought about solely by the unwillingness evinced by them to take steps for adapting the trade to the requirements of their continental customers. Firms in France, prompt to avail themselves of the opportunity, have already established large factories there, with the view of acquiring the trade for themselves and carrying it on in their own country. The Consul states that the causes of a state of things, so prejudicial to English interests, having been enquired into by him, may thus be shortly stated.

The English manufacturers, he states, have have lost the continental market because they have failed to adapt the trade to suit the local demands. Thus, for instance, they will not sell at a fixed strength, but quote their superphosphate at an uncertain price, say from 5s. to 6s. for an uncertain strength from 10 to 12 degrees. The strength, consequently, has to be tested

after it arrives, to ascertain the number of degrees; the price being then fixed accordingly. By this method of doing business the buyer is compelled at one time to take it at a higher price, and at another at a lower according to the results of the analysis. This the French farmers most strongly object to; they require to buy at a fixed degree so that they may know exactly what they are getting for the money they pay. He further considers it most undesirable that importers should have to manipulate the fertilizers after receiving them, which at present they are obliged to do in order to meet the requirements of their customers, the farmers; on the contrary, he insists upon it, that the fertilizers should always be sold exactly as received from the wholesale houses; because, when the proportions are altered subsequently, a tempting opportunity is given for adulteration, and the natural result follows that the goods dealt in acquire a bad name.

It appears to be universally admitted that a better article than that supplied from England does not exist; consequently, the Consul is of opinion that good business even yet may be done if only the English firms will sell at a moderate price, and study, more than they have at present evinced a willingness to do, the want and expressed wishes of their foreign customers.

Englishmen, as we know, are somewhat unwilling to travel out of old grooves, but in face of so serious a state of things as that disclosed in the Consular report, manufacturers will not be slow to perceive the absolute necessity of changing their system, in order to prevent the foreign trade slipping entirely through their fingers.

In any case it is clear that the time is now ripe for a change; consequently the opportune moment has arrived for the Canadian producers to unite in urging the adoption of their views upon the general body of manufacturers here; and as their views, as set forth by Captain Adams, seem to be based on justice, it is only to be expected that they will be fairly considered by the manufacturers, and as far as possible be given effect to in the alterations of the methods of doing business which seem to be now inevitable.

Yours etc.,

ROBERT H. JONES.

Buckingham, Que.,
13th Jan., 1890.

The Editor,

SIR,—We have perused Mr. Adams' grievances and his suggestions for remedying his unhappy experiences in disposing of his apatite ore, but we are not inclined to admit that the practices of well known brokers and dealers are so corrupt, or chemical analysis so intentionally elastic as a casual reader of these statements might be led to suppose.

We desire here, however, to only refer to the technical operations, the commercial dealings offering no difficulty to any competent man of business.

We presume therefore that the parcel of phosphate to be analysed has been correctly and methodically sampled, so that the sample *really* represents the ore in question; this result is no easy matter to obtain from the average product of our local mines, consisting of lumps and powdered *debris*, which are invariably of different degrees of richness, and when we take into account the rough and ready means employed, we may well marvel at so near an agreement of results as is usually obtained. It may also

surprise some readers to learn that we know of only one mine in this region which possesses any decent mechanical necessities for *reducing* and preparing their samples, and no mine possesses a chemical laboratory by which controlling analyses could be effected, thus rendering invaluable guidance for timely classification, by which subsequent disappointment might be avoided.

Now before comparing the results of analyses obtained by two or more chemists, we must first assure ourselves that the samples sent or subjected to analysis, are absolutely identical and homogeneous, and when this condition has been obtained, another cause of divergence in the analyses may creep in, if it has not been stipulated that the *same method of analyses* be adopted by the respective chemists.

These differences of analytical results have been recognized long ago in various commercial branches, to arise from the different methods of analysis employed on the same sample, and not to be attributable to any inconstancy of chemical reactions or even to faults of manipulation on the part of the operator. The analysis of such valuable manurial products as potash, nitrogen (ammonia) and phosphoric acid have undeniably figured very prominently as a cause of these complaints, until associations and chambers of commerce have led the way to agree upon and impose one particular method of analysis to be applied to these commercial samples. Thus the syndicated mining companies of the Somme phosphate (which is a high grade) have long imposed that the analysis guaranteed by them refer to the result obtained by Maret's method of analysis, both for phosphoric acid and for the contaminating ingredients of oxide of iron and alumina.

As we have strongly deprecated the rough rule-of-thumb systems existing in the mining operations in the Ottawa County, we hope to soon see a change for the better, and with this end in view it may be acceptable to some of your readers to here describe a method of phosphate analysis suitable for our Canadian apatite, and which is at the same time rapid, simple and trustworthy when carried out in accordance with the prescribed details. It is the method much employed in France, and generally known as Maret's method above referred to.

The whole of the sample is rendered sufficiently fine to pass through a sieve of 80 meshes to the linear inch, and then intimately mixed. The solutions of fixed strength are thus prepared:—

1. *Ammonical Citrate Ammonia*.—Dissolve 400 grammes of crystallised citric acid in liquid ammonia, .880 and complete volume to the litre.

Ammonical Solution of Chloride of Magnesium and Chloride of Ammonium.—Dissolve 8 grammes of carbonate of magnesia in *quantum sufficit* of hydrochloric acid; add 120 grammes of chloride of ammonium; render slightly alkaline by liquid ammonia; add excess of ammonia 200 centimetre-cubes, and water to complete volume of one litre; finally allow to stand a few days and filter before use.

3. *Wash-Water*.—Distilled water 800 cent.-cubes, ammonia 200 cent.-cubes, and chloride ammonium 5 grammes.

Analysis.—One gramme of the sample is weighed with a porcelain evaporating basin; 10 cent.-cubes of concentrated hydrochloric acid added, and then set to digest about ten minutes on the water bath; now add 20 cent.-cubes of water and allow to evaporate to perfect dryness. The dried residue is taken up with 30

cent.-cubes of dilute hydrochloric acid (containing $\frac{1}{3}$ part of concentrated acid) digested during ten minutes more on the water bath and subsequently filtered. The filtrate is received in a conical foot glass, the paper filter and porcelain basin being sufficiently washed with distilled water. Now add to the filtered liquid with washings, 50 cent.-cubes of the alkaline citrate of ammonia solution (1); 60 cent.-cubes of strong liquid ammonia (.880); and 10 cent.-cubes of the alkaline chloride of magnesium. The total volume of the liquid for precipitation being about 350 cent.-cubes; it is gently stirred for a few minutes and afterwards allowed to stand for at least twelve hours. The precipitated ammoniac-magnesian phosphate is collected on a filter, employing a feather to detach the adhering deposit in the precipitating glass. The ammoniacal wash water (3) is used for this washing, which should be effected in five rejections, taking the precaution to allow the filter to drain each time before proceeding to a fresh washing. The filter and its contents are allowed to drain, and partially dried is removed to a weighed platinum crucible or capsule and completely dried in the air bath. It is then slowly heated to dark red, and finally to a white heat, or until the calcined pyrophosphate of magnesia becomes absolutely white. After cooling it is weighed, and the known weight of the filter ash deducted, together with the tare of the crucible. This product multiplied by 63.96 gives the percentage of phosphoric acid in the sample, and the result of phosphoric acid multiplied by 2.183 gives the equivalent percentage of "bone phosphate," or tribasic phosphate of lime.

We have thoroughly tested this process ourselves, and find it reliable and expeditious, and we have thought it useful to describe it, because we have never seen it mentioned in any of the ordinary analytical text books.

On a future occasion we will also describe the Maret method of estimating the oxide of iron and alumina in mineral phosphates, which may have an interest for some of our local miners.

I am, etc.,

J. LAINSON-WILLS.

The Smelting Works at Golden, B. C.

CALGARY, 9th Jan., 1890.

The Editor,

THE CANADIAN MINING REVIEW.

DEAR SIR.—In the December number of your Review, under the above heading, you state that there is some talk of erecting another smelter in Kootenay, so located to suit the mines at Golden and Donald, and that Mr. McCarthy of Calgary was the moving spirit. As I am, no doubt, the person referred to, I take pleasure in giving you the particulars of the report which has reached you, and confirm same. Although considerable has been done by those associated with me, we have not, and do not now wish to make any statements but that which we are confident will be borne out by our future actions, as nothing is more detrimental to the interests of those engaged in mining or in mining enterprises, than spreading reports wholly foundationless, or made with the interest of working up a mining boom in any particular locality. I know of no industry which is more injured than the mining industry by false reports sent out evidently by those who have the sole object in view I have mentioned, and I attribute to this more than any other cause, the want of faith which the public are liable to have in anything connected with mining. What I herein state may be relied on. In the spring of 1888 H. B. Alexander of Alberta, John L. Bowen, James A.

Lougheed and myself formed a partnership for the purpose of erecting smelting works at Field, on the line of the C. P. R. in British Columbia, and purchased two mining locations at Mount Stephen near that place. In May, 1888, we went to Chicago and purchased from Messrs. Fraser & Chalmers a 40 ton smelter, an ore breaker, a pair of rolls, iron for reverberatory furnace, and in fact everything requisite for a complete plant, except engine and boiler which we intended purchasing in Canada; all this plant has been paid for and has been ready for shipment for some months. In August last we engaged S. S. Fowler, M. E. of Chicago, to erect and superintend our works, and for that purpose he came on, but after examining our proposed site at Field, and visiting Golden on the Columbia River, he advised us to locate our works at Golden, 33 miles west of Field, if a proper site could be obtained at that place. The Dominion Government, in order to encourage smelting operations in British Columbia, gave our firm a tract of land near Field, and in order to procure a transfer of the grant of land at Golden, we were forced to delay the erection of our smelter until that grant would be obtained. This the Government has now given us, and we have obtained 320 acres of land at Golden on the condition that we erect our smelting plant at that place, which we will as soon as spring opens. You will see by this that the report which has reached you has substantial backing. All our plant, with the exception of engine and boiler has been purchased and paid for, and the smelter will be erected as mentioned. I have personally been interested in the mines in British Columbia for several years, and will in another letter give some reliable information in respect to the development now going on in the Kootenay District in that province, which I hope may be interesting to some of your readers.

Yours etc.,

P. MCCARTHY.

In General.

Many Canadian phosphate schemes are now on the move in London. The Phosphate Trust (Ltd.) with £1,000,000 capital referred to in our last issue is expected to come out publicly this month. This company has included in its prospectus large areas over which the promoters have as yet no control, but which, it appears, they would purchase if their appeal for capital is successful. Another large and similar enterprise is also spoken of as being in preparation, and we shall be interested to see if the English public have become aroused to the advisability of phosphate investments in Canada.

London letters state that Col. North's nitrate enterprises are languishing, and his followers are beginning to lose money. It is said he is sustaining their spirits by promises of fortunes in phosphate, and it is thought his attention may be turned to Canada as a field for operations.

A strong firm in London are endeavouring to organize an undertaking for the manufacture of super-phosphate at Buckingham, in connection with the North Star Mine and other Lieve

river properties as the source of supply for phosphate. The sulphuric acid is to be obtained from Capelton.

We are indebted to the thoughtfulness of Mr. W. H. Hutchinson, of the Anglo Continental Guano Works, London, Eng., for a number of samples of foreign phosphates for the *Review's* museum. These consists of

Bull River phosphate.....	55/60%
West Indian ".....	60%
Lahn ".....	40/50%
Sombrero ".....	75%
Welsh ".....	50%
Basic Slag.....	40%

The same gentleman writes *apropos* of the discussion upon the alleged discrepancies between the buyers' and sellers' chemists in the analysis of Canadian phosphate:—"I have just been looking up the analysis of some parcels of Canadian phosphate bought by us. The buyers' and sellers' analysis are:—

For Buyer.	For Seller.
83.94	84.48
72.39	73.45
80.69	81.54
75.40	75.96
86.60	86.87

from which you will see there was no great difference—not any like the discrepancy alluded to by Captain Adams."

The total production of South Carolina phosphate for the year 1889 is estimated to have been 423,720 tons.

The phosphate beds belonging to the State of South Carolina are valued at \$7,000,000. The State debt of \$6,000,000 is about to be refunded at 4 per cent., and it is proposed to sell the phosphate deposits and wipe out the debt at once. A bill to authorize the Comptroller General to advertise the beds for sale has been favorably reported by the Ways and Means Committee of the House of Representatives, which, it is thought, will pass, despite the strong opposition from the phosphate interests of Charleston. The advocates of the bill figure that the State would save \$8,000,000, so far as the State debt and interest thereon is concerned, by cancelling the debt with the proceeds obtained from an immediate sale of the phosphate deposits. For, assuming the beds to last for fifty years, the State's royalty would amount to \$11,250,000; but interest on the debt for the same time would amount to \$12,000,000. The principal, too, would become due, and the excess above the royalty would be upwards of \$8,000,000. A great advantage which the purchasers of the beds would have would be their ability to fix the royalty at any figure they might see fit. The State royalty is \$1 per ton. The phosphate business of Charleston involves many millions of dollars, and the proposed legislation will no doubt be vigorously resisted.

For the following particulars regarding the new fertilizing works now being operated by Messrs. G. H. Nichols & Co., at Capelton, we are indebted to the courtesy of Mr. H. W. Wigglesworth, who in a recent letter says:—"Our fertilizing works are now in full swing preparing for the coming season's demand. Here, in the Eastern Townships, little trouble is anticipated, our last year's start and the very satisfactory results obtained having given quite an impetus to our business locally. In Ontario, where we did little last season owing to the limited time left at our disposal, we look for a large demand for our product,

our travellers reporting most encouragingly of the prospects. In fitting up the works, with our extensive experience in the States to guide us, we have put in a plant, which, if it can be equalled can certainly not be surpassed on this continent. For breaking the mineral phosphate the Blake crusher is used, this machine, as is well known, doing its work quickly and effectively. From the crusher the apatite is carried by elevators to a hopper which feeds the new Griffin mill. This mill is worked on entirely new principles, and grinds from 25 to 30 tons a day, discharging it screened and ready to be conveyed and elevated to the dissolving floor; and it does its work so finely that much of the difficulty in dissolving is overcome. The acid treatment, of course, depends very largely on the analysis of the ore, and upon definite chemical proportions; our success in reducing to a minimum the insoluble phosphate has been very gratifying, and must prove a great boon to the consumer. At present we are about to add to the Chemical Works a new set of chambers in order to insure an unstinted supply of sulphuric acid for the Fertilizer department. For mixing the raw material and grinding the superphosphate we have put in a Walker & Elliott Disintegrator, a machine which is now being very largely adopted in the Southern States to replace Carr's disintegrator. It revolves at the rate of 720 revolutions to the minute, pulverising by a sort of tearing action. The various raw materials are fed directly and only require passing through and screening to be ready for bagging, and the market. The new Disintegrator should grind 100 tons per day. We have also an excellently equipped laboratory where all the raw material and finished grades are analysed, and by which we are enabled to detect any faulty manipulation before it gets too far. As you are aware the price of mineral phosphate has risen very considerably since the summer, but having been fortunate to secure a large supply before the advance, we are enabled to sell our different grades at as low a price as we did last year. The demand for fertilizers both in Europe and in this country gives us unbounded confidence in the future of this business in Canada."

The following circular letter, under date of 28th ult., is being freely distributed by the American agents of a London firm:

"We cannot help being amused at the innocent credulity of these Canadian property owners, who lend such a willing ear to every man-jack of a runner, who talks so glibly of a "cash purchaser" in London and a "cash deposit" to be had only for the asking, and who in all probability, has not enough money in his pocket to pay for a single night's lodging at a fourth-rate hash house. Cannot you, with all your American cuteness, invent some process whereby you can instil into the brains of these same Canadian property owners a knowledge of the fact that they are being deceived, tricked, bamboozled and made fools of by these runners, impecunious fellows, who, having heard of the formation of the Phosphate Trust, are resorting to every subterfuge, every fast and loose game, to secure options on properties which they will offer to the Trust at so enhanced a price that the properties will be thrown back on the owner's hands with every chance of their being sold, utterly lost. * * * Having been advised from your side that several London firms of good standing had representatives in Canada authorized to pay deposits upon and secure phosphate properties, we have taken the trouble to enquire of these firms as to the truth of such statements, and in every single instance

they emphatically assert that they have no representative in America, and that any person representing himself as such, is doing so without any authority from them.

Markets.

European advices report the market strong with an upward tendency. A rumour was current locally to the effect that contracts had been made at a higher figure than 1/4d. for 80%, but on enquiry we find that there is no truth in the matter. A London house owning mines on the Lievres River have offered some of their phosphate at 1/4d. without finding a buyer. A sale has been made at Hamburg at 1/3d. for 80%, which is equal to 1/2d. at London, and this may be considered the opening price of the season. The market is firm, but prices are to a large extent nominal, for the miners are holding out for higher figures than the manufacturers is willing to give just now.

Kingston District.

About 100 men are now working under Superintendent Harris at Capt. Boyd Smith's mines in this district. Pits are being operated at Eagle Lake, St. George's Lake and Silver Lake, at all of which phosphate in paying quantities is being raised. A brisk season is expected at these mines.

The *Financial Times*, London, under date of 18th ult., contains an interesting report of the meeting of the Foxton Phosphate Mining Co. After working for six months a dividend was declared at the rate of 20 per cent., per annum, and a reserve was carried forward. The pits continue to produce a regular output, and Messrs. Lomer, Rohr & Co. have now some 800 tons on hand. The average yield from this mine is over 80%. The working is also being extended to other "shows" on the property, and these are beginning to yield considerable quantities of ore.

Templeton District.

As foreshadowed in one of our recent issues, the Blackburn property has passed definitely into the hands of the East Templeton District Phosphate Mining Syndicate, limited, the capital of which has been subscribed privately. This syndicate intends to push matters with the greatest vigor. The company has started hauling their No. 1 phosphate to the river Blanche, and their No. 2 to Messrs. Lomer Rohr & Co.'s mill at Bassin-du-Lievres, which mill they intend to supply with about 1,500 tons of phosphate during the present winter. We should say that the new company has been registered with a capital of £6,000 sterling. We understand the property is to be paid for in the main by a system of royalties extending over several years, so that, it is expected, the mine will pay for itself out of its own profits.

We have also pleasure in stating that another new company has been registered in London under the name of the McLaurin Phosphate Mining Syndicate (Limited) with a capital of £20,000 sterling to acquire and work 1,800 acres of freehold mining lands in this district. These lands are most favorably located, and bear the reputation of being good mining properties. Operations will be begun immediately on Lot 7 in the 11th Range and Lot 10 in the 10th Range; both of these lots adjoin the well known Blackburn mine.

The management of both of these concerns is in the hands of Messrs. Lomer, Rohr & Co., the

well known shippers at Montreal, who have displayed so much energy and enterprise in the development of the Canadian phosphate trade.

Lievres District.

The Anglo-Continental Guano Co. of London are now selecting a suitable manager for their recently acquired property adjacent to the Emerald. Their prospector, Hogan, reports most favorably of his further exploration of the Aetna Hill Lot, upon which a cobbing house has been erected. As soon as the manager reaches the mine actual operations will be begun on a large scale.

Mr. Lainson-Wills, who recently examined the workings so far done on the property of the Dominion Phosphate Co., Limited (of London) states that the ground is opening up very well in both pits. There are 30 hands at present employed, including the cobbers who started work after the New Year. The holidays have retarded the delivery of the new steam hoisting engine.

The exploratory works at the Central Lake mines are now restricted to the driving of the north adit level during the winter season. The past year's work has been very successful in establishing the value of this property. The output of some 350 tons of rich phosphate will be hauled out by a new winter road to the High Rock Landing.

Captain Williams has between 50 and 60 men working in the North Star pits. The yield of phosphate continues to be most satisfactory.

Mr. J. Lainson-Wills sailed for England by the Umbria on the 18th inst. Mr. Walter Pickford, manager of the High Rock mines, also left for London on the 4th per SS. Etruria. Among other Canadians interested in the phosphate trade now in London are:—Mr. J. Hilton Green, of Messrs. Wilson & Green, Montreal; Messrs. George Stewart, and E. B. Haycock, Ottawa; Mr. C. M. Pielsticker, of the Dominion Phosphate Co. (Limited), Buckingham, &c. We believe that Mr. S. P. Franchot, managing director of the Ottawa Mining Co., Buckingham, also leaves at an early date. With such a galaxy of talent in the field it will indeed be strange if we do not hear of some important transactions in Ottawa county mines and phosphate lands.

Mr. O. M. Harris, of Montreal, who has just returned from a visit to the pits of the Canadian Phosphate Company, reports very favorably of the work now going on there. Every preparation is being made for an active season.

During the past year considerable prospecting and development has been done on the Little Rapids mines with most gratifying results; these new workings have revealed large masses of apatite in paying quantities, and fully confirm the reports of the high value of this property as a producer of Canadian phosphate. A third shaft is now being sunk at a point about 500 yards west of shaft A, and in this

rich and promising mass of ore of exceptional purity has been uncovered; the present depth of this shaft is now about 40 feet. Shaft A is 190 feet, and shaft B 210 feet deep, and all the levels are now in good ore. We understand that active operations are to be begun early in the spring.

The frequent freshets have been very annoying to mining operations on the river.

Captain Henwood has struck a good body of ore in the north workings of the Emerald.

Perth District.

Contract work continues with gratifying results at the pits of the Anglo-Canadian Company.

Wakefield District.

Messrs Seybold & Gibson, Ottawa, have recently purchased the Moore mine in this district for \$5,000 cash. The property consists of some two hundred acres, and is registered as the north half of lot 12 and the south half of lot 13, 1st range Wakefield. Small development work has been done and some phosphate shipped. The new owners will commence operations immediately.

Nova Scotia.

In General.

The shipments of coal during the season of 1889 are reported to be somewhat less than the year previous. The figures being:—

Cumberland County Mines.....	418,932 tons.
Pictou County Mines	386,254 "
Cape Breton Mines.....	754,964 "
	1,560,150 "

or a decrease of 16,541 tons compared with the returns for 1888.

The Londonderry Iron company recently sent an agent to examine the deposit of red hematite occurring at Torbrook, near Wilmot. The bed is reported to be six feet in thickness, and to average 62 per cent. in metallic iron. It is understood that leases have been signed covering nearly two miles in length of the deposit.

Waverley.

On the 1st of Jany. the Lake View Mining Co. reported 900 feet of levels and crosscuts driven since July. All of this development work is at the 340 ft. level. In driving west a fault has been struck, and in crosscutting north along this fault several new lodes have been found which have never cropped to the surface. Some of these new lodes look very promising, being from three inches to 10 inches thick, and estimated by Mr. Hayward to be worth from \$15 to \$25 per ton.

In West Waverley one small lot of quartz from the Palgrave property has been crushed, which yielded at the rate of \$18 per ton. Only one battery of the mill has been run, the others not being in condition. A small force of men is kept continuously busy.

The Gue and Wilson property in West Waverley has been working during Dec. and Jany. The

shaft in the Union lode, having a depth of 240 feet, has been pumped out and cleaned up. It is the intention of the management to sink the shaft to a depth of 300 feet, and then open up the property by levels and crosscuts at that depth.

The crosscut tunnel under Laidlaw's Hill is progressing slowly, having now a total length of about 450 feet. The famous "Barrel Lode," which is the *raisen d'etre* of this tunnel has not yet been reached.

Oldham District.

Work in this district is very dull, the tribute work last month being of a very unsatisfactory nature. The property of the Oldham Gold Co. is yet in the hands of the Receiver and is practically idle, only two men being employed.

Central Rawdon.

The mill at this mine started up again this month after being refitted with a new engine and new boiler; but Manager Willis expresses doubt as to how long the batteries will be able to run, and says a new mill is a necessity of a pressing kind. The old workings of the mine have largely had to be abandoned, and a new shaft has been started in the vein. The character of the country rock at this mine is different to that of the gold measure proper, being easily weathered, and swelling and shaling off upon exposure; these characteristics have necessitated extra precautions in timbering both old and new openings, and have made progress somewhat slow. From developments made, the manager predicts a prosperous future for the property.

Salmon River.

Mr. Geo. A. Leslie of Halifax has sold his one-eighth interest in this mine to Gardiner Clish and A. K. Archibald of Truro. It is reported that the mine is looking better in its central portion.

Stormont District.

The Palgrave Gold Mining Co. of Isaacs Harbor has employed J. E. Hardman, M. E. to furnish the design and plan for a new ten stamp mill, and a new hoisting and pumping gear, with engine and accessories. The mill and plant are to be erected upon Hurricane Island this spring if the plans are approved. The eastern portion of the company's property has recently had a thorough separate test of its value per ton. The results were exceedingly good, and add very considerably to the value of the mine.

Mt. Uniacke District.

The Phoenix Co., under the management of Mr. H. B. Prince, is giving the low grade ores of this district a very thorough test. From results obtained from Mr. Prince, it appears that

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron; Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

the total cost of mining and milling including incidental and general expenses does not exceed \$2 per ton. The ore belt worked has an average thickness of 8 feet, and will yield from four to six feet of crushing material. It is believed that is the lowest cost per ton ever attained by any gold mine in the province.

Whiteburn District.

The McGuire mine at this place closed down indefinitely in December. It is understood that some changes in surface plant will be made before resuming work. The Graves mine is working full time with a force of 60 men.

Killag District.

Mr. Geo. W. Stuart has been busy this month removing his steam gear to the lode found in October, of which mention was made in the Review for November. As soon as the surface plant is ready mining operations will be resumed.

Renfrew District.

Mining matters here are very quiet. Both the Empress Co. and the Free Claim Co. have but half a dozen men, or thereabouts, each employed. It is understood that both properties are not looking so well as in the summer.

Pictou County.

During recent years the Acadia mines have greatly increased their production, and the past year has been no exception. The yield for 1889 shows an advance of 5,867 tons over last year, the returns given being 101,018 tons as against 95,151 tons in 1888. With a new hoisting plant and other facilities recently added, the prospects are good for a larger output during the present year.

Although there has been an increase in the sales of coke, the exports of coal from the Albion are still sadly in arrear, but it is hoped that the worst period in the history of this unfortunate mine is now passed, and that henceforth there will be a notable improvement in production. The shipments for 1889 are 52,668 tons against 64,388 tons during 1888, a decrease of 11,720 tons. The coke sales amounted to 15,839 tons.

Notwithstanding the small force at work in the pits, the production from Black Diamond shows a healthy advance on the previous year's operations. 1889, 32,416 tons; 1888, 23,686 tons; increase 3,700 tons.

The development of the iron deposits of Pictou county promises to be an immense industry. There are two companies about commencing work. One is American, and the other provincial and British capital. The American company has surveyed a road from their works to New Glasgow, some 18½ miles. They claim 40 square miles of iron and coal property. It is their intention to erect blast furnaces only, the ore being converted by this process into pig iron. The works in connection with the blast furnaces will cost about £40,000. Should a subsidy be granted, the company say they will extend the line to the sea coast. It is the intention of the local company to erect blasting and smelting works. The iron works at New Glasgow will take a great part of the output of the latter. It is believed that the part of the country in which these mines are located will become a second Pittsburgh.

We are glad to learn that the prospects of recovering the Foord pit are growing brighter. Explorations have been made a distance of over 150 feet on the north level, and the look of

things encourage the belief that it will pay to continue clearing up. Eight boxes of coal standing in the level were found only slightly charred. Since writing the foregoing we rejoice to hear that on Monday night the workmen proceeded half a mile on the level finding everything in excellent condition, the rails unmoved, etc.—*Stellarton Journal*.

Cumberland County.

The Springhill collieries have exported about 2,000 tons more than in 1888, the total export being 366,000 tons against 364,036 during 1888. In the early part of the year but little work was done at the pits, but during the last three months there has been great activity which is likely to continue for some time.

An improvement is noticeable in the yield from the Chignecto Pits, the figures for 1889 being 13,645 tons, as against 10,910 tons during 1888, an increase of 2,735 tons. Had there not been a scarcity of cutters more coal would have been sold.

The returns from the Joggins collieries show a falling off of 5,316 tons compared with 1888, the figures being 37,937 tons. This is not owing to any decrease in the demand for the coal, but simply from a failure to start the leading places in time, thus creating a scarcity of pit room. The works are now in a better position than ever before, and there is good reason to believe that the production during the present year will be largely in excess of the season just closed.

Cape Breton.

Although handicapped by the want of a railway and shipping place of its own, Bridgeport again has a slight increase.

There is little difference in the returns from the Caledonia compared with last year, the figures being:—1889, 102,525 tons; 1888, 102,931 tons; decrease, 400 tons.

The Gowrie mines show a decrease of 8,127 tons; of round there were shipped 83,572 tons, and of slack 16,573 tons. The total export for the year was 100,145 tons.

The International has been by far the most productive of the Cape Breton mines, and shows an increase of 23,419 tons over 1888. The total shipments were 113,063 tons, of which 95,707 tons were round coal, and 27,358 tons, slack. Work was steady in all the pits and fair wages were earned.

At Little Glace Bay the output is 3,400 tons less than in 1888, the decrease being attributable to an increase in the rate of freight, on account of which the full quantity of coal ordered at the beginning of the season was not called for. The returns are:—1889, 74,000 tons; 1888, 77,405 tons.

The coal from the Sydney mines is largely used for domestic purposes, and the shipments, therefore, vary little from year to year. The exports for 1889 were 125,060 tons, or a slight decrease from 1888.

Excellent work was done at the Victoria mines, and the yield shows a strong lead over the previous year's operations. The total quantity was 88,900 tons, or 16,400 tons more than 1888; 6,900 tons of slack were shipped from these mines.

The quantity shipped from the Reserve mines comprises 925 tons round and 16,846 tons slack, a total of 106,771, as against 109,063 tons in 1888.

New Brunswick.

The Brunswick Manganese Company's stock has been admitted to the unlisted department of the Boston Stock Exchange. The property is located at St. Martins, in St. John county. Shares, \$40,000; capital, \$100,000; transfer office, 34 Oliver street, Boston. Herbert H. D. Pierce, president; George D. Hall, jr., treasurer, and they with James A. Tilden, W. R. Stockbridge and John A. Loring are directors.

Quebec.

The exports of Canadian asbestos for the fiscal year ended 30th June last are officially stated to have been:—

	Tons.	Value.
No. 1 quality	4,228	\$304,336
No. 2 "	237½	11,192
No. 3 "	183	8,358
Total tons.....	4,648½	\$323,886

The following were the exports for the twelve months ended 31st December last, as per official returns received by us:—

From Coleraine	Lbs.	249,400
" Black Lake	"	3,450,020
" Thetford Mines	"	8,166,360
" Broughton	"	16,000
" Levis	"	32,000
	Lbs.	11,913,780

or 5,956 $\frac{1780}{2000}$ tons. This is a most satisfactory increase over 1888.

Work continues lively at the pits of the American Asbestos Company, Limited, at Black Lake. Their No. 3 pit is in excellent condition, and never appeared as good as at present. The veins are all large and well bunched. Up to December they were working a force of about 80 men, though at present their force is not quite so large. In November they mined 96 tons of asbestos, and about 34 per cent. of this was No. 1. This is much higher than the average of Black Lake mines. The machinery of this company was only put in operation about July 28th, 1889, yet, notwithstanding this, they brought their output for year ending November 30th, up to 511 tons. Beginning December 1st, 1889, it will be known as a limited company. They are adding a number of houses for their workmen this winter.

Mr. A. Steele, Supt. Que. Central Ry., and Mr. John McDonald, of McDonald Bros., Sherbrooke, have leased a Lot on the opposite side of the lake from the above works. This will be known as the "Central Mine."

The United Asbestos Company, Limited, are putting in a plant of hoisting and air compressing machinery. The plant is built by the Jencke's Machine Company, of Sherbrooke, and from what we see of the machinery already on the ground it is a credit to that company. There are two 70 h.-p. steel boilers, duplex 7" x 10" "Bacon" hoist, and 16" x 24" Rand compressor. These will be put in position as soon as possible; the engine house is nearly completed, and it is expected that all the machinery will be ready for work in a few weeks. At present a force of about 35 men are employed. In a new opening now being worked there is an excellent showing of asbestos.

Southward mine,—Bell's Asbestos Company—is closed for the winter.

The Anglo-Canadian Asbestos Co. Lt., have reduced their force of men for the winter. They are opening a number of new pits, and if they show up well their output will be largely increased for the present year. We understand that Mr. R. T. Hopper intends adding some new machinery in the spring.

The Coleraine Mining Co. has leased several lots of mining land to different parties.

Next to Johnston & Loomis, the St. Julie Mining Co. have taken a Lot. They are working a few men now, their work at present being entirely confined to prospecting their property.

Next to the above comes what is known as the Black Lake Mining Co. A few openings have been made on this Lot and some nice veins of asbestos uncovered.

The Laurier Mining Co. has acquired a Lot adjoining the Anglo-Canadian Asbestos Co. Lt. Very little work has been done as yet. They intend opening in the spring.

One or two other places have been leased by other parties, but no particulars can be obtained.

From the present outlook, we should say that the coming season will be the busiest that Black Lake has ever known. All the established mines are looking forward to a large year's work. Some of the mine managers are puzzling their heads over the labor question, as it is now, the men are scarce and most of the mines are short-handed. In the early spring the different companies will have to increase their forces by a considerable number, and it looks as if there will not be enough men to go around.

The American Asbestos Co. are getting a number of Belgian workmen out. Mr. Ed. Werthiem, Managing Director of this company, is expected to return in February.

The exports of copper ore from the Eustis and Capelton mines for the twelve months ended 31st December, as per our official returns, were 43,110 tons, and in addition to this there were shipped 1500 tons of copper matte. The shipments of ore and matte from the Harvey Hill mines during the same period has been very small, only some 255 tons having gone forward.

The value of the exports of Felspar from the Villeneuve mica mines for the quarter ended 31st ult. was \$487.50.

From the Bristol Iron Mines, during the same quarter, ore to the value of \$7,087.31, or 259½ tons, was shipped to the United States.

Ontario.

In General.

Notice of application for letters patent of incorporation has been published on behalf of the Gravel Bay Mining Company, the object being to work the Vulcan location, situated six miles north of Gravel Bay Station on the Canadian Pacific Railway. Five well-known gentlemen are the promoters, namely: Hugh Wilson, P.L.S., Mount Forest; Judge Kingsmill, Bruce; F. T. Sibley, formerly of the Silver Islet Company; W. E. Price, of Montreal, and Mr. Walter A. Dixon, of Toronto.

The location is 160 acres in extent. Assays of the ore by Prof. Chapman, of Toronto, give 60 per cent. lead and a high percentage of silver and gold.

We hear, writes the *London Iron and Steel Trades Journal* that a well known American engineer has prepared plans for six large blast furnaces, which are to be erected near to Ottawa, and we see no reason why pig iron production on a large and profitable scale should not soon be an important feature of Canadian industry. It is only a matter of time, and we believe that movements now on foot are likely to accelerate the event. The enormous production of pig iron in the United States has now rendered the great Republic practically independent of external supplies of crude iron, and we must be content to accept the inevitable and see Canada also become self-supporting in the matter of pig iron.

Sudbury District.

The Canadian Copper Company has closed down the Stobie mine for the present owing to the overcrowding of cars in the Sudbury yard incidental to the rush of business over the "Soo" branch of the C.P.R. Such a block has been created here that it has been impossible for cars hauling ore from the Stobie pits to get across to the Roast yard at the Smelter. The closing of these pits will throw about 40 men out of employment.

The "Copper Cliff" continues to do well. A rich strike of ore was lately made in the fifth level at a depth of 520 feet from the surface. About 130 men are employed here.

A force of about 70 men is employed at the "Evans" under the superintendence of Capt. James, formerly identified with the Coe Hill mines. About 100 tons carrying 8 per cent. copper and from 2 to 3 per cent. nickel are raised here daily. A pile of 1,500 tons has just been roasted at this mine. All the ore, however, is not roasted here; several car loads per day being shipped to the Roast-yard at the Smelter.

The smelting operations, in which about 60 men are employed, continue to give great satisfaction. No. 1 furnace is at present idle, the trestle having been taken down to allow the construction of a dump beneath it and to admit improvements in running out the slag from No. 2.

The Dominion Mineral Company continues the development of their property. About 60 tons per day are being raised. The management are also roasting their ore. The Smelter has not been put up yet.

The Murray mine is also working, and is doing good work.

The *Globe*, in a recent issue, has the following comment on the proposed extension of the Central Ontario Railway from Coe Hill, its present terminus, to the Sudbury mines:

It is understood that the Railway and Mining Companies are prepared to undertake the construction of the road to Sudbury, the erection of a furnace somewhere on the line for making coke iron with a capacity of 250 tons per day, and the extension of their smelting plant at Sudbury to a capacity of 1,000 tons per day, on condition of receiving certain subsidies from the two Governments. These mining and smelting industries would give employ-

ment to a very large number of men from the outset, and would be a boom of immense value to a section of country that has been for some time in a very depressed state—the counties of Northumberland, Hastings and Prince Edward. The circumstances, too, seem to favor some town or city of Ontario as the location of works for the manufacture of nickel-steel, and for the refining of nickel and copper ores. The plant for the manufacture of nickel-steel alone would, it is stated, cost \$3,000,000, and the Canadian Copper Company has received offers of any financial aid they may require from British, French and German capitalists should they go into the enterprise. We learn on good authority also, that the Governments of Great Britain, France and Germany have each made an offer to purchase all the nickel which the company can produce in the next ten years, but probably these offers have been made without any conception of the possible output of the Sudbury mines.

Port Arthur District.

The year 1890 opens well for the Port Arthur District. The Badger Mining Company, owners of the Badger silver mine near Port Arthur, have just declared a first dividend, payable January 15th, of 50 cents per share on 50,000 shares, equivalent to 10 per cent. on the total capital stock of \$250,000. This is all the more remarkable when it is considered that the mine had previously returned to the proprietors all the original capital invested in the lands, buildings, mining works, machinery and mill, besides having ample cash for ordinary working expenses still left in the treasury.

The December shipment from the Badger consisted of 15 barrels of high grade ore and 13 barrels of concentrates; value \$17,000. Everything looks prosperous and business like around the mine. Several men are employed. The mill is running night and day.

Owing to the mild weather and heavy snow fall, the water in the Silver Creek still continues sufficient so that the anticipated closing down of the mill, owing to shortage of water, is still delayed.

The location of the railway through the mining region is being pushed, and no doubt there will be changes made which will shorten the line and assist in the more economic working thereafter. In the meantime, the present terminus of the road at the Kaministiquia River Crossing—called "Stanley" in commemoration of the Governor General's recent visit—is quite a busy centre.

The West End Silver Mining Co. held its meeting in Port Arthur lately, and has made arrangements for more vigorous work at this most promising mine.

The various veins on the Beaver mining property are being energetically and economically developed by the able manager, Capt. Hooper, who has also the management of the Elgin mine near by, which promises in the near future to be a rival of its older sisters, the Beaver and Badger.

The diamond drill is still enquiring into the depths below of the Beaver; when some 1,500 feet have been penetrated, the drill will doubtless be put to work to test the vein proper at various depths.

Work is going steadily on getting out lumber, etc., for mills, houses, etc., at the new town site of Kakabeka. The company is now being organized in Philadelphia, and on the return

shortly of the business manager the tunnel for the utilization of the water power for smelting and other purposes will be commenced.

The shipments of last winter from the Shuniah Weachu were 22 tons of a value of \$10,000. All the workings continue to do well. Excellent stopping ground has recently been opened.

The main shaft of the Wolverine is down 130 feet. The vein is improving with depth, but some difficulty is experienced with water in the shaft.

A rumor is current that the Porcupine has been sold to an English syndicate. The price mentioned is \$50,000.

Rat Portage District.

It is announced that English people will take control of the gold mine on Sultana Island, and that operations will be begun in the spring. It is said that the syndicate has an option to purchase the property after testing it.

British Columbia.

The Revelstoke Mining Co., with a capital of £40,000 was registered at Victoria on the 23rd inst.

The output of coal from the mines at Vancouver Island during the past year has been largely in excess of any previous year. The total production, estimating that of the East Wellington Colliery at 35,090 tons is 548,503 tons, of which the Wellington mines furnished nearly 50 per cent. Placing the value of the coal at \$4.50 per ton at the pits mouth, the total represents a value of \$2,468,263. These mines give employment to over 2,300 men.

The following are the returns furnished by the different companies:

WELLINGTON COLLIERIES.	
Foreign shipments.....	196,510 tons.
Home consumption.....	70,524 "
Total	267,034
Number of men employed, 900.	
UNION COLLIERIES (6 MOS.)	
Foreign shipments.....	27,551 tons.
Home consumption.....	100 "
Total	27,651 "
Number of men employed, 450.	
NEW VANCOUVER COAL CO.	
Foreign shipments.....	179,953 tons.
Home consumption.....	38,000 "
Total	218,818 "
Number of men employed, 845.	
EAST WELLINGTON COLLIERIES.	
Foreign shipments (estimated).....	35,000 tons.
Grand Total.....	548,503 "

The New Vancouver Coal Company has prospected extensively during the year, and has recently put a shaft down to the famed Wellington seam, and found coal of good quality. It is the intention to put this coal on the market this month.

A large force has been employed at the Union Collieries opening up the mines at Union Bay, near Comox. It is expected that early in the year the property will be opened up sufficiently to permit the production of a large output, the company being under contract to the Southern Pacific Railway Co. to furnish 7,000 tons per day.

Considerable interest has been taken and a good deal of money spent last year in the claims in the neighbourhood of Kootenay Lake, but the want of a railway and the difficulties of transportation are still felt to be serious obstacles to the rapid development of what otherwise is a most promising field.

With increased facilities for production at the Wellington and Vancouver pits, and the assured improvements at the Union, there is every reason to anticipate a very much greater increase in the output of coal during the year just begun.

The Wellington and Vancouver Coal Companies have greatly extended their operations; the former has lately put down a shaft and found abundant coal of excellent quality.

Messrs. Wells, Fargo & Co. report an increase of \$15,751.47 in the shipments of gold dust from the province during the year. The following are the figures for 1889:—

Bank of British Columbia.....	\$253,123 87
Bank of British North America.....	46,489 64
Garesche, Green & Co.....	188,580 11

Total, 1889.....\$488,193 62

At the Nicola Mining and Milling Co's "Joshua" claim, in the Nicola district, about 28 miles south of Kamloops, a shaft is sunk 400 feet, while a tunnel has been drifted in one direction 600 feet, and another in a different direction, 1,100 feet. In addition, levels have been run from the shaft at every 100 feet, these extending from 150 to 250 feet. The "Tubal Cain," owned by the same company, is down 220 feet, and the "King William," another of these claims, is down 200 feet. There is now lying at Kamloops Station a 30 H. P. engine, with boiler, and 1,000 feet of wire rope recently purchased for hoisting purposes at the "Joshua" and other claims. This machinery will be taken out and set in position at once so that operations may begin early in the spring.

The "Mary Reynold's" claim, owned by J. Hepburn & Co., has now three shafts—one 100 feet, one 75 feet, and one 35 feet, all on the same vein. Drifts are also run from the 100 feet shaft, a distance of 90 feet; 3,500 tons of ore have been shipped to San Francisco, averaging \$163 to the ton. There is estimated to be \$10,000 worth of ore on the dump, averaging from \$50 to \$60 to the ton.

On the majority of the claims located in the Nicola district only assessment work was done during the past year. Several causes have led to this result, but probably the most potent was the closing down of the Star Mining Company early in the spring, followed by the burning of the quartz mill and other plant connected therewith. The prospects for a renewal of active operations during the present year are, however, good, the success of the Nicola Milling Co. having inspired confidence in the future of this promising field.

In the Illecillewaet district the development of a number of excellent claims proceeds steadily, and much activity is predicted during the coming season. Want of a home market where the value of ores could at once be realized, the difficulty and expense incurred by shipments of ore over long distances, and the lack of the necessary capital required to open up new claims, have been the great drawbacks

against which the poor prospector has had to struggle in recent years. But the outlook is more encouraging. A smelter has lately been erected at Revelstoke by a wealthy syndicate, and although the sampling works only have as yet been in operation, the management are prepared to receive and pay cash for the value of all marketable ores. The erection of these works cannot fail to be productive of the most beneficial results, and will undoubtedly prove to be a most important factor in the mineral development of the district.

But little work was done by the Cottonwood Gold Mining Co. Early in the year an excellent trail was graded from Nelson to the mines—four miles. The machinery imported was, however, found to be very defective, the so-called expert proved incompetent, and operations were early suspended. It is reported that the management intend to introduce a better plant this year.

A large number of improvements have been made at the "Poorman Gold Mine" which passed into the hands of the present company in the spring, at a price, it is said, of \$35,000. A Pelton wheel, to run under a head of 250 feet has been set up, Eagle Creek supplying the water. A large number of buildings have been erected, an expenditure of \$30,000 being represented in the labor and plant provided. Mr. Nail, the manager, is wintering with a gang of men at the mine, and expects, with the running of his mine in the spring, to turn out more than enough gold to cover all the expenditure.

Much of the progress of the Kootenay Lake district is entirely due to the energy and enterprise of Dr. W. A. Hendryx, an American physician, who first became acquainted with the country and its rich mineral resources during a shooting excursion in the fall of 1884. Impressed with the district as a basis for investment, he formed the Kootenay Mining and Smelting Co., and started work on the "Blue Bell," a claim notorious in its connection with its former owner Sproule, who, it will be remembered, was hanged in Victoria for the murder of a miner working on an adjoining claim. Obtaining a charter from the Territory of Idaho, Dr. Hendryx put through a waggon road from Kootenay Station to Bonner's Ferry. Until the end of last season this was maintained as a toll road, but it has now been sold to the county. It is free of tolls and is to be rebuilt. The doctor put a small steamboat, the *Surprise*, upon the river, and a year or two later added the *Galena*, which latter boat was enlarged and equipped with new machinery last winter. These boats and the *Idaho*, built by a Mr. Foy, have carried in the miners and the freight, and all the ore from the mines.

Some months ago the Government Reduction Works in Cariboo were set in operation, but it is generally known that the results were not very satisfactory, inasmuch as by the processes adopted only some 60% of the gold contained in the rock operated upon was secured. In order to attain better results a chlorination plant was added, and was put to the test lately with results that have proved eminently successful. On 23rd instant the Minister of Mines received the following telegram from Mr. E. A. Martin, the Superintendent at Barkerville, "Chlorination perfect success. Five trials. About eight tons yielding over 90%."

Development work upon the "Blue Bell" has never ceased since it was acquired by this company. Tunnels have been run into the bluff from all sides, and everywhere the material in good paying quantity has been struck. A working tunnel has lately been run in from the water front, and an engine and drill, with a small force, are now at work there.

The Toad Mountain Silver Mines, operated by the Hall Co., are reported to have yielded gratifying results on the year's operations. This valuable property has, however, been involved in litigation, and it is to be feared that further trouble is ahead, as it has lately leaked out that a couple of gentlemen from Victoria have visited the ground and staked out and recorded claims on the property now operated by the Hall's, as the "Kootenay Bonanza" and "Silver King" mines.

Silver Exports from Port Arthur Mines, 1889.

The following are the official returns furnished the REVIEW for the year ended 31st December last:

Company Floating in London.

BY A CANADIAN

Standing in Rotten Row, watching the never-ending procession of costly equipages, a man remarked in a tone of soliloquy, "There's great wealth in London!"

A man in the "city" said, "I know a hundred and fifty Americans who are here trying to float companies."

These remarks illustrated the saying "Where-soever the carcass is there will the eagles be gathered together." Possibly some ardent student of prophecy will also see in the mention of the feathered emblem of America a prediction of the second statement.

Wealth and wealth seekers are natural associates, and the fame of the riches of London draws to it from all the world those who can offer inducements for the investment of money. All sorts and conditions of men are represented in this group,—the railway king, the finance minister, the miner, rancher, inventor, schemer, and those who agree with the Tichborne claimant when he remarked, in language not suggestive of an aristocratic education, "There's men that has money and no brains, and men that has brains and no money. Them that has money and no brains was made for them that has brains and no money."

The favorite mode of securing investment is through the formation of limited liability companies. Prior to the year 1856 persons who invested in a joint stock enterprise were ordinarily liable individually for the whole debts of the concern, and many people were ruined by investing merely small amounts in undertakings that became bankrupt. In that year the principle was introduced in England of limiting the liability of an investor to the amount subscribed by him, so that whatever the fortunes of the company he could not be called upon to pay anything beyond the sum he had promised. In 1862, and in subsequent years, this principle was embodied in the "Companies Acts," and the details for the formation and management of such companies were fully prescribed and regulated. In consequence of this legislation an immense impetus was given to investment in that direction, and the number of companies attempting to float every year in England is something enormous. In consequence, the promotion of companies has become an established business, the methods of which are peculiar and interesting. Many companies are formed privately; the capital is subscribed through personal solicitation and the only necessary legal measure is for seven persons to sign the memorandum and articles of association setting forth the nature and regulations of the business. These have to be registered at Somerset House in London, after which, if approved, letters of incorporation are issued.

But the great multitude of schemes do not get their capital so easily and cheaply. There are many variations in the methods, but some of the most common means of floating companies are as follows:

An American has a gold mine in Colorado that he wishes to sell for £50,000. He seeks a "Company Promoter" in London. No one has a sign hung out bearing that name, but the article is often to be found under the sign of "financial agent," "broker," "accountant," "solicitor," "attorney," or without any designation. The promoter takes the papers and studies them. If attractive he makes an exhaustive examination, and there are few sharper or keener men in the world. He looks to see if it is genuine, and if it would "take with the public," the latter being with some the chief consideration. If he decides that the scheme has merit and will "go," he visits several capitalists, who form a syndicate and agree to float the company and pay for the mine the amount asked, but paying as much of it as possible in shares. They increase the price of the mine from 25 to 100 per cent., the increase being to cover expenses and pay them a profit for "underwriting" the company. The needed working capital is added to the price of the mine, £75,000 for the mine, and £25,000 for working funds, making the total capital £100,000, which is divided into shares of £1 and upwards; £1, £2 or £5 being the most popular; and £10 being the most genteel.

Now a telling board of directors must be got. The promoter has a list of men and their prices, needy men of title and position, who for an "honorary" a yearly remuneration of £50 to £100 and a fee of a guinea for each meeting attended, are willing to lend their illustrious names and give the investors the benefit of their oversight of business experience. Such men are termed "guinea pigs," and many noble persons are enrolled in the list. A full-fledged duke may be had for an "honorary" of £1,000. A right hon. captain may accept £500, and a member of parliament may be had for £250. A weighty list of names, five or seven in

number having been secured, with eminent firms as bankers, brokers, auditors and solicitors, each of whom perhaps receives a substantial honorarium, a glowing prospectus is written and printed, and after a dozen revisions to see that it is within the bounds of the law and that every clause is calculated to impress the public, it is approved for circulation.

The syndicate do not propose to risk any cash, and the next step is to go to an advertising agent, who estimates the cost of printing and circulating 100,000 prospectuses and of advertising in all the leading papers of the United Kingdom. This being determined, he seeks a "syndicate" who will advance the money for expenses and take the risk of the company's "going into allotment." If the capital is not subscribed by the public this amount will be less, but if the company "floats" it will be repaid three or fourfold according to judgment of the risk taken. Occasionally the expenses of a company of great promise are advanced and insured for "two to one," but mines are seldom taken at less than "three to one," that is, for each thousand pounds advanced three thousand are paid.

All being arranged, the prospectus and forms of application for shares are printed. They are sent to an agent who employs perhaps 250 men working night and day addressing them. The lists of addresses are made up from the share lists of companies and are classified so that separate lists are kept of investors in mines, railways, manufactures and special branches of trade. Some agents claim their lists to have such value, owing to judicious selection, that they charge five per cent. upon the capital merely for addressing the prospectuses. The clergy are almost always included in the list as they have often a surplus from the salary to invest and are supposed to be less able to criticise than laymen.

The post office is notified to send its vans and the whole batch of prospectuses is posted on one evening, and the next morning every great daily paper has the prospectus in its advertising column, and a notice of the company in its money article. Thus the prospectus and the paper bring their joint message to the investor, and if he favors the scheme he signs the application and sends it with a deposit to the bankers of the company.

Now the trouble begins for the promoter. The papers that have not been favoured with the advertisement and the numerous weekly "financial" papers flock to the office with promises of favourable leading articles and ominous intimations of what will happen if the advertising is held from them. The editor of the *Christian Union* sends his compliments and proposes to make "special and favourable mention" of the company, enclosing the proof of a leading article elevated to fulsome adulation of the enterprise. The neglected papers at once prepare denunciations and exposures of "the great swindle," they bring proofs to the promoter in hopes of being bought off, and, if he is abduate, the abuse appears in the next issue, and the admiring public glory in the fearless courage of this standard of honesty that dares to expose wickedness.

Members of the stock Exchange go to the brokers' office and ask them, "Are you going to support the market?" If the answer is "No," they leave the matter to the mercy of the investing public; but if the answer is "Yes," they send in applications for shares and begin buying and selling them among themselves, running the price up to a premium. This attracts outsiders who buy for "a quick turn,"

and as soon as the shares are unloaded on these people the apparent demand ceases. The majority of the companies are subscribed for in this way by brokers and speculators who desire to gamble with the shares and make quick profits. The number who invest genuinely for the sake of future dividends is small. The business is so overdone that the daily receipt of prospectuses goes into the waste paper basket. One scheme that sent out a million prospectuses got no applications. But anything that seems likely to "go to a premium" is rushed after. Each applicant asks for five or ten times more than he wants, in order to be sure of an allotment of the number of shares desired. Thus the capital is subscribed for over and over again when perhaps there is hardly one genuine investor who means to let his money remain in the shares in hope of dividends. The shares are taken merely as gambling counters in the hope of selling them at a profit before they need to be paid for. A year or two ago in London a timber business that had some great names on its prospectus was subscribed for twenty times over; a dog biscuit company had also twenty times the desired applications; a company for boiling down dead horses was subscribed for ten times over; a cigarette company got five times its capital subscribed. The success of the timber concern made promoters think that the public were waking up from their lethargy. In the next week 34 new companies were registered, only some of which went to allotment and of these only two were fully subscribed for. People think all this capital sought investment, but the figures no more represent cash than do the aggregate transactions of the Chicago Produce Exchange. Shares are applied for as grain is bid for, merely to sell over again without passing money.

But we have left our ideal mining company on the first day of issue. If applications come in freely, announcements of the fact are put in the papers, and it is advertised that the lists will close in one, two or three days. This is expected to hurry up investors. If the shares have been sufficiently taken up to give enough capital to pull through with, the company sends out its letters of allotment and has "floated."

There are said to be more company wreckers than promoters in London, and these now have their innings. The wrecker goes to the office and demands the list of shareholders, offering the legal fee for the same. This is given through fear of a summons from the Lord Mayor if refusal is made. The "financial paper" containing the most abusive article is mailed to each shareholder with a letter from a lawyer stating that the affair is a swindle, and if entrusted with the case he will endeavor to recover the deposit money. Armed with appealing letters the wrecker, who may be the lawyer, enters the company's office, expresses regret that such bad reports have got out and that his clients are so alarmed. He expresses confidence in the enterprise and intimates that if £500 should be given to him to distribute among the frightened shareholders, he can "square them." If the concern is really bad, the £500 is paid; the wrecker pockets it, and writes to his clients that the company is sound, and they have been misinformed.

When a company is proposed, it is generally assumed that it is a scheme for plunder, and every one rushes for a portion. Thus the large figures on the prospectus are divided among a numerous crowd, and the envied vendor, who appears to be reaping a rich harvest, sometimes barely escapes with the coat on his back.

It makes a much better impression on the public if payment for the property to be sold is taken in shares instead of in cash, but as the shares are usually sold, it is the same thing to the vender, and he gets credit for confidence in the enterprise at no expense. In fact, many promoters prefer their claims to be paid in shares, as they expected to sell them at a premium.

A promoter whose scheme failed to float and was thoroughly exposed in the financial papers, soon after started another company. A friend said to him, "Do you think anything with your name on it would go, after this last failure." "Oh, that doesn't matter," said the promoter, "there's a new fool born every minute."

Although Carlyle said the people of England were "mostly fools," it is not the fools who mainly support these things. They have been again and again exposed in papers and magazines, and a wide distrust prevails. The popular sentiment is shown by one of the "gags" of the theatre; an actress wishes to describe a mendacious person and exclaims, "He is like the prospectus of a limited company." As has been remarked, the investments of this class are mainly supported by the speculators who only consider whether the shares will advance in the market, and pay a little head to the lasting merits of the enterprise.

There has been lately a great movement towards turning industrial enterprises, manufacturing businesses and trading concerns into limited companies. This is a good way of preserving a profitable business when its proprietor becomes incapacitated, and is in accord with the spirit of the age which favors co-operation and a wider distribution of profits. But, doubtless, many rotten concerns have by this means been unloaded upon the public.

One gets the impression while moving in financial circles in London that gambling has become a recognized business, and that any means taken to promote such a cause are legitimate. Pious, devout men are engaged in these schemes, and men who will not hesitate to "support the market" and bid up their own shares will refuse to advertise in a Sunday newspaper.

All this business clusters about the vicinity of the Royal Exchange, which bears the inscription on its portico, "The earth is the Lord's, and the fullness thereof."

Increasing Demand for Plumbago.—

Few articles which enter largely into mechanical processes have, of late years, received more extension of their use than has plumbago. Until comparatively recently its employment was mainly confined to the manufacture of crucibles, while outside of these the imports of it by the United Kingdom were principally devoted to the manufacture of inferior lead pencils, and of what was nominally termed blacklead compounds for domestic stove cleaning etc. But of late years other qualities have been discovered to be possessed by this mineral, which has largely widened the sphere of its employment. It is as a lubricant that its high qualifications are now generally admitted, and its use in that character has greatly tended to increase its use; so greatly so, indeed, that whereas some years back its price ruled so low as £7 10s. the ton, contracts for its supply are now made at £20 the ton on board ship at the ports of export.

Gold Milling in the Black Hills.

(H. O. Hoffman, Rapid City, Dakota.)

(Continued from December issue.)

Those that are still good (dies last six weeks) are returned to the mortar without further cleaning. After the dies have been taken out the remaining sand is shovelled out and piled up in a convenient place in the mill to be treated separately in the rocker and the pan (see later.) It is rich in amalgam and contains pieces of iron that have accumulated in the mortar. Any particles of amalgam that have adhered to the rough sides of the mortar are removed and added to the sands. The dies are now put in place again. If new shoes are required they are placed on top of the dies, with the wooden collar slipped over the shank. Then the recesses for the chuck-block, screen-frame, etc., are cleaned by directing a hose upon them, and these are put in place, the screens having first been cleaned in a wooden box with brush and water. When the chuck-block is in place, the sands first removed are shovelled in to fill the bottom of the mortar up to the top of the dies. The drop of the stamp has now to be regulated. If new shoes are used, the wooden block, 1 inch higher than the drop, is placed on the shoulder of the shoe and the stamp let down until the head rests on the block. If the shoe has not been replaced, the block stands upon the die. In both cases the keys of the tappets are loosened, these are allowed to fall on to the prop and are then keyed up again. The apron-plates are now dressed in the usual way. Any amalgam adhering to the small sluices, leading to the mercury-traps, and to the sluice-boxes is removed and these are brightened in the same manner as the apron-plate. When the engine has been started up, the stamps that have new shoes are first allowed to drop several times until the sound and the vibration, felt when touching the tappet, show that the shoe is thoroughly fastened to the head. The splash-boards are put back in place, some ore is fed into the mortar, the water is turned on and the stamps of one battery after another are let down from the props. Special care has to be taken by the feeders to regulate the ore supply, as the mortars are empty above the dies when the mill starts up.

In cleaning up a mill, all the hands have to take part, the night shift working six hours extra.

This detailed description of the clean up of a 120-stamp mill has been given, because it seemed important to show how it is possible to accomplish it in the short space of seven hours without requiring any outside help. When it is remembered that more than a day was formerly consumed in this work, it will be seen how admirably the operations are now systematized and worked one into another.

When the clean-up of the mill is over and the stamps are once more in operation, the sands that were shovelled out from the bottom of the mortar have to be worked up and the amalgam has to be cleaned, so as to be ready for the retort. Two crush-men are detailed to clean up the sands. These contain bits of iron that have come from the tools used in the mine or the crushing machinery of the mill, and also pieces of amalgam. The sands are first treated in a rocker. Any coarse pieces of iron are picked up and collected in a separate heap. When the sands have been rocked for a little while and the hose has been played on them, the residue on the hopper is broken as fine as possible with a wooden mallet. The products obtained by rocking are the coarse particles remaining

finally in the hopper. These are washed in a coarse screen over the clean-up pan, and any amalgam remaining on the screen is picked out and thrown into the pan. The sands go back to the battery. The heavy sands that collect on the curtain and riffle are taken up in a bucket to be worked in the pan. Those settling in the sluice which conducts the slimes to the waste flume are shovelled out and returned to the battery.

There remains the purifying of the amalgam collected from the chuck-blocks, apron-plates, sluices leading from the mercury traps, mortars, old shoes, dies and screens. It is charged with water into the clean-up pan (5 ft. in diameter, the muller making 30 revolutions per minute) and from 600 to 700 lbs. of quicksilver are added. It takes about three hours to clean in the pan all the by-products that contain any amalgam. When this is all collected and the water above it is somewhat clear, the muller is raised with block and tackle and the entire contents of the pan are emptied through the lowest discharge-opening into a square box which overflows into the tailings-discharge box. The muller and bottom of pan are cleaned with brush and water. The liquid amalgam in the first box is now freed from water and passed through a strainer. The resulting pasty amalgam is removed, and freed from the excess of quicksilver by wringing it in canvas bags in water. The balls of hard amalgam remaining in the bags contain about 38 per cent. of gold. The quicksilver collected beneath the strainer goes back to the main stock; that obtained by squeezing the pasty amalgam is first verified by adding some nitric acid, stirring it, and then washing it with water.

The clean-up on the fifteenth of the month is much simpler than that on the first, as only the chuck-blocks are taken out and the mortar is left intact, except, of course, when any break has occurred in shoe or die. On the fifteenth, however, the mercury-traps are cleaned. Their contents go simply into the pan and are worked with the rest of the products containing amalgam. This clean-up lasts five hours—that is, two hours less than the one on the first of the month.

The cleaning up of old iron and wood chips, which is done once a year, stills remains to be mentioned in this connection. The pieces of iron that are picked out from the sands in the bottom of the mortar are first scraped, to remove any amalgam adhering to them. They are then thrown out upon an enclosed heap in the yard and left there to be corroded by atmospheric action. The rusting is hastened by adding some salt to the heap at various times. Once a year, the iron that has entirely fallen to pieces is charged with quicksilver into the pan and its gold extracted. The chips of wood, which float on the top of the water in the battery and often clog the screens, are repeatedly removed and collected in a box in one of the window recesses. They are then emptied on a heap in the yard, and once a year are set on fire. The ashes are collected and amalgamated in the pan. In this way are saved every year from 16 to 18 pounds of amalgam from the two mills of the Homestake Company (200 stamps).

Retorting and Melting.—The quicksilver still retained by the hard amalgam is removed by retorting. Both bulb retorts and cylindrical ones are used. They are all of cast iron. The cylindrical retort of the Homestake Company is 12 in. in diameter and 3 ft. long, and holds about 1,000 lbs. of amalgam. The usual charge of 500 lbs. is retorted in about 6 hours with $\frac{1}{4}$ cord of wood. The loss of quicksilver is nominal.

The retort-metal amounts to 38 to 40 per cent. of the original charge. At the Caledonia mill it is only 33 per cent., less care being taken in cleaning the amalgam; and at the Deadwood-Terra mills it is often only 25 per cent., by reason of the fine condition of the gold, which requires more quicksilver to form amalgam.

The retort-metal is now melted into bars. At the Homestake mill, two kinds of moulds are used, the 1500-ounce silver mould, 5 by 5 by 11½ inches, and the 700-ounce mould, 3½ by 4 by 9½ inches. The bars are cast from 3 to 4 inches thick and weigh from 1000 to 1400 ounces. It takes about four hours to melt four 1400-ounce bars and the crucible lasts for from eight to twelve charges.

The loss in melting with Homestake retorted bullion is only 1.5 per cent. and the average composition of the bars is 820 gold, 165 silver, 15 base metal. The loss of the Caledonia bullion is greater (7 per cent.), as less care is taken in cleaning the amalgam. The average composition of its bullion is 798 gold, 182 silver and 20 base metal.

The bullion is sampled, weighed, assayed and shipped.

VII. WORKING-RESULTS

The Homestake and Golden Star mills together produced, according to the report of the Homestake Company, from June, 1887, to June, 1888, \$895,822.37 worth of gold from 243,355 tons of ore, which corresponds to a yield in free gold of \$3.68 per ton. It is claimed that 85 per cent. of the free gold is saved. According to this the ore would run in free gold \$4.33 per ton. The total value of the ore varies from \$5 to \$10 per ton; the amount of concentrates in the pan, is \$24 per ton, although judging from the average assay of the tailings, (\$1.50 per ton) a much higher figure would be expected.

Two sets of experiments were made in the spring of 1885 by Dr. R. Goering on the Homestake and Golden Star tailings, the first when the mills had no mercury-traps, the second after these were introduced. Up to that time there had been collected by means of blankets in a separate building (the blanket house) 1124 tons of concentrates which assayed \$35.16 per ton. These, panned down, gave 20.5 per cent cleaner concentrates, assaying \$40.18 per ton. When amalgamated in the pan they yield 55.9 per cent. of their total value, the remaining pure pyrites assaying \$17.08 per ton. This shows that the gold recovered must have been either enclosed in quartz or rusty, or that amalgam had been carried off with the tailings and was recovered by the blankets. When in consequence of these tests the mercury traps were introduced, the loss was reduced. The concentrates then saved assayed \$27.63 per ton. They gave up 92 per cent. of their gold in the pan, but the pure pyrites still assayed \$12.26 per ton, showing that while the loss had been diminished, it had not been stopped. The concentration of tailings by blankets, being too expensive, was given up.

From the other mills under the Homestake management no official reports are made public; therefore no data can be given. It may, however, be stated that the tailings from Highland ore average \$1 per ton, those from Deadwood-Terra ore \$0.50 per ton, and seldom exceed \$0.75. It would be interesting to find how small the amount of concentrates is and how high these would run.

One point still remains to be considered in regard to working-results, that is the fineness to which it is necessary to crush the ore. Dr. R. Goering made tests to find a relation between size and assay value of tailings. Samples were

taken hourly for a length of time and the sands obtained dried, weighed and screened through different sieves. The figures are given below:

TABLE VI.—*Reduction between Size and Assay-Value.*

Per cent in weight.	Passing through screens, No.	Remain-ing on screens, No.	Assay value per ton.
94.07	50	..	\$1.24
2.53	50	40	2.13
3.40	50	..	2.79

They show that the loss in the tailing increases rapidly, if the screens are allowed to remain too long in the mortar. This is still better shown by another series of experiments (December, 1888) on tailings, running \$2 per ton, that were screened through a No. 30 mesh sieve. Of these, 6 per cent., that did not pass through the screen, assayed as high as \$5.02 per ton. The result is, as has been said before, that the heavy Russian-iron slot screens have to be exchanged every fortnight.

The Caledonia mill crushed, from May, 1887, to May, 1888, 73,425 tons of rock and produced \$295,816.25 worth of bullion, equalling a yield of \$4.02 per ton in free gold. Figures corresponding to those given in the Homestake Company could not be obtained. It may, however, be stated that the blanket concentrates of the Caledonia, amalgamated raw in the pan, yield a product of pure pyrites, assaying \$90 to the ton, and that the tailings from the blankets, when panned, yield concentrates worth from \$7 to \$9 to the ton.

TABLE VII.—*Cost of Milling in 1887-88 at Homestake and Golden Star Mills.*

Items.	Homestake Mill. (96,790 tons treated.)		Golden Star Mill. (146,565 tons treated)	
	Amount expended.	Cost per ton.	Amount expended.	Cost per ton.
Labor.....	\$24,789 90	\$0.2561	\$31,338 60	\$0.2138
Supplies....	1,263 71	0.0130	1,149 65	0.0079
Water.....	16,731 37	0.1729	25,097 10	0.1712
Wood.....	26,773 50	0.2766	40,156 50	0.2739
Machinery..	8,924 06	0.0922	17,884 96	0.1220
Oil.....	1,052 69	0.0109	1,233 21	0.0084
Candles....	156 00	0.0016	214 50	0.0014
Quicksilver..	1,001 25	0.0103	3,701 05	0.0252
Lumber....	684 06	0.0070	799 16	0.0054
Total....	\$81,376 54	\$0.8406	\$121,574.73	\$0.8292

In comparing the cost of milling in the 80 and the 120-stamp mills, it seems strange that there should be so little difference. Special causes must have affected this year's work, for the cost per ton in 1880* was \$1.3018 and \$0.7770 respectively.

The cost of milling at the Caledonia mill for 1887-88 was \$8.87 per ton, ⅓ going to labor and ⅔ to material. This is a low figure, if we consider that the mill has only 60 stamps and that the ore treated is very hard in comparison with any Homestake rock.

VIII. CONCLUSIONS.

Two striking features are presented by the foregoing review; the simplicity and effectiveness of the methods by which the free gold is extracted; and the evident waste of sulphurets in the tailings. These sulphurets appear, according to the figures given above (3 per cent., assay-

ing \$24 per ton), to be quite rich enough to repay working.

A simple and cheap method of concentration, for the large quantities to be treated, would probably be as follows: The pulp, after passing over a series of spitzluten, which would sort out the coarse sands, would overflow into a series of spitzkasten, and the overflow of these would be waste. The coarse sands, sorted out by the spitzluten, would contain, according to experiments made in 1885 on the large heap of concentrates, free gold, which would be recovered by crushing them wet in rolls or a Chilian mill, allowing the pulp to flow over amalgamated plates, and then pass over a separate series of classifiers or else go back to the main system. The graded pulp, obtained by the different spitzkasten, would be separated on continuous round tables, into pure concentrates, middlings, and waste.

The middlings would be worked separately, or be pumped back to the main system of spitzkasten. The cost of concentrating the tailings would probably not exceed \$1 per ton of sulphurets.

The method of working these concentrates would be that of barrel-chlorination, using bleaching powder and sulphuric acid to generate the chlorine. In a paper read before the Institute at the Buffalo meeting, October, 1888, Prof. William B. Phillips says the cost of dead-roasting on a 12-ft. revolving hearth, at the Phoenix mines, North Carolina, is \$2.03 and \$2.18 per ton. A combination of two systems of furnaces would probably accomplish this dead-roasting at a proportionately cheaper rate at the mills, where wood is \$6 a cord and labor \$3 and \$3.50 a day. The Spense automatic desulphurizing roaster would do the preliminary roasting cheaply, and the revolving hearth would effectually dead-roast large quantities of ore, whose sulphur had been nearly all eliminated. Prof. Phillips further gives the cost of chlorinating at \$2.66 per ton of concentrates. This figure would have to be considerably increased for the Homestake and other mills. The total cost would probably be not over \$8 for the ton of concentrates.

In closing this paper, the writer desires to express his thanks to the management of the Homestake and Caledonia mills for their courtesy in allowing him the run of the works and to Dr. R. Goering for his valuable assistance in obtaining detailed information. Also to Messrs. R. Graham and Chas. Ruth, for their uniform kindness in answering questions.

This Company will sell its instruments at prices ranging from \$10 to \$25 per set. These instruments are under the protection of the Company's patents, and purchasers are therefore entirely free from risk of litigation.

This Company will arrange to connect places not having telegraphic facilities with the nearest telegraph office, or it will build private lines for firms or individuals, connecting their places of business or residences. It is also prepared to manufacture all kinds of electrical apparatus.

Full particulars can be obtained at the Company's offices at above, or at St. John, N.B., Halifax, N.S., Winnipeg, Man., Victoria, B.C.

*Tenth Census of the United States, vol. xiii., p. 280.

Florida Phosphates.

Mr. W. P. Frost, Savannah, Ga., sends us the following, which we have pleasure in reproducing:

As Florida phosphates seem to be exciting a great deal of interest all over the country among fertilizer manufacturers and dealers, more especially in Charleston, where it is, of course, a matter of vital importance, and as there seems to be a dearth of accurate and intelligent information on the subject, a few remarks by one who professes to be an expert on such subjects, and who spent a month in Florida this summer looking up this matter, may be interesting to your readers.

No geological survey has ever been made of Florida, it being regarded as a "sand bank and a coral reef," and for this reason the value of her phosphate and other mineral deposits have been overlooked. Now that the present boom has been inaugurated, however, we may look for the development of some very valuable finds, not only in phosphates, but in other minerals, such as natural cement, gypsum, etc.

Fossil bones and phosphates, mostly low grade, are found nearly over the entire State, but in too small quantities to work. As is naturally to be expected, the former being more recent than in South Carolina, remains are in a better state of preservation, and some few handsome specimens are to be found. In the Sub-Tropical Exposition at Jacksonville is to be seen a magnificent specimen of the skull of a mastodon, wonderfully well preserved and with tusks five or six feet long. Numerous valuable fossils have been sent to Washington. The fossil remains found consist principally of the ribs of the manatee or sea cow, which are also found, though not so abundantly, in South Carolina. It is a curious coincidence that all the phosphate deposits so far discovered are on the Gulf coast. Nothing has been found on the Atlantic side of the peninsula. On the South Atlantic shore, however, which is very undeveloped, a better acquaintance may result in something.

Beginning on the Gulf coast, then, in the extreme northwestern corner of the little spur that runs out from the peninsula proper, we find the Sopchoppy Phosphate Company organized, and working in a desultory way a deposit in Wakulla County. Following the trend of the coast southwards, we come to the Savannee River, at the shoulder of the peninsula proper, which has furnished most of the fossil remains found, and which is said to literally bristle with them.

Coming southwards, we next strike the Withlacoochee River, on whose banks, about eighteen miles from the Gulf, the great phosphate deposit of Florida, and perhaps of the world, has been discovered. The next deposit of phosphate we hear of is in the Alafia River, a small tributary of Hillsborough Bay, near Tampa. On the southern shore of the mouth of Tampa Bay, on Tenaceia Island, and on the adjacent mainland, we find phosphates, which are also reported a short distance away in the Manatee River. Running our finger further south along the map we enter Charlotte's harbor, at the head of which enters Peace River, and at another point the Myakka River, on both of which there are phosphate deposits, but more especially on the first.

Up to September last these included all the known deposits of phosphates in Florida, although there were indistinct rumors of a valuable find on the South Atlantic coast, which, however, does not seem to have materialized.

Any one who has followed this description, with a map before him, will see that the whole Gulf coast is a phosphate bed. Fortunately, however, for our Carolina phosphate magnates, the majority of these deposits are of little or no value. The Sopchoppy deposit consists principally of a low grade phosphatic sandstone, mixed with a considerable percentage of fossil bones, which bring up the average analysis to something like 40 per cent. of phosphate of lime. It is not regarded as very valuable, although it might pay to separate the bones, which analyse about 70 to 75 per cent.

The Suwannee River deposits are not extensive enough to be worked profitably and are interesting from a scientific and geological standpoint only.

The next deposits are situated on the Withlacoochee river, about eighteen miles from the Gulf, near Dunnellon, a small place on the Silver Springs, Ocala and Gulf Railroad, a branch of the Florida Central and Peninsular, or the old Florida Railway and Navigation Company, which runs from Fernandina as far south as Orlando, with numerous branches. The deposit is owned by the Dunnellon Phosphate Company (lately organized), of which Mr. Geo. F. Dunn, of Ocala, is the president and principal stockholder. They own, altogether, about thirteen thousand acres of land, which was all selected by a prospecting party, who had a chemist along with them, and who purchased only where they saw phosphate indications. The company is capitalized at a million and a quarter dollars, two hundred and fifty thousand dollars of stock being for sale.

In order to understand the formation of the deposit, it is necessary to state that considerable tracts in Florida are underlaid by solid beds of carbonate of lime, which is still in a soft state, a little harder and more crystalline than our marl. This begins at varying depths from the surface, (sometimes only one or two feet), and continues down to great depths. The surface indications of this deposit are large slabs of flint, which occur in veins in the carbonate, and are left on the surface after the latter has been dissolved away and soil formed in its place by the gradual process of nature. The formation of the Dunnellon phosphate beds corresponds exactly with this carbonate formation, which leads to the theory that they were probably formed by the leaching away of the carbonate and the gradual deposition of phosphate of lime in its place. The surface indications in this case are (usually) a hard, dense, stratified, white rock, which analyses as high as the equivalent of 75 to 80 per cent. of bone phosphate of lime, and will average about 70 per cent. This is disseminated through the surface soil in varying quantities, where it is found, but by no means constitutes the bulk or the most valuable part of the deposit. Beneath this, at depths varying from one to five or six feet, is found a material varying in color from pure white to a dark, creamy yellow, and having nearly the same consistency as our South Carolina marl. I myself have seen an angler bored down sixteen feet into this stuff without getting through it. To this depth it remained of the same mechanical consistency throughout, perfectly smooth and free from grit. In other words it was a solid bank of phosphate (16) feet thick, to my certain knowledge. How much thicker I do not know, but "Crackers," (*i. e.* natives,) who were ignorant men and did not know the value of the material, (as evidenced by the fact that their lands were being bought from them every day for a song,) testified that they had seen wells dug in

this material, before getting through it to a water-bearing strata, to a depth of sixty feet. I do not mean to say that this deposit covers the whole tract which the company owns. It occurs in pockets, and runs in ridges parallel to the old shore lines and to the Apalachian range—*i. e.*, northeasterly and southwesterly. From my limited knowledge of the deposit, however, and the fact that all the land was, as I say, carefully and intelligently selected, I should regard, as a safe and conservative estimate, that it occurs on one-fourth of the thirteen thousand acres. However, as I was only on the ground for one week, my opinion on this point may not be reliable. I have not seen an analysis of it which ran below 50 per cent. of phosphate of lime. Several made by myself and other chemists ran 60 to 65 per cent. The average would be probably 55 to 60. It contains a trace of carbonate—no fluorine—a very small percentage of sand, about half per cent. of potash, 40 per cent. of lime, and 10 to 15 per cent. of iron and alumina. This latter is very injurious, ordinarily causing the soluble phosphoric acid in the acid-treated material to revert, (which in England is a very serious matter,) and also preventing it from drying out, another very serious objection here and elsewhere. But from experience gained in treating several samples of this material with acid I have come to the following conclusions: First, that the acid-treated material will dry out, especially when made from the marly or clayey deposit, which combines with the acid with great avidity, soaking it up and getting very hot without getting liquid at all. This is with the sun-dried material, and using such proportions of acid and phosphate as are usually used with Carolina rock. The rock deposit does not dry out so well when treated with acid, and might not be profitably used, as it takes a long time to dry, and then sets into a hard mass. Second, neither does the large percentage of iron and alumina cause the soluble phosphoric acid to revert, as I have analyzed samples of the acid phosphate two months after it was made, which contained an unusual percentage of soluble as compared to reverted phosphoric acid. I can only account for these injurious constituents not acting in their usual way by supposing that the presence of so much lime counteracts their presence. Third, this material yields a larger per centage of "available" when treated with acid than Carolina rock does. One specimen of acid phosphate, made in the proportion of one thousand pounds of 50° B. acid to twelve hundred of the sun-dried marly deposit, and analyzed two months after it was made, yielded 17 per cent. of "available," (of which 14 per cent. was soluble,) with 2½ per cent. insoluble. Another sample by a similar formula yielded two days after it was made 18 per cent. of available, with 2 7-10 per cent. of insoluble.

The mining and preparation for market of this material would be a simple and inexpensive process, as it occurs exactly like a clay bank—a solid bed of soft material—which would simply have to be shovelled up and brought to the surface. It would then have to be dried either by the sun or artificially on the large scale, probably by means of steam-heated cylinders, such as are used in Chicago establishments to dry tankage, etc. This would finish its preparation as far as the miners are concerned. The final process, the grinding, would interest the manufacturer and might give ours some trouble at first, as, although the material is perfectly soft and friable and contains very few lumps, it is perfectly "dead" when struck, and

the fine particles have no "slickness" about them. For this reason it would probably clog a Lucop mill or buhr-stone unless it was very dry. However, simply passing the very dry stuff through rollers might be sufficient, as it is in such a fine state of subdivision naturally, and soaks up acid so readily. The principal difficulty in mining would be drainage, as a portion of the deposit is in very low land, and in going down to such depths it would be necessary to have steam pumps and conduits for the waste water to the river. Taking all this into consideration, however, it could be mined for a great deal less than Carolina rock, because in the first place when a cubic yard was thrown out, it would be a cubic yard of pure phosphate, whereas in Carolina this constitutes but a comparatively small percentage. Secondly, the actual cost of getting down to the material would be nothing like so great, as not one-hundredth part of the surface earth would have to be thrown off in proportion to the phosphate mined. The drainage would probably not be more than on some of our lands. The drying should not cost more. There would be no washing. And, lastly, the grinding and crushing, after we learned how to do it, would have to be very much less.

As to transportation facilities, it would probably have to be shipped to Fernandina, which is a deep water port, one hundred and eighty-two miles distant. Or it might be lightered down the Withlacoochee River to the Gulf, but as the whole Gulf coast is very shoaly it would probably only be practicable for sailing vessels to get up to the mouth.

Of the other deposits in Florida, that on the Alafia River is being worked by an Atlanta company. There seems to be some doubt about its value, however, and I suspect that it is in too small quantities. Those on Tenaceia Island and the adjacent mainland consist of low

grade sandstone and fossil bones, and are not in sufficient quantity to warrant mining.

The deposits around Charlotte's Harbor appear to be very valuable. Geo. W. Scott, of Atlanta, with whom are associated several New York parties, own between five and six thousand acres of selected phosphate land, which was bought for very little, before the presence of phosphates was suspected. The company has been involved in a law suit from its formation, and an injunction served on Mr. Scott by one of the partners has prevented any work being done. Now, however, the objectionable partner has lately been bought out for a round sum (considering that he only owned a one-sixth interest), and we may expect developments on an extensive scale very shortly. All the mining that has so far been done in this locality has been done by a man named Morehead, who only owns some two hundred acres in the centre of Col. Scott's tract. All of it has been shipped by rail to Atlanta, and used by the Geo. W. Scott Manufacturing Company, who, from all accounts, are well pleased with it. Some of it runs very high, and all that I have ever seen runs over 60 per cent. It resembles Carolina rock more than any Florida phosphate, perhaps, but is in very much smaller nodules, and has a considerable portion of fossil bone in it.

The deposits on the Myakka River do not seem to be so valuable as those on the Peace River. From all I can hear there seems to be some good land to be bought in this section, however; i.e., on the Peace and Myakka rivers and Charlotte's Harbor.

Air-Compressing Machinery at Collieries.—Mr. J. Morison points out the danger attending the use of light material oils for

lubricating air-compressing machinery. On February 13, 1888, he examined at Newbattle Colliery Dalkreith, the discharge pipes leading from an air-compressor to a receiver 50 feet away. The pipes were of cast iron, 6 inches inside diameter, and had flanged joints, the joints being made with india-rubber insertion screwed up between the flanges. The compressing cylinder was 24 inches in diameter by 4 feet stroke, and air was compressed up to 50 lbs. per square inch. The cylinder was fixed in a tank containing water, but no other method was used for cooling the air during compression. The temperature of the air leaving the compressor was found to vary between 320° and 375° F. when compressed up to 50 lbs. per square inch. The receiver was blown off daily. Some little time previously the pipes leading to the receiver appeared to be unusually hot, and soon two of the pipe joints between the cylinder and the receiver began to blow, while sparks were blowing with the air out of the joint, and the pipe was nearly red hot. On taking out the joints, they were found to be charred and burnt through, and the interior of the pipes was coated with a charred deposit, doubtless the residue of the combustion of lubricating oil which had been used in the cylinder. The oil ordinarily used was lard oil, but owing to a temporary want of this latter, for a short time previously use had been made of a mixture of heavy mineral oil (high flash-point) with an oil bought as colza. The supposed colza oil was chiefly made up of thickened cotton-seed oil and intermediate mineral; its specific gravity was 0.91, and it had a strong mineral bloom, and flashed at 295° F. The author compared the circumstances of the two cases, and concluded that the flash-point of all oil used in air-compressing machines should be tested, or a guarantee should be obtained from the maker.

CHEMICAL APPARATUS!

OF EVERY DESCRIPTION.

Glass, Porcelain, Stoneware, Platinum Crucibles of every sort, Analytical Scales and Weights, Fine Chemicals and Reagents, including Volumetric Solutions. Every requisite for Analysis or Experiment. For Sale by

LYMAN, SONS & CO.,
384 St. Paul St., Montreal.

Illustrated Catalogue mailed on receipt of 10c. or Business Card.

MONEY ORDERS.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion and Newfoundland; also in the United States, the United Kingdom, France, Germany, Austria, Hungary, Italy, Belgium, Switzerland, Portugal, Sweden, Norway, Denmark, the Netherlands, India, Japan, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4	2c.
Over \$4, not exceeding \$10	5c.

Vol. IX. FEBRUARY, 1890. No. 2.

Florida Phosphates.

Much excitement has been caused in the fertilizer world by the report of the discovery of large deposits of high grade phosphate in Florida. It has been known for a long time that there were deposits there somewhat similar in nature to the Carolina phosphates, but generally consisting of smaller sized nodules, and in some cases of lower quality. Dr. Penrose in his monograph on "The Nature and Origin of Deposits of Phosphate of Lime," which was published last year by the U. S. Geological Survey, gives the result of his personal examination of these beds, but describes them as being "either of too small extent or of too poor quality to pay for mining." He says, "the phosphate found here (in Alachua County, near the central part of the State) belongs to the subdivision of phosphatic conglomerates. The rock consists of small pebbles, from the size of a mustard seed to that of a pea, closely packed in a matrix of indurated calcareous marl." The pebbles averaged 85 per cent. of phosphate of lime, while the whole mass of the rock gave about 48 per cent.

In localities on the west coast of Florida, phosphate resembling that of Carolina was dredged from the rivers, and averaged about 55 per cent. in quality. None of these deposits were deemed to be of any particular commer-

cial value at present, and not much attention was paid to them. But in the spring of 1889 Mr. Albertus Vogt who lives near the village of Dunnellon, in boring for a well found fossil sharks teeth in a whitish soil, which when analyzed by a chemist, proved to be phosphate of lime of high quality. This soil, or soft rock, was found to extend in a more or less pockety belt over a district some 6 miles wide by 30 miles long, in a southeast and northwesterly direction. Matters were kept as quiet as possible and lands were bought up rapidly. Real estate soon achieved a veritable boom and speculators rushed in from all quarters. Mr. Vogt and his brother are said to have realized \$100,000 each in cash, besides controlling a great deal of land, and owning an interest in the Dunnellon Phosphate Co., which was organized in September last with a capital of \$1,250,000. The Bradleys, the well known Fertilizer Manufacturers of Boston, are said to hold 4,000 shares in the company, and Mr. Peter B. Bradley has been appointed general manager. The company owns 39,000 acres of land.

A writer in the *Engineering and Mining Journal* gives the following account, which is confirmed by Mr. Frost, of Charleston: "In the last fall some progressive orange grower in the vicinity of Ocala, with a little more curiosity than his neighbors, sent to a chemist a sample of white subsoil that occurred in his grove, and with which everybody in that section had been familiar, supposing it to be only limestone, for it had been found in every well in the neighborhood. The chemist reported that it was 80 per cent. phosphate of lime. The secret got out and then the excitement began. In the area covering Citrus, Marion and Hernando Counties it seems that almost anywhere a pit or augur will reveal phosphate."

The chief deposits are found on the banks of the Withlacooche River, about 18 miles from the Gulf of Mexico. The phosphate occurs in pockets, which sometimes extend over several areas in width. It lies in beds varying from two to sixteen feet in depth as definitely proved, and much greater depths are asserted. It is of a soft nature and can be dug by hand or by excavators, and varies in color from a dazzling white (when dried) to a cream color. Analyses of different samples range from 40 to 86 per cent. of phosphate of lime. The bed varies in quality at depths, but the average would probably be 60 to 70 per cent.

A company has also been formed at Peace River to work similar deposits, and other corporations will doubtless come into existence. But as far as we can learn there is no immediate prospect of any considerable output of phosphate. Offers to buy cargoes are refused with the response that they cannot be supplied at present, and the whole interest seems to be concentrated upon efforts to sell lands, as is not uncommon in the case of mineral discoveries, there being always a benevolent disposition to allow others

to reap the benefit of the results of actual mining. An English prospectus issued last year naively remarked that the great profit in mining ventures was usually obtained, not by the original owner nor the final purchaser, but by the middle man, and the company proposed to occupy that position. The same feeling seems to animate the investors in Florida, and it does not seem probable than any output will be produced this year sufficient to disturb the markets, which have been very firm in view of an apparent scarcity of phosphatic supplies. The news of these discoveries has caused buyers to hold off, and there has been a decline of a penny in the English market, but if shipments are not made the price will be apt to recover.

Another drawback to the success of these deposits is the uncertainty of quality. It appears to constantly vary in richness, and chemists report that it is impossible to judge of its quality by the eye. It is therefore likely to prove of a lower average by the cargo than single tests may give.

But even if the deposits are all that the land boomers claim, the growing use of fertilizers will soon absorb the surplus, and we can be sure that there will continue a demand for phosphate, and especially for the richest of them all—Canadian apatite.

The Geological Maps of Nova Scotia.

In our November issue we took occasion to comment on the rumour that the Geological Survey would issue its geological map of Nova Scotia upon a reduced scale of four miles to the inch, and we were emphatic in pointing out that such a step would be a great mistake, and was extremely undesirable to those engaged in the extensive mineral developments of that most important mining country. Our remarks appear to have borne fruit, for the subject was recently brought before the Minister of Interior in the following petition presented by the Nova Scotia members of Parliament:—

The Memorial of the undersigned members of the House of Commons, from the Province of Nova Scotia, respectfully sheweth:

That the Geological Survey maps of the Island of Cape Breton, and of parts of the counties of Antigonish, Guysboro and Pictou in the Province of Nova Scotia, have been published on a scale of one mile to the inch.

That, the further surveys made on the mainland of Nova Scotia, have been prepared and plotted on the same scale.

That we regret to learn it is proposed to "reduce" the plans to one fourth the former size, and publish the maps on a scale of only four miles to one inch.

That in the opinion of experienced men most deeply interested in the development of the mineral fields of Nova Scotia, the maps if published on the smaller scale will be so crowded as to render them almost valueless to the public for practical purposes.

That a due regard for the public convenience requires the Geological Survey for the whole province to be published on a uniform scale.

That, as the maps yet to be issued cover the most interesting districts on the mainland of Nova Scotia, embracing the coal, iron and gold mines, it is desirable in the public interest that they be published on a large scale, with clear outlines and affording the fullest information practicable. Any other course adopted will be deeply disappointing—particularly to mining men in Nova Scotia.

That the cost of publication, if that is a material obstacle, may be reduced by a cheaper process of printing, which will serve the purpose, and the cost of "reducing" the office plans can (in part) be saved—but it is submitted that in this matter practical utility and public convenience should be the chief considerations.

We therefore most strenuously protest against the proposed change in the publication of the Geological Survey maps for the Province of Nova Scotia, and respectfully urge that a sufficient appropriation be provided to continue the issue of the Nova Scotia maps on the present scale of one mile to the inch.

It appears that out of \$102,479, voted annually by Parliament for the Geological Survey, about \$5,000 have been spent every year since 1882 on surveys and explorations in eastern Nova Scotia, but that no maps and only one report, which cost \$1,335, have been published. There would perhaps be required \$6,000 to print maps of the country surveyed in these eight years, on the scale and in the manner adopted for those of Cape Breton, and the annual expenditure of \$1,025 would then be sufficient to continue the publication of maps and reports. The industrial importance of the district, which contains valuable mines of gold, coal, iron and copper, has made such close investigations expedient inasmuch that maps drawn on a scale of one mile to an inch show greater minuteness of detail than most of those published recently by the Geological Survey on four or eight miles; their value, consequently, would be greatly impaired by the errors, omissions, and crowding of lines and names unavoidable in reducing them to such scales.

Asbestos; a Review of this Important Industry in Canada.

There is probably no mining interest in Canada that has shown such marked progress, or that gives such promise of profitable and constant returns as that of the peculiar mineral asbestos. Although of comparatively recent date the many uses to which its manufacture has been applied, have increased so rapidly that it is with difficulty that the production can keep pace with the present demand, although the output from the Canadian mines has increased one hundredfold in the last ten years. The word is derived from the Greek, *Asbestos*, signifying incombustible or unquenchable, and this property was known to the Ancients many hundred years ago. The term asbestos is, at the present day, applied to minerals which differ very considerably in their mode of occurrence and composition. That which was first known as the asbestos of the Ancients is a variety of the hornblende family, and allied to tremolite, actinolite, etc. It consists of fine, somewhat elastic fibres, varying in color from almost pure white to greyish and greenish tints, and in length at times nearly or quite two feet, with a soft silky aspect, looking very much, in fine specimens, like floss silk itself. In the flame of the blow-pipe, the mineral is but little acted upon, although after being exposed for some time to long continued heat the fibre loses tenacity, and becomes brittle or even sandy to the touch. It can be spun like cotton and woven

into cloth, and can be manufactured into a great variety of substances such as fire proof curtains, wallpaper, suits of clothing, millboard, rope and steam packing of various kinds. It is of special value for the last purpose, owing to its entire non-conductivity of heat and indestructibility when in the case of the severe work it has to stand in connection with marine and other engines, it is exposed to long and constant wear; in this respect far exceeding any material heretofore employed for this purpose. It has however been found of almost too slight consistency to possess great value for textile purposes by itself, but this has been overcome by combining the spun fibres of the mineral with threads of cotton or flax, and in the museum of the CANADIAN MINING REVIEW can now be seen a complete suit of clothing from helmet to shoes such as is supplied to the firemen of Paris and other cities on the continent, dressed in which a man can walk with almost absolute impunity into the hottest flame. The face in this case is protected by a very fine wire gauze, which enables the wearer to see dimly and to respire as well as the dense atmosphere which he has to penetrate will permit. For this very unique outfit of asbestos manufacture we are greatly indebted to the kindness of Mr. Ed. Wertheim, of the American Asbestos Co. (Limited), now successfully operating mines of the mineral in Black Lake district. The suit was made at Mr. Wertheim's extensive factories at Frankfort, Germany, and is well worthy of the attention of our civic authorities, who may be interested in the better protection of our firemen. Besides the true asbestos of commerce, other varieties known as mountain cork, mountain leather, and mountain wood are met with, but these have not yet been found adapted for use in the arts or manufactures, or at least not to any very great extent.

The mineral which is produced in Canada at the present day under the head of asbestos, is in reality not asbestos proper, but a form of serpentine called chrysotile. This occurs in veins in certain portions of the great belt of serpentine rocks of the Eastern Townships of Quebec, though in the serpentines of the Laurentian also this mineral is sometimes found in small veins, but not as yet in quantity to be economically available, though possibly subsequent exploration in this direction may disclose workable deposits there as well. In the Laurentian rocks of certain area, however, the variety actinolite sometimes forms hilly masses of considerable size, which has been mined for some years, and while not as yet found to be suited for the manufacture of millboard, and the finer qualities of steam packing, answers admirably for cements, paints, etc., in the same way as the tremolite of the State of New York; these deposits of actinolite are therefore highly important, and will without doubt increase rapidly in value.

Although of such recent date, the Eastern Townships asbestos, for the name may as well

be retained, has now a world-wide reputation, and is shipped in large quantities to the various countries in Europe, England, Italy, Germany and Belgium, and to the United States also, and of the many firms now engaged in its manufacture, the greater portion draw the bulk of their raw material from a small area in Eastern Quebec; the Italian mines, from which the asbestos was formerly obtained being worked with far greater difficulty than those in Canada, while the supply of the mineral is much more uncertain, and although for certain special lines the Italian may be more valuable than the Canadian, the latter has been found of sufficient value for most purposes so as to almost entirely supplant the former, even with those firms who control the output of the Italian mineral, a fact evidenced by the late purchase of a Canadian property by the United Asbestos Co., of London, England.

Although asbestos was known at many points in Eastern Quebec more than thirty years ago, and was exhibited at the International Exhibition in London in 1862, no attempt was made to work the mineral for some years. The credit of the discovery of the Thetford area is probably due to a French-Canadian named Fecteau, and following upon his discovery certain areas were secured from the Government by private parties. The true value of the mineral was not at first recognized, and in the first year of mining operations, (1878) only 50 tons were taken out, for which a ready sale was not at first obtained. The importance of the discovery was however speedily ascertained, and new companies obtained tracts of rocky land in the townships of Thetford and Coleraine, and began the work of exploration and mining. Had the Government of Quebec at that day been in possession of the requisite information regarding its mineral lands, it is very probable that the thousands of acres which rapidly changed hands in that section of the province, would have brought in much greater returns than the usual Government rate. Curiously enough, however, though the areas of the serpentine in the townships of Thetford, Coleraine, Ireland and Wolfestown are very extensive, the portions in which the mineral asbestos is found are comparatively rare and the mining though now prosecuted for nearly a dozen years, is practically confined to two small sections about four miles apart. The first, and as yet the most important of these, is the small mound near the Thetford station on the Q. C. railway, which rises about 80 to 90 feet above the track; the other, the bold ridge of brownish looking rock to the southeast of Black Lake station, which assumes much greater prominence, and probably has an elevation of 650 to 700 feet above the railway at this point. It must, however, be said in regard to some of the areas of serpentine that lack of sufficient exposures, owing to soil and forest growth, prevents in many cases, a careful search, but in other portions where the

bare rock is well exposed as on the great ridge of Ireland and Wolfestown, as well as much of that towards Lakes Caribou and Little St. Francis, much of the rock has a hard reddish-brown weathered surface which does not promise favorable results to the prospector, who from a comparatively brief experience can very generally decide, with a fair amount of assurance, whether certain areas are likely to prove of value or not as a source of supply for asbestos.

The growth of the industry can be seen at a glance by comparing the output of 50 tons in 1878 with that of nearly 6,000 tons in 1889, a total which would have been further increased, presumably by some 500 tons at least, had the pits of the Scottish Canadian Company at Black Lake been in operation. The importance of this industry to the Province of Quebec may be inferred from the fact that this amount represents a cash value at the mines of about \$450,000, and the industry has now risen to such proportions that hundreds of thousands of dollars of capital are now seeking investment wherever an opportunity of successful operation is presented. Caution, however, on the part of those desiring to invest is advisable at present. The productive areas of the present asbestos district are very well known to those interested in the industry, and the really valuable areas now in the market can easily be counted on the fingers of one hand.

The methods of working are being radically changed. The old system of hand labor and horse derricks which have prevailed for years, and which in the face of a limited demand answered well enough so long as the depth and extent of the quarries were small, have now become entirely impracticable in the face of large pits and the urgent necessity for large production. Steam derricks, drills, and the most improved labor-saving appliances are now being rapidly introduced. All the new companies are putting in plant of the most approved pattern, with the result of much greater economy in labor and greater capacity of output, which in this case also means largely increased profit. Further improvements are, however, urgently called for, and that very speedily, if the mining of asbestos is to be carried on at the maximum of profit. Some simple appliances by which the mineral, especially the shorter and poorer grades, can be separated without the tedious process of cobbing by hand, should be the earnest study of all interested in the business of mining, and what is at present of quite as much importance, especially in the case of those companies who have been at work for some years, is the necessity of getting rid of the huge and unsightly dumps which now cumber the good ground and limit very seriously the extension of operations as well as the profitable working of some of the pits now carried on.

There is no doubt that in the case of the Thetford mines these dumps cover some very rich ground, and the same remarks apply also

to certain areas at Black Lake. The mining of asbestos at either place has not been of a highly scientific character, and during the visit of the American Institute of Mining Engineers to this section last October, many remarks of this character and as to the desirability of placing these mines on some more desirable basis for future successful operations were expressed. In particular the bad management of the dumping ground was commented on. The removal of these, however, should not, if properly undertaken, be attended with any serious loss, and might even possibly be conducted with profit. It is well known that in the early years of the industry the separation of the smaller veins was not closely attended to. Large veins were plenty, and cheap and speedy extraction was a necessity, consequently much very fine fibre went into the lower part of these unsightly heaps of what is regarded as refuse. In fact even in the newest portions of these dumps, veins of asbestos ranging from half to three-quarters of an inch can be frequently seen, all of which should repay extraction if suitable machinery were employed. While in the present condition of most of the pits, veins of asbestos of large size, ranging from one to three or more inches, are common, the uncertain nature of the mineral is such that in view of the investment of hundreds of thousands of dollars at which many of these properties are now held, when any are placed in the market, the great desirability of testing the rocks at lower levels by some cheap but satisfactory method should be apparent to all interested, and not only so but on the part of an investor is almost a necessity. To the company investing many thousands of dollars in an asbestos property to-day, the chances for successful working, or of getting back their own with profit, depend very largely upon the continuation downward for a considerable depth of profitable veins; for while in the case of a property, acquired at Government rates of \$1 per acre, the capital upon which dividends must be paid is very small, the case is very greatly reversed when a price of \$1,000 to \$3,000 per acre is demanded, and the cost of a plant sufficient to put such a property on a satisfactory working basis is added. This means a very different method of conducting mining operations, and a constant and sure source of supply for some years to come at least is a first requisite. The advisability of thus testing the lower portion of the serpentine has been pointed out in the reports of the Geological Survey, and the use of the diamond drill by which cores could be readily obtained at a very cheap rate from a number of holes, bored at different angles, advocated. The cost of boring such holes to a depth say of 150 to 200 feet should, when the machine is on the ground, not exceed fifty cents per foot, and should veins of asbestos reticulate through the rocks as plentifully at such depths as are now seen

at the surface, their presence would, without doubt, be recognized in some of the holes.

As regards the present status of the industry, there are at present engaged in mining at Thetford no less than six companies, two new ones having commenced operations during the past season, viz., Messrs. Lucke and Mitchell, of Sherbrooke, and A. H. Murphy & Co., of Montreal. The low lying area between the railway and the Thetford River has been proved to some extent by different parties, and while promising veins have been found at several points, these do not appear so numerous or so important as regards size and quality as those in the knoll at Thetford station. These areas should be thoroughly tested and their value ascertained before dumping grounds are located there, which may require to be removed again before long, since it is very possible that large and important veins may be concealed. On the property of Lucke & Mitchell several veins of very fine fibre, in thickness up to nearly two inches, are found in a portion of the low lying area, so that care is necessary in laying out the work for the future.

At Black Lake several new companies have taken up areas and commenced development work, preparatory to mining during the coming season. These are for the most part located contiguous to the line of the Quebec Central railway to the southwest of the present workings, and adjoining the mine of the Anglo-Canadian Co. Among these new companies are the St. Julie Mining Co., the Black Lake Mining Co., and the Laurier Mining Co., but in none of these has the development reached such a point as to enable one to pronounce definitely upon the success of the several undertakings. The works of the American Asbestos Co., on the high ridge southeast of the Black Lake station are, however, worthy of mention for the amount of work done during the past season, and for the energy and system displayed, as well as for the good results already obtained. This mine is at the highest elevation of any at present worked. The plant is excellent, and the quality of much of the fibre very good, a fair proportion ranking No. 1. New workings of the Anglo-Canadian in the face of the high hill which is about 350 to 400 feet above the railway at this point also show excellent veins of asbestos, while in the pits of the United Asbestos Co., which has lately acquired the property known as the Frechette-Dauville mine and which is intermediate in position between the Scottish and the Anglo-Canadian mines, some very fine "cotton" is obtained, the percentage of firsts from this pit during the past season probably amounting to over forty per cent. This mine is now being thoroughly equipped with steam derricks, compressors, drills, etc., by the Jenckes Machine Co. of Sherbrooke, who have lately made a specialty of mining machinery.

To the north-west of the Coleraine station, adjoining the area of Fenwick and Sclater, opera-

tions have been commenced during the past season by W. H. Lambly & Co., of Inverness. Near the crest of the hill in which this mine is situated several very good veins are seen, but work has not sufficiently developed the property to ascertain the value of the lower cuttings. As in the case of the copper industry some years ago, an asbestos boom will doubtless set in, and some of the many properties placed upon the market will furnish very poor returns to the investors. All is not gold that glitters, and all serpentine is not asbestos bearing. The folly of placing at greatly inflated prices, properties comparatively undeveloped, should be avoided in the interests of legitimate mining. While from certain standpoints the prospective profits of asbestos mining may seem very large, the actual returns are not in all cases commensurate with the expectations. The figures quoted of prospective output and profit in several of the prospectuses which have lately appeared, can never be realized, since these figures are, to a large extent, based upon an exaggerated output of first quality, chimerical ideas which in the case of the properties mentioned can never be realized either for quality of fibre or quantity of production; and it should be the endeavour of every one engaged in legitimate mining to discourage any attempts that may be made to flood the market with undeveloped and sometimes unprofitable areas, at figures which even the most profitable mines at the present time would scarcely warrant. The profits from asbestos mining must very largely be obtained from the output of "firsts" and "seconds." There cannot at present prices be any great margin in "thirds," and still less on "waste," and as the percentage of "thirds" from some of the mines is nearly equivalent to half the output, the source from which profitable returns can be reasonably looked for is largely reduced. These proportions can readily be seen from the figures quoted in the last issue of the Geological Survey, where the percentages of the different grades for the several localities are stated, as also in an excellent paper by Dr. Ellis on the mining industries of Eastern Quebec, read before the Ottawa Meeting of the American Institute of Mining Engineers, and reproduced in another portion of this issue.

Notable Prosperity of Port Arthur Mines.—In his address to the Board of Trades Mr. Thomas Marks, the president, dealt at considerable length upon the rapid growth and development of the mines in the vicinity of Port Arthur, indicating the prosperity of the mines in the following terms:—The Port Arthur silver district continues to be prominent, and never in the history of silver mining here have matters looked so prosperous. Large shipments of ore have been made all through the season, new mines are being worked and prospects developed, and altogether, affairs in the Port Arthur silver district are bright and business like. The recent dividend at the Badger of ten per cent on the total capital stock of \$250,000, after having returned to the proprietors all the money invested by them in mining, machinery, purchase of lands, &c., some \$200,000; the rise in Shuniah Weachu stock, the development at the Beaver, the rich ore body struck at the Elgin, the showing at the West End, one and all point to the eventual value to the district and our people of the silver mines.

Quebec Crown Lands; Gross Misrepresentation of the Output of Quebec Mines.

In his Annual Report, recently issued, the Commissioner of Crown Lands for the Province of Quebec announces that the revenue from the sale of Crown lands during the past year has been \$58,818.94, of which \$4,997.50 was realized from mining lands. The foregoing figures, he says, "show that the Province is making progress, and that our sources of revenue are being developed in a satisfactory manner." Quite so; but unfortunately it is progress towards the time when the revenue will decline from the exhaustion of the forest, and the depletion of rich areas of mineral wealth which, under a just and equitable system of mining laws, ought to be yielding a large and increasing yearly income to the Provincial Treasury. Again, we are informed that "the fees on permits, etc., granted to persons interested in mining amounted to \$124, and the expenses to \$3,229.27." We have been told that the Government has under consideration a revision of its effete system of mining laws; surely it is full time when such an absurdity as this appears from year to year in its Blue Book. Appended to the report is a statement of the work done by the Mining Service for the year, in which some statistics of the production of the Quebec mines form a prominent and attractive feature—we say attractive, for any one conversant with these industries cannot fail to be impressed with striking instances of their glaring inaccuracy. Here, for instance, are a few of the discrepancies:—

PHOSPHATE.

QUEBEC MINES, 1889.	Mr. Obalski's Fanciful Figures.	The Actual Shipments.	The REVIEW's Authority for its Returns.
Name of Company or Mine.			
	Tons.	Tons.	
Ottawa Phosphate Co.	3,500	1,300	Lomer, Rohr & Co.
Canadian Phosphate Co.	7,300	6,040	Millar & Co.
Central Lake Mining Co.	1,000	210	Lomer, Rohr & Co.
Phosphate of Lime Co.	6,500	6,886	Wilson & Green.
Dominion Phosphate Co.	6,000	8,350	Lomer, Rohr & Co.
Little Rapids	500	<i>Nil</i> ; no shipping done.	W. A. Allan.
Blackburn Mine.	1,500	800	Lomer, Rohr & Co.
Jackson Rae.	200	<i>Nil</i> .	do
Chapleau Lot.	Not mentioned.	125	do
Grier Lots (East Templeton)	do	100	do
Chas. Lionais & Co.	150	170	do
Bassin du Lièvre Mining and Milling Co.	1,700	Did not raise a pound.*

* "These 1,700 tons," write Messrs. Lomer, Rohr & Co., "are certainly incorrect, as this company did not raise any phosphate during 1889. They ground for the Canadian Phosphate Co., the Ottawa Phosphate Co., as well as for ourselves, all of which has been included under the shipments of the different companies."

ASBESTOS.

Thetford District.	3,850	4,803	Quebec Central Ry. Returns.

INDIVIDUAL INACCURACIES.

American Asbestos Co.	380	530	American Asbestos Co.
United Asbestos Co. (formerly Frechette)	330	379¾	Mr. Frechette.

COPPER.

QUEBEC MINES, 1889.	Mr. Obalski's Fanciful Figures.	The Actual Production.	The REVIEW's Authority for its Returns.
Name of Company or Mine.			
Eustis Mining Co. (Including 1,700 matte.)	Tons, 33,000	Tons. 34,089 (Inc. 1,773 matte.)	Eustis Mining Co.
G. H. Nichols & Co.	35,000	36,000	G. H. Nichols & Co.
Cillis and Moulton	2,000	No shipm'ts; 2,000 tons raised, est'd	Dr. Ells.
Memphremagog Mining Co.	900	800	Mining Bureau, Geol. Sur. Can
Excelsior Copper Co.	255	255	Quebec Central Ry. Returns.

FELSPAR.

Villeneuve Mica and Mining Co.	250	411	Canadian Pacific Ry.
-------------------------------------	-----	-----	----------------------

IRON.

Bristol Iron Co.	Not mentioned.	2,650 Shipd. Nov. & Dec.	Bristol Iron Co.
-----------------------	----------------	-----------------------------	------------------

Differences in other returns are also apparent; but we think these figures are sufficient to show that absolutely no reliance can be placed on Mr. Obalski's statistics. Mr. Obalski states that these estimates are very approximately made; this is just what we object to. The accurate returns of the shipments of phosphates, asbestos, copper and the other minerals are accessible at the end of the year, and can readily be obtained if the information is sought from the proper quarters. There can, therefore, be no excuse for discrepancies like these in statistics bearing the impress of Government authority; they are misleading to the public, and do great injustice to the mines and the very promising industry which they represent.

A Lesson from the Toronto Fire.

If the destruction of the University of Toronto, deplorable as we all must feel it to be, will only impress upon Parliament the very urgent necessity there is of better protection from a similar and what would be a more serious disaster to our Geological and Natural History Survey Museum and offices, it will not have been an unmixed evil. As we have repeatedly pointed out in these columns, the present incommensurate structure is utterly inadequate to the wants and uses of the institution, and adjacent as it is, to a number of rickety old fashioned buildings, it has absolutely no protection against destruction by fire. At present it holds the most precious collection of minerals, fossils, and botanical specimens contained in any one building on the American continent. The loss of such a valuable collection would be irreparable. In a monetary sense they represent more than a million of dollars. Surely these are worthy of a better fate? If, instead of indulging in jealous intrigues and internal bickerings over family troubles, the members of the staff would unite in pressing the urgency of this matter with half as much energy and zeal as they have lately displayed in pulling the political wires for purely personal ends, something definite might be done to avert a public calamity, which may occur at any time under existing circumstances. Now that Parliament is in session it is both right and proper that the facts should be placed before the representatives of the people, and that they should be asked to assist the Government by their support, in projecting the erection of such a structure as would place Canada abreast of the other nations of the civilized world in the march of improvement.

Imports of Coal, by Water, at the Ports of Montreal, Sorel, Three Rivers and Quebec, for the Years 1888 and 1889.

Rumored Discovery of Coal North of Lake Superior.

Late Port Arthur papers are full of accounts of supposed discoveries of coal said to have been made in the country north of Lake Superior. From time to time similar discoveries have been alleged to have been made in various parts of the Provinces of Ontario and Quebec in localities where it would be almost impossible for coal to occur, if there is any truth in the conclusions of geologists. On looking into the question and reading what is said in the reports of the Geological Survey as to the rocks of the region referred to, we have come to the conclusion that while nothing is impossible, it is *exceedingly improbable* that coal of any kind exists in the region to the north and northwest of Lake Superior. Dr. Bell in his report for 1877, describes beds of lignite in the drift along the Missinaibi River far to the northeast; but in his report for 1886 the same gentleman gives reasons why true coal need not be looked for in the great region westward of James Bay, including the country in question. No coal has been found in any part of the world in rocks of such ancient date as those which occupy the whole country to the north and west of Lake Superior or until we come to the plains; and Dr. Bell shows that the evidence of the drift is all against the chances of finding coal anywhere to the northeast. The Geological work bearing on this problem having been done already by the Dominion Survey, we do not see that anything is to be gained by the proposal to ask for \$1,000 from the Government of Ontario and the same amount from that of the Dominion. The ignorance of the results already arrived at by our own Survey appears to be at the bottom of much misunderstanding which might be obviated if the Reports of the Survey, or rather a summary of them, were better disseminated. Cases of this kind show the necessity of finding better means of diffusing among the public the valuable information already acquired at the public expense.

The Economic Geology of Ontario.

Although the Report of the Royal Commission appointed to enquire into the mineral resources of Ontario is not yet ready for distribution, we have been favoured with a glance at the advance sheets of that portion of it which has special reference to the economic geology of the Province. Dr. Bell has evidently done his work in a painstaking and highly creditable manner, and has succeeded in condensing into some fifty pages, not only an interesting, but a scientifically accurate description of what is known of the geology of this section of the country up to the present time. The first part of his report defines the proper meanings of some of the commoner geological terms which are often too loosely used, and explains the origin of the

proper names in Canadian geology. An outline is then given of the various rock systems and formations of Ontario, and each is described in the light of the most recent investigations. These divisions are described in their chronological order. The origin of the various Laurentian rocks and the true position and relations of the Huronian system are clearly stated. After the general description of the Huronian the leading facts are given as to iron, copper, nickel, silver, gold zinc, antimony and other ores in this pre-eminently metalliferous formation. The Animikie, or silver-bearing formation of Lake Superior is described in an interesting and intelligible manner, and all dates of discovery, workings, etc., are accurately stated, Dr. Bell having been personally familiar with these. The various unaltered formations with their accompanying economic substances, such as salt, gypsum, petroleum, natural gas, etc., are described in their proper order. Dr. Bell is a specialist in surface geology, and devotes a few pages to a graphic summary of this branch of geology as far as it refers to the Province of Ontario. A few pages are added in regard to the copper, nickel and gold mines of the Sudbury district, so as to bring the subject up to the end of 1889. Taking it in its widest sense we do not remember to have read any geological report which, for the number of pages, has proved so interesting and satisfactory. We understand that the complete Report of the Commission, which, as we have said before, has been far too long delayed, is to be submitted to the Local Legislature during the present session.

Importation of Mining Machinery.

In the House of Commons on the 31st inst.

Mr. Lister asked whether the Government has allowed any machinery used in the copper or nickel mines at Sudbury to be imported free of duty, or to be used in bond? Has the importation into Canada of any mining machinery been permitted without the payment of duty during the past five years?

Mr. Bowell—Application was made for the admission, free of duty, of some machinery that had been used in the mines of the United States, for use in the copper and nickel mines at Sudbury, Ontario, which was conceded by Order-in-Council. The British Columbia Government appropriated a sum of money to purchase machinery for the purpose of erecting reducing works in the Cariboo district, British Columbia, upon which duty was paid, and application was made to the Dominion Government for a refund of said duty as such machinery was not manufactured in Canada. That application was granted. No refund has been made, for the reason that it has not yet been shown to the Department what portion of the machinery imported is not manufactured in Canada. When that is done, a refund will be made.

The Natal Coal Fields.—The existence of extensive coalbeds in Natal of a rather better quality than any yet found the Cape Colony has long been known; but owing to the absence of any local demand and the prohibitory cost of transit by ox wagon, they were almost unworked until recently, when the railway from the port of Durban was extended sufficiently near them to admit of a portion of the supply for the locomotives being conveyed to the line. An extension of the railway to the Transvaal border, now in progress, will admit of the coal being put direct into the trucks, when it is anticipated that the Natal railways will be worked exclusively with local coal, and that the coasting steamers will also be supplied with it. Mr. William Milne, locomotive superintendent of the Natal Government railways, considers that some descriptions of Natal coal are almost equal in steam-generating properties to South Yorkshire coal, which was exclusively used formerly on the Natal railways.

LETTERS TO THE EDITOR.

Phosphate Analyses.

LONDON, ENG., January 15th, 1890.

The Editor,

SIR,—I have read with great interest Captain Adams' letter in your November number on the subject of the sales of Canadian phosphate in Europe.

The first point about which Captain Adams complains is the cash discount of 2½%, the answer to which is that it is the custom of the trade. I should imagine that when Captain Adams purchases machinery or supplies for his mines that he secures a discount for cash payment; but in addition to this there is another matter to be considered, viz.: that the broker in Europe who sells the phosphate to the manufacturer often has to take the risk of drawing on his buyer, whereas he accounts to his seller on a cash basis.

The next point is the moisture question. A few years ago when phosphate was sold "as it rises" (*i. e.* analysis on the normal state) it frequently happened that the test was below guarantee, simply because the moisture was taken into account in the analysis and was not deducted from weight, the result being that a cargo of phosphate sold as 80% and which tested say 81% on the dry basis, but only 79% in its natural state was rejected for being below guarantee and a heavy allowance claimed. Captain Adams also appears to lose sight of the fact that what is lost in weight is made up in the analysis which is proportionally higher; and further than this, the phosphate being sold with one-fifth of a penny rise for every unit above guarantee, the seller secures an additional price for every unit, as the rise is taken on the analysis of sample dried at 112°, and not on the analysis in normal state. On a cargo testing say about 83% on dry analysis, and only 80% in normal state, the gain to the seller would be about 4s. 2d, or \$1 per ton.

Further, Captain Adams, while on the one hand objecting to have the moisture deducted from weight, claims on the other to have his phosphate analysed on the dry state; in other words he wants to be paid the phosphate price for any moisture which the cargo happens to contain.

To come now to the question of difference in tests of samples taken on shipment and on discharge, Captain Adams appears to have been singularly unfortunate in his experience. For the last two years all the phosphate shipped by the Canadian Phosphate Co., limited, has been analysed previous to shipment, and the results obtained on both sides have been practically identical. I think an explanation of Captain Adams' trouble may possibly lie in the fact that his shipments may have been mixed ones, *i. e.* the collective output from a large number of pits which gave different grades of ore, and would be therefore very difficult to sample. I have seen the sampling done at numerous places in England and on the continent, and I am of opinion that the current system of taking about 1% of the cargo as it is being discharged from the ship is as fair a method as could be adopted, for the whole sample taken is ground up to powder and well mixed before the final samples are taken. In the case of mixed shipments it is more probable that the discharge sample would be the correct one, as after the double or treble handling, the various grades would be thoroughly distributed through the whole cargo. I think, however, that in taking samples up country at the mines, a loss of 1% in the test should be calculated on, seeing that the phosphate is likely to get a certain amount of extraneous matter mixed with it during its conveyance from the mines to Montreal, and during shipment from the dirty wharves provided at Montreal.

I do not at all agree with the suggestion to leave the sampling to one recognised authority, for in cases of disappointment on the part either of buyer or seller, which would be sure to occur sooner or later, the trouble would recommence. In addition to this the cost of sampling, which is now very trifling, would be most materially increased, for such a sampler would want at least four or five guineas a day, and as he would have to be waiting at all times in the docks until the steamer commenced to discharge the phosphate, payment would have to be made for about four days work on each shipment.

As to there being anything in Capt. Adams' argument that buyers' chemists are *ipso facto* lower than sellers', this I do not for one moment admit, for in one contract A will be the chemist for Buyer and B for Seller, in the next *vice versa*, and so on. For my own satisfaction I have made a list of a number of cargoes, and I find in adding up the total of thirty tests by buyers' chemists and by sellers', that whereas the sellers' tests gave a total of 2423 units, buyers gave 2433, or an average difference of

about $\frac{1}{2}\%$. I have seen cases where differences between chemists have been 2% or even 3%, but the reference to the 3rd chemist always settles this point.

On the question of reductions claimed for cargoes being under test, Capt. Adams has given your readers but one side of the case, viz.: the seller's, who, having delivered a cargo inferior to what he has sold and guaranteed, finds himself obliged to suffer in consequence. Now let us consider the buyer's position. A manufacturer has a buyer of say 1000 tons of 18% superphosphate; before accepting the order he enquires the price of the cheapest phosphate from which he can make this quality: he chooses perhaps 80% Canadian and buys 500 tons with which to fill his order. When the Canadian phosphate arrives it tests say only 78%, or not sufficiently high to enable the manufacturer to make the superphosphate he has sold. The manufacturer has therefore to replace with material from another source, and it frequently happens that he has to pay a higher price for his raw material. He therefore not only loses part or all of the profit he calculated on making, but finds his work blocked with a lot of material which he did not want. Therefore, in making an offer for the same he calculates the loss he has incurred in having to buy other material, and deducts this from what he considers the value to him of the 78%, which he never bought, and which the shipper who sold him 80% expects him to keep. I have certainly known cases where claims have seemed excessive, but it is not always possible to know how the buyer is placed by the default in guarantee, and the broker or agent in Europe being thus between the buyer and seller, may find himself in a truly trying position, his seller having delivered a cargo below guarantee and his buyer claiming a heavy allowance. The seller thinks the broker is not looking after his interest in settling with a heavy allowance, and the buyer refuses to listen to any new offers of phosphate made by the broker, because he cannot rely upon receiving what he has bought. I have known instances where the buyer has consented to a re-sampling in order to satisfy the Canadian seller, but I have never yet heard of a case of this kind where the second sampling has given any appreciable difference from the first.

As to selling phosphate on a sliding scale without guarantee, the proposal is absolutely impracticable, for the manufacturer only buys phosphate of that particular grade which enables him to produce the superphosphate for which he has buyers.

In conclusion, though I admit there have been troubles in the Canadian phosphate trade, I am of opinion that it has in most cases been the fault of the sellers, who generally imagine their phosphate to be of a better quality than it really is; but I think that now that the industry is beginning to be more seriously studied and treated with more system, the results obtained in Europe will not be a cause of dissatisfaction to the Canadian sellers.

I am, yours, etc.

C. C. HOYER MILLAR.

MONTREAL, Feb. 15th, 1890.

The Editor,

SIR,—With your permission I would like to have space for a few remarks on the subject of Phosphate Analyses, which has been under discussion in your columns for the last three months.

There is no doubt that in the past, miners of Canadian phosphate have been disappointed at the valuations of their ore at European ports, even though they have based their expectations of returns on analyses of their goods made by Canadian or U. S. Chemists. The question is, what has been the cause of their disappointment? Is it the sampling, or the analysis, or both? I have had some little experience in sampling, with more in analysing Canadian phosphate, and I am firmly of opinion that very many, if not all, the cases of disappointment are to be traced to improper sampling of the ore, either here or on the other side of the water.

Sampling, as Mr. J. Lainson-Wills very properly remarks in your January issue, is no easy matter, and it is high time that our miners should pay more attention to the matter here, as well as at the port where the European purchaser accepts the cargo. More careful attention to this matter will, I am convinced, result in fewer disappointments when accounts of sales are received.

As to the analysis, chemists, both on this continent and in Europe, are almost a unit in using what is known as the Molybdate method, and when working on duplicate samples find no difficulty, as a rule, in obtaining closely concordant results. At the same time it must be admitted that the correct determination of the amount of phosphoric acid in a sample of ore is by no means an easy matter; indeed, in the valuation of no other commonly occurring ore is greater care required.

In conclusion I may be permitted to add that I am surprised to see Mr. Lainson-Wills advocating the method of analyses he outlines in the January REVIEW. This method, which is uncertain, and likely to give too

high results, has for some years been almost universally discarded in favour of the Molybdate method already mentioned.

I am, yours, etc.,
J. T. DONALD.

MONTREAL, Feb. 21, 1890.

The Editor.

SIR,—I have read with interest the comments made by correspondents in your January number upon my previous remarks as to the commercial difficulties attending the sale of Canadian phosphate. Mr. J. Lainson-Wills, in his learned article, waives aside the question by saying: "the commercial dealings offering no difficulty to any competent man of business." So it appears that the whole trouble is due to the incompetency of Canadian shippers, and as they all, without exception, have suffered severely from the causes indicated, they all stand condemned. If our inefficiency is the cause of all our troubles, it is well that we should know it; but it would be a kindness to us if Mr. Lainson-Wills would give such instruction as might enable us to reform, or else convince us of our hopeless incompetency and induce our retirement *en masse* from the business in favor of competent men. His prescription of Maret's method of analysis is said by our best authorities to be defective, but he hits the mark when he suggests that "the same method of analyses be adopted by the respective chemists."

Mr. Hutchinson's analyses show a gratifying agreement, in no case being as much as one per cent. different. But his statement confirms my assertion that the buyer's analysis is lower than the seller's in a large proportion of cases. *In the five instances which he gives the buyer is lower every time.* I denounce this as a grave commercial scandal worthy of the attention of the honorable chemists whose reputation is necessarily involved in such a condition of things. Chemical reactions certainly cannot vary with the differing commercial interests, nor can the chemists be supposed to prostitute their noble science. The explanation is that different methods are used, and after a little experience it is found out that certain men are usually higher or lower in their results, and these henceforth become sellers' and buyers' chemists, respectively. The fault, if it be a fault to follow the recognized custom of taking every possible advantage in trade, lies with the merchants and manufacturers, and the remedy rests with the chemists. Let them adopt uniform methods of analysis, and we shall doubtless secure an average agreement in results.

Yours, etc.,

ROBT. C. ADAMS.

Cobalt in the Nickeliferous Pyrrhotite of Sudbury.

MONTREAL, Feb. 11th, 1890.

The Editor,

SIR,—In a recent issue of your Review reporting the Transactions of the American Institute of Mining Engineers in Ottawa, I noticed a statement to the effect that pyrrhotite never contained cobalt.

In December last, a specimen of Sudbury pyrrhotite free from gangue was placed in my hands for analysis. On careful investigation it was found to contain 3.843 per cent. of nickel and 0.59 per cent. of cobalt. I may also add that it contained 0.33 per cent. of copper.

Cobalt is found in the pyrrhotite of Elizabethtown, Ont., and in that of other localities in Canada.

Apologising for encroaching upon your valuable space, I am,

Yours, etc.,

MILTON L. HERSEY, B.A. Sc.

Chemical Laboratory, McGill College.

Metallurgical Progress in 1889.

The metallurgical progress of the past year has been mainly in the direction of perfecting existing process rather than in that of new discovery, at any rate as far as can be judged by communications made public. At the spring meeting of the Iron and Steel Institute considerable interest was exerted by a record of experiments on the addition of nickel to iron and steel, which had been carried out at Halside in Scotland, by Mr. James Riley, and showed that lined steel containing 5 per cent. of nickel has its elastic limit and alternate strength raised by nearly one-half, while the hardness is but slightly augmented. With the large increase in the supply of nickel from Canada, it is not improbable that steel of this kind may become practically useful at no distant date. The open hearth furnace, variously modified both as regards shape and material of construction, continues to increase in usefulness. For the large purposes, such as the ingots required for modern artillery, furnaces of 30 to 40 tons capacity are now frequently employed, and the increasing use of dephosphorising methods, even with the highest class of pig iron, is specially noticeable. This is rendered possible by the use of refractory basic materials, such as caustic magnesia, and more particularly chromic iron ore, the latter being used not only for melting furnaces but also for the beds of reheating furnaces.

In General.

Messrs. Andrew Hunter & Co., 4 Fenchurch Avenue, London, Eng., have acquired the business formerly carried on by Messrs. Moller, Gaetz & Co., as chemical brokers and phosphate merchants.

In another portion of this issue we publish a summary of the evidence in the suit of the Hamilton Fertilizer Co. vs. Wilson, which opened at Hamilton on the 7th inst. The suit was for payment of a note for \$120 given for a shipment of "Sure Growth Fertilizer." The analysis of the fertilizer gave:

Phosphoric acid, soluble in water.	0.86 %
Soluble in citrate of ammonia . . .	5.61
Insoluble	1.71
Ammonia	5.40
Potash	5.24
Moisture	7.03

The defendant alleged that it had not benefited his crops, and refused to pay. In all probability the fertilizer did not produce immediate effects owing to deficiency in soluble phosphoric acid, but the land will perhaps show its good effects in the following years. Since this was written, we find that pressure upon space compels us to withhold the evidence and verdict in this case.

Markets.

The following is an extract from Messrs. Couper Millar & Co.'s circular under date of 16th ult: The "Corner" in phosphates becomes daily more acute, and it is hard to say how manufacturers' wants are to be supplied during the spring months. Long prices are being paid by continental buyers for high test material, and very little obtainable, while medium and low test is scarce, the strike of the coal workers on the Continent having actually shut up some of the works *pro tem.*, which tends to aggravate the situation, they pleading "*force majeure*" as a reason for non-delivery on existing contracts. Mineral phosphates.—South Carolina offering sparingly at 11d. to 11½d. per unit according to port. Some continue scarce; indeed, there is very little available for early delivery of any test. Canadian enquired for, but raisers are not disposed to sell yet at even 1s. 3d. per unit for 80 per cent. with 1-5 of a penny rise, basis London delivery. Belgian, owing to the coal strikes, is, generally speaking, off the market for the present. Aruba is not offered, and the much-prized Curocoa does not come forward. Cambridge and Bedford coprolites wanted, but what little is raised is consumed in the district.

Later advices, under date of 10th February, state that the "boom" in Florida phosphates has had a tendency to depress the market, and quotations for Canadian are a penny less. 1/3d. can be obtained at Hamburg, and 1/2d. for English ports. South Carolina has dropped 50 cents per ton, equal to one half-penny per unit. 65% phosphates have been sold for next year's delivery at nine pence, which is an advance of one halfpenny on last year's prices.

Freights.

The outlook for the coming season is good. Quotations are as follows: Liverpool, 6/3d.; Glasgow, 6/3d.; London, 7/6d.; Hamburg, 12/6d. to 15/. An unprecedented number of outside vessels are reported to have been secured for deals, and plenty of room is therefore anticipated.

Templeton District.

Mr. A. S. Thomson, of Toronto, is now operating with a small force on Lot 27, Range 10, in the district of East Templeton. During December about 60 tons of No. 1 ore were mined and hauled to station.

Operations are now going ahead at the McLaurin property, lot 7. A couple of boilers and other machinery have been shipped, and, as soon as the snow leaves the ground, work will be pushed actively on the other portions of the property.

About 900 tons have been shipped to the front from the Blackburn since the beginning of the year. The average daily output at present is eleven tons, with a force of 50 men. Three boilers and four steam drills have been added to the plant, and the prospects for a large output during the coming season are good.

The Annual General Meeting of the Templeton and Blanche River Phosphate Co. was held at Montreal, on the 1st inst. The following directors were appointed:

Wm. Cassils, president; R. McLea, vice-president; Dickson Anderson, managing director; Hugh Graham, J. M. Kirk, Henry Hogan, A. Holden, directors. The retiring directors were H. J. Beemer and T. Trimble. Mr. P. S. Ross was re-elected secretary to the company.

A little mining has been done on Lot 35 in the Gore of Templeton with most satisfactory results. A vein of pure green apatite forty-four feet long by three feet in width, and other "shows" equally promising, have been uncovered. The owners will resume working as soon as the snow leaves the ground.

Mr. Wm. MacIntosh, of Buckingham, is hauling phosphate to the Blanche from his Murphy lot. Recent developments are reported to be highly satisfactory.

Lievres District.

The output of the North Star to date is estimated to have been a little over 2,000 tons. Mr. R. N. Hall, M.P., of Sherbrooke, is now in London with the object, we understand, of placing this productive and well developed property, associated with some adjoining Lots, in the hands of an English syndicate which proposes to acquire them. We have heard it stated on good authority that the profits of this company on last year's operations were between twenty and thirty thousand dollars. Capt. Williams has a force of some 60 men now in the pits, which are all doing well.

The High Rock Mines, which lately have been in rather hard luck, are now looking very much better, and all the pits, particularly the Cap Rock, are turning out satisfactory outputs once more. Foreman Smith is now running a tunnel from No. 11 through to No. 9, and anticipates the discovery of some rich veins.

The pits of the Canadian Phosphate Company, although slightly troubled with water lately, have been turning out exceedingly well. Especially is this noticeable in No. 2, where large masses of high grade are found and the pieces being too large for the tubs are being hauled up by chains. The Star Hill Landing is well filled up with various grades of ore, ready for shipment on the opening of navigation.

The Anglo-Continental Guano Co. has appointed Mr. Smith, a gentleman reputed to have an extensive experience in the mining of phosphates in Europe, as the superintendent of their recently acquired property. Mr. Smith has arrived at the mines, and is now engaged in operations preliminary to more active work.

At Little Rapids, work on the newly discovered fissure proceeds with a small force. Developments are reported to show three feet of clean ore in the vein. This property is now in good shape for more extensive workings.

Some very important developments have been made during the past few months on lot 27, in the 4th Range, Portland West. Average samples of the ore, which is red in colour, have analysed 89 per cent. of tribasic phosphate of lime. Mr. Lainson-Wills reports it to be the most remarkable surface showing of apatite in this country, covering, as it does, an area of about 200 feet by 40 feet, and revealing the existence of a vast deposit of the purest crystallised red apatite, having a course of N.W. and S.E.

Peter Powers and a force of some 25 men continue to make satisfactory headway at Central Lake. The mine is being outfitted with an excellent plant comprising 40 H.P. boiler, drills, steam hoist and other machinery.

Mr. S. P. Franchot, of the Emerald, is now in London.

The Dominion Phosphate Co. (of London) have some fifty men working under Manager Gibbs. This mine is also being equipped with new machinery, including 50 H.P. boiler, additional steam hoists, drills, derricks, etc. A couple of large scows for the shipment of their output below the rapids are in the stocks.

Kingston District.

We regret to have to record this month two very deplorable accidents, which resulted fatally, at the pits of the Foxton mine. The accident on the 4th inst. is described by an eye-witness as follows: Dennis Mooney, working in one of the shafts, 150 feet deep, placed a portion of a steel drill on the bucket to be taken to the surface. When he thought everything was clear he resumed his work, but he did so too soon. The bucket was being pulled from the opening just about that time, and, canting, the point, which is about 11 inches long, descended with great force. It came in contact with Mooney's head, cutting through his hat and then through

his skull, and wedging itself solidly in his head, one end protruding through his mouth. When he was raised from the pit he presented a terrible appearance. The bar and hat were removed, the latter containing a handful of brains. A physician was summoned, but nothing could be done to save the man's life.

The other unfortunate occurrence took place on the 13th inst., and is described as follows: Michael Hogan fell out of a bucket head foremost down the dark shaft for a distance of ninety feet. He was only engaged at the mine for half a day. As he was being drawn up at six o'clock he grew nervous, lost his hold, and though grabbed by a companion, fell overboard to his death.

The output from these mines has not been so good this month, in consequence of a good deal of dead work in the pits. A fault has been found in the bottom of the main pit which has shifted the phosphate and reduced the production temporarily.

Nova Scotia.

At the annual meeting of the Cumberland Railway and Coal Co., held at Montreal, on the 12th inst., the old board of directors was re-appointed.

At the annual meeting of the Londonderry Iron Company, held at Montreal, on the same date, a report of the operations of the company during the past year was submitted. A dividend of 6% on the preferred stock, payable on 15th March, was declared, and the old board of directors re-elected. At a subsequent meeting of the directors, Mr. A. P. Paterson was appointed president and managing director, Hon. Donald McInnes, vice-president, and Mr. James Phymster, secretary.

The annual meeting of the Black Diamond Coal Co. was held a few days ago. The report of the directors was fairly encouraging. The following were elected directors: D. C. Fraser, Graham Fraser, Geo. F. McKay, J. L. Jennisen and Harvey Graham. The directors recommended the payment of a dividend of 10 per cent. on the nominal capital of the company. The recommendation no doubt was very satisfactory to the shareholders.

We understand that the New Glasgow Iron, Coal and Railway Co. has made a contract with the Stellarton Brick Manufacturing Co. for the supply during this year of 650,000 red brick to be delivered on cars at Pictou Landing. This will insure a good season's work for the brick company, and looks like business on the part of the iron company.

It is reported that the Londonderry Iron Company, owning the Acadia mines, will open and operate the Torbrooke iron mines in connection with its works. These mines are in Annapolis County, N.S., and produce red hematite ore of a very superior quality. The company, it is stated, has secured leases on the property covering about two miles of the ore vein, which is six feet in width, and contains 62 per cent. of metal.

Whiteburn District.

The McGuire mine, to which reference was made in January issue, is reported to be closed for a long time. The Graves mine has made a change of management, Mr. Whidden retiring. The new manager, Mr. W. J. Smart, is an American, and has had an extensive experience in mining in the United States.

Pleasant River District.

Messrs. Thompson & Newcombe have about finished their preparations for active work, and will give their property another test. Larger pumps have been ordered, and will soon be placed.

Molega District.

The Parker-Douglass Co. have received a small diamond drill this week, and intend to use it for prospecting their extensive property. It is intended to bore horizontal holes from the 100 ft. level first, and subsequently to be used for prospecting from the surface. The same company has also on the way an 80 horse-power Rand air compressor, and seven drills, and are considering plans for the transmission of power, either by air or wire rope, from an extensive water power distant about one and a half miles from the mine.

The Caledonia Co. expect to start their mill in a few days. This company is employing a large number of

men and should be one of the largest producers in the camp.

The Malaga Mining Co. are working four of their lodes this month with good prospects, and the product will be large as usual. The company are considering plans for increasing the facilities and output of the mines, and have employed J. E. Hardman, M.E., to consult with Mr. McGuire, the manager, relative to the same.

Oldham District.

The property of the Oldham Gold Co. will be sold, by order of the Court, at Oldham on March 22nd. Little work has been done on this property for some years.

The Standard Gold Company's property, now owned by John Kilhun, Esq., is being prospected by cross-cuts and drifts under ground, and the management hope to reach new pay ground in a few months, or less time.

Fifteen Mile Stream.

The Egerton Gold Mining Company has sold all its property and privileges to a small syndicate, which has appointed J. A. Fraser, of Glasgow, as manager. It is understood that new machinery will be put in at once, and work be vigorously prosecuted this summer.

Central Rawdon.

Manager Willis had the mill running during a part of January, and reports the results as coming fully up to the standard.

Millisigate District.

Work has been recommenced upon a small scale on the property of the Duluth Gold Mining Co. It is of a prospecting character, but the results thus far have been most encouraging.

Beaver Dam.

Work here was discontinued in January for the winter. As soon as the weather will permit, the building of the new stamp mill will be commenced. It is reported that Mr. Turnbull will reside at the mine and manage it, and will also continue the supervision of Mr. North's mine at Renfrew.

New Brunswick.

The treasurer of the Brunswick Manganese Company, to which we referred in our last issue of January, has received advices, according to Boston papers, that a cargo of 200 tons of ore was shipped to Andrew Carnegie, of Pennsylvania, on the 23rd ult. The company has also much more ready for shipment. The reported net profit is some \$11 per ton. Owing to the tides of the Bay of Fundy, shipments are necessarily irregular.

Quebec.

The Villeneuve Mica & Mining Co. expect to have 1,000 tons of their spar ready for shipment in the spring. This spar (orthoclase) is being largely utilized in the manufacture of pottery ware, for which experiments have proved it to be admirably adapted. The shipments last year were purely of an experimental nature, and comprised:

To Trenton, N.J.	171 tons
To England	225 "
To St. Johns, Que.	15 "

Total..... 411 "

Some three tons of uncut mica (muscovite) are now lying in stock.

The asbestos market remains firm; prices range much higher than they have ever done before, and as the demand is undoubtedly greater than the prospective supply even better figures may be looked for during the coming season.

The American Asbestos Co. (Limited), have driven a tunnel from the foot of the hill under their No. 2 and 3 pits, and are now driving a rise to cut the No. 2 pit. The tunnel is 6 x 6 feet, and the rise is being driven in rich asbestos ground. By means of this tunnel they will do away with all pumping, and it will at the same time give them a splendid face or slope to work on. About 150 men and boys are employed.

We are indebted to Mr. Klein, the courteous manager of these mines, for the following official returns of exports and production during 1889:

EXPORTS.		MINED.	
	Tons.		Tons.
No. I.....	51 ¹¹ / ₁₀₀	No. I.....	79 ² / ₁₀₀
No. II.....	68 ⁷ / ₁₀₀	No. II.....	81 ² / ₁₀₀
No. III.....	259 ¹² / ₁₀₀	No. III.....	357 ¹⁵ / ₁₀₀
Hornblende....	2	Hornblende....	12

Total tons.... 381¹/₂ Total tons.... 530¹/₄

Average men and boys employed during year, 60. These mines were first opened last year, and during the

first six months, only hand-work by contract system was in vogue. An excellent equipment of steam working machinery was then introduced, and the results up to date have been most satisfactory.

Messrs. King Bros. contemplate equipping their mines at Thetford with a complete new working plant.

All the machinery of the United Asbestos Company Limited, Black Lake, is now on the ground and nearly ready to run. As soon as the weather becomes a little more settled the management will increase the force, and work the mine on an extensive scale. From returns received from Mr. Frechette, who formerly operated the property, we are informed that the exports to the United States during 1889 were:—

	Tons.
No. 1.....	165½
No. 2.....	62
No. 3.....	132¼
Waste.....	20
Total.....	379¾

Average number of men and boys employed during year about 30.

Prospecting on the property of the Black Lake Mining Co. has developed some very nice veins of asbestos.

The asbestos lots in Coleraine, in which Messrs. Lucke & Mitchell, Sherbrooke, have a part ownership, were merely worked last season with a view to prospecting the property. The surface work was so satisfactory that it has been decided to put in a complete plant early in the spring, and go to work in earnest.

The Geological Survey map of the asbestos region is now in the hands of the engraver, and will be ready for distribution at an early date. The map is a fine piece of work. The difference in the Surveys of some of the Lots, particularly those of the Thetford district, when compared with the Surveys previously executed by the Crown Lands Department at Quebec, show a wide divergence in the location of some of the properties, and we should not be at all surprised to find some lively litigation among the owners as a result. The surveys made under Dr. Ellis, being the most recent, are probably the most accurate.

Capt. Williams will commence operations on the Murphy Lots early in the spring. The exports in 1889 were: To United States, 66½ tons; Canada, 51½ tons. The average men and boys employed were 24 during four month's work.

It is, we believe, the intention of the Anglo-Canadian Co. to equip their property with an additional plant, in order to carry on more extensive operations. A number of new places were prospected last year, and these are sufficiently promising to warrant the addition of steam power to work them. The ground in rear, adjoining the Frechette (now United Co.'s) mine shows equally well, and a large quantity of choice material was obtained from these pits during last year. Mr. R. T. Hopper informs us that the total output from the pits during 1889 was 603 tons, of which about 500 tons went to the United States and the balance to Great Britain.

A further dividend of 10 per cent. is proposed by the board of the Bell's Asbestos Company Limited, making 22½ per cent. for the year 1889. The sum of £1,938 will then remain to be carried forward. We are indebted to Mr. Thos. Sheridan, manager of the company's mines in Canada for the following figures of production during 1889:—

	Tons.
No. 1. Crude.....	1,200
No. 2. do	200
No. 3. do	400
Total	1,800

Mr. W. H. Lambly, of Inverness, did a little preliminary working last year on his property, Lot A, Coleraine. About four months work was done with an average of eight hands, and twenty-three tons were raised.

Official figures received from the company state that the output from the Eustis copper mines during the year ended 31st December last amounted to 34,089 tons of 2,240 lbs. Of this quantity 18,114 tons were smelted, 14,725 tons exported in raw state, and 1,250 tons put in stock. The matte produced comprised 1,773 tons.

Messrs. G. H. Nichols & Co. advise that the production of ore from their Albert mines, Capelton, during the

year ended 31st December, 1889, amounted to 36,000 tons, of which about 25,000 tons were exported,

The Brompton Lake Asbestos Company gives notice of application for Letters Patent of incorporation. The chief place of business of the new company is to be at Quebec; capital \$60,000, in 600 \$100 shares. The names of the applicants are:—E. B. Greenshields, Montreal; Sir Donald Smith, of Montreal; Frederick Stancliffe, Montreal; R. W. Hudson, Bankhall, Liverpool, Eng.; E. J. Hale, commission merchant; Elliot E. Webb, William Cook, Archibald Hay Cook, advocate; G. H. Thomson, Andrew Thomson, president of the Union Bank, Quebec, all of Quebec. The said E. B. Greenshields, Andrew Thomson, A. H. Cook, E. J. Hale, G. H. Thomson to be the first and provisional directors of the company.

Ontario.

A member of the Local Legislature writes to us as follows: "It is expected that the report of the Mining Commission will be ready for distribution during the present session. The Commissioner of Crown Lands has a couple of Bills to amend the mining laws, but neither have as yet been introduced. He tells me that he has some provisions to prevent the taking up by one person for speculative purposes of large areas, but the royalty business he does not feel so sure about."

Reports from the County of Hastings point to a revival of the mining operations in that district. The company that recently purchased the Bull actinolite property is now working with satisfactory results. Rumours are also current that other mines which have long been idle will shortly be worked again by a wealthy syndicate.

Sudbury District.

Dr. E. D. Peters, the well known American metallurgist who has been so eminently successful in the management of the extensive mines and works of the Canadian Copper Co., has resigned to superintend the construction of the new works of the Westinghouse Air Brake Co., Southern Arizona. Dr. Peters is succeeded by Mr. Woodbury, of the celebrated Calumet and Hecla mines, Mich.

At the mines, work goes along very much as usual. No. 2 furnace has shut down for a few days in order to admit some repairs, and No. 1 is now in good running order. The company is at present erecting a school house at Copper Cliff. It is estimated that about 3,500 tons of matte is now in the stock yards.

Mr. Merry, representing the mines operated by Messrs. Vivian & Sons, states that some 90 men are now working in his pits making preparations for an active season's work.

Port Arthur District.

The past month has been unusually encouraging. The continued good fortune accompanying the development of the Beaver mine at great depths by means of the diamond drill, as well as developments at places where the workings are in the cherty formation underlying the Animikie black slates, has demonstrated the fact that this lower formation carries silver veins of great richness. Some of the assays are reported as going about \$700 to the ton. This fact will undoubtedly be the cause of many more prospects being opened up, as numerous minor investors have been holding back pending the result of the operations of others.

In addition to the prosperous condition of the Beaver, Badger, Elgin, Shuniah Weachu and West End mines, another couple of silver prospects are coming fast to the front.

The vein on the "Murillo" property about ten miles west of Port Arthur has widened, and is now producing first-class ore in quantity. This prospect is owned by an English company, who are equipping the mine with all the machinery necessary for rapid and economical working. An English assayer is resident at the mine.

The next aspirant for honours is the "Star" prospect on the west boundary of the township of Strange, about 2½ miles north of Whitefish Lake. There is a large group of promising veins in this locality, and the reported extraordinary richness of the first shaft is attracting much attention and numerous enquiries for lands in the neighbourhood.

The iron land excitement still continues. It is not known what success the engineering party exploring for a branch of the Canadian Pacific railway line to the Atikokan iron has met with. Those best competent to judge predict a very easy route for over four-fifths of the distance.

The iron king of the district, Mr. R. R. Paulson, is building a dépôt for supplies, outfit, etc., at the east end of Arrow Lake to facilitate the development of the immense iron tract which he controls. It is expected that the P. A. D. & W. railway will reach these lands before next fall, as the contractors are displaying unusual energy. The bridge across the Kaministiquia river is just approaching completion, and for about twenty-five miles further the line is dotted with camps of men taking out ties and timbers.

It is reported that the old reliable Rabbit Mountain mine has been bonded to a syndicate, who have guaranteed to spend \$10,000 in a test, and will purchase if development proves favourable.

The Board of Trade at its last meeting discussed the "Torrens" land title system, Hunter's Island lands and local crown lands agencies in mining districts, and appointed experienced men to co-operate with the Bar association in memorializing the Ontario Government to make certain changes highly desirable in outlying mining districts. In the "Torrens" system it would appear that more than four owners cannot be entered against one piece of land. Now when valuable mining discoveries are made it is not unusual to hear of sales of even a fiftieth part, and most people, especially Americans, desire to have a tangible, saleable document, which at present cannot be obtained. The Hunter's Island question is a most annoying one for those who purchased in good faith years ago, and have not received their titles. The want of a title has doubtless caused much loss and worry to the original purchaser, and the Government should take immediate steps to have the ground carefully inspected in order that patents may issue for lands which are in no way valuable for timber. Mining lands open for sale ought to be placed in full charge of the local Crown Lands Agent. It is extremely annoying to have strangers—intending purchasers and explorers—asking day after day what lands are available, and to hear the answer "you will have to write down to Toronto and find out for yourself, and you may get an answer in a week." What is there to prevent the Government placing all saleable lands in the hands of its local agent who is acting under their instructions and can at an hour's notice seek advice from headquarters when in doubt. No money need go into their hands but should be deposited in the bank to the credit of the Government, and a copy of the deposit receipt given to the Crown Lands Agent. This would obviate any possible objections, and any one on arriving here and starting out for the mining region, could go out with a full understanding of what he was about. An explorer or intending purchaser would not be wasting time and money on land which might be already the property of another, and the waste of a week in corresponding with the department would be obviated.

The *Star* has the following comment on the West Beaver property, now on the English Market: "We observe that a fresh attempt is being made to induce the public on this side to purchase what is known as the West Beaver Silver Mine. We are informed that the mine is 'extremely valuable,' and the Beaver mine is being trotted out as being 'in close proximity,' and as having yielded £60,000 in less than two years. No one who knows the facts will wish to dispute that the Beaver is fairly valuable, but there is nothing to show that the West Beaver, or the properties now offered to the public are of value. There is no record of profitable bullion. The Porcupine was opened some years ago, but we have yet to learn that it was done so at a profit. The truth is the promoters of the syndicate are trying to dispose of the West Beaver and other properties on the strength of the Beaver—the one mine which has paid for working."

Now we know little about the merits of the West Beaver, and can therefore say nothing in its favour or against it; but we most emphatically repudiate the statement that "the Beaver is the one mine that has paid for working." The *Star* is apparently very ignorant of the Port Arthur district, and should make itself thoroughly acquainted with the facts before making itself ridiculous by any such untruthful assertion.

The January shipments from the Badger amounted to \$15,000. Its superintendent at present is engaged principally in developing new ground, very little stoping being done.

The Shuniah Weachu Mining Company has driven a drift through an ore body 125 foot long, west from No. 3 shaft. It is all shipping ore, averaging 450 ounces to the ton. A block of ore has been opened up in No. 4 shaft east and west, between the first and second levels, 60 feet deep by 90 feet long. Stoping on both of these ore bodies will be commenced in a few days. The stock of this company is steadily going up in the English market, and the developments at the mine appear to warrant it.

Rat Portage District.

Messrs. Matheson & Chaffee are preparing to resume operations on the Winnipeg Consolidated. The present depth of the shaft is 125 feet.

The new English company formed by Messrs. Taylor Sons to work the Sultana is to commence operations in the spring.

Mr. Oliver Dounais is pushing the development of his claim at Clearwater Bay. He has two shafts down some 100 feet, and has begun cross-cutting.

Man. & N. W. T.

Application for Letters Patent under the "Companies Act" is made on behalf of the Crowfoot Coal Company, Limited; capital stock \$25,000, in \$100 shares. The names of the applicants are:—William A. Allan, Ottawa; Henry LeJeune, Regina; H. E. Secretan, Civil Engineer; A. F. Eden, Land Commissioner, and Heber Archibald, barrister-at-law, the last three named applicants being of Winnipeg. The said William A. Allen, A. F. Eden and Heber Archibald are to be the first or provisional directors of the company.

British Columbia.

It is rumoured that the Island Mountain Company, Cariboo District, will commence working again in the spring. A proposition has been made by Mr. C. D. Rand, of Vancouver, on behalf of some British capitalists, to the owners here of some 23 locations, for the purpose of forming a joint stock company, with a capital of \$300,000, and to commence work by the first of May. All the owners here have signed their consent. It is generally considered that capital is all that is required to make this place one of the richest gold mining centres in the world. If the above-named companies go to work, it will make a change for the better for the whole Province of British Columbia, which is universally acknowledged to be a country possessed of vast mineral resources, awaiting development.

The Nason, of Antler Creek, has again shut down, the pumps not being able to manage the water, and the claim still remains unprospected. The Barker Co., of Williams Creek, is at work running for a spot supposed to be left from old times.

Everything in the mining line looks better and more encouraging at this moment than has been the case in many years back. We are all hopeful and in the best of spirits. The cold weather has again set in, the thermometer registering at the time of writing below zero. Yet it is dry and bracing.

A proposal is on foot to form a syndicate with \$300,000 to develop the property of the B. C. Milling & Mining Co. Messrs. John Taylor & Sons, London, Eng., are interested in the venture.

The four mines at Field, which were part of the assets of the defunct British Columbia Smelting Co., were sold at public auction a few days ago by Sheriff Bedgrave, and were bought in by the Vancouver Syndicate for about \$7,500. These mines, and property in connection, cost the old company in the neighborhood of \$80,000. Mr. Ceperley has gone up to Field as the representative of the Vancouver Syndicate.

Application was made some time ago by the Government of British Columbia for a remission of customs duties on certain mining machinery imported by the Government, and entered at the port of Vancouver. The reply of the Department was that a remission would be granted if it could be shown that similar machinery was not being manufactured in Canada. Among the articles imported was a No. 2 Kendal quartz mill, which is made only in the United States; but as the British Columbia Government has failed to place a distinct value on the mill, and the invoice being a bulk one for mill, engine, boiler, pan, settler, etc., it was impossible to arrive at the amount of duty to be remitted, and accordingly the application has been refused.

We regret very much to have to record the complete destruction by fire, on the 4th inst., of the new Reduction works at Barkerville; loss \$25,000. These works were established in the centre of the Cariboo mining district by the Local Government last summer for the purpose of testing British Columbia ores. They were completed in November, and the operations were very successful. Their destruction by fire is a severe blow to mining prospects, which were looking very bright, owing to the interest taken in the development by English capitalists. It is thought the Government will re-build at once.

D. W. A. Hendryx, manager of the Kootenay Mining and Smelting Company, writes that his brother is in negotiation for the purchase of the Silver King, Kootenay, Bonanza and American Flag mines, the property of the Hall Bros. and others, and located on Toad Mountain, near Nelson.

The Phosphate Trust.

The Phosphate Trust, to which a reference has been made in these columns, has, we understand, been withdrawn in its original form, and it is now said that the proposal will be submitted on a more modified basis. Below we publish extracts from some of the English financial papers commenting upon the Trust and also communications from readers of the REVIEW upon the subject:

A gentleman prominent in the trade writes:—"On Tuesday Mr. ——— told me that our Ottawa County lands are included in the scheme. I gave an offer of these lands to a Montreal lawyer last February for four months, and from what Mr. ——— tells me I infer that his agents must have taken this liberty, although the matter was wholly withdrawn from them last June. I should like very much to see what they have done, and would like to put my people on their track. It is consummate cheek; but nothing surprises me now on the part of a London company promoter.

The *Star* says: "Our well informed contemporary, the CANADIAN MINING REVIEW has received a very remarkable document which purports to be the prospectus of a new concern on the eve of being submitted to the English public under the pretentious title of the Phosphate Trust (Limited)." * * * * *

Our contemporary warns the public against having anything to do with the venture. We repeat the warning. It is not the only one of its kind coming from the same quarter.

The *Financial Times* quotes the REVIEW's article *verbatim*.

"A well-known firm of English chemical brokers and phosphate merchants writes: "We have read and are very much in accord with the remarks in the December number of your REVIEW about the late proposed syndicate for the purchase of Canadian phosphate lands. If any sales had really been carried through on the basis of such figures, the industry could only have been discredited. Well selected lands have a solid value, which we expect will improve."

Another gentleman, well known in London, and intimately associated with the trade, differs from our views in the following terms: "I read with great interest your very able article on 'Phosphates' in the December number, in which you advocate large working capital, the want of which has always been the drawback of Canadian phosphate mining. You further state that large operations are essential to success, and that you hope to see soon a large amount of capital put into the working of these mines. With all this I thoroughly agree. Turning over a few pages, however, I see you go for the proposed Trust. I take it from the opening comments that you had no time to study the "private and confidential" document put before you, or you would have noticed that the essence of the scheme was to get a large sum of money to work the Canadian phosphate deposits, and, further, that 'every property will be separately examined and selected by the company's experts, etc., before being acquired.' Now, the way this scheme has come about was as follows: Dozens of properties were being hawked round in all quarters, and had, say, ten of them been floated, the capital would have most probably exceeded that of the proposed Trust, and there would have been attempts to float some twenty or so more. Now, instead of this having taken place, which would have been a misfortune to the industry, increasing competition in all ways, in the buying of provisions, machinery, etc., and on the other hand, in the selling of the ore, the present scheme seeks to combine a very large number of properties and work them all as one undertaking. The company does not bind itself to acquire the properties offered to it, nor does it follow, as your comments suggest, that, because a property is unknown to you, or to me, or to C, D or E, it is *ipso facto* worthless. Of course the final success of the scheme depends on the management, but I think the idea is a sound one, and I very much regret that you criticised our rough advanced prospectus, marked "private and confidential," in a manner apparently very hurried. Should this scheme not go through, I think it will throw back Canadian phosphate again and make it next to impossible to get any capital put into the industry."

A Montreal firm extensively interested in the mines, and the largest exporters of the mineral last year, have expressed their views in the following terms:

"In the first place, the name of the company, as a "Phosphate Trust," would certainly tend to deceive the public, as a Phosphate "Trust" would intimate that the promoters held at least the "balance of power" in the Canadian phosphate business, whilst if you look into the properties they propose to hold, you will hardly find one of any great importance, and all the actual phosphate producing properties are in other hands. Leaving aside the right of the "Trust" to bring forward a great many properties without the actual consent of the owners, we consider the scheme as by far too gigantic, and we doubt whether anybody with an intimate knowledge of the Canadian phosphate deposits would wish to invest money therein. The taxes on the nominal capital stock of such a company would in themselves constitute a good dividend for any reasonable company.

Curious Occurrence of Lightning in a Scotch Colliery.

Drumsmudden colliery is near to the Ayr and Muirkirk railway, 1½ miles above Dronagan station, and consists of two pits, each 200 fathoms deep, and forty yards apart, having a large pumping engine and coupled winding engines, both under the one roof, and built on a stone seat. The height of the chimney is 120 feet, and it is fitted with a lightning conductor, made of copper ¾ inch diameter, about 5 feet long, with copper wire ¾ in. diameter attached. The pumping pit is 10 yards from the boiler stalk, and has a pithead frame 40 feet high, over which two pulleys are fixed, guiding the haulage ropes to the pit bottom. There is also a Guibal exhaust fan connected with this pit. On Wednesday morning, 21st November, 1888, a thunderstorm of unusual and alarming severity burst overhead, and a flash took place at a time when the ascending cage was within 20 yards from the surface. The engine man was made powerless by the electricity, but, fortunately, had the presence of mind to throw himself on the brake lever, and stop the engine. When he recovered, he felt pained in the arms, neck and shoulders. Probably the fluid ran along the beam of the pumping engine, then down the steam pipes which are connected to the winding engine, and along which it would find its way to the throttle valve handle. A heavy charge descended the conductor on the stalk uplifting the earth and ashes at the bottom, but otherwise doing no damage. The pit bottomer of the winding pit heard a loud, cracking noise, and saw a clear bluish flame on the crowns on the roof at the pumping pit. The signal boy was terrified, seeing fire running and leaping between the haulage rope and the rails. The chainman was engaged at the time taking down the empty race, and was sitting on the last hutch, with his feet on the chain. When about 40 yards down he felt a shock through his legs, and was pitched down on to the road, and lay stunned for a time. Twenty yards beyond the foot of the slope dock, or 320 yards from the pumping pit bottom, and 240 fathoms from the surface, two boys were standing, one having his feet on the rails and his head almost touching the electric bell wires. He got a shock turning him round about, and both were terrified by seeing fire flying between the rails and wire. They ran off to find the oversman. When they found him they were white with fear, and said fire was flying all through the pit. Fortunately no serious injury was done to any of the workmen or property by the above strange occurrence.

Refining Gold at the Australian Mints.—The process employed in refining gold at the Australian Mints, according to the *London Mining Journal*, is different from that resorted to at the British Mint. It seems in Australia that when gold is melted in the crucibles, which are first heated to a dead-red, borax is placed upon the metal in a melted state, then chlorine gas is passed through a pipe, which is gradually depressed until it reaches the bottom, and when the compressor is relaxed, so that the gas bubbles up through the gold in its molten state, but without causing the projection of any globules. Hydrochloric acid from time to time is also introduced into the generator, and by this means a rapid evolution of chlorine is kept up. When the gas first passes into the gold, fumes escape from the holes in the crucibles. These consist only of the chlorides of inferior metals that are attached to the valuable ones, none of the chloride of silver escaping. When any silver remains in the gold nearly the whole of the chlorine continues to be absorbed; afterwards, when the refining is nearly completed fumes of a darker colour make their appearance, and the end of the operation is indicated by the flame or luminous vapour appearing first of a bright yellow colour, and gradually growing into a deep, reddish brown. The value of chlorine in gold refining is certainly not a novelty, but it is claimed it has not before been put into practical use, though its action on gold has been no secret to chemists, for it does not mix with it at a red heat.

10,000 Egyptian Cats: Sale of a Curious Cargo of Very Ancient Manure.

Messrs. Leventon & Co., of Liverpool, received the other day a consignment of 19½ tons of embalmed cats from Beni Hassan, Central Egypt. In this parcel are the remains of about 180,000 cats. Specimens of these have been placed in the Liverpool Museum. Messrs. Leventon & Co. are about to employ them as manure, and a correspondent writes: "Last week a most interesting auction was held, in a large Liverpool broker's office—namely, twenty tons of cats. To understand what they are, it is necessary to know something of ancient history. It is well known that many nations, in prehistoric times, adopted the religion of totemism, believing that there was a relationship between man and the bird, beast or reptile which he particularly fancied. The totem of the ancient Egyptians was the cat, hence when a cat died it was gaily buried with all honors—being embalmed, sometimes decorated, and, in short, had as much attention paid as any human being. It had been long suspected that a cat cemetery existed on the east bank of the Nile, and in the autumn of 1889 a lucky Egyptian found this ancient burial ground at Beni Hassan, about 100 miles from Cairo. Laborers were soon at work, and dug out hundreds of thousands of cats. Some were quickly sold to local farmers, and the bigger lots and their way to an Alexandrian merchant—then, by the steamers Pharos and Thebes, to Liverpool, where they were knocked down at £3 13s 9d per ton to a local utiliser merchant. The auction was only known to the trade, but even the 'bone' buyers looked nervously at the large samples exposed, the genial broker knocking the lot down with one of the pussies' heads for a hammer.

Hoisting Machinery.*

(By William Giliie.)

In this day of progress and improvement, one is struck by the rapid developments that have taken place, and the new improvements that have been introduced for the purpose of raising the mineral from the mines. A good many steps of improvement intervene between the crude methods of slowly winding up small quantities of coal, for centuries ago, and the rapid, well-disciplined traction of the present day. The ingenuity of man is always been equal to the wants and requirements of time; and in no other way has his genius been more tested, than in that of devising methods for raising the mineral from the mines.

Our subject brings to our attention the names of such men as Savoury, Newcomen and Watt. In 1698 Thomas Savoury invented an engine to pump water from the mines, for which a patent was granted, it being known as the "Miners' Friend." The steam was used to produce a vacuum, and the pressure of the atmosphere was depended upon to raise the water in the pumps.

Thomas Newcomen, about the same time, was busily engaged upon his atmospheric engine, and the results, though rude and imperfect, were far in advance of anything of his time. The atmospheric engine grew rapidly in favour, and was extensively used by mine-owners, who did not like Savoury's engine. Newcomen's was an atmospheric engine because it depended on the pressure of the atmosphere to perform the downward stroke, and do the principal part of the work. Its great disadvantage was, that the cylinder was required to be hot one time and cold at another, thus the fresh steam heated a cold, wet cylinder, thereby losing three-fourths of its power. This wasteful expenditure of steam continued until James Watt, the renowned engineer, having made a model of the atmospheric engine to repair, saw the great defect of the engine, and at once went to work to solve the problem of a separate condenser. In this he succeeded, and to him belongs the honour of having introduced all the leading principles of the steam engine as we have it now.

Mr. C. M. Percy, in his Mechanical Engineering of Collieries, lays down the following conditions, which every good winding-engine should fulfil: They should be strong, durable, and comparatively light in construction, with more power than is necessary for the maximum amount of work to be done, easy to handle and reverse, quick to start and stop, and capable of reaching their highest rate of speed in a short time; also, they should work in pairs and be so proportioned that in case of a break-down with one engine, the other would be capable of raising the load, although slowly.

Modern hoisting-engines possess all of these requirements, except economy in the well-known horizontal, direct-acting, high-pressure, non-condensing engine.

This question of economy did not matter so much when mining was in its infancy, when shafts were shallow and the products of the mines had to be conveyed but a short distance; but with the great and rapid development of the mining industry, and the fierce rivalry and competition that is now existing, economy is one of the most important points to be considered. Engines work-

ing without expansion and without condensation, are of the most extravagant class, for with non-condensation one-third of the absolute pressure exercises no effective pressure at all, and with non-expansion more steam is required for the same amount of work, than if the engine worked expansively. For, when steam is admitted to the cylinder at a high-pressure the piston attains a great initial velocity, and before the stroke is completed the steam is cut off, the rest of the stroke being completed by the elastic force of the steam already in the cylinder. The steam expands as the piston moves forward, and consequently, its pressure is in conformity with the law of Mariotte's and Boyle, until the piston is at the end of the stroke, thus a great saving in steam is effected, and, as a consequence, a smaller amount of coal is required, and a maximum amount of work is obtained from a minimum amount of steam. If we wish to find the pressure of steam at any point in the stroke, when the engine is working by expansion, and an indicator diagram cannot be taken, we can find it by the following rule:—

Let us suppose that steam is admitted into a cylinder 6' long, at 60 lbs. pressure, and the steam is cut off when 2' of the stroke has been performed.

The pressure during 1st foot of stroke is.....	60 lbs.
The pressure during 2d foot of stroke is.....	60 lbs.
The pressure during 3d foot of stroke is.....	$2/3 \times 60 = 40$ lbs.
The pressure during 4th foot of stroke is.....	$2/4 \times 60 = 30$ lbs.
The pressure during 5th foot of stroke is.....	$2/5 \times 60 = 24$ lbs.
The pressure during 6th foot of stroke is.....	$2/6 \times 60 = 20$ lbs.

Total pressure..... 234 lbs.

Dividing this total pressure, 234 lbs., by 6, the number of ordinates taken, gives an average pressure in the cylinder of 39 lbs., the terminal pressure being 20 lbs.

The great difficulty in applying expansion-gear to hoisting-engines is, that we want full power all through the stroke, and during the changing at the top and bottom of the shaft. Little has been done toward making our winding-engines work by expansion, and while this economic principle has been applied to all other classes of engines, scarcely one per cent. of winding-engines have any such arrangement. We hope that mechanical engineers will soon see the utility of applying some automatic arrangement, making the hoisting-engine as economical as that of any other class.

The work performed by a hoisting-engine is the lbs. of coal raised through any given height, i. e., if 2 tons are lifted from a shaft 600' deep in one minute, the useful work will be equal to $2 \times 2,000 \times 600 = 2,400,000$ units of work, or foot lbs., and $2,400,000 \div 33,000 = 72.73$ horse-power. This work is termed the useful horse-power, without allowing for friction of machinery, etc. Work may be defined as the combination of force and motion. The unit of work is one pound lifted a distance of one foot. While power may be defined as the speed of doing work, the unit of power is a force of one pound put through a space of one foot in one minute. A horse-power is equal to 33,000 units of power. The actual or indicated horse-power is the amount of power that is being exerted by the engine, and includes all resistances such as the moving parts of the engine. The indicated horse-power is found by multiplying the average effective-pressure by the area of the cylinder in square inches, and this by the mean speed of the piston in feet per minute, which gives the units of power; and this divided by 33,000 will give the horse-power of the engine. To illustrate, suppose we have an engine with an effective-pressure of 40 lbs. per square inch, acting on a cylinder 30" in diameter, the speed of piston being 200' per minute. The units of power will be $30 \times 30 \times .7854 = 706.86$ area of cylinder, and this, multiplied by the pressure, which is 40 lbs., and the result multiplied by the speed of the piston, 200' per minute, will give the units of power or 5,654,880, and this divided by 33,000 equals 171.36, the indicated horse-power. The average effective-pressure is the difference of pressure between the fresh steam that is entering to force the piston down, and the exhaust-steam that has a tendency to prevent the piston from being driven down. Mr. Percy, in solving questions like the above, allows 50% for resistances, and as the work to be done by a hoisting-engine is not continuous, it is best to have a sufficient margin of power under all conditions.

The modulus of an engine is that fraction, which expresses the ratio of the work done to the power applied. If the work applied to an engine equals 60 horse-power and the engine only delivers 40 horse-power, then $\frac{40}{60} = \frac{2}{3}$ modulus, $\frac{1}{3}$ of the power applied is lost in friction in the moving parts of the machine.

We can ascertain the pressure of steam, and the diameter of the hoisting-drum, when the load is specified, the time of a winding given, with the length of stroke and area of cylinder. For example: If the diameter of

a cylinder is 20", the speed of the piston 360 feet per minute, length of stroke 5 feet, and the time of hoisting from a shaft 720 feet deep, is 40 seconds.

Then, $\frac{360 \times 40}{60} = 240$ feet distance travelled by the

piston in 40 seconds of time, and as the piston makes a forward and backward stroke at each revolution of the drum, the distance travelled in one revolution would be 10 feet. The revolutions a drum would make during a winding would be 240 divided by 10 or 24, and as the shaft is 720 feet deep, $720 \div 24 = 30$ feet circumference of drum, and $30 \div 3.1416 = 9.5$ feet the diameter of drum. If 2 tons or 4,000 lbs. are to be lifted in the load, then $4,000 \times 30 = 120,000$ lbs. the moments that are acting on the drum, and as the diameter of the cylinder is 20", the area will be $20^2 \times .7854 = 314$ area of cylinder, this multiplied by 10 feet, the distance travelled by the piston during one revolution of the drum, equals 3140. The number of pounds that are acting on the drum $120,000 \div 3,140 = 38$ lbs. pressure of steam that must be applied to the cylinder per square inch, adding 17 lbs. for resistances the total pressure would be 55 lbs. per square inch.

In connection with hoisting-engines various methods have been adopted for the purpose of counterbalancing the load, which I will briefly notice here. The chain and staple are being replaced by more modern methods. The incline counterbalance is used to some extent, the counterbalance force may be found by multiplying the weight of the counterbalance by the height of the incline and dividing the result by the length of the incline. The tail-rope counterbalance consists of a rope the same size as the hoisting-rope passed around a sheave at the bottom of the shaft, the pulley being free to move upwards or downwards between guides. The Koepe system does away with the winding-drum and substitutes a sheave connected with the engine. There is a return sheave placed at the bottom of the shaft. Two ropes are used, one connected with the tops of the cages passing around the sheave that is used instead of a drum. The other is attached to the bottom of the cages passing around the sheave in the sump. The advantage claimed for this system is, that it gives a perfect counterbalance in all parts of the winding; smaller engines are required as well as engine-rooms and no drum is necessary.

The conical drum is fast coming into favor, as the load is uniform throughout the hoisting, the full cage at the bottom of the shaft being attached to the small diameter of the drum, and the empty cage at the top of the shaft to the large diameter, so that the principle of the drum is, that a heavy weight, when acting on the short arm of the lever, is equal to a lighter weight applied on the long arm.

Everything in connection with a hoisting-engine should be kept in good order, so that the friction of the machine will be reduced as much as possible, and the guides in the shafts should be kept well greased, thus increasing the amount of work.

The Mining Industries of Eastern Quebec.

(By R. W. Ellis, L.L.D., Geological Survey of Canada.)

That portion of Quebec to which the few remarks I propose to make are more particularly intended to apply, viz., the Eastern Townships, has long been known for its mineral wealth, and has enjoyed a reputation for mining enterprises, second probably to no other part of Canada. Capital has been invested in large amounts at various points, some of which has yielded a handsome return to the investors, while in other cases the inevitable results of rash and foolish speculation have followed, much good money has been sent after bad, and the principal result has been a dearly bought experience. This is a peculiarity which, I take it, is not entirely confined to Canada, and it can safely be said that this portion of Quebec does present to-day more advantageous openings for the investment of capital, wisely and skillfully applied, probably, than at any stage of its past history. It may be said, generally speaking that these industries are at present confined to not more than half a dozen lines, among which may be enumerated, in the order of their present value, copper, asbestos, roofing and other slates, gold, and the manufacture of lime. Silver, chromic-iron, antimony, nickel and the various ores of iron, have also been worked to some extent.

The relations between the geological structure of any country and its mineral wealth are very close and of the highest importance, but while, as officers of the Geological Survey, possibly the greater part of our energies have been devoted to the unravelling of the complicated problems of structure which have from time to time been presented in regard to the age of the several rock formations in Canada, a certain amount of attention has always been paid to the careful study of the economic aspect of the question. Some of the most intricate problems of geological structure have been encountered in that section of Quebec east of the St. Lawrence River,

*Read at the Ottawa meeting of the American Institute of Mining Engineers.

upon the elucidation of which much labor has been expended for more than forty years. It is no great cause of wonder, therefore, that changes of opinion have taken place concerning the age of certain portions, as new light has been presented by successive years of study.

To better understand the positions of the several mineral-bearing zones of eastern Quebec, it may briefly be stated that the rocks of that section are divisible into three grand classes, viz.: the crystalline schists, which occur in the form of extended anticlinal ridges, the slates and sandstones, often highly quartzose, which flank these ridges on either side, and the areas of volcanic rocks, diorites, granites, serpentines, etc., often of large extent, with which both the preceding divisions are intimately associated. As to their age, the views of those who have more recently studied these rocks differ widely from those expressed in the earlier publications of the Geological Survey. Instead of now regarding the great ridges of crystalline schists as altered Middle or Lower Silurian sediments, it has been very conclusively established, both from palæontological and stratigraphical evidence, that they are much older, being, in fact, for the most part, at least, pre-Cambrian, by which is meant that they underlie the lowest known fossiliferous Cambrian zone. In the same way much of what was forty years ago regarded as Upper Silurian, in which was included a very large area in the southeastern portion of the province, has been found to really belong to the Cambrian and Cambro-Silurian systems. In this way a connection has been established with well-recognized mineral-bearing zones of other provinces and countries, in places where formerly a marked discrepancy in the relations of the rock formations was apparently presented.

As regards the geological position of the principal mineral-deposits of this section, we now find that the ores of copper, where found in workable quantity, are very largely confined to the areas of the crystalline or older schists. Deposits of considerable extent, it is true, are found at other horizons, more especially in connection with masses of dioritic rocks, but as a rule these have not, in so far as yet worked, proved very continuous or of marked value.

On the other hand, the asbestos, or, more properly speaking, chrysotile, occurs in serpentine rocks which are for the most part associated with the Cambrian slates and quartzose sandstones, although serpentinous rocks are found along with the schists at certain points. The roofing slates, at one time regarded as of Upper Silurian age, are also now held to form part of the great Cambrian series, as is also the case, I believe, with the slates of the Welsh quarries, while the gold, the mining of which has, however, as yet been entirely confined to the alluvial deposits, or to the gravels of old river channels, is also without doubt in great part derived from quartz-veins in slates of the same Cambrian age. The statement as to the age of this last is important, from the fact that these slates were for many years regarded also as of Upper Silurian age, and have been so described in the *Geology of Canada*, 1863, in which the earliest views of the Survey as to the structure of this region, viz., those of 1847, are simply repeated. The resemblance of these gold-bearing slates, which are especially developed in the Chaudière and Ditton areas, to those of the Cambrian gold series of Nova Scotia was, however, pointed out many years ago, and referred to by Logan, Selwyn, Hunt and others.

The copper-deposits in Eastern Quebec, operated for many years, and still worked, are those known as the Capelton mines. They are situated about seven miles south of Sherbrooke, the principal city of Quebec, east of the St. Lawrence, and are located on the eastern flank of a ridge of talcose, chloritic and micaceous schists, which in this locality form a somewhat narrow belt, some miles in extent. It has, in the late reports, been described as the second or Sherbrooke anticlinal. Throughout this belt of schists, with which are associated considerable masses of greenstone or dioritic rock, deposits or veins of the sulphuret or copper pyrites are numerous; and a few years ago, at the time of the great copper boom, a number of mines were opened in this section. While at many of these places the veins promised well at the time, the gradual decline in the price of copper, and the generally low grade of the ore, rarely yielding more than four to seven per cent., resulted in a gradual suspension of most of these enterprises. At the present time, while prospecting is again being resumed with some vigor, mining is confined almost entirely to two locations at Capelton, viz., the Nichols and the Eustis mines. The continued success of these workings has been due to several causes. One, probably, is the great size of the vein, which is stated to reach, in places, a thickness of 45 to 60 feet, and has been worked to a depth of over 1,500 feet. A chief cause, however, is that these ores are rich in sulphur, the bulk of the raw ore being used, first of all, for the manufacture of sulphuric acid, the residue being subsequently utilized for the extraction of the copper. A certain percentage of silver in the ore is also, doubtless, a very important factor as regards their present successful working, the amount at times ranging as high as 10 to 12 ounces to the ton, and probably even

higher, though probably 3 to 4 ounces represent the average.

The output of ore from these mines is large, ranging from 30,000 to 40,000 tons per year for each. While the greater part of this product is shipped in the raw state, smelting works, recently repaired by the Eustis Company, now dispose of over 1,000 tons per month, which is reduced to matte on the spot. At the Nichols mine adjoining, a correspondingly large amount is used for the manufacture of acid. A portion of the latter, with the phosphate of the Ottawa Valley, is converted into superphosphate of lime. This industry, in the not distant future, bids fair to assume very large proportions. At the smelting works of the Eustis mine, the large percentage of sulphur is, at present, burned off and lost.

The larger lodes of copper-ore at these places appear to be mostly in the form of the yellow sulphuret or chalcopryite, with which is found a very large percentage of iron pyrite. These have their largest development in the townships of Bolton, Hatley and Ascot, though in some of the mines formerly worked, for instance, in the old Huntington mine, a large proportion of the pyrite is the magnetic variety or pyrrhoite. The rocks associated with these ores are, for the most part, schists of various kinds, with diorites and sometimes serpentine. Variegated and virtuous ores are also found, in considerable quantity, in the more westerly belt of Acton, Halifax and Leeds, where they have been worked to a very considerable extent. These are frequently associated with nacreous or talcose schists, as at the Harvey Hill, or with limestones, slates and trappean rocks, as at Acton. At both of these localities very extensive workings have been carried on, and a large amount of very rich ore has been extracted. The mines of Harvey Hill are again being operated under a new management, the new company being styled the Excelsior Mining Company.

A very full description of the character and distribution of the various copper deposits of the eastern townships is given in the latter portion of the *Geology of Canada*, 1863, pp. 709-736, and supplemented in the general report, 1866, pp. 34-44. From these it will be seen that many localities exist in this area other than those just mentioned, which are really deserving of careful attention at the present time as a source of supply for copper, both for smelting purposes and for the manufacture of sulphuric acid. The great and present value, however, of the copper deposits above indicated is more particularly due to the fact that, in the more easterly or Ascot belt, the veins of pyrites which are without doubt in many places, of great extent, contain a very large percentage of sulphur, rivalling, in this respect, most of those yet known to occur in the copper-bearing belts of the Atlantic portion of the adjoining States. Their great importance as a source of supply for ores suitable for the manufacture of acid is just now beginning to be fully realized. It is, presumably not too much to say, that within the next five or ten years, great developments in this respect will take place throughout this section.

In the belt of crystalline schists, both to the north and south of Sherbrooke, recent developments indicate that possibly the heaviest and richest ore veins have not yet been reached; and, in view of the new conditions which have arisen, much of this district would repay careful prospecting. Further to the north again, in Ascot and Garthby, new developments are at present being made that promise fine returns, and bid fair to equal, if indeed they do not surpass, the well-known mines of Capelton.

The asbestos industry, although of comparatively recent date, has since its inception in 1878, rapidly increased in importance, and bids fair to speedily become the leading mining industry of the province. While the occurrence of fibrous serpentine or chrysotile in the Townships has been known for many years, and has been mentioned in the earlier reports of the Geological Survey, its true economic importance remained unrecognized, and it was not until the opening of the Quebec Central Railway across the serpentine belt of Thetford and Coleraine that any importance was attached to this peculiar mineral. Although occurring to some extent with the serpentines of the Laurentian district, north of the Ottawa River, its direction in this extent has not as yet been sufficiently studied to warrant a clear expression of opinion as to the actual value of these areas, and the production of asbestos or chrysotile is as yet entirely confined in Canada to the Eastern Townships, and to the serpentine rocks which are at present regarded as forming a part of the volcanic belt of the lower Cambrian system of Quebec.

This mineral differs entirely from the actinolite of central Ontario, and the asbestos of the Township also presents several points of difference when contrasted with that from the Laurentian district. This is seen in the greater softness, silkiness and tenacity of the fibre of much of the former, a property which gives it great value for spinning and for its working into the finer variety of textures to which it is now so extensively applied.

The stratified rocks associated with the serpentines of the townships in which the workable asbestos occurs are

generally slates of various colours, black, gray, green and purple, with occasionally conglomerate and sandstones, which are often hard and highly quartzose. These are frequently associated with diorites, which often form large mountain masses as at Orford, Ham, Broughton and other points, and which in texture are generally fine-grained, both massive and concretionary, and in colour, range through shades of green to brown.

In the province of Quebec the serpentines extend for many miles, in a series of interrupted outcrops from the boundary of Vermont, nearly to the extremity of the Gaspé peninsula. At several places, notably at Thetford and Coleraine, and in the Shickshock mountain-range of Gaspé it presents a large development. It is sometimes found in bands of a few yards in breadth, apparently interstratified with the slates and sandstones, and sometimes with diorites, in conjunction with which it forms knoll-like hills or elongated ridges of considerable extent. In many places a gradual transition from the diorites to the serpentines can be observed, and it seems very conclusively settled, both from observation in the field on a large scale, and from analyses in the laboratory of the Survey, that much of the serpentine is an alteration product from dioritic rocks, rich in olivine or some allied mineral. While generally massive, the rock has at times a slaty structure, and in many localities the mass is much shattered and broken. More especially is this latter feature noticeable in quarries or areas where dykes of diorite but more generally of a whitish granite or granulate, cut the serpentine. This latter rock, which has generally a grayish or grayish-white color, consists for the most part of orthoclase feldspar and quartz, but at times contains an admixture of mica, classing with a true granite. Whatever may be the age of these whitish dykes, which frequently become masses of considerable extent, they certainly are newer than the serpentines, which they traverse, as is evidenced clearly by the alteration and shattering of the mass traversed along the contact. The view is held by many of those engaged in mining asbestos, that the presence of these smaller dykes exercises a favorable influence on the production and character of the veins, in the same way as the action of diorite dykes upon copper or other metalliferous strata on the production of ore deposits.

Among the principal areas of serpentine which are found at so many widely scattered points, the most easterly yet known is at a point called Mount Serpentine, about ten miles up the Dartmouth River from its outlet in Gaspé Basin. The serpentine is here associated with limestone and surrounded by strata of Devonian age. Small veins of asbestos are found in the rock, but not yet in quantity sufficient to be economically valuable. West of this the next observed is the great mass of Mount Albert, whence it extends west in a great ridge for some miles. This mass is known to contain veins of chromic iron, and traces of asbestos have also been observed, but the area has never yet been carefully explored with a view to ascertain the presence of the mineral in quantity, owing largely to the present difficulty of access.

In Cranbourne and Ware, to the north of the Chaudière River and in the vicinity of that stream between the villages of St. Joseph and St. Francis, several small knolls are seen, in all of which small and irregular veins are visible, but apparently not in quantity sufficient to render them economically important, at least in so far as yet examined. Further to the southwest, in Broughton, Thetford, Coleraine, Wolfestown and Ham, a very great development of these rocks is observed, forming at times mountain-masses from 600 to 900 feet above the surrounding country level, and presenting very peculiar and boldly marked features in the landscape by their rugged outlines and curiously weathered surfaces. The large areas of this division terminate southward at a point termed Ham Mountain, a very prominent peak of diorite which marks the extremity of the ridge. In this great area, which we may style the central area, asbestos can be found at many points in small quantity, but at a comparatively few does it occur in quantity and quality sufficient to warrant the expenditure of much capital in its extraction.

The third area, regarding that of the Shickshocks as the first, begins near the village of Danville, and may be styled the southwestern area. Thence it extends through Melbourne, Brompton, Orford, Bolton and Potton, in a series of disconnected hills, to the American boundary, beyond which the continuation of the serpentines can be traced into Vermont. In these areas, with the exception of the peculiar isolated knoll near Danville, the asbestos has, as yet, been observed in small quantity only, and generally of inferior quality. Large areas of soapstone are found at points throughout the area, and the associated diorites have a large development. It must, however, be said of this section, that considerable areas, whose outcrops can be seen along the roads which traverse the district, are concealed by a dense forest growth, and the true value of such portions must, for some considerable time, be largely conjectural. In fact, until the forest and soil are completely removed by the action of forest fires, as was the case at Black Lake and

Thetford, the search for asbestos is likely to prove difficult and unsatisfactory. It is, however, very evident from the studies already made on this interesting group of rocks in Canada, that all serpentines are not equally productive—a fact very evident even in the heart of the great mining centres themselves, where large areas of the belt are made up of what is known as barren serpentine. As a general rule, however, the rock likely to prove asbestos-producing can be determined by certain peculiarities of texture, color or weathering.

At the Thetford mines, and in that portion of Coleraine lying to the northeast of Black Lake, certain conditions favorable to the production of asbestos appear to have prevailed, and have led to the formation of numerous veins, often of large size, which, in places, interlace the rock in all directions. These veins range in size from small threads to a width of 3 to 4 inches, and in rare cases even reach a thickness of over 6 inches. The quality of the fibre, however, varies even in these localities, and while much of it is soft, fine and silky, other portions are characterized by a harshness or stiffness which detracts greatly from its commercial value.

Several theories have been put forth as to the origin of the asbestos veins. From a careful study of many places throughout the belt, it would seem that the theory of segregation applies equally to these as to quartz veins or other mineral lodes. The fibre of the veins, unless distorted by pressure, is always found at right angles to the sides of the fissure, and frequently in veins of what are regarded as of large size, say from two and a half to four inches, the continuity of the fibre is broken by a dividing zone or comb, if one may use the expression, of grains of magnetic or chromic-iron. In certain cases, also, the mass of the serpentine appears to lose color near the veins or in immediate contact with them, but this feature is not always observed.

The fissures or veins are not always regular or persistent for any very great extent. A small vein at the surface, of half an inch in thickness, may quickly enlarge to one of three inches or more, and, continuing, may die out entirely, while others come in on either side. They have much the aspect of gash veins in slaty rocks, though many instances are seen where the fibre maintains a tolerably uniform size for considerable distances.

The containing rocks show the presence of numerous faults, as in other mineral localities, but possibly in the serpentine these are often more plainly marked. These faults throw the veins from side to side, and frequently are of sufficient extent to cut off entirely the working face of a highly productive area, the rock on the other side of the fissure being often entirely barren. The sides of the fault, in such cases, show extensive slickensides, and frequently have great sheets of coarse or woody-fibred, or imperfect asbestos, along the planes of fracture. Occasionally, pockets or small veins of chromic-iron are found in close proximity to the asbestos.

Much of the asbestos found at the surface, or in the upper workings, is discolored. This is generally the case where the rock is shattered by the action of the intrusive dykes, or from some other cause, and the coloring is doubtless due to infiltration of water along the lines of jointing or fracture, becoming less as the rock grows more solid. The quality of the fibre in such cases improves as the mine becomes deeper. A somewhat similar remark may be made as to the quality of the fibre at the surface as compared with that from a lower level, but proceeding from a different cause. Owing to the destruction of the forest over the serpentine knolls by extensive fires or by the action of the weather, the asbestos veins, which are exposed at the surface, have frequently a certain amount of harshness, which entirely disappears as the vein is opened. This peculiarity is probably due to the action of the fire, by which a certain proportion of the contained water of the mineral is dissipated; and in this connection, also, a very interesting study is afforded by the comparison of the output at the Thetford mines with that from certain areas in the Black Lake district. At the former, the fibre is remarkable for its soft, silky character, and the percentage of harsh fibre is comparatively small. The same is true of certain of the Black Lake mines, but at others, though many veins of good size are also found, a very much larger proportion of the fibre is harsh or brittle. The cause of this difference has long been a subject of speculation to those more immediately interested in the subject, some attributing it to a difference in level of the two localities—a theory, however, which can scarcely be maintained in view of the fact that much of the output from the Black Lake mines, from the higher levels, is of the best quality.

The presence, however, of large masses of the intrusive granulite near Black Lake, as contrasted with its almost entire absence at Thetford, where it is found generally in small dykes, leads to the inference that to this intrusion of heated matter may be largely due the lack of softness and silkiness in much of the Black Lake output. The presence of such great masses would have a tendency to dissipate a certain proportion of the contained water from the chrysotile, which is really a hydrous silicate of magnesia, in the same way as the action of the forest fires, though on a much more extended scale. The same

effect can be produced by placing a piece of the mineral in the fire or on a sufficiently heated surface, when in a short time it will be found to have lost its softness to a large extent and become harsh and brittle.

The extraction of asbestos in the present stage of the industry may rather be termed quarrying than mining proper, the workings so far being all open cuts. The rock is blasted out, broken up, carried to the dumps and subsequently cobbled by hand, the latter being generally done by boys. The smaller veins, of a fourth to a half inch, are frequently left in the rock of the dump, as not in the present state of the industry repaying the cost of extraction. There is no doubt, that with suitable machinery for crushing and cobbling the greater part of most or all of the dumps, which have already reached a large size, would easily pay for working over, while the removal of the dumps themselves, from the fact of their covering much valuable ground, will very shortly become a necessity.

The workings at Thetford are at present confined principally to four companies, viz.: King Bros., The Bell Company, Irving, Johnston & Co., and Ross, Ward & Co. These are all situated on a small knoll of serpentine which rises to a height of 80 to 90 feet above the adjacent track of the Quebec Central Railway which traverses the properties. The output from all these mines is practically the same in quality and length of fibre, though in the quarry of Irving, Johnston & Co., veins of extra width, nearly six and a half inches, have been found. This extra length of fibre does not, however, possess any special advantage, since it is generally broken by grains or partings of iron, and for practical purposes good clear fibre of two to three inches, or even less, is quite as valuable as any. In addition to the properties at this place above mentioned, new workings have lately been commenced by Mr. A. H. Murphy, now of Montreal, and by Lucke & Mitchell, of Sherbrooke, both of which promise well. These are to the west of the railway, and at a lower level, and some extra work may be involved in the removal of a considerable covering of drift in places. The ground between the railway and the Thetford River, which here marks the western limit of the serpentine, has also been lately proved to some extent, and portions of it found to contain asbestos in satisfactory quantity, but the greater facilities for working the upper levels are such as to give them the preference for the present.

At Black Lake, four miles south of Thetford mines, four companies are also located. These are the Anglo-Canadian, the Frechette-Dauville, the Scottish-Canadian and the American Asbestos Company or Wertheim's, at all of which a large amount of work has been done. They are all at higher levels than the mines at Thetford, and the output, as already stated, is not, as a whole, equal in quality comparing the percentage of "firsts" produced. This will be seen from a statement of the relative percentage of the two districts, though this is again to a certain extent affected by the difference in grading practiced by the several companies. Thus from the Thetford area the percentage of "firsts" ranges from 50 to 70; "seconds" from 7 to 30; "thirds" from 20 to 40. From the Black Lake district, the percentages are: "firsts" 10 to 50; "seconds" 25 to 30; "thirds" 20 to 60.

The prices of asbestos are at present quoted at a considerable variation, due to the fact just mentioned that the output from the several mines is to a certain extent differently graded. Thus the "seconds" of one mine are quoted at \$75 per ton, while from another the price of "firsts" is very little more. Extra quality of "firsts" again, naturally commands a higher price than the ordinary run of the grade, but generally speaking it may be said that the scale of prices for the several grades of the output at the mines is as follows: Asbestos, No. 1, \$80 to \$110 per ton of 2,000 pounds; No. 2, \$50 to \$75, and No. 3, \$25 to \$40. In addition to the above a certain amount of waste is obtained from all the mines, and is sold at from \$10 to \$15 per ton.

Taking the scale of prices and the percentage of the higher grades, it is seen that at the present time, commercially speaking, the properties of Thetford are entitled to the first place. This is to some extent explained by the fact that a considerable proportion of the Black Lake output is off-colour, the areas worked lying partly below the crest of the main serpentine ridge, and having a considerable covering of drift. At Thetford, owing to elevation of the knoll on which most of the mines are located, the loose or shattered rock, if it ever existed there, has been largely removed by glacial action, the surface of the rock being frequently polished and striated. It has always been expected that the Black Lake output would increase in value when the shattered surface rock was removed, and this expectation has, to a certain extent, been realized in so far as the workings have proceeded, the rock generally becoming more solid at greater depths, and the color and quality of the fibre improving. New workings along the face of the ridge at this place have also disclosed the presence of large veins of excellent material, and greatly superior to that from the lower works, yielding a large percentage of first quality.

Here the action of the intrusive granulites has not been felt apparently to any considerable extent, and the conditions in this respect more closely resemble those prevailing at Thetford.

In estimating the value of Asbestos properties, the question of the relative percentages of output should be carefully considered, since, while the number of tons produced by two areas might be approximately equal, and to the uninitiated the properties in consequence be nearly equal in value, the one from the large amount of "firsts" would be capable of paying very handsome dividends, while the other would require great economy of management and yield far less satisfactory returns.

In addition to the areas just described, several others are worthy of notice. The knoll of serpentine near Danville, of small extent, has been worked for some years by Mr. Jeffrey, of Richmond, with good results. The veins at this place are not large, seldom reaching two inches in width, but the quality of much of the fibre is excellent, and, though small, a considerable number of them produce a good amount of asbestos. The proportion of "firsts" from this mine is at present about twenty per cent., and of "seconds" 60 per cent., the remainder, of course, being "thirds" thus approximating more closely the output of the mines at Black Lake.

A more curious deposit, however, is that known as the Broughton mine. The asbestos here is apparently confined to a single vein, having a hanging wall, in places, of soapstone. This vein was remarkable for its large size when first worked, being at times nearly or quite a foot thick, as well as for the great silkiness and softness of fibre. It had more the aspect of a well-defined vein, and has been worked for a distance of several hundreds of yards, and to a depth of about 70 feet. In the lower workings, however, it decreased rapidly in size, and at last split up into minute strings, rendering it worthless. Another peculiar feature observed at one of the mines near the Coleraine station is the presence of mica, or a similar mineral, associated with the asbestos veins, or in close proximity to them, and occurring in irregular fissures in the rock, of several inches in width. The rock is much shattered, and the mica is not, in so far as yet observed, found in any of the other mines in this section of the country.

In many places the serpentine is intimately associated with masses of soapstone. In such cases, while occasional small and irregular veins of asbestos may be seen, in none of those examined has the quantity, with the exception of the vein at Broughton, just described, been found to be of much economic importance.

The slate quarries, of which a number have been worked to some extent, occur at various localities throughout the Eastern Townships, and are presumably all confined to the slaty portions of the Cambrian system. Several of these were started in the colored bands of what was formerly styled the Lauzon and Sillery divisions of the Quebec group, where red and green shades are common; others were located in what were regarded as slates of Upper Silurian age, the later investigations in the field having very conclusively shown however that their true position in the geological scale is much lower. At the present time, owing to various causes, the economic extraction of slate is confined to but two places, viz., that of the New Rockland quarry, near Melbourne, and that near Danville. The output of the latter is almost entirely confined to school-slates, while that of the Rockland Company embraces roofing-slates, billiard-table tops, mantels, etc. The character of this slate is reported equal to that of the Welsh quarries.

An interesting feature at the former place, geologically speaking, is the contact of the slates with the serpentine, probably by a line of fault. A ready demand exists for the output from both these quarries, and a large force of men is employed. The New Rockland quarry especially has an excellent plant, with a magnificent water power, transmitted to the works by cable, and an outfit of cable or travelling derricks, which work to perfection. This quarry has at present a depth of 200 feet, and is connected with the line of the Grand Trunk railway, four miles distant, by a narrow-gauge road, by which a great saving in the cost of transportation is effected.

The lime works of the Dudswell Lime and Marble Company are well worthy of notice, both for their very considerable extent and for the great purity of the lime manufactured. They are located on a belt of limestone of Upper Silurian age, which is in places highly fossiliferous, and which rests on the one hand upon Cambrian and pre-Cambrian rocks, and on the other upon the Cambro-Silurian sediments of the great eastern area. In certain portions the limestone has been altered to a highly crystalline and compact marble, which, when polished, presents a very attractive appearance, the corals, of which much of the rock is composed, being well brought out. Other portions of the marble show an intricate banding of dark or blackish shades, alternating with yellowish tints, forming the variety known locally as "black and gold," and which has been very favorably compared with the celebrated Porter marble of Italy. Several thousands of dollars have already been spent in

testing the value of this marble deposit, and the rock, a short distance below the surface, appears quite solid, so that large and compact blocks can be readily obtained. The stone for burning is obtained from large ledges of a dark or grayish rock, in places also crystalline, which in the upper quarry presents a nearly vertical face of 80 to 90 feet. This is in close proximity to the kilns, of which there are 10 in all, 6 in the upper or older works and 4 in the lower and newer works, about a half mile distant. Each of these kilns is stated to have a daily capacity of 300 barrels of lime, so that the entire output is not far from 2,500 to 3,000 barrels daily. The lime manufactured is remarkable for its purity, the foreign matter in the rock averaging not more than 1 to 2 per cent., and has already obtained such a reputation for excellence that it controls the market throughout a large part of Quebec and Ontario, and through the adjoining States as well.

It would scarcely be doing justice to the mineral wealth of the Eastern Townships should we omit all mention of the gold-fields of this district. Discovered first in 1835 by a daughter of one of the *censitaires* of Mr. C. DeLery, in a small stream called the Touffe des Pins, a branch of the Chaudière River, that gentleman, on being made aware of the fact, easily confirmed it by examination of the locality, and obtained several pieces of considerable value. Subsequent explorations of this stream and its tributaries showed that the gold was scattered over a very considerable area, being, in fact, obtainable in greater or less quantity in nearly all the branches of the Chaudière, as well as in the bed of that stream where it was accessible, nearly from the boundary of Maine to that of the seignior of St. Marie.

The limits of this gold-field were gradually extended, and it was found on examination, both on the part of the Geological Survey and by private individuals, that the metal could be obtained, by simple washing in the pan, from the sands and gravels of nearly every stream south from the Chaudière to New Hampshire and Vermont. The character of much of the gold over this area was so fine that the returns were not found to repay the labor of hand-washing, but in certain portions, notably in the upper Chaudière and its branches, and in the south-eastern portion of the province, in the township of Ditton, much coarse gold existed, from which nuggets of large size were obtained, reaching a value in some cases of over \$1,000. The greater part of this coarse gold was water worn, but occasional large pieces were found which were comparatively ragged and had quartz attached.

For some years the source from which this gold was derived was a question not clearly understood. It was first regarded as belonging to the quartz-veins which occurred in the crystalline schists of the Notre Dame range of hills, which traverse a considerable portion of the country in a northeasterly direction, the materials from their disintegration being spread over a considerable area to the south. The age of the rock underlying the area in which the gold was most commonly found was, at that time, regarded as Upper Silurian.

On the upper branches of the Chaudière, and on the Du Loup stream, heavy beds of gravel occur which were deemed worthy of a careful test as to their value as a source of gold; and a series of washings, made in 1851-52, under very disadvantageous circumstances, however, and with very ordinary appliances, showed a very fair margin of profit to operations if conducted in the large way and with a proper expenditure of capital, many of the large areas of gravel being found sufficiently rich to warrant such an enterprise. Unfortunately, the only attempts of any considerable importance in this direction, either through lack of proper management or other causes, do not appear to have been so successful as anticipated; an experience, however, that should not be held as conclusively establishing the unprofitableness of the entire section.

The Ditton area, being entirely in private hands, has furnished no official returns from which the quantity of gold obtained from this district can be ascertained; though, from the coarse character of the gold there found, and the fact that certain persons have carried on mining continuously for many years, it is evident that much rich ground exists on the upper branches of the Salmon River. The appliances for mining and saving the gold appeared to be of the crudest kind, no provision existing for the extraction of the finer portion of the yield. Nuggets of \$50 to \$150 are reported from this place, and many quartz-veins traverse the black slates and sandstones which form the country rocks. Some of these are, without doubt, auriferous, from the fact that ragged gold in quartz is found in close proximity to them.

The largest operations in gold mining have been carried on in the Beauce section, and principally on a branch of the Chaudière River, known as the River Gilbert. Here, also, the mining was of a very crude kind; but though the returns for this area are largely incomplete, the official figures show that for 1877 to 1883 a very considerable quantity of gold was obtained, even under the very unfavorable conditions that prevailed. Much of the gold was very coarse, large nuggets being frequent. Owing to litigation and other causes, the mining on this

stream has, to a large extent, been abandoned, though a large part of the old river channel, from which the greater part of the gold was obtained, yet remains untouched.

The presence of these old river channels in the tributaries of the Chaudière River is a very important feature in connection with the profitable extraction of gold in this locality. Indications of these are visible on the Famine River, the Pozer stream, the Gilbert, which has been worked to some extent and already referred to, the Des Plantes and the Millstream, where successful mining is being carried on at the present time. The bottoms of these channels, which are, in places, many feet below the present water courses, of the streams, contain several feet of well-defined river gravel cemented with sand and clay, in which the greater part of the coarse gold occurs, the upper portion being largely occupied with quicksands, gravel and clay. On the Millstream, also, there appears to be a great lack of appliances for saving the fine gold, the greater part of which is undoubtedly carried down the sluices and lost in the main stream.

A series of essays and examinations, conducted by Messrs. Hunt and Michel, and published in the *Geological Survey Report*, 1866, shows conclusively that many of the quartz-veins in the Chaudière district contain gold in paying quantity. The greater ease of working the gravels, however, and the present lack of capital, has, as yet, diverted attention from the working of these quartz-leads. This lack of capital is, to some extent, due doubtless to certain peculiar conditions of tenure of the lands which are not considered satisfactory to those contemplating investment in this direction. If these were put on a proper basis, and the country thrown open as a mining district, good results would certainly follow.

It will, however, probably be found that the most profitable fields of investment will be confined to the areas of Cambrian slates, and, judging from the fact that the largest nuggets have been obtained in close proximity to certain well-defined quartz-veins which occur in the vicinity of lines of anticlinal structure, the principle now generally admitted in the Nova Scotia gold-fields, that the paying leads are located near these anticlinal axes, will doubtless be found to apply to the gold-fields of eastern Quebec.

In this connection it may be mentioned that in their character the slates and hard sandstones of the Quebec gold-fields are very similar to those of Nova Scotia, and they in all probability belong to the same geological horizon. The southward extension of the Ditton gold field should be looked for and found in that portion of New Hampshire adjoining and lying on the upper waters of the Connecticut River between the Hall and Indian streams. Since black slate and schistose sandstones have been reported by Prof. Hitchcock as there existing, precisely similar in lithological character to those of the Ditton area, and since the strike of the beds in both places is continuous, the valleys of the streams in that section should be also auriferous.

Of argentiferous galena, rich veins are known to exist, more especially in the Cambrian rocks of the Chaudière River, and upon the Du Loup, one of its principal branches from the east. Assays from some of these veins show a percentage of silver ranging from \$30 to over \$400 per ton. The veins are of good size, but the largest deposit, that of Risborough and Marlow, is at present accessible with difficulty. This will be shortly overcome by the proposed extension of the Quebec Central Railway, which is to cross this area, then these properties should become very valuable.

Of the iron ores it need only be said that deposits occur at various points, some of which are of great purity and excellence. The great drawback, at present, to their successful working is the lack of suitable fuel for smelting, wood for charcoal being generally too scarce in the immediate vicinity, while the geological formations in Quebec and Ontario are such as to render the chances of finding coal in either province an impossibility. Should the problem of cheap transportation of coal, either from the mines of Nova Scotia or from those of the United States, to some central point, such as Montreal or Sherbrooke, ever be solved, it is confidently anticipated that these ores will form no inconsiderable factor in the mineral wealth of eastern Quebec.

The deposit of antimony near Garthby has been known for many years, and beautiful specimens can be obtained there, but the lack of a market, in view of the occurrence of large veins of the mineral in Nova Scotia and New Brunswick, and the lack of facilities for extraction on the spot, have hitherto interfered with its successful development. This, also, is one of the problems that should be solved in the near future.

It will be seen from this sketch of some of the leading minerals in this portion of the Dominion, that the chances for the profitable investment of capital in several important lines are not few. Improved methods of mining, a more extended market, and, in the case of the gold, greater security of title to those desiring to invest with a view to scientific mining operations will do much to improve them. The great value of these several industries is only now beginning to be understood, and it

can be safely predicted that before many years the mining industries of this section will take a much more prominent position than they have ever yet enjoyed, and will be regarded with increasing favor as a field for profitable investment by capitalists both at home and abroad.

The Geological Relations of the Principal Nova Scotia Minerals.*

BY E. GILPIN, JR., HALIFAX, N.S.

Any estimate of the economic mineral value of an unvisited district is to the mining engineer largely a comparative one. If he knows that certain minerals characterize any given geological horizon he naturally draws upon his experience of the same ores as met by him under similar geological conditions. And if he has not had the personal experience, the investigation of the geology of a similar district as given in a trustworthy report enables him to lay a fair basis for conclusions.

In a general way these conclusions are of value, and while they pronounce on the possible mineral fecundity of a given district, they often give a decided rebuttal to startling statements of discoveries of ores.

The number of the geological horizons in Nova Scotia is limited, but they are well developed, in some cases typically, and exert a prominent effect on the agricultural and industrial distribution of its inhabitants.

The following table, based on Sir William Dawson's *Acadian Geology*, will serve as an outline for my notes:

Modern.

Triassic sandstone and trap.

Permo Carboniferous.

Carboniferous { Upper coal measures.
Productive coal measures.
Millstone grit.
Marine limestone.

Devonian { Lower Carboniferous.
Upper Helderberg.

Upper Silurian { Oriskany.
Lower Helderberg.

Clinton.

Lower Silurian.

Cambro-Silurian.

Cambrian, Longmynd series.

Laurentian.

This list is intended to refer rather to the divisions known to contain ores, than to be a complete geological scale of the province.

Geographically speaking, in Nova Scotia proper these divisions are represented as follows: On the Atlantic coast are the Cambrian of the gold-fields with their associated granites. Then follow the measures of the Cobequids running through Cumberland, Pictou, Colchester and Antigonish counties, supporting Silurian and Devonian strata, the latter being met also in the western part of the province. The Carboniferous occupies the gulf shore, and much of the district surrounding the basin of Minas. The Triassic measures are met in narrow fringes and outliers around the Bay of Fundy. In Cape Breton the northern part of the island is largely composed of Laurentian, which occurs also between the arms of the Bras d'Or Lake. The Carboniferous rests on it, and forms fringes, while it is replaced in Richmond county by several large areas of Devonian.

Taking the divisions in descending order, their best known minerals are:

Modern.—Beds of bog iron-ore, manganese wad, peat, infusorial earth and clays are frequently met. A number of years ago the iron ore was smelted in connection with older ores, at Clementsport near Annapolis. Deposits of considerable extent have been observed in Shelburne, Queens, Kings, and Pictou counties, and no doubt exist at many other localities. The wads are met in Cape Breton at several points, in deposits of considerable size, yielding from 20 to 40 per cent. of ore with water, iron, silicious matter, etc. Smaller deposits are not unfrequently found, but as there is no demand they are not sought after. The deposits of infusorial earth have been used locally for insulating steam pipes, and as an absorbent in the manufacture of dynamite.

Triassic.—The trap and associated ash-beds yield numerous varieties of zeolitic and other minerals. At several points they are penetrated by veins of massive and crystalline magnetite and specular ore of remarkable purity. The thickest vein that has come under the writer's notice, of magnetite, was about 15 inches wide.

At numerous points, most noticeable at Margareville, copper ores, principally carbonates with native copper, are found in veins in the trap and ash. These veins have been explored several times without success. No records have been made of the "low-grade" values of these rocks, and I believe from the frequent occurrence of copper ores over so wide an extent of territory that locally, beds may be found carrying the disseminated metal in amounts of economic value. The associated sandstones,

*Read at Ottawa meeting Am. Inst. M.E.

red and friable, yield no building stone of value, and as yet have furnished to the miner only a few tons of manganeseiferous ochre.

Permo-Carboniferous.—In the great mass of sediments covering large areas in Pictou, Colchester, and Cumberland counties, and presenting fossil evidence of a transition from the Carboniferous to the Permian, there are few minerals of economic value. A few thin seams of coal are met, with fire-clay. At numerous points the sandstones and shales present irregular bedded masses and layers of copper ores, principally gray sulphurets, with films and coatings of carbonate. These ores are associated with fossil plants to whose presence their deposition is to be attributed. Hitherto, attempts to find these ores in workable amounts have not been successful. A sample from Caribou, near Pictou, gave:*

	Per cent.
Copper.....	40.00
Iron.....	11.06
Cobalt.....	2.10
Manganese.....	0.50
Sulphur.....	25.42
Lime.....	0.92

Admirable varieties of building stone, variously tinted sandstones and free-stones have been quarried from these measures.

Upper Coal Measures.—These strata in general resemble those noticed in the preceding section. There is however more coal; and layers of clay iron-stone are frequently met.

Productive or Middle Coal Measures.—The principal mineral of this formation is coal, which is worked in Cape Breton, Pictou and Cumberland counties. Deposits are known in five other counties, but have not been worked to any extent. The production last year was about 1,700,000 tons. The coal is bituminous, and the writer is not aware of the occurrence of any hard coal, although several discoveries of graphitic shale have been heralded as anthracite mines. Speaking in general terms the Cape Breton coal is the most bituminous, that of Cumberland less so, while the Pictou coals rather approach the semi-bituminous or steam variety. All the districts furnish coke of fair quality.

The following average of an analyses, from a paper on Canadian coals, read before the Montreal meeting of the British Association, will serve to show the variation in quality:

	Cape Breton.	Pictou.	Cumberland.
Moisture.....	0.75	1.19	1.46
Vol. combustible matter.....	37.26	29.10	33.69
Fixed carbon....	58.74	60.63	59.35
Ash.....	3.25	9.34	5.50

The fire-clays accompanying these coals have never been systematically tested as to their value for fire-brick. Some that have come under my notice are too high in alkali and iron, while others theoretically were of satisfactory composition. An investigation into the capabilities of the fire-clays of Nova Scotia would form an object worthy the attention of the Canadian Geological Survey. Beds of cannel and oil coal, and of bituminous shale, are frequently met, but are not at present of economic value.

Beds of clay iron-stone (in a few instances of the black band variety) up to a thickness of 12 inches are numerous. The following analyses made by me are samples from the Pictou coal field:

	Clay Iron-stone.	Black Band.
Moisture.....	2.132	0.732
Iron protoxide....	45.361	36.000
Alumina.....	16.962	3.180
Silicious residue...	0.780	16.546
Lime.....	trace	3.780
Magnesia.....	1.655	0.783
Manganese.....	trace	4.450
Sulphur.....	0.612	0.214
Phosphoric acid....	trace	.586
Carbonaceous matter	6.140
Carbonic acid.....	27.589
Metallic iron.....	35.00	28.000

Millstone Grit.—The dividing line "between the millstone grit and productive measures is not a fixed one, and consequently there are workable beds of coal in its upper part referred to this horizon, but practically belonging to the productive measures. Throughout this range of measures thin seams of coal occur at numerous points, but in the presence of the larger and better known beds they have not yet received attention. At the Joggins, Cumberland county, large quantities of excellent grindstones are made for local use, and for export, and numerous beds of quarry rock are known.

Marine Limestone.—This horizon is very strongly developed in Nova Scotia, and to its presence is due the fertility of the central and northern part of the province, for its gypsum, limestone, and marl yield soils of permanent fertility. Its most prominent mineral is gypsum, in every variety and texture, which occurs in beds in many cases extending for miles, and reaching in thick-

ness 100 feet. It is quarried for export to the United States, chiefly near Windsor, in the basin of Minas, the annual production varying from 100,000 to 150,000 tons. A few thousand tons are annually sent up the Gulf of St. Lawrence from Cape Breton, but the export trade, on account of the difference in freight, is from the Windsor district. Limestone is equally abundant, and is burned for local use, and used in rough masonry, and at Walton, near Windsor, furnishes a beautiful red stone, which it is said will first be used in the new buildings of a prominent New York newspaper. At several points these limestones carry deposits of manganese, lead, iron, and copper ores and barytes. The manganese is met as pyrolusite with a little hard ore, and is of remarkable purity, carrying very minute amounts of iron. It brings a price varying up to \$100 a ton, but the demand is limited. I am not aware of any deposits of these ores adapted to the steel-makers' purposes. Tenny Cape, Onslow, and Loch Lomond are the best known mines.

The iron ores are limonite, red hematite, and spathic ore. As yet the ores of this series are little worked, but they are of undoubted value. The purity of some of them may be shown by the following analysis of a sample from Brookfield:

	Per cent.
Water.....	11.36
Silica.....	1.54
Sulphuric acid.....	trace
Phosphoric acid.....	trace
Metallic iron.....	60.00

The spathic ore occurs in beds, the limonite and red hematites as contact and replacement deposits. The lead-ores occur as small segregated veins, and as aggregates. The silver contents of the Nova Scotia lead-ores are variable, assays have returned as high as 100 ounces, but the average would not exceed 10 ounces. The copper-ores resemble in composition and mode of occurrence those already described. Celestine, fluorspar, and brine and mineral springs also occur in these measures.

Devonian (Upper Helderberg, Oriskany).—In the hills lying to the south of the Annapolis valley are numerous important bedded deposits of magnetite and hematite. The ores vary in character, but some are of excellent quality and favourably situated for mining and exportation. In Guysboro' county the Devonian measures carry several large deposits of specular ore of good quality, but as yet unproven. The ore is presented in veins and in large masses, and may be connected with the dioritic dykes found at this point. It occurs under similar conditions near St. Peters. I believe that by some the copper-ores of Pilsbory Lake and Lochaber in Antigonish County are referred to this horizon. These deposits are connected with igneous dykes, and, as far as they have been explored, appear very promising, but their distance from shipping, etc., has diverted attention from them.

Upper Silurian.—(Lower Helderberg, Clinton).—In Pictou and Antigonish counties, strata which are referred to this age carry important deposits of bedded red hematites, varying in thickness up to 50 feet. The ores are silicious, but frequently free from sulphur and phosphorus; their metallic contents vary from 35 to 50 per cent. Owing to their size and accessibility they can be cheaply mined, and will probably be utilized in connection with the richer ores found in their vicinity.

Lower Silurian.—These measures, as developed in Cape Breton carry several beds of red hematite, and deposits of copper pyrites and sometimes cupriferous iron pyrites.

Cambro-Silurian.—This term has been provisionally applied to the mass of strata forming the Cobequid hills and reappearing in Pictou County. The ores occurring in these measures embrace several varieties of hydrated and anhydrous peroxide. At Londonderry the limonite occurs with a little specular in a large interstratified vein containing ankerite and sideropelites, the latter being used to some extent in the furnaces of the company operating at this point. Magnetites have also been met in parts of this range. In Pictou County the ores occur in interstratified veins in the ankerite, but are principally specular. Copper and gold ores are reported as occurring in this range, but I am uninformed concerning their economic value. The deposits of antimony-ore, at Rawdon, Hants County, have been worked for several years, and are probably extensive. Their exact geological horizon is not yet clearly known, but they are referred to here.

Cambrian (Longmynd).—The only mineral of economic value yet found in these measures is gold. The strata are slate and quartzite lying in large abrupt folds, which have permitted the intercalation of the gold-bearing quartz-veins, varying in thickness up to 12 feet. The gold is also found disseminated in some of the beds of slate. Copper, lead, zinc, iron, and molybdenum sulphides occur with the gold in the quartz-veins, but not in amounts of economic value. The auriferous territory is estimated to cover 3,000 square miles, and as the annual production of gold is only about 23,000 ounces, there is ample opening for miners.

Laurentian.—This series is widely distributed in Cape Breton, and roughly speaking is divisible into the felsite and the limestone series. They contain red hematite, in places magnetic, of excellent quality, although some are reported to be rather high in phosphorus for Bessemer purposes. Copper ores, graphite, asbestos and mica are also found. The limestones are frequently altered into marbles. Some of the deposits are beautifully tinted, and are said to be adapted for building and statuary purposes. At present the West Bay (Cape Breton) marble is largely burned into a lime of excellent quality, which is used in the province, and exported to the United States, etc. To complete the parallel between these Cape Breton strata and the Laurentian rocks of the vicinity of Ottawa, there remains to be discovered in the former "Phosphate Rock," and there appears to be no reason for its absence.

Copper ores are found at numerous points and are undoubtedly valuable as they are widespread and at the surface show well, but up to this date no decided steps for development have been made except in the case of the copper ores of Coxheath, near Sydney. Here the Eastern Development Company has proved several large veins carrying copper in workable amounts to a depth of 300 feet. The ore is calcopryrite with erubescite, and carries considerable amounts of gold and silver. Molybdenite also occurs in small disseminated grains and nodules at several points, and a few lots have been shipped to England.

In summing up these brief notes it may be said that the visitor to the province would place the minerals, irrespective of any development effected, in the following order: Coal, Iron, Gold. It is perhaps unusual to find these three so close together.

Parties desiring extra copies of this issue should write at once for them as no spare copies can be furnished within ten days succeeding publication.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,

Halifax, N.S.

North-West Mounted Police.

RECRUITS.

APPlicants must be between the ages of Twenty-two and Forty, active, able-bodied men of thoroughly sound constitution, and must produce certificates of exemplary character and sobriety.

They must understand the care and management of horses, and be able to ride well.

The minimum height is 5 feet 8 inches, the minimum chest measurement 35 inches, and the maximum weight 175 pounds.

The term of engagement is five years.

The rates of pay are as follows:—
Staff-Sergeants.....\$1.00 to \$1.50 per day
Other Non-Com. Officers.....85c. to 1.00 " " "

	Service pay.	Good conduct pay.	Total.
1st year's service, soc.	—	—	50c. per day.
2nd " " " "	50	50c.	55 " "
3rd " " " "	50	10	60 " "
4th " " " "	50	15	65 " "
5th " " " "	50	20	70 " "

Extra pay is allowed to a limited number of blacksmiths, carpenters and other artisans.

Members of the force are supplied with free rations, a free kit on joining and periodical issues during the term of service.

Applicants may be engaged at the Immigration office, Winnipeg, Manitoba; or at the Headquarters of the Force, Regina, N.W.T.

ALFRED SMITH, M.E., Etc. Etc.

IS OPEN TO ACT AS

Consulting Engineer to Gold Mining Companies.

Examinations and Reports on Mines carefully made out and prepared. The treatment of refractory ores a specialty. Estimates made for the erection of the most approved machinery for treating. First class references in England, Nova Scotia and the U.S.A.

ADDRESS:
ALFRED SMITH, - - - Sheet Harbor, N.S.
Cable Address.—Tapsmith, Sheet Harbor.

PHOSPHATE LANDS FOR SALE

600 ACRES

IN THE

BOBB'S LAKE DISTRICT, ONT.

These lands are on the Surveyed extension of the proposed Brockville, Westport and Sault Ste. Marie Railway, and are located within four miles from Station on the Toronto and Ottawa Division of the C. P. Ry.

Splendid show for developments made. Highest grade of ore. Half interest for sale; or owner will convey an interest for cost of slight further developments.

Further particulars by addressing,

P.O. Box 126,

SAULT STE. MARIE, ONT.

SEALED TENDERS marked "For Mounted Police Clothing Supplies," and addressed to the Honourable the Minister of Railways and Canals, will be received up to noon on Wednesday, 26th February, 1890.

Printed forms of tender containing full information as to the articles and quantities required, may be had on application to the undersigned.

No tender will be received unless made on such printed form. Patterns of articles may be seen at Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party decline to enter into contract when called upon to do so, or if he fail to supply the articles contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to any newspapers inserting this advertisement without authority having been first obtained.

FRED. WHITE,
Comptroller N.W.M. Police.
Ottawa, January 24th, 1890.

LEDOUX & COMPANY,

10 CEDAR ST., NEW YORK,

Engineers, Metallurgists & Assayers.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

THE BELL TELEPHONE CO. OF CANADA.

ANDREW ROBERTSON, PRESIDENT

C. F. SISE, VICE-PRESIDENT

C. P. SCLATER, SECRETARY-TREASURER

HEAD OFFICE, - MONTREAL.

H. C. BAKER, Manager Ontario Department, HAMILTON.

This Company will sell its instruments at prices ranging from \$10 to \$25 per set. These instruments are under the protection of the Company's patents, and purchasers are therefore entirely free from risk of litigation.

This Company will arrange to connect places not having telegraphic facilities with the nearest telegraph office, or it will build private lines for firms or individuals, connecting their places of business or residences. It is also prepared to manufacture all kinds of electrical apparatus.

Full particulars can be obtained at the Company's offices as above, or at St. John, N.B., Halifax, N.S., Winnipeg, Man., Victoria, B.C.

Want Column.

Fifteen cents per line; no advertisement to occupy less than two
lines. Orders for this column, and for all transient advertisements,
must be accompanied by cash.

Remittances.

Remittances should always be made by Bank Drafts, Cheques or
Post Office Orders, made payable to the Manager. American
Postage Stamps are of no use to us whatever, and will not be
accepted in payment of small amounts.

Co-Operation Invited.

The publishers earnestly request the co-operation of readers of
the REVIEW for information, communications that can be utilized,
suggestions, news items, etc., etc. All such should be addressed
to the Editor.

Vol. IX. MARCH, 1890. No. 3.

The Duty of Mining Machinery.

In another place our readers will find a full
report of the recent debate in the House of
Commons upon the question of a remission of
of the present tariff upon imports of mining
machinery. A measure which will ensure the
admission free of duty of all mining machinery
not manufactured in the Dominion, and which,
at the same time, will grant a reasonable pro-
tection to those manufacturing interests already
established in our midst is eminently desirable,
and will do much to further and promote the
development of our mines. The subject will be
discussed again when the Budget is before the
House; and from all we can learn there is
every indication that a measure, such as we
have indicated, will be adopted.

Some Proposed Changes in the Ontario Mining Laws.

The General Mining Act of Ontario, 1877,
has long been a legitimate subject for criticism,
having some few good points, some bad ones,
but the most very indifferent. It is a matter of
notoriety that under the provisions of this Act
large areas of valuable mining lands have been
sold and are now lying idle, no provision re-

garding their mineral development having been
coupled with the patent given by the Govern-
ment. It has therefore been with considerable
curiosity and some hope that we have examined
the two Bills which have been brought forward
in the Ontario Legislature this winter, amending
or supplementing the General Mining Act.

We may confess to a little disappointment in
finding that these Bills cover only two of the
many sections or divisions of the Act requiring
revision, and that the defect alluded to above
has not been included. One of these Bills is
entitled "The Mining Claims Act of 1890,"
and deals only with that portion of the public
lands which has not been sold, *i.e.*, vacant
Crown lands. To some minor points of this
Bill (to which detailed reference is made later)
exceptions may honestly be taken, but the bill
as a whole is good, its recommendations are
many, and it is a decided step forward and in
the right direction. The mode of procedure to
be followed by a discoverer in order to obtain a
mining claim is set forth in a plain, direct and
explicit manner, devoid of any technicality not
easily understood by the average prospector.
In examining this Bill the following points have
occurred to us, and we give publicity to them,
not in any spirit of adverse criticism, but wish-
ing to help on, if possible, a good work already
begun:

To section 5 a provision might be added re-
quiring that a duplicate of the rough sketch
accompanying the application should be posted
on a board set in a conspicuous place on the
claim pending the survey of such claim by a
P. L. S., and that when so surveyed a copy of
the surveyor's plot and field notes be so posted
until a patent for the same has been issued and
accepted. This is not an absolutely necessary
feature, but we think it strongly advisable that
every possible step should be taken at the be-
ginning to prevent the possible clouding of a
title, and to prevent or lessen the chances of
the same ground or a portion thereof being
staked out by a junior claimant; thereby avoid-
ing the risks of conflict and subsequent liti-
gation.

In section 6 some reference might be made
as to the provincial land surveyor tying his sur-
vey to some natural or permanent monument
when in unsurveyed lands. Perhaps a reference
to the meridian would be better, but would in-
volve the surveyor's using solar attachment for
their instruments. Any measure looking to the
fixing of what have been called "floating
claims" is most desirable, and will be welcomed
in the mining districts.

It is hard for us to see the force of the ob-
jection contained in these words in section 7:
"But the said lands or any part thereof shall not
be re-staked by or on behalf of or for the benefit,
directly or indirectly, of the claimant, or anyone
claiming or holding through him or them." Why
a claim thus forfeited or abandoned, and by

that very action reverted back to the domain
and possession of the Crown, should not be
open to be again staked by anyone whatsoever,
even by the delinquent claimant himself, we fail
to see. It seems on its face to be a harsh and
inequitable provision, and we feel sure it can
and will be easily evaded. Circumstances are
numerous in almost every prospector's life,
whereby a claimant might be unfortunate
enough to be unable to comply, within the spec-
ified time, with the requirements of the Act. It
seems to us better to allow such an one an even
chance with others.

Possibly, also, there is room for debate as to
the wisdom (sec. 8) of any legislation curtailing
the aggregation of mining property into suffi-
ciently large blocks to warrant and induce the
investment of capital. We are aware that this
section applies only to "mining claims," and
not to lands obtained by "purchase or other
wise," but the reasoning may be as valid for the
one as the other.

The Bill, however, as we have said before, is
good and should pass, and we hope sincerely
that other Bills, looking to the remedy of other
deficiencies and inaccuracies, will be introduced.
There are still many sections of the General
Mining Act which are defective; for instance,
we hope to see the qualifications of the Inspec-
tor put upon a higher footing; such officers
should be competent, educated and trained
mining engineers, as well as petty justices of the
peace. A provision also is needed granting (as
in the United States and Nova Scotia) a right
of way over any and all mining claims or loca-
tions, for roads, ditches, canals, tunnels, etc.,
when required for the working of other mining
properties, providing at the same time proper
safeguards for the damages occasioned thereby.

Another Bill which has been introduced is
called "An Act to regulate mining operations."

This Bill is simply a necessary piece of regu-
lating legislation; it is modelled (in places *ver-
batim*) upon the "Mines Regulation Chapter"
of the Nova Scotia Statutes, but is neither so
full nor so effective as the latter. There is need
of such an Act, and but little criticism can be
made upon its provisions.

Section 11, however, requiring that notice be
sent to the Inspector every time a new shaft is
commenced, or the working of an old one is dis-
continued for two months, is entirely unneces-
sary, excepting in coal mines, and in the Nova
Scotia Statutes these provisions are expressly
confined to coal mines.

We also think Section 13 too weak; no law
can be framed too strongly which prohibits abso-
lutely the holding, by an Inspector, of any
interest whatever, however slight or small, direct
or indirect, in any mine situated in any district
under his jurisdiction; and the penalties cannot
be too large or heavy.

We note, also, the omission from this Chapter
of any provision for a second or escapement
shaft. This is an important omission, and should
be remedied.

Iron Ship Building in Nova Scotia.

The Province of Nova Scotia presents an almost continuous line of sea shore, and even the narrow isthmus of Chignecto connecting it with the mainland will soon be crossed by a marine or ship railway, so that it would then be fairly termed an island, as a vessel can make a circuit around it. Its shores do not present long unbroken ranges of inhospitable cliffs, but harbor succeeds harbor, and these open on sheltered bays. This convenience of shelter, and the proximity of large tracts of timber forests, gave rise to a large lumber business. The absence of roads and the accommodating ocean highway at every man's door, invoked a vigorous coasting trade. It is, therefore not to be wondered at that the Nova Scotians, with their natural mechanical ability turned readily to wooden shipbuilding, big ships to carry lumber, and equally big ships to sell to foreigners, smaller ships to carry fish, etc. to the West Indies, and coasters to carry coals to the United States, and to collect fish from every cove of Labrador and Newfoundland for the distributing centres, and a great fleet of schooners and brave little boats for fishing in the rough surges of the shore banks.

Thus grew the graceful procession of vessels, and daily there slid from the sloping ways, the trim schooner, and the stately barque full rigged, and waiting only her cargo to set sail. This went on until some careful compiler of statistics found out that every man, woman and child in the Province owned enough tonnage of shipping to give each a vessel of their own. Finally some hard headed man conceived the idea of making steam compete with sails, and of pitting iron against wood. The barques built in the sunny creeks of the Bay of Fundy from the pleasant grooves of the uplands were confronted by the products of the gloomy iron and coal mines of Glasgow and the Tyne.

Thin of skin, carrying great cargoes, paying few men, disdainful of breezes, the ocean tramps soon secured the shipper's favor. Until at last the sailing vessel close pressed, finds occupation in charters where time and cargo combine to equalise the price of a ton of coal. The coaster finds her freight gone when a sturdy steamer runs from port to port with the regularity of a railway train, and a few tons of coal neutralise a breeze which meant hours of watching for the best built fore-and-after.

This applied to the province means that broadly speaking Othello's occupation is gone, for now when the cordage, iron, canvas, provisions, etc., can be provided at home, the coal shipping harbors and the mercantile ports, instead of the crowds of square rigged vessels of a decade passed, show only a few rusty steamers. These boats, carrying some 2,000 tons, load rapidly, steam away and return to the coal shoots in a few days from Montreal and Quebec. Long and narrow, numerous hatches receive the coal, and a half score of rattling steam winches rapidly discharge the cargo on the wharves. The steamers monopolise the trade of the Gulf. Some return

empty to the harbors of Pictou and Sydney, while others readily carry at nominal rates, return cargoes of flour, etc., and in the fall they disappear to engage in the general carrying trade of the world.

The force of the inevitable has been conceded; a steamer is now purchased by the local capitalist, who used to build a schooner in his back yard. The question is "could not the steamer be built here by the sons as profitably as the barque or schooner was by their fathers?" To realise the problem it is necessary to notice the conditions under which the shipbuilding trade has grown abroad. In the chief English ship yards are great stores of iron and steel, and the closer the ship yard is to the iron ore and the coal mine, the cheaper the steamer can be built.

In Canada these favorable conditions exist in Nova Scotia, and Pictou and Sydney can be pointed out as localities well adapted for building iron vessels. At Pictou Harbor immense deposits of iron, coal and limestone lie within a radius of a few miles, in a district traversed by railways, and well cleared and settled. Much has been said of the cheap pig irons of Alabama and Tennessee, but American iron masters have repeatedly predicted that it can be made much cheaper by many a per cent. at this point. The ores are of almost all varieties, adapted for steel, as well as for the cheaper grades used for many industries. At Sydney Harbor the distance between the three requisites is greater, but water and railway communications are favourable enough to neutralise this. Both these points can draw upon the large deposits of iron ore known to exist in Labrador, Newfoundland and Quebec. In brief, it may be said that at no point on the seaboard of the American continent, except perhaps in British Columbia, are the conditions for this business as favourable as in Nova Scotia. The Province resembles Great Britain in this respect, and the eye of the doubter fails to see why the new Scotia may not worthily rival the ship yards of the Clyde.

Conceding the fact that every advantage is offered here for making cheap iron for building ships, their engines, etc., the question arises, what is to become of the fleet of the Golden Hope—where will they sail, who will buy them? At present there is work enough for one ship yard to meet the demand for steamers in Nova Scotia alone. Not only are the old wooden steamers which plied between Prince Edwards Island, Nova Scotia and United States ports being replaced by new iron vessels, but new lines of trade are being opened up. The western and southern shores of Newfoundland, Labrador, Prince Edwards Island, the outports of Nova Scotia, all are being rapidly connected by lines of steamers, and the projectors are finding their pioneer boats too few and too small.

Why should the gulf coal-carrying trade not be in the hands of those who are also shareholders in the Nova Scotia coal mines and fac-

ories, and why could not the provincial ship's husband tend with equal success the freights of this class of vessel, succeeding by the inexorable laws of progress to the more interesting sailing vessel of his youth? Iron barges, propellers, river boats; the great lakes and the St. Lawrence, should absorb many a ton of iron ore and coal, to provide transportation facilities. Along the coast there are required tug boats, launches, and coasting steamers for the lumber and pulp mills, the lobster factories, the fishing stations, the West India trade and all the industries that spring up when assured of regular and cheap transportation. And as even yet sailing vessels find a vocation in certain trades, an iron built or a composite ship will secure a market, or yield a return at least equal to that received from the same class of vessels elsewhere.

Already in the Pictou district there are foundries, forges and shops engaged in the construction of engines, boilers, etc., and very slight changes in plants would permit the construction of an iron steamer of moderate tonnage, the pioneer of a fleet equal in speed, strength and capacity to those now engaged in our waters but moulded and riveted from provincial iron smelted from provincial ores, and owned and navigated by the successors of those who built and sailed our wooden fleets.

Natural Gas in Ontario.

At the meeting of the American Institute of Mining Engineers held in Ottawa last October, a paper was read by Mr. Chas. A. Ashburner (since deceased) on "Natural Gas Explorations in the Eastern Ontario Peninsula," by which he meant the Niagara district. This paper contains observations on the relation between petroleum and natural gas, and on petroleum and gas in Western New York, but the part of most interest to us is that referring to explorations for gas west of Niagara river. Mr. Ashburner, having been a leading expert in these matters, and therefore to be considered as, in some sense, a public man, we think we may be entitled to criticise his remarks, notwithstanding that he has unfortunately died since this paper was read. Mr. Ashburner came to the conclusion, among other things, that "little hope can be entertained of finding gas in commercial quantities in the Trenton limestone under the Eastern Ontario (Niagara) Peninsula," also that "it cannot be expected that gas would exist in any of the strata in commercial quantity unless the gas-reservoir stratum is covered with at least 400 feet of superincumbent strata; nor can it be expected that gas will be found in any two or three different strata in the same well." Now, we do not see any ground for the first of these statements. We do not see why gas may not be found in the Trenton group under the Niagara Peninsula as well as in Ohio or anywhere else. Mr. Ashburner shows that in the region in question this group is 677 feet thick, including the "Quebec limestone" which, however, is a formation we do not know anything

about, and it certainly does not exist in Ontario. As to the second of the conclusions referred to, we fail to understand why the author has placed the requisite thickness of superincumbent strata at this particular figure. We should think that more depends on the nature of the strata than on its thickness, and that 400 feet of some kinds of rocks would be more than sufficient, while of others this would be far too little. A comparatively thin band of impervious shale or clay, if firmly compressed by other strata, would be sufficient to hold down the gas.

The St. Catharines well which was sunk for gas to a total depth of 2,200 feet was not a success, but the section thus obtained through the different formations will be of much value or future reference for geological purposes. By combining the results obtained in the wells bored for gas at Buffalo, Port Colborne and St. Catharines, Mr. Ashburner thinks the most likely horizons for finding it are the upper part of the Medina and the lower part of the Salina formations.

Since the time of Mr. Ashburner's visit to this district, Mr. E. Coste is said to have obtained gas in two wells, half a mile apart, about midway between Welland and Fort Erie, but in what quantities we have not been able to ascertain. Early in the present winter Dr. Bell, of the Geological Survey, was consulted as to the prospects for obtaining natural gas by boring at Forest, on the line of the Grand Trunk railway, and just south of Kettle Point on Lake Huron. As this place is underlaid by gas-producing rocks, and lies directly in the line of the Cincinnati anticlinal, he had no hesitation in encouraging the proposal to bore. The result was that gas was struck at a very moderate depth in the first well sunk. At first the pressure was very strong, but we understand it has since diminished considerably. The wells at Kingsville in Essex county are situated upon the same line, which Dr. Bell had laid down distinctly upon Logan's geological map a considerable time before the first well was started at Kingsville, and he had fully described the course of this line in his paper on "The Petroleum Field of Ontario," read before the Royal Society of Canada on the 27th of May, 1887, and published in full in the REVIEW. If, therefore, any credit is to be given for laying down this line it is clearly due to this gentleman.

The Future of Nickel Steel.

Some most remarkable statements, of great interest to the steel trade, were recently made by Mr. S. J. Ritchie, of Akron, Ohio, the well-known head of the Canadian Copper Company owning the celebrated Sudbury mines. It is understood that Mr. Ritchie visited last summer the principal iron and steel works of Great Britain and the Continent, and that the following statements are based on his investigations:—
"Within the last year nickel has come to assume a very important place in metallurgy as

an alloy with steel. These results have been obtained in Great Britain, in France and in Germany. In France the cartridge shells are made of an alloy of equal parts of nickel and copper. In Great Britain large guns for the navy are being made of an alloy of nickel and steel. This has also been done in an experimental way in Germany, but heretofore and before the discovery of the nickel deposits in Canada, the supply of nickel was so small and the price so high that it would have been impossible to have supplied any considerable want, even had its utility been known. The Iron and Steel Institute of Great Britain is composed of the most prominent manufacturers of steel both in Great Britain and upon the Continent, and it has at its meetings many American manufacturers. The discussions at its annual meetings represent the best talent and skill in everything pertaining to iron and steel that is to be had in the world, and its conclusions are the highest authority to which we can appeal. About one year ago this institute appointed one of its most competent members, a manager of the Steel Co. of Scotland, to make an extensive series of experiments with this alloy. This he did, and reported the results of his efforts to the meeting of the institute, held in London, May 8, 1889. This report has attracted the attention of steel manufacturers all over the world. No results approaching the high elastic limits and breaking strain of those reported from this alloy had ever before been seen. I myself saw a piece of this steel, made by the house of William Jessop & Sons, of Sheffield, which contained about six per cent. of nickel, and which was one inch square, that sustained a weight of 108 tons, and also showed a high elastic limit. These results were so wonderful that parties in Europe, who manufacture guns and armor plates for three principal governments, have offered to contract for our companies' entire production for a period of ten years. The proportions of copper and nickel in the ores belonging to our mines are just about those used by the French Government in the manufacture of cartridge shells. The proportions of iron and nickel are about what are used in nickel-steel, which it is proposed to use in the manufacture of guns and armor plate."

Wire Rope Fastenings.—In a paper read before the American Society of Mechanical Engineers, by Mr. Wm. Hewitt, a description is given of the behaviour of the fastenings which were employed in making tests of wire ropes. When using ordinary spliced-in thimble it was found that the strain elongated the thimble, forced one end past the other, which cut one or more of the strands so that the rope almost invariably broke in one of the splices. With conical sockets the rope pulled out under a strain, varying from one-half to three-fourths of the breaking load. A cast steel rope, two inches in diameter, was tested with socket fastenings prepared in the usual way with the addition of an annular wedge driven in around the core, with the result that the wires pulled out of the socket about three-quarters of an inch, and the rope then broke under a load of 266.250 pounds, being 71½ per cent. of the tensile strength of the individual wires of which it was made. The method of capping ropes in Britain is noticed, and it is suggested that the fastening might be made more secure by employing nuts to force up the rings which surround the joint.

LETTERS TO THE EDITOR.

Public Museum for Ontario.

Toronto, 20th March, 1890.

SIR,—At last Toronto appears to be awakening from its long torpor in relation to popular and practical science. With everything to boast of as to situation, intelligence, wealth and material progress, it is one of the few great cities of the world without even an approach to what is worthy of the name of a museum. The Province of Ontario is rich in minerals. Few countries are so favored. Here in the east we have apatite, marble and iron—to the west are apparently inexhaustible stores of petroleum and salt—at the north lie the richest deposits of nickel that are known to exist anywhere! Not to mention European cities, if we look at those of the United States, Australia, New Zealand, Tasmania, Chili and the Argentine Republic, we find there vast collections of the mineral products of the several countries—even Costa Rica has its national museum; but Toronto has none. Outside of Ottawa, the best geological collection is said to be in the small town of Elora, some fifty or sixty miles west of Toronto. A few specimens collected by the Ontario Mining Commission are on exhibition at the Canadian Institute, but what a paltry display for so great a yield. Toronto requires a first class collection in the interest of education as well as in that of material development; for the student as for the miner; for the tourist as for the prospector; for the citizen as for the foreign capitalist.

The Ontario Government threw away a splendid chance to move along the right line when it sent the beautiful specimens shown at Philadelphia, to an obscure hiding place at the Falls of Niagara—specimens too, which some of those who presented them assure us were given only upon the understanding that Toronto was to be the place of exhibition.

It is now freely acknowledged that the eye is one of the best mediums through which we can receive instruction, and while this holds good relative to other departments of human knowledge also, our plea has reference chiefly to the products of the quarry and the mine. Ontario is proud of her educational system, but here there is a yawning gap.

Again, for utilitarian purposes a museum has no equal. Here should be seen samples of all that is yielded by the country, and in connection with the collection one should be able to procure reliable information regarding location, output, percentages, routes of travel, markets, prices, profits, losses, and the hundreds of other particulars that practical men want to know. It should resemble neither a toy-shop nor a raree show, but ought to be purely and solely an illustrative, industrial mining bureau. Every day that Ontario lacks an institution of this sort, she is losing tens of thousands of dollars, and our only fear now is, that should the present agitation bear fruit, the fruit will be so politically sown as to be unpalatable.

There is no room in an institution of this kind for soft-handed hangers-on, and the head should be a man who knows the country, who knows his business, and who will earn his salary.

Yours, etc.,
"PROSPECTOR."

A Canadian Mint.

MONTREAL, 19th Mar., 1890.

The Editor.

SIR,—I have looked over the reports of the recent debate in the Senate on this subject. The speech of the mover (the Hon. Mr. McInnes) displayed a singular want of acquaintance with the real position, in confounding silver and gold together.

I don't believe the statement that five or six per cent. is lost in sending gold to San Francisco, or that there is a similar loss in sending it from Nova Scotia. Gold dust is not gold, and there are various degrees of fineness which would account for the larger part of the five or six per cent.

Silver is a different matter. The United States have made an enormous profit on silver by what is practically swindling the public, that is, by issuing eighty cents worth of silver and calling it a dollar. They have done this on an immense scale. But things must surely right themselves some day. It would be just as easy to make the same amount of money by issuing eighty cents worth of gold and calling that a dollar. That, however, would be instantly detected and would right itself at once.

The silver fraud is now going on, and the cure of it is a slower operation.

I am rather surprised to find that our own Treasury makes money out of silver. I never heard of this before, and am not acquainted with the circumstances.

I am, yours etc.,

GEO. HAGUE.

[We should say that the Canadian profits derived from silver coined during the year ended 30th June last amounted to \$52,774.21. The earnings of the U.S. mints from all sources during the same period aggregated \$10,351,701.47, while the expenditure and losses of all kinds amounted to \$1,502,665.60, leaving a net profit of \$8,849,035.87.—EDIT.]

Phosphate Analysis.

LONDON, Eng., 27th Feb., 1890.

The Editor,

SIR,—Supplementing my preceding letter of Jan. 13th, I call your attention to a printer's error concerning the ammoniacal solution of the mixed chlorides of magnesium and ammonium employed in Maret's method of estimating phosphoric acid; where the quantity of carbonate of magnesia should be 80 grammes instead of 8.

The following is the method of estimating iron and alumina in mineral phosphates, and adopted by Maret, of Paris.

The whole of the sample is reduced to a fine powder as in the previously described operation, and 2 grammes, carefully weighed, are introduced into a small flask with 15 cent. cubes of strong hydrochloric acid. (If the sample be rich in iron and alumina, say over 5 per cent., then 1 gramme will be found sufficient.) The contents of the flask are maintained in ebullition for a few minutes, then diluted with about 30 cent. cubes of distilled water, a crystal or two of chlorate of potash added and ebullition continued until the greater part of the free chlorine be eliminated. Filter into a precipitating beaker; the volume of filtrate should not exceed 350 cent. cubes after due washing. When quite cold add 2 cent. cubes of glacial acetic acid, followed by liquid ammonia, drop by drop, and with stirring, until the appearance of a permanent precipitate; a weak solution of ammonia is then added until the whole possesses a distinct, yet faint alkaline reaction; further, add 2 cent. cubes of glacial acetic acid and allow to stand a few hours. The clear liquid is then decanted through a filter, the precipitate follows, and the filter is allowed to drain. Return the precipitated phosphates to the beaker, employing a little dilute hydrochloric acid (water 9 to acid 1) to remove last traces from the filter, and to redissolve the precipitate in the glass. A second precipitation similar to the first is now effected, except that one half a gramme of neutral phosphate of ammonia is added to the liquid previous to the treatment with ammonia. After standing a few hours the whole is filtered on the same filter as employed in the previous operation, and the collected precipitate is duly washed with distilled water, drained, dried, and afterwards calcined at dull red heat. It consists of the mixed phosphates of iron and alumina:—

This residue is treated in the same capsule which served for the calcination, with a few cent. cubes of hydrochloric acid, the excess of which is subsequently evaporated by application of a gentle heat; take up with water and introduce the solution into a small flask to be there reduced to the lowest state of oxidation by pure zinc and sulphuric acid—the titration of the iron is then ascertained by permanganate of potash as usual. The quantity of iron found being calculated into $\text{Fe}_2 \text{ P}_2 \text{ O}_8$, this latter is then deducted from the weight of calcined residue, above mentioned, and the phosphate of alumina thereby ascertained, and from which the weight of the alumina ($\text{Al}_2 \text{ O}_3$) is deduced. This method is fairly rapid and practical.

I am, etc.,

J. LAINSON-WILLS.

New York, March 7th, 1890.

The Editor,

SIR,—I am very greatly interested in the discussion which has arisen in your columns upon the letter addressed to you on the 17th November last by Capt. R. C. Adams. Will you excuse me if I ask permission to occupy in connection therewith, a small portion of your valuable space?

In the January "REVIEW" Mr. J. L. Wills, after describing what is known as the "Maret" process for determining the phosphoric acid in phosphate ores, says, "I have thoroughly tested this process myself, and find it reliable and expeditious!" In the February "REVIEW," Mr. J. T. Donald, after explaining that the chemists of the world are "almost a unit" in using the "Molybdate" process, remarks, "I am surprised to see Mr. J. L. Wills advocating the method of analysis he outlines in the January REVIEW! The method, which is uncertain, and likely to give too high results, has for some years been almost universally discarded in favor of

the Molybdate method." In the same issue of your journal, Capt. R. C. Adams returning to the charge, and replying generally to his commentators, observes, on the subject of the analysis, that, "his (Mr. Wills') prescription of Maret's method of analysis is said by our best authorities (?) to be defective."

Now, sir, I am very curious indeed to discover, if possible, upon what or whose authority Messrs. Adams and Donald make their sweeping charges against this so-called "Maret's method?" Can they justify it themselves on any truly scientific grounds? Can they point out in the method, properly conducted—any inherent source of error? I do not believe they can!

During the past three weeks the whole of the fertilizers and phosphate rocks sent to this laboratory have been analyzed in duplicate. The determinations of phosphoric acid have been made—simultaneously and with equal care—by the Maret and the Molybdate methods. The following results are selected from our agenda:

Date.	Serial No.	Nature of Material.	Maret's Method.	Molybdate Method.
February 1890.	1.	Mixed Fertilizer.	13' 270	13' 247
	2.	"	10' 111	10' 105
	3.	"	18' 900	18' 900
	4.	Bone Black.	31' 130	31' 320
	5.	"	28' 700	28' 530
	6.	Bone Meal.	29' 150	28' 970
	7.	"	28' 630	28' 640
	8.	S. Carolina Rock.	26' 420	26' 310
	9.	Canadian Apatite (ground).	37' 000	37' 200
	10.	"	39' 640	39' 511
	11.	"	32' 185	32' 300
	12.	"	40' 320	40' 321
	13.	Refinery Residue.	29' 100	29' 410
	14.	Acid Phosphate No. 3.	13' 150	13' 200
	15.	S. Car. Phosphate (ground).	26' 000	25' 799
	16.	"	27' 300	27' 270
	17.	Florida Phosphate Rock.	32' 200	32' 600
	18.	"	34' 190	34' 189
	19.	"	16' 930	16' 900
	20.	"	24' 740	24' 732

The figures speak for themselves. If they serve no other purpose, they may stimulate the gentlemen I have named to further investigation, and thus teach them the folly of intemperate and ill-considered denunciation.

Yours etc.,

FRANCIS WYATT, PH. D.

The Geological Maps of Nova Scotia.

HALIFAX, March 19th, 1890.

The Editor:

SIR,—At the risk of being thought a "damned insane visionary," as a silver-tongued statesman once called the first miner who proclaimed the discovery of gold in Nova Scotia, may I add to what you say in the CANADIAN MINING REVIEW for November and February another reason for continuing the publication on a larger scale of the Geological maps of Nova Scotia.

That this province, with an area of only 17,500 square miles, one-fifth of which is occupied by lakes and arms of the sea, supports one-tenth of the population of the Dominion, and from mines scattered over every part of its surface yields more than one-fourth of the total annual production of minerals in the Dominion, or ten times that of the neighboring province of New Brunswick, (which has an area of 28,000 square miles), has made it so well known that geological map-making seems to be the best if not the only scientific work which the Geological Survey can find to do.

Its history has been written by Judge Haliburton (Sam Slick), Brown, Murdoch, Campbell, Longfellow and Bourinot, and is the history of the early settlement of North America from Europe. Its geographers are Church and Mackinlay, Gisborne, Mackenzie and Murphy. For the language of its aborigines we have Dr. Rand's Micmac Dictionary; for their folk-lore, Leland's Algonquin Legends. In archaeology and ethnology there are books by Patterson, Gilpin and Piers; and the social life and habits of the people may be studied in the novels of Haliburton, Pro-

fessor De Mille and Cozzens. The game and fish of the forests and streams are described by Hallock and Capt. Hardy; the scenery of the lakes and mountains by Howe and Roberts, Osgood and Morton, Warner and Farnham, whose descriptions are brightened by photographs, sketches and paintings such as those by Mason and others who follow the annual pilgrimage of tourists to the beautiful shores of the Bras d'Or Lake and Bay of Fundy.

And of observers in natural science there are names of eminence and authority. In botany and zoology, Professor Lawson, MacKay and Morrow, Drs. Gilpin and Sommers; in meteorology, Allison and Poole; in mineralogy and chemistry, Professors How, Harrington and Marsh, Alger and Jackson and Mr. Gilpin, the head of the department of mines; in palaeontology, Sir William Dawson, Professors Hart, Salter, Owen and Hall, Leidy, Billings, Davidson, Matthew; in general and descriptive geology, Sir William Logan, Sir Charles Lyell, Gesner, Brown, Campbell and Fletcher, Drs. Honeyman, Selwyn, Hunt and Ellis; in reports on special mining districts and geological formations, Poole, Gilpin, Rutherford, Hamilton, Hartley, Routledge, Barlow, Barnes, Robb, Heatherington, Professors Hind, Lesley, Chapman, Sillimon, Browne and Lyman. An abstract of many of the conclusions which fill thousands of pages of valuable contributions to science from these and other observers is contained in Dawson's Acadian Geology, a large book of 800 pages.

Since, therefore, the Geological Survey cannot do better what has been done by all these specialists, its aim should be to correlate their work and extend it when done in isolated localities.

To miners, explorers and those engaged in scientific research in a mining district, maps are of the first importance. This was clearly and strongly stated in a report on the gold-fields of Nova Scotia made in 1871, by the present director of the Geological Survey, who, while admitting that the various country maps (usually published on a scale of one mile to an inch) show accurately the course of the roads and the general outline of the streams and lakes in their vicinity, points out that "the want of even approximately correct topographical maps of the gold districts is a serious hindrance to their development . . . and to the progress of geological investigations . . . and every dollar expended towards their production eventually becomes an annual saving to the country." In 1881 he began, conjointly with the Provincial Government, a survey of these gold-fields, which comprise nearly one-half of the superficies of the province, to prepare for the use of prospectors a general map for which "after careful consideration a scale of half a mile to one inch was decided upon as the most suitable." Since that time, although the grant from the local government was soon discontinued, the survey has been carried on by Mr. Faribault, who has made a good map of the country east of Halifax which is now to be issued on a scale eight times as small as that decided upon as the most suitable, although, about a year ago, the director recommended that the provincial government "might be asked to assume the extra outlay involved in publishing on the larger scale." This outlay would not of course be nearly as great as the cost of one of the small scale sheets multiplied by the number of sheets on the large scale embraced in it, for the minuteness of detail in the former, requiring greater skill and care on the part of both draughtsman and engraver to make it even approximately correct, would add largely to its cost.

Yours, &c.,

A MINE MANAGER.

Canadian v. Italian Asbestos.—Mr. James Boyd, managing director of the British Asbestos Company, who can speak with an experience of ten years in Italy, writes to the London papers respecting the New Asbestos Company which has been formed to develop certain French and Italian properties as follows: "I have recently heard that a Canadian asbestos property has been acquired by the company holding the greater part of the Italian properties, or by parties interested in it. They could raise hundreds of tons from their Italian properties; and if they do not do so there must be a reason for it, and I believe the reason may be sought for in the fact that, whilst Canadian asbestos fibre can easily be spun into thread fit for manufacturing into rope or cloth, Italian can only be so spun on a commercial scale by the admixture of cotton, or some other material, owing to the want of cohesion amongst its fibres. Owing to the increasing steam pressures used in connection with triple expansion engines, a great increase has taken place in the consumption of packings made of asbestos cloth, and I believe it is practically impossible to make this of pure Italian asbestos. The English Admiralty have, I believe, persistently refused to put Italian asbestos packing on their list, for the reasons above stated. * * The protective tariffs, so called, in France are not so high as to prevent both Italian and also English manufacturers of Canadian asbestos goods from selling their manufactures there; and as a matter of fact, the prices in France are lower than in England."

PHOSPHATE.

In General.

The economical use of the most appropriate turnip manure was the subject of a paper read before the Strathogie Farmers' Club the other day by Mr. Wm. Scott, Corliestone, Scot. The author recounted the results of a number of experiments carried out on his farm at the instance of the Highland and Agricultural Society, who supplied the manures. The specific questions which the experimenter sought to settle were: 1st, Should the phosphate be soluble or insoluble? 2d, Should the phosphates consist of bone, mineral phosphates or Thomas slag? 3d, Should nitrogenous manure be soluble or insoluble, or a mixture of these? 4th, What proportion should the phosphates have to the nitrogen? For this experiment the kind and qualities of the different manures used were as follows: (1) Fine bone meal, 50 per cent. phosphates, and 5 per cent. ammonia. (2) Dissolved bones, 16 per cent. soluble phosphates, 21½ per cent. insoluble phosphates, and 3 per cent. ammonia. (3) Ground Charles-ton phosphate, 57 per cent. phosphates. (4) Super-phosphates, 29 per cent. soluble. (5) Thomas slag, 38 per cent. phosphates. (6) Organic manure, 7 per cent. ammonia. (7) Sulphate ammonia, 24½ per cent. ammonia.

For this experiment 10 plots of land of one-fortieth of an acre were required, as uniform in quality as possible, so that each might get the same chance for a crop. The quantities of manure were so arranged that each plot received the same amount of phosphates and ammonia, viz., 5 lbs. phosphate of lime, and ½ lb. ammonia, *i. e.*, at the rate of 200 lbs. phosphate of lime, and 20 lbs. ammonia per acre. These are the amounts of phosphates and ammonia contained in 400 lbs. bone meal which was applied to plot 1. The manures were used along with about 18 yards good rich dung, and the seed—Sittyton Aberdeen green top yellow—was sown on June 12th, the plants being carefully singled (on which the weight of the crop largely depends) on 20th July at 8 inches apart. Mr. Scott sums up the results of his experiments as follows:

Plot of 1-40th of Acre.		Total Weight of Tops and Bulbs per Acre.	
No.	lbs. bone meal...	T.	C. Q. LB.
No. 1-10	lbs. bone meal...	31	1 1 20
No. 2-13½	lbs. dissolved bones...	32	17 0 16
	— 1½ lbs. organic manure...		
No. 3-9	lbs. ground phosphates...	32	1 1 20
	— 7 lbs. organic manure...		
No. 4-17	lbs. superphosphate...	30	10 0 0
	— 7 lbs. organic manure...		
No. 5-13½	lbs. Thomas slag...	32	2 3 12
	— 7 lbs. organic manure...		
No. 6-7	lbs. organic manure...	30	2 3 12
No. 7-17	lbs. superphosphate...	34	17 0 16
	— 3½ lbs. organic manure...		
	— 1 lb. sulphate ammonia...		
No. 8-17	lbs. superphosphate...	32	10 0 0
	— 2 lbs. sulphate ammonia...		
No. 9-17	lbs. superphosphate...	35	1 1 20
	— 1½ lbs. sulphate ammonia...		
No. 10-17	lbs. superphosphate...	38	14 1 4
	— 1 lb. sulphate ammonia...		
No. 11-18	yards dung and no manure...	33	14 1 4
No. 12-18	yards dung and 5 cwt. No. 1 tur- nip manure per acre...	42	14 2 4
No. 13 -18	yards dung and 5 cwt. special mix- ture per acre...	43	2 3 12

That soluble phosphates are preferable to insoluble phosphates Mr. Scott considers the experiments have clearly brought out, and he believes it would be much more economical if much less manure were given to the turnip crop at one time, his view being that it would be more desirable not to put in what is necessary for the whole rotation with the turnip crop, but that it would be better to supply the plant food year by year, a very considerable saving being by this means effected.

Some American fertilizer manufacturers formed a pool recently to contest the State's right to impose an annual license tax of \$500 on each brand sold in North Carolina. The Farmers' Alliance propose to boycott all firms which refuse to pay the tax unless they do so under protest. This, it was thought, had settled the matter, but now there are new developments. The American Fertilizers Company, of Norfolk, Va., which had refused to pay the tax, and whose goods had been seized by the Department of Agriculture, have entered an action for a mandamus to compel the State Treasurer and Commissioners of Agriculture to issue licenses to any company, though said company should offer to pay the tax under protest. The position taken by the company is that the tax is unconstitutional, unjust and unequal in its operation, by compelling small manufacturers to pay as much on a single

brand as large dealers. The company also claims that a tonnage tax would be the only just one and that manufacturers would not object to it. It proposes to carry the matter to the United States Supreme Court. The State now derives about \$40,000 revenue from this tax.

Markets.

An English correspondent writes—The phosphate market is dull at the moment, as is customary at this time of the year, for manufacturers are busy delivering their fertilizers, and don't want to turn their attention for the moment. Sales, therefore, are not brisk; but prices are well maintained. Somme, 75 % (ground), being 17d. per unit, with ½d. rise and 70% 15d. with rise ex. c.i.f. London, as compared with 11d. and 10d. respectively 26 months ago. In fact, I see no chance of high grades falling in price owing to the small supply and increasing demand; but, on the other hand, I do not think much increase is probable. I should like to call your attention to one fact, viz., that though four years ago, when the market for fertilizers was at about the lowest point, 400,000 tons of Basic Slag and 150,000 tons of Somme phosphate—equivalent to 300,000 tons of super-phosphate—were thrown on the market, yet this enormous increase in the annual supply (700,000 tons) has been more than digested; for, as you know, prices of various phosphates have risen from 25 to 50%, and Basic slag has risen from 32/- to 52/- per ton. In fact the demands for slag greatly exceeds supply, and the use of this slag on lands where fertilizers had never been used has led to an increase in the use of super-phosphates.

Company promoting has been very slack of late, not owing to the scarcity of money but rather on account of the high bank rate.

Our latest quotations are:—Canadian 80% sold at equal to 16d., with ½ rise basis London delivery—an advance of 40% on last year's prices. Somme, 70 to 75%, selling at equal to 1/3¼. London terms, and 75 to 80%, at 1/5¼, with rise, but little on the market. Belgian scarce, and only a little 40 to 45%, and 45 to 50% available. Aruba and Curaçoa off the market. Cambridge about 50/-, but nothing offering.

Templeton District.

At the McLaurin mine, machinery is being placed, and as soon as the snow is off the ground operations will be begun on three lots. Lately only a few men have been employed, and these principally in making preparations for future work.

At the Blackburn, the owners are taking out phosphate at the rate of 15 tons per day, and expect to do so from this out right along, and better when the dry weather sets in. About 1,300 tons, representing the winter's work, has already been hauled down.

Kingston District.

The probabilities point to a large quantity of phosphate being mined in this district during the coming season, for beside the mines already at work quite a number of new properties will be worked as soon as the weather is settled. The great drawback to the district is poor roads.

The Foxton mine, which lately has been a bit off color, is now yielding as well as ever, for after sinking a few feet, a large body of rich ore was struck and operations are now being conducted on a large vein twenty feet in width.

Mr. Webster's mine at Gould Lake is working in a small way, and making an output of from three to four tons per day. The working force will be increased shortly.

At the Hibbert mine, near Sydenham, principally "dead" work has lately been done, but the pits are reported to be looking well and in good shape to mine with rapidity and economy.

Lievres District.

At all the mines on the river mining operations go on much as usual, and there is really nothing of special mention to report. All the pits continue to produce satisfactorily, and when navigation opens there should be an increase on previous years in the quantity of tonnage to go forward.

The new machinery for the Dominion Phosphate Co. (of London) has arrived at the Rapids and will soon be in place and at work.

Mr. P. H. Smith, manager of the High Rock mines, writes to say that the output from his pits, during February, was fully one hundred tons over the average, and that the mines never looked better than they do to-day.

The output from the new pit at Little Rapids, since the beginning of the year, has been sixty tons, with an average force of three men—a very creditable showing indeed.

MINING NOTES.

Nova Scotia.

At the annual meeting of the shareholders of the Inter-Colonial Coal Mining Company (Limited) held a few days ago in Montreal, the following directors were elected for the ensuing year:—Messrs. Gilbert Scott, Henry A. Budden, Peter Redpath, Robert Anderson, James P. Cleghorn, Alexander Gunn, W. M. Ramsay, H. S. MacDougall and Thomas Wilson. At a subsequent meeting of the board, Messrs. Gilbert Scott and Henry A. Budden were re-elected president and vice-president respectively, and Mr. W. J. Nelson reappointed secretary-treasurer of the company.

Darr's Hill District.

It is rumoured that Mr. Geo. W. Stuart has sold all of his interest in the famous Dufferin mine, and will devote his attention this year to the development of his valuable property in Killag district.

Central Rawdon.

Bills to incorporate the "Central Rawdon Mining Co., Limited," and the "Northup Mining Co., Limited," have been passed in the Nova Scotia Assembly. Returns from these companies for February are not yet at hand.

Waverley District.

The cross-cut tunnel which has been driving under Laidlaw's hill the past year has been stopped. It had attained a length of 460 feet and had cut several veins, but none were recognized as the "barrel quartz" vein to prospect which was the object of the tunnel. It is probable that work on the tunnel will be resumed shortly by another syndicate.

The Lake View Mining Co. have decided to proceed immediately with the erection of mill, probably of 20 stamps. The No. 6 vein in this property is enlarging going east, and now has a width of about 18 inches. The "Taylor Twin" Lode keeps its width of 24 to 26 inches. The management are still driving on the lode cut west of the fault, which is believed to be the Dominion lode of West Waverley. This lode has a width of from 10 to 14 inches, and at present is deemed worth \$40 per ton.

Mt. Uniacke District.

The Phoenix Co., after thoroughly cleaning up the openings in their mine and testing the dumps, begin this month the mining and crushing of fresh material taken from the stopes. The management are confident that the present year's work will demonstrate the feasibility of working low grade ores at a profit.

Caribou District.

It is rumoured that the Lake Lode Co. are at last going to add five stamps more to their present five-stamp battery. If, as the manager says, their vein is 12 feet wide and worth \$10 per ton, such a mining policy is entirely incomprehensible.

The property of the Truro Gold Mining Co. in this district is looking well, and as soon as the weather will permit, active developing operations will be commenced.

Stormont District.

The old "North Star" lode has been reclaimed by Mr. H. K. Fisher, of the Palgrave Co. The water has been pumped out and the incline retimbered, and mining operations will be carried on there the coming summer. The mine has been equipped with a new boiler and engine, with hoisting and pumping gear, and a large boarding-house built within 100 yards of the mine.

Oldham District.

The sale of the Oldham Gold Co.'s property has been postponed, by order of the Supreme Court, until May 3rd.

Goldenville.

Returns from this district continue to be of a spasmodic character. Nothing more has been heard of the rich strike reported last September as being found in the

eastern part of the district. During February 150 tons were crushed from the western part of the district (on the old Sutherland property), which yielded at the rate of \$9.50 per ton. Properties here are held at too high a valuation to induce the investment of capital.

Lake Catcha.

The Oxford mill is again running, with abundance of quartz ahead. The mill has been temporarily shut down to permit the cylinder of the engine to be re-bored and other parts refitted. The management report a very satisfactory saving of fuel as the result of the improvements.

Quebec.

Work in the asbestos region has been pushed with customary vigor during the past month, but the weather has been such as to throw back the production considerably. The miners are, however, looking forward to the opening of spring, and extended operations when the weather permits. As is usual at this time of the year, there is a plentiful supply of labor.

At Thetford, the different mines are working their customary force.

Messrs. King Bros. have placed an order with the Jenckes Machine Co., of Sherbrooke, for a duplicate of the plant supplied by that firm to the United Asbestos Co. (limited), Black Lake; the machinery is to be in position by May 1st. Messrs. King Bros. expect to largely increase their output during the present year.

We are informed that Mr. George R. Smith, now with the Ingersoll Rock Drill Co., has about completed arrangements with Mr. A. H. Murphy for working the property of the Thetford Mining Co. on contract this coming summer. This mine was equipped with boiler and steam hoist last fall, but by the time the machinery was put up the mine was closed for the winter.

Messrs. Lucke and Mitchell, with the other parties interested jointly in the "Wells Lot," have given an order for some machinery, which will be placed early in the spring. They propose enlarging the openings started last summer, and which show a splendid bunch of veins. The work will be in charge of Mr. H. J. Williams, New Rockland.

At Black Lake, the pits are all in operation.

The American Asbestos Co. (limited) have completed their tunnel and rise. The tunnel was driven 160 feet, and the rise is 59 feet high. They are now sinking No. 2 pit, and have no anxiety about water when the spring break-up comes. Mr. Ed. Wertheim, managing director of the company, is on the ground. About 140 men and boys are employed at these pits.

The United Asbestos Co. (limited) have their machinery in operation, and it is giving good satisfaction. At present but two drills are being worked at their pits, but we believe it is their purpose to increase the number as soon as practicable. A third pit is being opened, and derricks are to be put up at once.

The Anglo-Canadian Asbestos Co. (limited) are working their usual force. Some additional machinery will be added to their plant in the spring.

Messrs. Steele, and McDonald Bros. are erecting a building on their Lot.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

Prospecting on the Lots of the St. Julie Mining Co. and the Black Lake Mining Co. is being carried on with moderate success. Some nice samples have been taken from the latter.

Mr. John McCaw, of the Brompton Lake Asbestos Co., writes to say that he expects to have all the machinery in place at the mine and ready for work by the end of the month. A small force has been employed since the 22nd January in prospecting operations. Mr. McCaw states that five tons of low grade sent in to the Cyclone mill, at Montreal, yielded 7,682 lbs. of merchantable asbestos; the result of this test is satisfactory, as the company will be able to utilize all the short fibre, which hitherto has been thrown upon the dump and lost.

The price of crude asbestos continues to have an upward tendency, a sale by the Johnstone-Irvine Co. of one hundred tons having lately been made at one hundred and twenty-five dollars per ton. Messrs. King Bros. are also reported to have sold a similar quantity at one hundred and thirty dollars per ton, delivered on the cars at Thetford.

The Wolfestown Mining Company shipped, during last year, one hundred and fifty tons of soapstone.

At the mines of the Bristol Iron Co., Pontiac Co., good work continues to be done under direction of Capt. Symons. The following telegram, under date of 12th inst., from the consignees in Pennsylvania, speaks for itself as to the quality of the shipments being made from the mines: "Your ore is turning out splendidly; twelve cars last sampled and analysed show over 63 per cent. metallic iron and .005 phosphorus."

Ontario.

The Sydenham Mica and Mining Co. continue active operations on their mica mine. The output, which recently has been somewhat below the average, is improving again, and your correspondent is informed that the turn-out will soon be up to the old standard.

A fair quantity of mica is being produced from the Grant mine, near Sydenham. A cutting-house in connection therewith has been opened at the village.

Madoc District.

The lease of the Powell gold property, in the Township of Marmora, to a Mr. Taylor, manager of the Flinton gold mine, is reported, but at present no work is being done.

The Consolidated mines, at Delora, and the Richardson property, at Eldorado, are at present idle, with no good prospect of being re-worked very soon.

Large contracts have been made by the lessees of the Crookston quarries to supply the city hall, Toronto, and other public buildings with heavy limestone for the foundations and more solid parts. From 100 to 150 men will be employed as soon as the boarding houses are completed.

Port Arthur District.

The vigorous prosecution of the railway into the mining district has brought from the far south not a few American capitalists, who are interesting themselves in investing, and what is better, arranging for the development of recently acquired properties. Many shanties are being built, outcrops uncovered, trails cut, and other preparations are being made for extensive work.

The Board of Trade has been busy urging upon the Government the urgent necessity of a remission of the present onerous tariff on imports of such mining machinery as is not manufactured in the Dominion. A memorial has also been presented to the Local Legislature pressing for the issue of patents for lands surveyed on Hunter's Island, and also to empower local agents to dispose of applications for lands without the tedious delays now incurred in referring such to headquarters.

At the Shuniah Weachu, developments of late have been such that the stock still continues to rise in the English market. It is reported that Capt. Tretheway is about to resign. From his long and intimate acquaintance with some of the most celebrated mines, and his practical knowledge of mining plants, he would be the right man in the right place as Mining Inspector under the new Act—so thinks our correspondent.

The diamond drill at the Beaver has been down 1,600 feet, and is now operating from the surface of the ground where the Beaver vein, when produced, will form a junction with the North Bluff vein. The veins will be tested at various other points. The drill will also make tests

from the Beaver vein to the Big Harry vein. Captain Williams is timbering up the stopes, and has eight completed. It is estimated that there are 20,000 tons of milling and shipping ore ready to be stoped. The engineers are pushing the mill, and it will be ready for the spring work. The capacity of the mill is 25 head of stamps; this power is being doubled, and will probably be trebled if matters are as satisfactory as they are believed to be. As soon as the mill starts, 30 tons of ore will be hoisted per hour. There is some 3,000 tons of mill rock on the dump.

On the 20th ulto., the Badger Silver Mining Co. declared a second dividend of twenty-five cents per share (or five per cent.), payable on the fifth day of March. It will be remembered that, about two months ago, this mine declared a dividend of ten per cent., and that, previously to that, they had made an assessment and then returned it, so that inside of six months they have actually paid dividends upon a mining capital of \$250,000 to the extent of twenty-five per cent. The mill of the company has been shut down owing to cold weather, but a shipment of ore will be made early this month, which will likely be the last until May, when regular shipments will again commence. From last accounts, the mine is looking as well as ever. The management seem more than pleased with the country; and it is hinted that early in the summer they may take hold of no less than three other large mining enterprises, all in this part of the country.

The West End is working only a small force at present; but there is no diminution in the richness of the ore extracted.

The Crown Point has been doing further development at the west end of their vein. It is reported that an interest has been sold at a big figure, and that the force will shortly be doubled.

Operations at numerous prospects continue active and promising, and the iron deposits along the P. A. D. & M. Railway are being uncovered and tested at numerous points.

The Elgin has 200 feet of sinking, 425 feet of drifting and 75 feet of cross cuts finished. The main vein is four feet wide and will yield all the way from 30 to 600 ounces to the ton. It has not yet been touched except for the purpose of testing the drifts being made alongside of it. A force of men is working in No. 1 end to connect with No. 2 shaft, and it may be said that no piece of property shows better results and prospects for the amount of time and money expended upon it. It is now under the supervision of Capt. Hooper of the Beaver—Mr. James Emmons having charge of the men.

Sudbury District.

It is estimated that there is being daily produced at the Canadian Copper Co.'s mines about 90 pot loaves or matte, each weighing 450 lbs., an output which yields an aggregate of more than 4,000 tons of nickel a year.

Rat Portage District.

At a recent meeting of the stockholders of the Rat Portage Reduction Works Company, held at Winnipeg, Mr. R. T. Riley was appointed trustee for the Winnipeg stockholders, and the appointment of Messrs. Drewry and Riley on the directorate was confirmed. The manager reported that work on the building was progressing favorably.

Mr. R. Sims, president of the Canada Mining and Reduction Company, reports that rapid progress is being made with the construction of the new reduction works at Rat Portage. It is expected that the building will be completed and the machinery in position about the first week in May.

North-West Territories.

Advices from Lethbridge state that there are good prospects of a decided increase in the production of coal from the Galt mines during the coming year. It has been decided to sink an air shaft to connect with No. 1 ventilator, and sink and timber two new shafts down to the coal bed. Two boarding houses, providing for one hundred men, will be ready for use early next month, and if necessary, further accommodation will be provided for a large increase in the working force. The superintendent states that the company has decided to raise the output from the inclined plane to 500 tons, and that from No. 1 shaft to 400 tons per diem. More men are required for work in the mines, and also for the construction of the railway extension.

Mr. E. T. Galt states that the N. W. C. N. R. has leased their railway to the Alberta Railway and Coal

Co., and that work on the extension of the boundary will commence as soon as the frost leaves the ground.

A Special General Meeting of the Canadian Anthracite Coal Company was held at Ottawa on 20th inst. The following directors were present:—Hon. J. G. Thorp, Cambridge, Mass.; Mr. Macleod-Stewart, Ottawa; Mr. L. Painter, Menomine, Wis.; Mr. A. Pugh, St. Paul, Minn.; Mr. Coffin, Eau Claire, Wis.; and Messrs. A. Stewart and L. Crannell, Ottawa. The meeting was called to consider certain proposals from an English syndicate to acquire and work the mines of the company at Banff, N.W.T.

The Alberta Railway and Coal Company have assumed the property of the North-Western Coal and Navigation Company, Limited, and extensive preparations are now in progress to increase the colliery output at Lethbridge up to 1,000 tons daily before 1st October next, this being the date when their new railway to Great Falls, Montana, is to be completed. The length of this railway—guage 3 feet—will be about 200 miles, 70 miles being through Canadian territory. The surveys are now well advanced, and the contractors, Messrs. Grant and Ross, are at work on the American side. It is understood that grading will shortly be commenced at the Lethbridge end of the road. Contracts have already been awarded at Lethbridge for the sinking of two additional shafts and air shafts in connection therewith, and building operations for the accommodation of miners are very brisk.

British Columbia.

A letter received by the Vancouver *World* from Barkerville, Cariboo, under date of the 13th inst., speaking of the burning of the Government chlorination works, says the origin of the fire is not known; but it appears that on Monday the workmen were thawing out some of the pipes, and the supposition is that a smouldering spark did the damage. About 10 o'clock Monday evening, W. C. Price, who was left in charge, and sleeps in the engine-room, went through the building, as was his custom before going to bed, to see that everything was all right, and noticed nothing wrong. About 4.30 the next morning he was awakened by the roaring flames, and tried to get into the chlorinating-room, where the fire appears to have started; but could not, on account of the flames. He then went to some miners near by to get assistance, but the fire was beyond control, and the whole buildings were completely swept away.

At the adjourned general meeting of the Perry Creek Gold Mining Company, it was decided to issue a \$75,000 extension of the capital stock, and a number of the new shares were at once spoken for by the present shareholders. The remainder of the new stock will be placed in the hands of Bourchier, Croft & Mallette for negotiation. Several fine nuggets of Perry Creek gold are at present on exhibition in the cabinets of the firm named.

From the annual report of the Minister of Mines for the year ended 31st December, 1889, we learn that since 1858 the estimated total yield of gold and silver amounted to \$52,236,753. Last year's gold product was of a value of \$588,923, of which \$490,769 were known to have been exported by the banks, leaving some \$98,154 as having been carried away in private hands. The estimated yield of silver was \$47,873. The number of miners employed was 1,929, their average yearly earnings reaching \$330.

The quartz industry of the province has made most gratifying progress during the past year. English and American capital has been attracted into the Kootenay, Cariboo and Yale districts, and a large amount of development work has been done. Smelters for the treatment of ore have been erected at Vancouver and Revelstoke. Kootenay district has received the greatest attention during the year, that section adjacent to the line of the C.P.R. and the Kootenay Lake region in particular. From the Kootenay mines, silver ore of exceedingly rich character has been forwarded to the smelters of Helena and Butte for treatment, with excellent results, though the cost of transportation has been very heavy. Machinery for treating gold quartz has been taken to several mines. With the building of necessary railways and the establishment of rapid and cheap communication with the outer world, Kootenay Lake district gives promise of becoming one of the richest mining regions on the continent.

A Movable Platform for Inclined Planes in Mines.—The object of this arrangement is to make connection between the rails of steep inclined planes, worked by engine power, and those of intermediate level roads which branch off them to each side. It consists of

an angle iron frame, having two horizontal top bars, one on each side of the incline rails, and at the same level as the branch road rails. On one of the top bars is hinged a malleable iron plate after the manner of a trap door in a floor. When this plate is in a vertical position, in which it is kept by a counter-balance weight, it blocks the branch road, and the trains on the incline are free to pass up and down. When the plate is lowered to a horizontal position, it rests on both of the top bars, and its upper end touches the incline rails, and so forms a connection between the branch road and the incline.

The Gold Miners' Association.

The second Annual Meeting of the Gold Miners' Association of Nova Scotia was held at Halifax on the afternoon of the 4th inst. Some important changes in the by-laws were ratified, and the following office-bearers elected for the ensuing year: President, Mr. George W. Stuart, Truro; Vice-president, Mr. J. M. Reid, Oxford Mines, Lake Catcha; Secretary-Treasurer, Mr. T. R. Gue, Halifax. After a short discussion upon the geology of the gold fields, and an address from the retiring president, Mr. B. C. Wilson, the meeting was adjourned until the evening, when the annual banquet was held in the Halifax Hotel. A number of the invited guests were present. The following is a copy of the very unique (and horribly indigestible) bill of fare:

ANNUAL BANQUET.

Halifax Hotel, March 4th, 1890.

—MENU—

SOUP.		
Nitro-glycerine, with Noodles of Stearine Candles.		
FISH.		
Boiled Winze.	Fillet of Cross-cuts.	Fried Skips.
ENTREES.		
Arsenical Pyrites, a la Frue Vanner.		
Amalgamated Plates, Quicksilver Sauce.		
Air Drill Croquettes.		
REMOVES.		
Roast Quartz, stuffed with Nuggets.		
Stamp Batteries, with Amalgam Jelly.		
Retort Gold, Borax Dressing.		
Boiled Bullion, U. S. Mint Sauce.		
GAME.		
Baked Whin, with Poverty Dressing.		
Waverley Tunnel, Barrel Quartz Sauce.		
SALADS.		
Floured Quick Salad. Assay Office Mayonnaise.		
VEGETABLES.		
Mashed Fusees, with Damp Caps.		
Fried Upraises.		
Boiled Back Staples.		
Sweet Dynamite.		
PASTRY.		
Jumbo Plum Pudding, Pennyweight Sauce.		
Oxford Breaks.		
Rawdon Bricks.		
Dufferin Pie.		
Wine Harbor Jelly.		
Pick Cheese.		
Shovel Crackers.		
DESSERT.		
Pinched Lodes.		
Pickled Dies.

Buckets.		
Shoes.		
Ropes.		
Sheaves.		

Duty Trials of Pumping Engines.

Purchasers of pumping engines often stipulate that they shall give a certain "duty" before they are taken off the contractor's hands, and in cases in which the duty is likely to fall short, disputes sometimes arise between the builders and the experts making the trials as to the allowance to be made for certain things—as to whether the duty is to be calculated on the actual quantity of water delivered or on the plunger displacement; whether any allowance should be made for the friction of water in the pump passages and pipes; and in the case in which the boilers are not supplied by the same contractor, and the evaporation of so many pounds of water is fixed as being equivalent to the combustion of one pound of coal; as to whether the pound of coal is to be taken as the equivalent of the water evaporated from the temperature of the feed water in the pond; also as to whether only dry steam should be charged against the engines, and also to what allowance, if any, should be made for steam consumed by the feed pump engine. The methods of gauging the condition of the fires at the beginning and end of the trials are open to variation in the practice of different individuals, and the reports are not made so that a fair comparison can be instituted between the different engines. "Without doubt," the author concludes, "many of those unsatisfactory features are due to the fact that duty trials are often conducted by civil engineers whose training and experience does not qualify them for expert work of this character, and such tests, while they may be perfectly sincere, cannot be regarded as authoritative.

Concentration of Low-Grade Ores.

(By Henry F. Armitage, Lake City Colo.)

The object of this paper is to give a few useful hints on the concentration of low grade ores. The machines that I shall speak of are Cornish rolls, revolving screens, Hartz jigs, spitz-lutte, and the Linkenbach buddle, (or Roberts's patent buddle as it is called in Colorado). I think the reason why some of them have been discarded in favor of more recent inventions is that they have not been given a fair chance to do their work in a satisfactory manner.

Cornish rolls are usually looked upon as a machine designed simply to crush the ore as a preliminary to sending it to the sizing-screens, beyond which they have nothing to do with dressing the ore. On the contrary the rolls give the key-note to the whole process. It is well known that one class of rock will crush differently from another, and from the result obtained by passing the ore through the rolls, the size of the first revolving screen and the surface required on the jig-screens must be determined. If it is found that the mineral crushes clear from the quartz, a large mesh can be used on the first sizing-screen, and the tailings will not require recrushing; but if it is found that some of the tailings from the first jig are ragged, (that is, are carrying off particles of mineral sticking on the quartz,) it will be necessary to recrush them. Again, if a large percentage of the tailings carry off mineral, it will be more economical to commence with a finer mesh screen than to recrush the tailings.

Having determined the best mesh to use on the first sizing-screen, the different sizes on the other screens can be determined from it. I have found for practical purposes that, commencing with a 6-mesh, the next should be 8, then 12, and finally 18. The holes in the jig-screen should be a trifle larger than in the revolving screens. For instance, if the revolving screen is made of No. 14 wire, the corresponding jig-screen should be of No. 16 wire. The jig-screen surface required for each size made depends on the way the ore crushes in passing through the rolls, and this is shown by the quantity of crushed ore passing through each revolving screen. Supposing, for example, that the sizings are 6, 8, 12 and 18, and it is found that 40 per cent of the crushed ore passes through the 6-mesh screen, 15 per cent through the 8-mesh screen, 15 per cent through the 12-mesh screen and 30 per cent through the 18-mesh screen; then, if three-compartment Hartz jigs are used, it will require two three-compartment jigs to treat the ore from the 6-mesh screen, one three-compartment jig to the eight, and one three-compartment jig to the 12-mesh. The 18-mesh jig catches everything that is fine enough to pass through the 18-mesh revolving screen, and it is necessary to separate the finer slimes from the ore before it is allowed to go on the jig. I have found that a spitz-lutte does this work most satisfactorily. As I have not seen one in any other mill in Colorado, I present a sketch of this very simple machine.

It consists of two inverted cones, one inside of the other. The inner cone is suspended from a frame by a threaded bolt fastened to a cross-brace, *aa'* on the cone. The outer cone rests on the dead water tank, *cc'*. The ore and slimes after passing through the 18-mesh revolving screen, run into the inner cone and pass through the perforations, *B*, at the bottom, into the space between the two cones. Here they encounter an up-current of water coming from the pipe *bb'*. This pipe is connected with a tank at sufficient height to give the required head. The finer slimes are separated and washed out at the point *cc'* where they run into the trough, *EE'*, surrounding the outer cone and are carried to the buddle-table by the spout *F'*. The heavier particles of mineral and quartz fall into the hopper, *A*, and are drawn off by the stop-cock *G*, on to the jig. By raising or lowering the inner cone, by the screw and nut *ee'*, the space at the point of discharge can be increased or decreased. It is essential that this space should be of the same area as the area of the space at the point *H*, so that the up-flow of water will be of uniform velocity from the starting point at *H* to the discharge at *cc'*. This flow is regulated by the valve, *K*, and by it the quantity of slimes sent to the buddle-table can be controlled. The stop-cock *G*, is kept open only sufficiently to let the ore that falls into the hopper *A*, run off to the jig.

This machine will take off all the slimes and let the ore of proper size go to the 18-mesh jig, the quantity being about 20 per cent of the ore crushed. As this ore, being very fine, takes longer to settle and pass through the jig-screen than the coarser sizes, I find it better to increase the number of compartments on this jig. This refers to ores that contain galena, gray copper, yellow copper, and iron pyrites, and from which it is necessary to save and separate these minerals. In doing this on a three compartment jig, I found the copper minerals and pyrites were crowded out at the tail-gate before they had time to settle and pass through the jig-screen. But if the ore has to pass over five or even six compartments before reaching the tail-gate, it has had time to settle through the beds and the tailings will be clean.

The Linkenbach buddle was fully described in a paper by Mr. Richard F. Rothwell, read at the Boston meeting

Fig. 1.

Section of Spitz-Lutte

Feb. 1883, (*Trans.* xi. 475). It is a stationery table with rotating water sprays, which I consider an excellent apparatus for treating low-grade slimes, but like jigs, it must receive fair treatment to be able to do its work well. The slimes as they come from the spitz-lutte carry too much water. The whole of the water used on the revolving screens, together with that used in the spitz-lutte for washing out the slimes, would run on the buddle and prevent it from doing its work as it should. To prevent this excess of water from reaching the buddle, I let the slimes run into a hopper-shaped tank and draw them off from this to the buddle. By making the slimes from the

I do not think it is advisable to increase the number of strokes when the stroke is shortened; that is, to run the finer jigs at a higher speed than the coarser ones, as this has a tendency to disturb the bedding, though I believe it is done in many cases.

In bedding the jigs, the best plan is to bed each compartment with the same ore which that compartment is going to handle. In treating an ore containing galena, gray copper and iron pyrites, bed the first compartment with galena, the second with a mixture of galena and gray and yellow copper, and the third with yellow copper and iron pyrites. The bedding of each jig can be ob-

Fig. 2.

Slime-Tank

spitz-lutte discharge at the bottom of the tank, as shown in the accompanying sketch, very little can rise to the surface of the tank, and get away by the overflow, the slimes being sucked out by the pipe *kk*, as fast as they are delivered. The valve *L* must be left open sufficiently to allow the slimes to pass to the buddle without accumulating in the tank, the surplus water passing off at the overflow. The middlings from this table, consisting of the lighter ores, I carry to a Frue vanner.

The length of stroke given to the jig-plungers is a matter to be determined by experience. No rule can be given, since the difference of fit of the plungers in the jigs would change the effect of any given stroke.

tained from the headings of the preceeding jig. To obtain bedding for the first jig, put into the first sizing-screen a small section of larger screen. If the first screen is 6-mesh, put into the screen a strip of 4-mesh wire-cloth 6 inches wide, which will allow enough ore of the proper size for bedding to pass to the first jig and keep the bed supplied. This will save the time and trouble of having to crush and screen ore to make this bedding.

By close attention to the bedding on the different compartments, a perfect separation of the different minerals can be made. If the headings of the first compartment show any copper, the bed is not heavy enough, and if the headings from the second compartment show galena, the

bed on the first compartment is too heavy.

On the jigs use the least possible quantity of water to do the work, but be liberal with water on the revolving screens. The water in the jigs should be perfectly clear. If the jigs are muddy, slime is sticking on the ore, instead of being washed off in the revolving screen and going to its proper place on the buddle table.

DISCUSSION.

RICHARD PEARCE, Argo, Colo.—The subject of the concentration of low-grade ore is one of special importance to Colorado at the present time.

The State has hardly kept pace with other districts in that branch of mining industry. It has been customary for Colorado miners to sell their ores to the smelters in mass, just as it comes from the mine, but now the necessity for concentration is coming to be more plainly seen especially in the low-grade ores of certain localities, not favoured by cheap facilities for transportation to the smelters. It must be remembered, however, that in some instances concentration is accompanied with heavy loss in gold and silver. In the concentration of a mass of auriferous chalcopryite in a gangue of quartz in California, only 40 per cent. of the gold was saved, the valuable mineral being finally distributed in the quartz. As an example of the opposite character, the London mine, between Leadville and Alma, may be cited, where, in concentrating from 4 tons to 1, there was a saving of over 90 per cent. of the gold. The gold in this case was contained in the pyrite.

CHARLES J. MOORE, Leadville, Colo.—The results attained by concentration at Leadville are not entirely satisfactory, and the work is not thought to be good unless 80 per cent. or more of the lead is saved. The ores subjected to concentration are chiefly sulphides—pyrite, galena and blende. The silver occurs most generally in the galena and blende, not in the pyrite, except in those parts of the Leadville district where the ore occurs in fissure-veins, in granite country, or in porphyry dykes, in which cases I have noticed the pyrite often to be the principal silver-vehicle, or, at least, equal to the blende as such, the galena taking the third place both in quantity and relative silver value. In these veins also is found considerable rhodonite or manganese silicate, but, as a rule, this mineral shows little affinity for silver; it is often, however, impregnated with pure pyrite and nearly pure galena, the former in the largest quantity, as we should expect from the frequent association of manganese and iron.

The percentage of saving of silver is less than that of lead, seldom amounting to more than 60 p. c. This is explained by the fact that, owing to the objectionable behaviour of the blende in the furnaces, this mineral, carrying silver with it, is allowed to go into the tailings. The problem is, how to get rid of the blende and not lose the silver it contains; or how to save all the galena with the silver it carries, and not retain so much blende as to effect the cost of smelting unfavorably. If the crushing is extremely fine, silver is lost in the form of a light sulphide that floats on water.

At Aspen there is only one concentrating mill, that at the Molly Gibson mine. The ores contain a large amount of barite, not easily separated from the ore. In some of the Aspen mines there is considerable lead, but the ores are generally dry. The gangue of the ore in Leadville is partly quartz and partly siliceous dolomite; in Aspen the gangue is principally a changed dolomite. In some mines, however, those which carry lead, the gangue is the changed blue limestone, a rock which carries from 80 to 96 per cent. of CaCO_3 .

JOHN M. DESLOGE, St. Louis, Mo.—In connection with the subject of the concentration of low-grade ores, something may perhaps be learned from an account of the German-American practice at the old mill of the Desloge Lead Company at Bonne Terre, Mo. The mill was destroyed by fire in March, 1886, and the mine is at present a part of the St. Joseph Lead Company's property. I must therefore depend considerably on my memory for the facts and figures I am able to give.

The ore yielded on an average about 7 p. c. of a non-argentiferous galena, and 1 per cent. or more of cobalt-and-nickel-bearing pyrites. These minerals occurred in an almost non-siliceous, true dolomite, containing few or no fossils, and belonging geologically to the horizon of the Lower Silurian. The rock was impregnated unevenly throughout a stratum of many feet in thickness. Bodies of ore carrying 20 per cent. of galena were not unfrequently met with, but these richer portions were mixed with the leaner rock, for it was found that better results were obtained when the ore to be concentrated was kept at a nearly uniform standard. The ordinary products of concentration, aside from the waste, were two in number; one locally called "mineral," containing about 70 per cent. of galena and 15 per cent. of dolomite, with little or no silica, and a middle product, known locally as "sulphide," consisting of about 33 per cent. of galena, 33 per cent. of dolomite, 33 per cent. of pyrite, with something less than 1 per cent. of cobalt and nickel.

The ore came from the mine in $\frac{1}{2}$ ton cars, and was dumped by cradles provided with balance-wheels, by

means of which the empty cars were quietly and quickly righted. The ore fell in front of three 9" by 15" Blake crushers; originally, two of them were of the lever pattern and the other eccentric, but, after long use, the eccentric, not having two-thirds the capacity of the others, was replaced by one of a different pattern. In regard to the use of wrought iron jaw-plates, I can say that my attention has been called to an idle crusher fitted with such plates, whose appearance as to usage and wear seems to indicate the practicability of employing that material. The ore was broken so as to go through a 2-inch ring and thence directly to three pairs of 14" by 30" Cornish rolls, with chilled tires made of car-wheel iron. These usually wore from four to six months, but, at the time of the fire, there was one pair in fair condition that had been doing an average daily crushing of 80 to 100 tons a day of moderately hard limestone since the starting of the mill, about five years before.

The coarse rolls delivered a product of hazel-nut size, which was taken by a belt-elevator in buckets holding 10 pounds each to three sets of 9 mm. screens, 3' by 8'. All that was too coarse to pass through the screens returned to the rolls for recrushing. The ore that passed through fell upon three sets of 7 mm. screens, 3' by 6'. The screen-openings were all round-punched.

The sized ore between 9 mm. and 7 mm. went to three pairs of 2-sieved roughing-jigs with lever slot-motion, the speed being in proportion to the arc travelled. The stroke was $\frac{3}{8}$ inches with 100 revolutions a minute. The sieve-wire was No. 8. A Lake Superior Collom roughing-jig was, after some service, abandoned, though its work compared favorably with that of the other jigs.

The ore that passed through the 7 mm. screens went to water-currant classifiers, one for each screen. Here three classes were made: one from 7 mm. to 5 mm.; a second from 5 mm. to 3 mm., and a third below 3 mm. The ore of size between 7 mm. and 5 mm. went to twelve roughing-jigs, of the same pattern as those previously mentioned, but with No. 15 sieve-wire instead of No. 8. The stroke was $\frac{5}{8}$ of an inch with 120 revolutions a minute. The ore between 5 mm. and 3 mm. went to Hartz, or eccentric-jigs. Of these there were two sets of four each with three sieves of Nos. 15 and No. 20 wire. The stroke was $\frac{1}{2}$ inch, with from 150 to 200 revolutions a minute, according to the ore.

All the jigs in this portion of the mill had the automatic cap-discharge from the sieve. The roughing-jigs had, approximately, a capacity for treating 25 tons in twenty-four hours; the eccentric-jigs a capacity of 12½ tons. The product known as "mineral" was obtained from the first compartment of the jigs, and generally, also, from the first hutch-boxes. The product from the second compartment of the roughing-jigs was usually recrushed, but that from the second compartment of the eccentric-jigs working on the stuff between 5 mm. and 3 mm. constituted the "sulphides." The product of the third compartment was recrushed and subsequently treated in another part of the mill.

The two sets of Cornish rolls for recrushing were of the same pattern as those previously mentioned, but they were run at about double the speed, making 25 revolutions a minute, and crushing 40 tons, more or less, in twenty-four hours. The product of these rolls went to a 3 mm. screen. The part that was too coarse to pass through the screen was returned for recrushing. That which passed through went to two sets, four in a set, of 3-sieve eccentric jigs, from which "sulphide" and some "mineral" were obtained. The tailings or "chats" went to settling-tanks and were thence delivered into side-dumping cars and hauled away by a locomotive running on a track of 3 foot gauge. The slimes and tailings were handled in the old mill, where there were a set of rolls, a screen, two roughing and two eccentric-jigs, two Evans and one Coggin table.

These tables were adopted after an exhaustive competition with Ritinger side-bump tables. Their capacity was at least five times that of the Ritinger tables, and they gave nearly as clean a product; they required less power and less attention, used no more water and showed less wear. The tables were used for treating slimes from the settling-tanks. Each table could treat about one ton an hour, making 60 to 80 revolutions an hour. One table was used with fair results, to treat the waste slimes of an old settling-pond. The headings of the tables were clean, and the middlings went to light-bumping tables or vanners for higher concentration.

The rated capacity of the mill was 300 tons of mine-rock in twenty-four hours, and the average work was 250 tons. The water used amounted to 1200 gallons a minute. The mill gave employment to about 33 men, including those needed for loading the tailing-cars, but not the engineers or firemen, who were engaged also for a part of their time on mine work. The approximate cost of milling was 40 cents a ton.

The breakers required the service of about 14 men. From my knowledge of the Gates crusher I am of the opinion that, for the same capacity, they would not need more than one-quarter the number.

The rolls for recrushing the finer material did not give satisfaction. The loss was about 30 per cent. on a 10

per cent. galena. This loss was due to the presence of dolomite, to which particles of galena adhered, or of fine galena which was washed away in the tailings. There was great need of pulverizers and slime concentrators that would do good work and have large capacity. Several pulverizers were tried but without success. A single-head steam stamp-mill, constructed on the principles of the Rand drill, was tried, but that failed.

For fine grinding, the Heberle mill, used by those who adopt the Lake Superior practice, and for slime concentration, buddles of the Evans pattern, with light-striking tables to take the buddle middlings, seem to me worthy of consideration where such losses like those at Bonne Terre occur. The old mill was started with 15 mm. screens; but in the other mill, where it was planned to discard down to 7 mm., less attention was given to screen-sizing, and more to the work of the roughing-jigs.

In milling our extensive deposits of low-grade ore with a low price of lead, it was commercially important for us to decide on the most economical practice, and to determine whether it were better to treat rapidly a large tonnage, even at a loss of 30 per cent. or more, or to work with a higher per centage of saving on smaller quantities. In the former case, one screen-sizing may be the best, as is the present practice of the St. Joseph Lead Company; but, in my opinion, what these ores require is two screen-sizings, the first to not over 7 mm., and the second to some finer size (unless the screen is replaced by some other modification of sizing apparatus), and good grinding and sliming machinery.

Free Importation of Mining Machinery.

In the House of Commons on 26th ulto:—

Mr. PLATT moved:

That machinery designed for use in mining operations should not be subject to Customs duty when imported into Canada for mining purposes.

He said: I desire to state that it was not at the instance of any party or parties interested in the introduction of mining material, free of duty, into this country, that I placed this motion on the Order paper. I became aware on several occasions last year that efforts were made by parties interested in the importation of mining material, to induce the Government to admit that material free of duty. I also became aware of the fact, which every hon. member I suppose is aware of, that the mining industry, although at present an infant industry in this country, is just about entering upon a period of development far beyond what many of our people realise. The vast, and I may say, illimitable mining resources of this country are becoming more and more apparent to the people, and we are looking forward to the day when the mining industry of Canada will be second in importance only to the agricultural industry. When we look over the geological map of this country, and when we read something of its mineral resources, we cannot but look forward with pleasure to the day when Canada will be *par excellence* the mining country of the world. I believe it is the duty of the Government, particularly at this time, to give every encouragement to those who are trying to develop those vast resources, and it is that view alone which has induced me to place this motion on the paper.

Mr. MARA: I am very glad to see that there are other portions of the Dominion, as well as the Province of British Columbia, which are agitating in favor of the free admission of mining machinery. Last Session, the hon. member for Cariboo (Mr. Barnard) brought this matter before the House and clearly proved that the machinery required to get out our refractory ores is not manufactured in the Dominion. He also clearly showed that the manufacturers would not suffer by the free admission of this machinery, that at present mining machinery is practically barred from entering into the Dominion, and that, if it were admitted for two or three years free of duty, the manufacturers would have a much larger market than they have at present. Since last Session, the attention of the Minister of Customs has been repeatedly called to this question by the Provincial Government, by the different Boards of Trade, and by the press of the Province, which, although divided on every other subject, is united on this. We cannot understand why that gentleman will not yield to the representations which we have made. We consider that, in a matter affecting the tariff, we have a strong claim upon the Dominion Government. We pay a very large sum yearly into the Dominion Treasury. Last year we paid in duties of Customs and Excise, \$1,100,000, nearly five times as much as the Province of Prince Edward Island, 50 per cent. more than Manitoba and the North-West Territory combined; and, estimating our population at 100,000, exclusive of Indians, we pay more than twice as much per head as any other Province in the Dominion. In a matter of this kind, affecting an infant industry, we contend that, where we can show that it will not injuriously affect any other industry, the Government ought to yield to so reasonable a request as we have made. Situated as we are, so far from the manufacturing centres of Ontario and Quebec; having to pay

a very heavy toll upon all manufactured goods taken into the Province, whether they are from Ontario or from Quebec, from the United States or from England; being, as far as manufactured goods are concerned, consumers rather than producers, the tariff presses heavily upon us. When the National Policy was framed, it was intended to protect every interest and to assist every industry. The farmer of Ontario is protected by the duty on his coarse grains and root crops; the manufacturer of Ontario or Quebec is doubly protected, first, by a high tariff on all goods manufactured into the Dominion, and secondly, by the admission of such raw material as is required for manufacturing purposes and is not the product of Canada; the coal-miner of Nova Scotia is protected by a duty of 50 cents and 75 cents a ton on coal; the iron industry of Nova Scotia is also protected by a bounty; but you will look in vain for any single article which is protected for the benefit of British Columbia, and on the free list there is not a single article intended to foster or encourage any industry in that Province. Since the discovery of gold on the Fraser River, British Columbia has produced over \$50,000,000 of gold. Almost the whole of this has been in quartz diggings. The placer mining has not been successful, and the miner has devoted his attention to quartz, which will give more employment and be of greater benefit both to the Province and to the Dominion. In prosecuting his search for quartz, he has, to a large extent, been successful. Large bodies of low grade ore have been found all over the mainland of British Columbia. In the district of Kootenay, along the line of railway, mining development has been retarded, largely owing to the mining belt being practically locked up in a dispute between the two Governments. That, I am happy to say, is settled, and we may soon look for an era of prosperity in that section. But when we take the far-off district of Cariboo, as well as the southern and western district of Kootenay, districts almost inaccessible, far removed from roads and trains, where the cost of transportation is high and living expensive, the miners and prospectors have had many difficulties to contend with. In regard to the southern district of Kootenay, that portion to which I now call the attention of the House, if hon. members will look on the map they will find that it is bounded on the south by the States of Montana, Idaho and Washington, and is only separated by an artificial or imaginary boundary line. These districts are rich in gold, silver, copper and lead; and the large output of coal and silver, chiefly from the States, has contributed greatly to the wealth of the United States during the past few years. The prospectors of quartz, labor under difficulties that the ordinary miner has not to contend with. The miners who are working placer diggings, or hydraulic mines, have, by their own individual efforts, or aided by mining companies, succeeded in working their mines, but with the quartz miner it is different. It takes years of labor and a large outlay to get a quartz mine successfully opened, and even then the capitalists have to step in before any successful working can be done. In that portion of Kootenay bounded by Montana and Idaho, the topographical features are somewhat similar to those of the States I have mentioned. The formation of rock is the same, and, as might have been expected, the miners, in their march northward across this artificial boundary, have discovered large bodies of low grade ore, and mines which will equal any of those in Colorado, Nevada or Idaho. Last year, in visiting that section of the country, I obtained a list or memorandum of shipments of ore from a few of the mines there. To show the state of development of these mines, I will read returns from the different smelting companies of the shipments of ore from that section:

Silver King....	70	230 silver,	20 p. c. copper.
No One.....	146	87 "	
Little Donald..	85	90 "	35 p. c. lead.
Spokane.....	65	40 "	70 "
Della.....	20	120 "	
Sky Line.....	15	225 "	
Krao.....	12	95 "	50 p. c. lead.
Gallagher.....	14	110 "	\$14 gold.

Mr. CHARLTON: I suppose these yields are in each case so much per ton?

Mr. MARA: In each case per ton; and I may say they are authentic. Several of the returns I got from the mine owners, and the others were furnished me by the Gold Commissioners. Now, you will see that these returns are not samples from a few ounces of rock, but returns from shipments of hundreds of tons. It may be said, that where the rock will yield such a large return, there should be no difficulty in procuring machinery or capital necessary to work the mines; and so it would be, if these returns represented the whole of the ore extracted from the mines. But this ore, when run out from the tunnel, has to be picked up by hand experts. The freight alone from the Silver King Mine to Butte is \$33 per ton, and from the Hot Springs Camp to Helena, \$26.50 per ton; so that miners can only ship the higher grade ore, and instead of shipping it away, there is now lying on the dump hundreds of tons of ore that it will not pay to move for want of mining machinery. Here we have hundreds of tons of ore that, in treating, would give em-

ployment to a great number of men, and representing hundreds of thousands of dollars, but it is lying there idle, simply because the rates of transportation are so high, and the Government impose a duty upon mining machinery so high that such machinery cannot be brought into the country. I do not think a stronger argument can be used in favor of the Government yielding to the concession we ask. I visited another mine called the Blue Bell or Hendryx Mine. In that mine, I went down 100 feet below the surface, and traced a vein of ore 87 feet wide. The greater portion of this only yields from 4 oz. to 10 oz. in silver, and one small portion yields 20 oz. in silver and gives 50 per cent. in lead. Several shafts have been sunk on this mine, the ledge has been cut across in several places, and to-day there are thousands of tons of ore exposed to view. That mine can produce more galena and more lead than is to-day consumed in the whole Dominion of Canada; and I was informed by Dr. Hendryx, one of the principal owners of the mine, were the duty taken off mining machinery, their company would be prepared at once to put in a plant that would cost about \$200,000, and the machinery alone would cost \$100,000, but they are not prepared to pay into the treasury of the Dominion something over \$30,000 in shape of duty. In discussing this question with these mine owners, who are chiefly Americans, I said to them: Now, you are Republicans in your own country, you are protectionists; how is it that once across the line you throw your protectionist principles to the wind, and you cry out for free trade? Their reply invariably was: That is not the case. We were protectionists at home, and we are protectionists here. We believe in the policy of America for Americans, and we do not blame you for insisting on a like policy of Canada for the Canadians. But we say this: You do not manufacture in Canada the machinery requisite for the treatment of our ores, and even if you did manufacture that machinery, there is no means of our getting in the Ingersoll rock drill. Steam drills are manufactured in Montreal, but they could not get one in Montreal because they had no means of taking it in from our side, and this rock drill had to go in from the American side and had to pay a duty of 30 per cent. I was informed that, instead of that one drill, there would be a dozen drills in use in Kootenay if they could be taken in free of duty. I met there a very intelligent man from Spokane, a representative of Spokane capitalists, and in conversation with him I learned that the capitalists he represented would also put machinery on the different claims in which they were interested if the duties were removed from mining machinery. He was originally in a bank at Spokane; he is a man who has some knowledge of geology and assaying, and was selected by the Spokane people to select locations for them in the Kootenay country. I asked him to give me the benefit of his views in writing, which he did a short time after, and which, with your permission, Mr. Speaker, I will read to the House. He states:

"In relation to the benefits accruing to this section by the abolition of duties upon mining and reduction machinery, I have to state that were such a measure accomplished, I would within a year have a concentrator of from thirty to a hundred tons here, as well as at least two hoisting plants, and probably a quartz mill and other mining machinery such as machine drills, etc. I am positive that at least two others would do as much more, and I further feel confident that a very large and complete smelting plant would be erected; and, of course, with the advent of these industries the progress of this section would be apparent. At present we cannot obtain these things in the Dominion, and if we could, transportation to this point is at present impossible, and that renders protection in one case a hardship, without any industry being protected, hence nothing is accomplished favorable to any party. Our ores in the main are of such a grade that we must be able to mine and reduce cheaply to insure a profit, and the margin of profit is so small that machinery on any but one or two claims would not be feasible while duties exist and transportation is exorbitant. It is apparent, then, that great things must result with the energetic working of the claims, and a vast amount of industries incidental to extensive mining accompany and follow up the new era of prosperity, and, in my opinion, all it needs to bring on this state of affairs is a little fostering by the Government in the shape of duty rebates and better transportation."

I might say with respect to the question of transportation that that is a difficulty which, I believe, will very shortly be solved. Every northern trans-continental line is now seeking an entrance into Kootenay. The Northern Pacific are about to build a line from Kootenay to Bonner's Ferry, from whence a steamer can be taken to any of the mines on Kootenay Lake. The Spokane and Northern Railway Company has an application for a charter now before the House for a line running from the international boundary near Pew Doreille, and the Canadian Pacific Railway Company are applying for a charter from Sproat's Landing on the Columbia River to Nelson on Kootenay Lake. So the difficulty with respect to transportation will soon be solved, and it only remains now for the Dominion Government to say whether they will assist the mining industry by allowing mining machinery to be admitted free of duty. It may be said by members of the Government that the letter I have read, as well as the information I have furnished, is from American sources. I admit that; but I will say this, that it is only through American enterprise, industry and capital that that section of the country has been opened. However, the same feeling pervades every other part of

the province, namely, that unless the duty is taken off mining machinery, very little advance can be made in mining industry for years to come. A few days ago, I read a letter published by a resident of Victoria, a representative of British capital to the extent of \$500,000, and the representative of a company which is doing good work in developing the mines of Nicola, in which the matter was put very clearly. I may add that he is a supporter of the Government, and a Conservative, and, being an Englishman, he, John Bull like, goes straight to the point and strikes out from the shoulder. I will read an extract from his letter. After referring to the work done in the Nicola country, he says:

"You might assist that development by more vigorously and persistently pressing for the removal of the practically prohibitory duty levied by the Dominion Government on mining machinery, without which the mines cannot be worked. The situation at present is this: The Province which owns the minerals acts most liberally to those engaged in mining. It gives them away to whoever discovers and prospects them. It makes trails and roads to render mining districts accessible. It does all this without deriving any revenue, except small sums from miners' licenses and record fees, which do not begin to recoup it for its large and generous outlay. The Dominion, which does not own the minerals, but which would gain the lion's share of benefit from a mineral development, through its heavy tariff neutralises the efforts of this Province by prohibiting the working of the mines unless it first receives a toll of 30 per cent. of the value of all machinery necessary to extract the minerals from them."

"To show you how this operates I will instance Nicola, and what applies to that district applies to all others in the Province:

"The ores of Nicola are refractory. They consequently require far more expensive machinery to treat them than free milling gold ores, which, except at and near the surface, have not yet been discovered in British Columbia. This means a large outlay and the payment of about twenty thousand dollars to the Dominion for the privilege of working Provincial mines that the Dominion never owned. I know that outside capitalists look upon this Dominion 30 per cent. tax on mining machinery as little better than a black-mailing operation, and they prefer to invest in semi-barbarous countries, such as South Africa, where they are not plundered of a portion of their capital before they have a chance of investing it, as they are at present if they venture into the Dominion of Canada."

"My opinion is that an output of precious metals from the quartz mines of Nicola and other mining districts of British Columbia will be delayed until the Dominion permits mining machinery to be brought in without the present preposterous duty being levied upon it. Every well-wisher of this Province should energetically protest the continuance of a tax which stops the investment of capital in mines and prevents the development of the greatest natural resource British Columbia possesses."

That is the opinion expressed by nearly every man, miner or otherwise, who has an interest in British Columbia. What we ask is this: that the Dominion Government should take the duty off such machinery as is not at present manufactured in the Dominion; and we contend that the manufacturers, instead of being injured, would be benefited by that measure. We say that such machinery as concentrating machinery, quartz mills, reduction mills, sampling mills, and refining works, are not manufactured here. So our request is a very fair one. We ask that the Government will take the duty off that class of machinery for a short time, and we further ask that they will remove the duty from all machinery, including motive power, in that part of Kootenay at present inaccessible from our own side. I venture to predict that in the district of Kootenay, if that policy be followed, inside of three years you will have a market for more mining machinery than is manufactured in the whole Dominion to-day.

Mr. BARNARD: I have submitted to the Minister of Finance a list of mining machinery which we hope will be admitted free of duty, and the greater part of which is not, I am quite satisfied, manufactured in Canada. I am in hopes, as all the members from British Columbia are, that the Government will be able to place some of these articles, if not all of them, on the free list. In the meantime I will defer making any further remarks on this subject, until the Minister of Finance has announced the changes in the tariff which he proposes.

Mr. CURRAN: I desire to state in regard to some of the remarks which have been made here, that I have been informed by several manufacturers that the statement, that we did not manufacture in Canada all the mining machinery required, is not correct. The manufacturers have assured me, and I have no doubt that they have also assured the Government, that they are perfectly able to manufacture in Montreal, and, I believe, in other large manufacturing centres as well, all kinds of machinery of whatever description it may be, which is required for mining purposes. In the meantime it is perfectly certain that the discussion of to-day must do good, if it does nothing else than to attract the attention of manufacturers to the statements made here, and induce them—if the distance be too far to transport the articles manufactured in either Quebec or Ontario—possibly to establish branches of their industries in that new province, where, if all that we have heard to-day be correct, there will be a very large field for them to reap a rich harvest in the manufacture of this mining machinery.

Mr. DAWSON: I would certainly favor the maintenance of the duty on such machinery as can be manufactured in this country, so as to prevent competition; but the fact is that in these new districts of Algoma and British Columbia (which must depend greatly on mining, and where there are new mines being discovered every day), it is very desirable that, until we can ourselves produce the machinery required in mining, it ought to a certain extent be admitted free of duty. There are certain

things, such as diamond drills, and complicated machinery like amalgamators, which are not produced in this country, and which cannot be produced profitably until the mining industry has been much more developed than it is at present. I would not wish that any machinery which can be manufactured in this country should be admitted free, but the Government should take this into their favorable consideration, and see if in some way the demands of certain sections of the country in this respect can be met.

Mr. JONES (Halifax): Perhaps no province in the Dominion is more interested in the mining industry than the province from which I come. Our vast coal fields and gold mining enterprises there, are even now of great value, and are increasing every year. I know it to be a source of complaint among those interested in that industry that they have been compelled to pay duty on a class of machinery which is not made in the Dominion. I remember when, a few years ago, the duty was first placed on coal by the present administration, one of the gentlemen of Halifax, who is supposed to represent the coal interests—who made it a question during the election, and had always advocated that a duty should be placed upon coal—was anything but satisfied when the regulation for the tariff on coal was presented to Parliament. That gentleman, who is recognised as an authority on the subject, said, that while the Government had imposed a duty on coal, they had taken away largely, if not entirely, the advantage which the miners would gain, by imposing heavy duties on machinery and other materials used in mining. The miners have always labored under the disadvantage of being compelled to pay heavy duty on what they required to develop their mines. The hon. member for Montreal centre (Mr. Curran) made the statement that all mining machinery could be manufactured in the Dominion, but that seems to be contradicted by other hon. gentlemen who spoke on the subject. Whether it is manufactured in the Dominion or not is of very little consequence. If it is made in the Dominion, of course it is only sold at the relative value which the machinery would cost, plus the duty if it were imported. There is, therefore, no advantage to the miners of the country that they can purchase machinery in the Dominion, because we know that manufacturers of machinery, like other manufacturers, fix their prices at what it will cost to lay down the foreign article plus the duty. I add my testimony to that of the hon. gentlemen who have spoken, that, in the interests of the coal and gold mining industries of Nova Scotia, it is of the highest importance that the miners should have free access to the markets of the world to purchase their machinery, and in which they can get the best articles at the lowest possible price.

Mr. MULOCK: The hon. member for Yale (Mr. Mara) has furnished us with some useful information as to the workings of this particular feature of the tariff, in regard to the great mining industries of the province from which he comes. We have expended many millions of public money to develop the resources of that province and to add to the material wealth of the whole of Canada, and to day the hon. gentleman has informed us, on the authority of a gentleman whose name he did not give, but whom I understand to be in political sympathy with the party to which he belongs, that the present tariff in its operation, locks up the mining wealth of British Columbia as effectively as nature has ever done. That statement, coming from the source it does, it cannot be said for a moment that the hon. gentleman or his witnesses are animated by anything but the best interests of the country in asking for relief from that state of things, and I cannot understand on what just grounds relief can be denied. Apart from the artificial obstructions offered by the tariff, there are sufficient obstacles presented by nature itself to the development of the mining resources of British Columbia, and certainly, until some change is made in the tariff, which is within the reach of the Government, we need not expect any return from the vast sums we have expended for the development of that province. Could a more forcible attack on the Government come from any source than that which has been disclosed by the correspondence of my hon. friend? He says those great gifts of nature, those great undeveloped laboratories in the bowels of the earth, are locked up and made useless to man, by reason not altogether of natural obstructions, but by reason of the artificial obstructions imposed by the administration and endorsed by the House, and, in a sense, by the country. Under these circumstances I think we are bound as a Parliament to give the fairest consideration to the proposition, and I think we can do so without impairing the general scheme which hon. gentlemen opposite have supported, and which they deem to call the National Policy. We can, without prejudice to that scheme, provide relief in the present instance. As hon. gentlemen have said, the tariff should not be available to handicap industries established in Canada, when Canada herself does not provide relief. Here we have the exact case to justify the suspension of the operation of the tariff in regard to this particular industry, at all events until manufacturers are found in this country ready to supply the needs of

the mining industry. Therefore, in order to meet the views presented by the hon. gentlemen who have spoken, while not jeopardising this great industry by giving occasion for the cry of the National Policy being in danger, I beg to move the following amendment, which, I think, leaves the National Policy in all its integrity, and is perhaps an argument in favor of its existence, at all events by admission, as it does not suggest an attack upon it:

That the motion be amended by inserting after the word "machinery" the words, "of kinds not manufactured in Canada."

Mr. CHARLTON: A year ago last summer as a member of the Ontario Mining Commission, I came in contact with a great many miners in various parts of the Province. The Commission visited all the mining regions of Ontario, and in the course of its investigations, took the evidence of 150 miners and persons connected with mining. Among other things which these miners declared desirable in their interests, for the purpose of securing greater development to the mineral resources of the country, was the introduction, free of duty, of machinery not manufactured in Canada, and the investigations made by the Commission on this point were of the closest and most convincing character. It was found that various kinds of machinery were not produced in Canada, such as for amalgamating work, stamps, diamond drills, &c. It is only reasonable to suppose that in the United States, where the mineral production amounts to \$560,000,000, compared with less than \$16,000,000 in Canada, the development in machinery and methods for producing ores has been much greater than it has been in Canada. Now this is a matter on which the miners undoubtedly are good judges as to their wants. We visited the copper region in Sudbury, the silver region west of Port Arthur, the mineral regions of all parts of Ontario, and there was no dissent among the miners anywhere as to the desirability of the introduction of mining machinery from the United States, not produced in Canada, free of duty. It was quite evident, from the results of our investigations, that the want of this has been one of the great bars to the development of our mineral resources. Canada unquestionably possesses mineral resources of great extent and importance, both in the precious metals and in copper, iron and the other metals. The mineral resources of Ontario are second to those of no region on this continent, although their development, and consequently their production, is very small, and anything that will tend to develop this industry will be in the general interests of this country. I hope the hon. Minister of Finance will take into account the vast importance of this almost undeveloped industry. Our own mineral resources are probably greater than theirs, except in coal, and the Government should seriously consider what steps may be taken to promote mining in Canada, and no step they could take will have a more direct beneficial effect than the one they are asked to take by the hon. member for North York. Nothing would be more likely to develop the vast mineral resources of Ontario and every section of the Dominion than the passage of this resolution.

Mr. COOK: It is very well known how rapidly the mineral resources of this country are being developed, particularly on the north shore of Georgian Bay, and the Prairie Sound and Algoma districts. There is understood to be nickel there sufficient to supply the world, and nickel is becoming a very important metal, as it can be alloyed with iron. But the proposal of the hon. member for North York does not meet the case. In the first place, if a party wishes to order machinery, such as is required for large establishments as they have at Sudbury, by ordering all that he requires in one or more establishments on the other side, he is placed in a more favorable position as regards prices than if he ordered part in Canada and part in the United States; and besides, in having a portion of the machinery made in Canada, and a portion in a foreign country, these two portions may not work satisfactorily together. For these considerations I shall vote against the amendment of the hon. member for North York, and for the original motion. I wish to do what is the best practical thing for the interests of this country, and if it is going to ruffle the feelings of any hon. gentleman on the other side or this, it is no matter to me. I do what I consider my duty to my constituents and to the country, and I shall, therefore, vote against the amendment of the hon. member for North York.

Mr. DAVIS (Alberta): Coming, as I do, from the eastern slope of the Rocky Mountains, representing a constituency 600 miles in extent, I shall support this resolution. I think we should be allowed to get all the mining machinery required into that country as cheaply as we can, so that we may get a population there which will make it really a country. Being handicapped by the long haul and the distance we have to take our goods through the mountains afterwards, I think we ought rather to be paid a bounty than to be asked to pay a duty on the machinery which comes into that country.

Mr. CASEY: I do not see any possible objection which protectionists can have to the amendment of my hon. friend from North York, (Mr. Mulock), seeing that it does not propose to interfere with any protection which is now, or which may hereafter be given to the manufac-

turers of mining machinery in Canada. If such machinery is to be taxed, then protection subsists in regard to it, and in regard to all other kinds of machinery; no harm is done by their free admission. I believe in encouraging the largest and most productive industries of the country, and the mines are worth vastly more to the country than all the manufacturers of mining machinery who exist now or ever could exist in Canada. The manufacture of mining machinery is only a means to carry on the mines, and I do not consider it is fair to carry on a national protective policy in such a way as to encourage the means at the expense of the object. A national protective policy should encourage the industry of the country, and the only way in which the mining machinery industry can benefit the country is to benefit the mines. Notwithstanding the existence of manufacturers in Hamilton or elsewhere, I intend to vote for the motion of my hon. friend from Prince Edward (Mr. Platt). The object of every patriotic policy must be to obtain the greatest good for the greatest number; to follow a course which will add to our wealth and standing, and will give employment to the greatest amount of labor.

Mr. MARA: As to the amendment and the motion as they now stand, I put it to my hon. friend from Prince Edward (Mr. Platt) whether it would be to the interest of the miner, or of the mining industry, that the motion should be pressed to a vote to-day. If it were, it might be defeated, and that would mean that the hands of the Government would be strengthened to allow matters to remain as they are. I am satisfied that my hon. friend does not wish that; neither do I; and I would suggest whether it is not well to withdraw the motion, or allow it to stand, or, I will propose that the debate be adjourned until such time as the Government make known to the House their proposed tariff changes. Then we can deal more easily with these matters than we can at present. If, however, the question is then pressed to a vote, I will be with the hon. gentleman. I, therefore, move in amendment to the amendment:

That the debate be adjourned until after the proposed tariff changes are laid before the House by the Government.

I will withdraw that if the hon. gentleman will withdraw his motion.

Hon. G. E. FOSTER: I desire to say a few words on this discussion, which has upon the whole been an interesting and a profitable one. A great many members comparatively have spoken in the course of this debate, and a great many opinions have been given from practical men and persons who are well acquainted with the districts from which they come in reference to the mining resources of different parts of our Dominion. I may say that that which was stated by my hon. friend from Cariboo (Mr. Barnard) is perfectly true. During the past year he has been constant, in season and out of season, in pressing this matter upon the attention of the Government; not only himself, but other members from British Columbia who have similar interests with him in this respect, have also made strong and vigorous recommendations to the Government to take off the duty on mining machinery. Persons interested in mining development in Ontario, in the Lake Superior region, and who are anxious to get in mining machinery, have also been pressing the Government to make some modification in the matter of admitting such machinery for the purpose of developing those mines. The same thing has taken place in various other portions of the country where mining development is comparatively new; the Government have not been idle in the matter, and I may say to the House that there is no one subject in connection with the tariff which has engaged more of our attention during the last few months than the question which is the subject of discussion to-day. But, of course, there are difficulties connected with it. There are three interests which ask to be considered. In the first place, there are those who are interested in putting in mining machinery for the development of new mines at the present time; they want a modification of the duties. There are those who have, under the National Policy, been investing their money and who have been engaged in developing mines in various sections of the country; and no person can take a comparative view of the state of the manufacturing industry ten years ago and its state to-day, without seeing the immense strides that our manufacturers have made in the way of producing machinery of almost every description and of excellent quality as well, to be used in mining industries. That matter has to be regarded, and it might well be considered by those who have invested their capital in that way, and who have arrived at a good degree of development in that industry, and were producing machinery of a very extensive character and of good quality, that it would not conduce to the permanency of the best interests of the country in that line, should we agree to the request of my hon. friend from Prince Edward (Mr. Platt), that all mining machinery should be allowed to come in free. His motion is very wide indeed. It would include everything, from the most complex and the largest kind of machinery, to the simplest forms of machinery, which are made in Canada just as well and just as cheaply as they can be made anywhere. Then there is another interest

to be considered, which is the interest of those miners who, during the last ten, fifteen or twenty years, have gone into mining ventures in this country, who have been at the cost of putting in machinery, having imported it and having paid the duty upon it. New machinery put into new mining industries would compete in a certain way with their own, and involve a competition which this interest look upon as being somewhat unfair to them. So that these three interests have all to be considered, and have been considered by the Government. Then, of those who ask for free mining machinery, there are three different classes. There is one class who want the duty taken off all mining machinery so that it may come in free. That class is represented by my hon. friend the mover of this motion, provided we take the motion as the index of his own views on that subject. I think that motion is wider than the sense of this House or the sense of the country, would approve of. There is another class who want only such machinery to come in free of duty as is not made in Canada. Now, any hon. gentleman who looks at the matter will understand the difficulty of coming to a conclusion as to what machinery can be made in the country and what cannot be made in the country, a much more difficult thing, perhaps, than to come to a conclusion as to what machinery is made in Canada and what is not made. Then there is another class who want mining machinery brought in free for a limited period, machinery of such a class as is not made in Canada. These are the three interests. I could not quite understand what was meant by the hon. member for Yale (Mr. Mara), when he stated that mining machinery could not be taken in there from the east; that an implement, for instance, from Montreal could not be taken into the Kootenay district, because it had to go through American territory, without paying double duty. I think that cannot be so, because we have, just as they have in the United States, arrangements for bonding by which, on their side, articles can be taken from the United States territory through Canadian territory into the United States again, and *vice versa*, without payment of duty. However, these are the conditions of the question. The Government have had them under serious and earnest consideration—we have them under consideration to-day. The duties which are involved, if they were to let mining machinery in free, would be considerable. Although it may be that the Government would have had a right to do that by Order in Council, the matter was so important that, suppose they had decided to take the duty off such machinery, it would scarcely have been wise to do so in view of the fact that Parliament was soon to meet, when the great interests involved in this matter could be taken up and considered by Parliament. It has been announced that the Government intend to make certain tariff changes, and I am in a position to state, as I have stated here, that we are considering this matter with a view to its best possible solution. Under the circumstances, it does not seem necessary to press the matter to a vote. I think my hon. friend who moved the resolution ought to take the assurance that I have given that the Government are carefully considering this matter, and to abide events, at least until the Government's opinion, after mature consideration, is laid before the House, when each hon. member will be at liberty to take such course as he sees fit.

Sir R. CARTWRIGHT: I believe my hon. friend from Prince Edward is moving entirely in the right direction, entirely in the interest of a deserving class in this community, and entirely in the interest of this country, in pressing that all this mining machinery should be admitted free. Further, I think that, as the Government ought to have made up their minds on this question—they have had plenty of time to do it—my hon. friend has nothing to gain by delay in pressing the House to a decision on this motion.

Sir D. A. SMITH: I am in favour of the most liberal protection being given to manufacturers in Canada, but I think this question is open to some exceptions, and this is one of those cases where an exception should be made; and I am, therefore, in favour of the motion of the hon. member for Prince Edward (Mr. Platt). At the same time, after the representation made by the Minister of Finance, I think it advisable that the amendment of the hon. member for Yale (Mr. Mara) should be adopted now, and I hope that the Government will give their consideration to this motion, and that, without further action on the part of any member of the House, they will be prepared to accede to this request. It is of the greatest importance possible that every encouragement should be given to the development of the industries, mining and otherwise, of British Columbia; and as the hon. member for Alberta (Mr. Davis) said, the expenses of transport are alone sufficient against that country. So that I certainly think the duties against all importations there, especially when the articles are for developing the great resources of that country, should be made as light as possible.

Mr. PLATT: Had the hon. the Minister of Finance requested the withdrawal of the motion, or that we

should grant an adjournment of the debate without further discussion, upon the ground that he was giving his best and most favourable consideration to the question under discussion, we might have been disposed to grant the request. But he preceded his requests by remarks which led me to believe that he is not at all prepared to accept the principle of the resolution. He has told us plainly that he believes the resolution which I have the honour to place before this House will not meet with the approbation of the House and the approbation of the country. If that be his opinion, I cannot reasonably expect that the principle will be embodied in the new Tariff Bill he proposes to bring down; and if he is not yet convinced that the people of the country are willing, for the purpose of encouraging the mining industry of Canada, to admit mining material free of duty for a limited period, if you like, or for any length of time that may be necessary, this House will be failing in its duty if it does not do its utmost to force its opinion upon the Government. The hon. gentleman tells us of various difficulties that stand in the way. We have heard of those difficulties before. They are difficulties which will meet any Government under the circumstances when they are nursing and cherishing what is known in this country as a protective or National Policy. It is part and parcel of that policy to throw difficulties in the way whenever such questions come before us. The manufacturers, who have had ten years of protection, the hon. gentleman tells us, have arrived at a certain degree of development and prosperity; and it was understood when the policy was adopted that after those industries became established, those other industries which were for the time suffering in consequence of the protection afforded those manufacturers, would in turn receive benefit, and those industries which had been able to get on their legs in this country, would no longer receive the benefit of a protective tariff. Now, mining is an old industry, but as regards its development in this country it is still an infant industry. Manufacturing industries, if they have arrived at the degree of prosperity which the hon. gentleman states they have reached, are no longer infant industries, and I hold that the mining interests of this country are such, that it is the duty of the Government, that those older industries so long supported by the policy of protection shall no longer stand in the way of the advancement of the mining industry. I maintain that the resolution I have submitted is one which will meet with the approbation of the country, because our people are becoming alive to the importance of the mining industry. We know that while in the past many mines in Ontario have remained undeveloped, new processes have been introduced which are likely to be brought into use in Ontario for the refining of the magnetic iron ores, the machinery for which will not be manufactured here for many years. We are aware that these new machines are just being manufactured in the United States and some other countries. Take, for instance, the appliances connected with the Edison process for separating magnetic iron ores, the new inventions for reducing copper and separating the nickel which exists so largely in the ore of the mines east of Prince Arthur, and we possess this class of mines which American capitalists are seeking to develop, and which American ingenuity and industry promise to render profitable. We know that for many, many years past, mines like Coehill and others of magnetic iron ore have remained white elephants on the hands of those who thought it was impossible to remove from the ores the sulphur they contain. Mr. Edison has discovered a method by which he is confident this can be done, and he has already purchased and selected a site in Trenton, and likewise sites in other places, for the erection of works into which he is willing to put his own money, and he has already made offers to different corporations as to what he is willing to do, and wherever his name is mentioned capital will flow into those enterprises. This is just the time for action, and there should not be a moment's delay in publishing what this country is willing to do on behalf of the mining industry, and the Government will not be justified in pursuing the course indicated by the Minister of Finance in yielding to those difficulties which he says are before his eyes at every turn, and in refusing that for which my motion asks. If the whole concession for which I ask cannot be granted, I hope the request embodied in the amendment will be granted; I will be willing to accept that rather than lose all. I suppose the motion for the adjournment of the debate will be carried. I think, however, as the discussion has aroused so much interest, and has been participated in by members on both sides of the House, I will scarcely be justified in taking the question out of the hands of the House, and I will leave it with the House to decide.

Mr. BARNARD: Considering the discussion which has arisen on the subject, it may not be amiss to refer to the fact that a year or two years ago the Government of British Columbia, in order to stimulate mining industries in the section which I represent, lately erected works intended as testing works in the district of Cariboo, at a cost of \$15,000 or \$16,000. The Government expended

that money itself to assist the mining industry in that district, and to promote the introduction of capital there. They made what I deem to have been a justifiable request on the Dominion Government, namely, that a rebate of duties should be allowed in that case. I believe the matter has not been settled yet, but that a discussion has arisen between the Provincial Government and the Dominion Government as to whether machinery of that class was or was not manufactured in Canada. Unfortunately, the whole works were burned down the other night, immediately after their completion, and I would suggest to the Government, if application is made for rebate of duty, as the Provincial Government propose to re-erect the works, it should be granted as applicable not only to the machinery in the works destroyed, but also to the new machinery.

Mr. BLAKE: I submit, Mr. Speaker, that this amendment is not in order. It is a motion to adjourn the debate, and is, therefore, a substantive motion and can not be an amendatory motion.

The Speaker: The motion is not a substantive motion; it is an amendment to the amendment, and, although improperly worded, it is in order as an amendment; but it ought to read: "That all the words in the main motion and in the amendment be struck out, and the following words substituted therefor." As an amendment I hold that it is in order, while if it were a substantive motion I should have to declare that it is out of order, since it specifies an undetermined time that the debate should be adjourned; instead of being put as all motions for adjournment, either of the debate or of the House, are, purely and simply, that the debate be adjourned now.

House divided on the amendment to the amendment, with the following result: Yeas, 109; Nays, 77.

Amendment to the amendment agreed to.

The question has thus been held over until the proposed Tariff changes are laid by the Government before the House.

Nova Scotia Gold Yield, 1889.

We are indebted to Mr. W. H. Brown, Accountant of Public Works and Mines, Halifax, for the following statement showing the quantity of quartz crushed and yield of gold by months for the year ended 31st December, 1889. Since these figures were compiled, one or two additional returns have been handed in, making the yield 250 ounces greater, or a total for the year of 26,155 $\frac{1}{2}$ ounces, and increasing the total value of the yield to \$496,950.40.

1889.	Quartz Crushed.	Yield of Gold.	Value.
	Tons.	Ozs. Dwts.	\$ c.
January	2,560	1,728 14	32,845 30
February	2,979	1,765 2	33,536 90
March	3,373	2,378 12	45,193 40
April	3,536	3,086 15	58,648 25
May	3,363	2,882 5	54,762 75
June	3,193	2,169 6	41,216 70
July	3,572	2,200 5	41,804 75
August	3,276	2,088 4	39,675 80
September	2,932	1,977 2	37,564 90
October	3,578	1,816 17	34,520 15
November	3,650	2,078 10	39,491 50
December	3,001	1,734 ..	32,946 00
Totals	39,013	25,905 12	\$492,206 40

RECAPITULATION.

Quartz crushed	39,013 tons.
Yield of gold	25,905 $\frac{1}{2}$ oz.
Value, at \$19	\$492,206.40.

The revenue received by the Department from Provincial mines shows a very satisfactory increase, being \$167,903.13 as against \$152,895.46 in 1888, or a total gain of \$15,007.67. The sources from which this substantial income was derived are as follows:

	1888.	1889.
Prospecting licenses	\$ 9,571 49	\$ 15,358 08
Rents (leases for gold) ..	4,720 50	6,055 00
Gold royalty	8,612 41	9,959 25
Licenses to search	3,940 00	5,260 00
Licenses to work and leases	1,275 00	2,875 00
Coal royalty	124,776 06	128,395 80
	\$152,895 46	\$167,903 13

Gold-Mining and Milling in Korea.

(By Willard Ide Pierce, New York.)

The native method of milling and mining gold-ores in Korea may not present any specially new features, but are chiefly interesting as primitive practices still followed at the present day.

In mining where the rock is hard, wood is piled up near the face of the tunnel or drift and then set on fire. The fire burns for twenty-four hours, after which, three or four days are given for the rocks to cool before the miners go in and extract the loosened material. The only tools in use are a hammer, a steel gad about five inches long, and a flat spoon-shaped basket. The pay-streak or chute is closely followed, and in place the workings are very small and intricate. Rock not yielding more than \$6 per ton is not extracted. The manner of opening a mine is to begin on the outcrop, where the rock pays, sink a shaft or run a tunnel on the vein, and follow the pay-streak and more easily worked ore. When this is exhausted, or the influx of water interferes, the opening is abandoned and operations are begun again at a new spot on the outcrop. The place usually selected is as high up on the mountain as possible, and in no instance is advantage taken of the topography by running a cross-tunnel to tap the vein.

The ore is brought in baskets to the surface, and there placed in sacks, holding about 150 lbs. each, and taken to be crushed. The rock is first crushed between two stones, as shown in Figure 1. The upper stone is oval

and rounded on the bottom, so that it can be readily rocked on the under stone. Two pieces of wood, used for handles are placed, one on each side, in grooves in the upper stone, and held in position by means of straw rope. The lower stone is not smooth on top, but exhibits three elevations running lengthwise, with shallow depressions between them. The middle elevation acts as a fulcrum on which the upper stone may be rocked. From two to ten men, according to the weight and size of the stone used, are employed in rocking. With four men, from 300 to 350 lbs. of rock can be crushed per day, the stone making 50 complete oscillations per minute. The men squat on each side of the stone and move it to and fro by means of the wooden handles. The ore is fed, in pieces up to the size of an egg or even larger, by one of the men. During the crushing one man on each side, as the stone rocks from him, uses a stick or scraper to stir the crushed rock. When the ore is fine enough, it is swept out on a piece of cloth, placed at one side of the stone, the rocking being continued all the time. After a certain amount has been crushed, it is usually put through a horse-hair sieve, and the coarser portion is treated again. An upper stone intended for four men, measured 23 inches in length, 20 inches in width at the base and 15 inches in height. Crushing is usually performed in sheds to prevent the wind from blowing any of the fine stuff away.

The crushed ore is taken to men who rub it between stones until it is very fine; the rubbing is generally done wet. The powered ore is received by other workmen, who pan it and save the free gold. The pan is of one piece of wood, 20 inches in diameter and 5 inches high; and the men who use this instrument are the most expert panners I have ever seen. The pan is not held in the hands, but floats on the surface of the water, one side only being raised or lowered to agitate the contents. As the pulp is very fine, and the gold in the same condition, the top of the water in the pan is frequently sprayed so as to settle any gold that may be floating. The first tailings are washed off directly from the right-hand side of the pan. After this the sulphurets and gold are collected on the right-hand side of the pan, and the tailings on top of the sulphurets are, by a few skilful movements, washed over to the left-hand side. The pan is then half revolved and the tailings are washed off from the right-hand side. The same operation is repeated after the tailings have all been removed, with the sulphurets and gold, the former being saved and again rubbed. No quicksilver is used; but I do not think that there is any loss in free gold.

Vol. IX. APRIL, 1890. No. 4.

Our Gold Fields In Quebec.

In view of the increased interest which has of late been manifested in the mineral resources of the Province of Quebec, not only as regards the comparatively new mineral asbestos, in the production of which Canada may now be said to lead the world, but also in the development of large and new bodies of copper ore, the great value of which as a source of supply for acid is just beginning to be fully realized, it is a matter for enquiry why the gold fields of the Province, concerning which so much has in former years been recorded, should have failed to attract the attention which they so evidently deserve. For that in the Province of Quebec there exists a very large extent of territory containing rich deposits of gold, not only in the alluvions of its ancient river channels, but in many of the quartz veins which traverse the slates and sandstones of the Chaudiere and Ditton Districts, and of the whole belt of similar rocks which extend along the eastern portion of the Province contiguous to the boundary of New Hampshire and a portion of Maine, has been very conclusively established. One has but to take up the papers written on this subject by the late Mr. James Douglas of Quebec, or to glance over the earlier reports of the Geological Survey, more especially those from 1847 to 1866, to see that, in this area, the chances for profitable gold mining, under suitable Government regulations and proper management, are unsurpassed by any other portion of the Dominion, and possibly even by the adjoining States.

The evidence also presented before the Select Committee appointed by the Quebec Government in 1865 to consider the question of the Chaudiere gold field, while containing doubtless some statements bordering on the sensational, and therefore requiring to be cautiously accepted, present such a mass of cumulative evidence, both on the part of skilled workmen in this field, as well as from ordinary explorers, that we can but come to the conclusion that had such stories of the presence of gold in large quantity proceeded from any other section of the country than the Province of Quebec, the influx of gold miners and of capital would have almost equalled that of the palmy days of the Californian discovery.

The evidence presented in the different reports of the Geological Survey is also largely confirmatory of that stated by other writers on the subject; and yet, in the face of all evidence tending to prove the existence of a gold field equally adapted for quartz mining, as shown by repeated assays from a number of leads, with

that of Nova Scotia, and far surpassing that country in the value of its alluvial workings, a feature in gold mining which has in Nova Scotia apparently never awakened any interest, we find not more than three or four companies, almost without capital, trying in a very small way and with the worst appliances and the almost entire lack of proper mining skill, to extract the gold from the ancient river channels, whose presence and great richness have been known for twenty years, but which, except in two or three widely separated cases, have never been explored to any extent.

The history of gold mining in the Province of Quebec has apparently from the very start been a huge system of blunders, and possibly the greatest, as it was the first, consisted in giving the entire control of all the gold found in the seignior of Rigaud, Vaudreuil, on the Chaudiere River, and in which the richest developments yet found are located, into the hands of one person or family *forever*, and without any provision being made for the payment of royalty to the Government, since the clause inserted in the letters patent, and intended to cover this point, was so worded that it practically became inoperative; the royalty only being payable on such gold as was obtained by smelting the ore—a mode of working gold which has never prevailed in this country in gold mining, and which most surely never will. By the *forever* clause in the lease the outside public are entirely debarred by the Government from taking any part in mining or exploration in this section of the province, except by permission of the owners of the seignior. But this is in turn prohibited, since in 1864 the De Lery Company, who derived their patent direct from Government, sub-let their entire mining right to the De Lery Gold Mining Company for a term of thirty years, so that until the second ownership expires no work can be done in the seignior by outside parties without direct permit from the second company. The effect of all this is very evident. While the company is apparently quite willing to grant mining leases to any person desirous of working gold mining claims in any part of their territory, there is a very well founded objection on the part of those contemplating investment in this direction to advance the capital necessary for the erection of permanent works on the large scale by which the extraction of the gold can be most profitably carried on, owing to the insecurity of tenure existing under the present regulations. Works adapted to the requirements of the case mean the construction of reservoirs for permanent storage of water to meet the possible requirements of a dry season, extensive flumes or ditches for the conveying of such water when required, properly prepared grounds and appliances for washing the gravel and collecting the gold when separated; in fact a somewhat extensive plant. This, with a prospect that in a very few years their lease must of necessity expire, and if good results are obtained, an

almost absolute certainty of non-renewal from the original company on any terms which would permit of profitable mining, has effectually placed a bar to all possible chances of development in this direction. Here, then, is one of the principal causes why capital does not at present flow into the Chaudiere district, rich as it is in gold.

As regards the second gold mining area, which, according to the most reliable reports, is in many respects equally as valuable as the Chaudiere, though not nearly so extensive, we find that, in a lucky moment for the proprietor, but an unlucky one for the Government of Quebec, the whole right and title to some 6,000 acres of the country, including mineral rights as well, has also passed *forever* into the hands of a private individual, and is, if anything, even more securely locked up in so far as the investment of capital is concerned, than the other.

The history of gold mining in Quebec, from the first discovery, sixty years ago, furnishes reading, not only of great interest, but of a kind from which good sound practical lessons may be derived. The first vein of gold found in 1836 was valued at from \$50 to \$60; a very fair sized nugget for any country, and sufficiently large, one would suppose, to warrant anyone interested in gold mining to make further and vigorous search; yet for nearly fifteen years but little attention seems to have been paid to it, further than in the securing in 1846, by the De Lery family, of the mining rights already referred to. From 1850 to 1860 desultory mining operations were carried on at a number of points by various parties. Some exceedingly rich pockets were found on the Des Plantes and the Gilbert, as well as on the main Chaudiere River, while a series of trials at the forks of the DuLoup in 1851-52, extending over one acre of gravel from the bank of the stream with ordinary appliances only, showed a margin of profit sufficient to warrant anyone in investing the capital necessary to make a speedy and abundant fortune should the proper appliances be used. The amount of the gold obtained from this acre of gravel was considerably over \$4,000—the profit considerably over \$1,000. The results of these trials are given in the report of the Geological Survey for those years, and being official may be taken as reliable. Yet, owing to some dispute with the proprietor of a neighbouring lot, the work which promised so well had to be abandoned, and nothing further was done in this quarter for nearly thirty years. It is unfortunate that the next attempt to extract the gold from the gravels of the DuLoup in 1879-80 should not have been undertaken by some one with even a slight pretence to mining knowledge so that the most fitting plan for successfully carrying on the washing of the gravels, and what is equally important the collecting of the gold afterward might have been adopted, but instead we find a very large amount of money, aggregating many

thousands of dollars, placed in the hands of a person who certainly, from his previous occupation, could not be supposed to have acquired much practical or scientific knowledge of the best means to be employed in the extracting of the gold. A trench eleven miles in length was dug along the banks of the river DuLoup for conveying water for the hydraulic process, and a magnificent head of about 150 feet was obtained, sufficient to tear down the gravel banks at any desired rate, but very slight provision appears to have been made for collecting the gold, either coarse or fine, after the bank was torn down; though from the trials made in 1852 it is known that there was sufficient in every cubic yard to have paid most handsome dividends, even by the old rocker method of washing. Under such management it can scarcely be a matter of wonder that the costly experiment was a failure of the worst kind.

A second attempt to work an old channel near the village of St. George was equally disastrous to those engaged, though the outlay was on a greatly reduced scale, the management being the same. Four shafts were here attempted before bed rock could be reached, the operations extending over a period of several years, the last and final attempt requiring nearly twelve months to sink 165 feet. This surely implies engineering skill of a wonderful kind.

In the work on the Gilbert, where exceedingly rich ground was found in 1863-64, the mining also was of the crudest kind. The claims allotted were very small, water could not be obtained for washing the gravel properly, and there appear to have been no proper appliances for saving the fine gold. A sluice 1,800 feet long, built at a cost of about twelve thousand dollars, to bring water from the upper part of the stream, which had been dammed for that purpose, was destroyed before it could be utilized, simply through lack of proper precautions in its construction; yet here, in the face of all these adverse circumstances, gold was obtained in large quantities, so that four men, working under the greatest disadvantages, are said to have taken out nearly \$80,000 in less than four years. Anyone visiting the workings as conducted at the present day must wonder how any gold except the coarsest can be saved at all. Sluices of very slight pitch and of insufficient length, are unfitted with any proper means for saving the fine gold, the greater part of which must of necessity be carried away down the stream with tailings. The only mining skill observed is on the part of those who have used the pick and shovel in some former enterprise in the vicinity, and yet, gold in good paying quantities continues to be obtained, simply because much of the gold in the district is coarse, and nuggets of ten to one hundred dollars are not uncommon, while others having a weight of nearly sixty ounces have been obtained.

Such coarse gold does not travel far, yet no practical attempt to test the quartz leads by milling has ever been made, except by one ill-starred crusher so faulty in construction that when free gold was put in none ever could be extracted. Yet, in spite of all these well known facts, when the value and importance of the gold fields of Eastern Quebec are mentioned most people calmly shrug their shoulders and smile incredulously. Why? Because most people are content to take the results, or rather the lack of results due to stupid blundering and ignorance of the first principles of mining, properly so called, as a satisfactory and conclusive test of the true value of the entire district.

There is no doubt, as can be proved by the evidence furnished both from official reports and from other sources, that in nearly, if not in every stream, tributary to the Chaudiere above St. Joseph, gold can be obtained in paying quantities with material of the right sort and knowledge of the conditions involved.

The gold mining of to-day should be understood far better than that of twenty years ago. In the Nova Scotia gold fields the mistake of sinking shafts in unprofitable lodes is not now made so frequently as in the first days of the industry in that Province, simply because certain laws apparently exist which govern the distribution of the metal. Scientific skill is now producing profitable returns where twenty years ago bad management and utter ignorance on the part of those in charge of valuable mines squandered capital by the hundreds of thousands of dollars. The crude style of gold mining has also surely lasted a sufficiently long time in Quebec. But until some provision is made on the part of the local government by which the titles so long ago obtained can be extinguished and these areas thrown open to the advent of outside capital, there does not appear to be much chance of permanent improvement in this direction. Should the government of Quebec acquire once more the titles to the mining rights of the province in gold, and proclaim the districts of the Chaudiere and the Ditton mining districts, with proper regulations as to title, size of claim, royalty, etc., there is not the slightest doubt that capital, to almost any desired amount, would pour in for the development of this great industry. In the present condition of mining in Quebec, with its great deposits of apatite, copper, asbestos, iron, gold and silver, one would suppose the establishment of a well organized mining bureau would be a prime necessity, not only conferring great benefit upon the province at large but bringing in also a very considerable direct revenue to the government. The little Province of Nova Scotia has long felt the benefit arising from such a bureau, and certainly, with proper management, Quebec, with her far greater variety and abundance of mineral wealth and her immensely greater area, would derive not only equal but far greater

results from the establishment of such a department. The mining industries of Quebec are but in their infancy. No one can say to what enormous proportions they may in the next twenty years extend. Foreign capital is awaiting investment to-day in many lines, but is restrained from entering, in some cases by the unfavourable conditions which are known to prevail. Surely the time is not far distant when these conditions will be changed, and when the gold mines of Ditton and the Chaudiere, freed from the incubus that has so long stifled their development, will be teeming with a mining population whose labours will be properly directed and whose rewards will be sure. May the happy time come right speedily.

A New Superphosphate Company.

From an interview with Mr. R. N. Hall, M.P., we learn that his recent trip to London was successful in securing the organization of a company with a substantial financial support for the manufacture, on a large scale, of artificial fertilizers for the Canadian and American markets. The scheme involves the purchase of the property of one of the most prominent phosphate companies in the Buckingham District, and a long term contract for the supply of sulphuric acid from the Capelton Works, near Sherbrooke. It is intended to erect large superphosphate factories both at Buckingham and at Capelton.

Mr. Hall reports an increased interest in the London market for developed phosphate properties, and much enquiry about asbestos. The great obstacle in securing capital for the development of both these industries is the enormous speculative prices placed by proprietors and agents upon properties controlled by them.

When it is considered what an extensive area is represented by phosphate indications, and the thousands of such properties which are offered and pressed upon the London market, the folly of such a course must be apparent.

When prices have come down to a basis which leaves some chance for the employment of capital in *bona fide* working we shall see prosperous activity in our phosphate districts. The present speculative mania does no good to those who are responsible for it, and only hinders the development of a legitimate industry. The keen competition for the English and Continental markets between the phosphate supplies of Norway, South Carolina and Canada, with certain recognized disadvantages pertaining to the latter in the way of transportation and difficulty of treating the rock, should convince speculators that it is only upon the basis of moderate prices that the working of our phosphate areas stands any reasonable chance of success.

A new company, styled the Nova Scotia Syndicate, limited, was registered in London on the 25th ult., with a capital of £12,000, in £5 shares, to acquire and work mineral properties, and particularly the Waverley Mine, upon terms of an agreement with C. G. Palgrave.

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

No. 1.

Mr. E. Gilpin, Jr., Deputy Commissioner and Inspector of the Nova Scotia Mines.

In commencing a series of sketches of representative mining men, difficulties necessarily present themselves in making a selection of a subject for the first; but Nova Scotia has been, and is so pre-eminently to the forefront in mineral development that we have no diffidence in giving as our initial portrait the "counterfeit presentment" of one of her sons, whose name and personality are alike familiar and prominently associated with the industry, and who has, in a very conspicuous manner, contributed much to the material welfare of her various mining interests.

Mr. E. Gilpin, jr., Deputy Commissioner of Public Works and Mines, and Chief Inspector of the Mines of Nova Scotia, was born in the city of Halifax, N.S., in the year 1850. His father was the Very Reverend Dean Gilpin; his mother Amelia McKay, daughter of the late Mr. Justice Haliburton ("Sam Slick"). Mr. Gilpin was educated at the Halifax Grammar School, and thereafter at King's College, Windsor, where he graduated in 1871 as B.A. with "optime" in chemistry, and honours in geology and mineralogy; also Welsford, General Williams and Alumni prizeman. At Windsor he had the advantage of pursuing his chemical and mineralogical studies under the late Dr. How, well known as one of the best analysts of the day. These studies were continued afterwards under Professor Lawson, at Dalhousie College, whenever the pursuit of his profession gave opportunity. After leaving college he began the practical study of Mining Engineering, especially at the Albion collieries of the General Mining Association in Pictou county, and the knowledge and experience gained in this way was materially extended and improved by a visit to the principal mining localities in England.

In 1873, he was elected a member of the Nova Scotia Institute of Science, and in 1874, a member of the Geological Society of London. After visiting professionally all the mining points in the Lower Provinces and Newfoundland, he was for two years engaged in the exploration of the iron ore deposits of Pictou County, succeeding Sir William Dawson, who had devoted much time to the problems presented by the unequalled grouping of many iron ores of various geological ages in a comparatively small district.

During the existence of the Halifax Technological Institute he was appointed Lecturer on Mining, but did not lecture, as the Institute was not able to secure sufficient support to

guarantee complete courses. The success attending the drawing and mechanical engineering classes, however, laid the foundation of the present Art School of Halifax.

In 1879 Mr. Gilpin was appointed by the Government of Nova Scotia its Inspector of Mines. In September, 1881, he was appointed a member of the Board of Examiners of Colliery Officials, to which Board he has continued to act as Secretary up to the present time. The visit of a portion of the British Association to Nova Scotia, was under his charge, in so far as related to the mineral sections of the Province. He also read two papers on Nova Scotia Gold and Coal before that Association. Mr. Gilpin also acted as local secretary during the memor-

E. Gilpin

able visit of the American Institute of Mining Engineers to Nova Scotia, and was entrusted with the carrying out of the various excursions, etc., which resulted in one of the most successful and enjoyable meetings held by that body. At this meeting he was elected a member, and contributed an excellent paper descriptive of the Nova Scotia gold fields.

In October, 1886, upon the decease of the then Deputy, Mr. Gilpin was appointed to the position of Deputy Commissioner of Public Works and Mines conjointly with his position as Inspector, and these positions he still holds in conjunction with an appointment made some years previous as Provincial Analyst.

Upon the formation of the Royal Society of

Canada he was appointed one of the original fellows.

Following the formation of a Board of Examiners for granting certificates to Underground Managers and Overseers of Coal Mines, the Government has established schools of instruction for candidates desirous of undergoing examination, at various points in the coal districts. In these schools, ten in number, are taught mine surveying, mining practice, etc., to an extent corresponding to the positions to be filled by those passing the examinations.

These schools are under the supervision of the Inspector of Mines, who, it must be confessed, is not allowed by the Government to rust for want of work. Amid the various details of inspection, of the instructors' schools, and the various calls of the Public Works Department of even a small province like Nova Scotia, Mr. Gilpin has still found time to write many papers on Nova Scotia mines and minerals for home and foreign societies. In 1883 a large edition of his report on the Nova Scotia minerals was circulated by the Government, a new edition of which is much needed. His annual report on the mining industries of the province gives full details of the progress of the development of this resource, whose importance may be seen when it is stated that the revenue from Mines Royalties is now \$165,000 a year, nearly double what it was a few years ago.

The Transactions of the North of England Institute of Mining Engineers, the Geological Society of London, the Nova Scotia Institute of Science, the Royal Society of Canada, and the American Institute of Mining Engineers contain numerous papers by him, among which may be mentioned: "The Carboniferous of Western Newfoundland," "The Coal Measures of Newfoundland," "Limonite Ores of Pictou Co.," "Nova Scotia Copper Ores," "Pictou Coal Field" (several papers), "Submarine Coal of Cape Breton," "Iron Ores of Nova Scotia," "Pit Waters," "Gypsum of Nova Scotia," "Canadian Coals," "Trap Minerals," "Geology of Cape Breton" (several papers), "Gold Fields of Nova Scotia," "Folding of the Carboniferous in the Maritime Provinces," "Manganese Ores of Nova Scotia," "Limestones of Pictou Co.," "Notes on Nova Scotia Gold Bearing Veins," with other papers of more technical and local character, principally contributed to the transactions of the Nova Scotia Institute of Science, etc. Many of these papers contain analyses by the writer, notably those on the iron ores and pit waters. The paper on Canadian coals gives the fullest set of analyses of Nova Scotian ores ever made, being the result of a special investigation into their qualities made by him for a foreign syndicate. This paper was read before the North of England Mining Institute, and awarded by them with a special present of mining books.

The paper on the Limestones of Pictou County, read before the Royal Society, gave his analyses of numerous beds of this mineral, and while showing the suitability of certain beds for iron making, incidentally touched upon their freedom from magnesia, a point of interest from their connection with marls and gypsums.

The Canadian Institute of Civil Engineers embraces most of the mining engineers of the Dominion, and Mr Gilpin has assisted to further their aims in the Lower Provinces. Has served as a member of Council; and its Transactions contain an elaborate paper by him on coal mining in Nova Scotia, giving in detail the systems of working, hoisting, pumping, etc.

Mr. Gilpin was married in 1875 to Florence Ellen, daughter of Lewis Johnstone, Surgeon, Albion Mines, and has three children.

Of untiring industry and unequalled integrity and honor, an ardent lover of geologic science, a trained and competent engineer, Mr. Gilpin combines in ample measure those sterling qualities which contribute so largely to the material well-being and prosperity of the mining community in which he takes so conspicuous a place.

The subject of our next sketch will be Mr. H. S. Poole, General Manager of the Acadia Coal Company at Stellarton, Nova Scotia.

Au Revoir.

During the last few days the Geological Survey has suffered a severe loss in the resignation of Dr. A. C. Lawson, one of its most efficient officers, who has gone to Vancouver to begin independent work as consulting geologist and mining engineer.

Dr. Lawson is a gold medalist in Natural Sciences of Toronto University, and a Doctor of Philosophy of John Hopkins University in Baltimore, and in 1882 accompanied Dr. Bell across the plains of the North West in his expedition to the Athabasca river.

Since that time he has been engaged in unravelling the geology of the Archæan plexus on Rainy river and the Lake of the Woods, and the results of his labours are published in the Annual Reports of the Geological Survey for 1885 and 1887-8, while another report on an adjoining area is shortly to appear.

In the summer of 1888 he attended the meeting of the Universal Geological Congress held in London, England, at which the origin of the Archæan gneisses and schists was one of the principal objects discussed, and his able paper there, read before the geologists collected together from all quarters of the globe, proving the intrusive character of many of the basal Archæan gneisses, placed him at once in the first rank among the scientific men of the day. He is also the author of many other papers and memoirs, all giving evidence of close observation, extensive research and deep thought.

Being an expert mineralogist, and an easy and accurate writer, he is eminently fitted to assist in developing the great natural mineral

resources with which British Columbia is so richly endowed, and his sterling integrity and independence will soon recommend him to all with whom he may be brought in contact.

Dr. Lawson carries west with him the best wishes of a large circle of friends and admirers, not only in Ottawa, but throughout America and Europe.

The Mineral Production of Nova Scotia in 1889.

The Annual Report of the Commissioner of Public Works and Mines is to hand, and, as usual, contains a mass of information respecting the provincial mines of great interest and value to the general public. From the returns furnished to the Department, we find that there is an increase in the yield of eight, and a decrease in the production of nine of the minerals recorded in the report for 1889. Of gold there has been a yield of 26,155 ounces as against 22,407 in 1888, or an increase of 3,748 ounces; iron ore, 45,907 tons compared with 41,611 tons in 1888, an increase of 4,296 tons; manganese 67 tons as against 88 tons in 1888, decrease 21 tons; coal raised, 1,756,279 tons against 1,776,128 tons, decrease 19,849 tons; coke made 35,565 tons, as against 29,808 tons, increase 5,757 tons; gypsum exported 147,344 tons, against 125,800 tons, an increase of 21,544 tons; grindstones 18,000 tons, against 17,225 tons in 1888, increase 775 tons; antimony 55 tons, as against 308 tons, decrease 253 tons; limestone 19,000 tons, against 15,448 tons, increase 3,552 tons; and an increase in the production of copper ore to the extent of 500 tons.

Wire Ropes.

In concluding an excellent paper read before the South Wales Institute of Engineers, Mr. T. H. Deakin said:—It would appear that the wire required to make a good rope must combine strength and toughness; but no hard-and-fast rule can be laid down as to the make of ropes for indiscriminate use, and I find the better plan in asking quotations for ropes is to give the makers the exact conditions under which the ropes will have to work—whether in a downcast or furnace-shaft; whether the pit is a wet one; size and form of drum, and the pit-head pulley, the load, and the speed at which it is lifted. A respectable firm will then, for its own reputation's sake, give the benefit of its experience, and suggest a make likely to yield the best results under the special circumstances of working. Some years ago I took charge of a colliery where it had been customary to use 4 in. circular iron wire ropes working off an 8 ft. diameter drum. The average life of the three last ropes used was, in the upcast shaft, six months eighteen days, and in the downcast eight months sixteen days respectively. We adopted two three fourths in. circular improved plough steel wire ropes in lieu of the larger iron ones, and the average life of the three succeeding ropes has been for the upcast fourteen months six days, and for the downcast twenty-five months fourteen days; the cost at to-day's prices of the iron ropes being 3s. 5'60d. per fathom, and of the plough steel ropes 4s. 11'75d. But the steel ropes lasting more than two and a half times the life of the iron ropes, made the comparison in cost in favour of the plough steel ropes, as say 5s. is to 9s. 1d. There were also other advantages in using the plough steel ropes: (1) They gave one-eleventh greater breaking strain; (2) the engines had less than half the weight of rope at the "lift;" (3) when taken off the shaft they could be used for haulage purposes, whereas the large iron ropes were done with. It was therefore clear that the wrong make of rope had been used on so small a drum. Speaking generally, it may be taken that after providing ample strength, then the lighter the rope the

better. This is sometimes objected to because small wires are ordinarily used in the smaller ropes, and there is therefore less wear in them; but this need not be. I remember a case of a long underground incline where the gradient was so little that the empty tubs would scarcely take down the rope, and where, on this account, it was necessary to have as light a rope as possible. It was also necessary to have a medium-sized wire, for the road was a wet and dirty one, causing a good deal of rubbing. For this work a rope was made of four strands, thus allowing of a fairly large wire to be used in a small rope. I would not, however, recommend using ropes of this make, except under some such circumstances as the above, for with four strands the rope is not as uniform in shape, nor can it be as easily or firmly spliced, as when made in the ordinary way. Ropes are made either flat or round, and these are again divided into "ordinary make," such as those first in use, or "compound" ropes. An "ordinary" made rope is understood to be a six-strand rope with six wires in each strand. A "compound" is made with wire cores in the strands, such as a six-strand rope, with eight or more wires outside and a wire strand for core. For winding purposes, if the ropes are made of the old construction, a rope six strands of nineteen wires will be found to give good results. If the rope is made "Lang's lay," fewer and larger wires may be used, and ropes six strands of seven, eight or nine wires with wire cores do excellent work. When wire cores are used they should be made of annealed wire, so as to allow for the stretching of the strands when under load.

LETTERS TO THE EDITOR.

Phosphate Analysis.

TORONTO, April 17th, 1890.

The Editor:

SIR,—With reference to the vexed question of phosphate analysis, and different results obtained by buyers' and sellers' chemists respectively, the solution of the trouble is not a difficult one. I would suggest the appointment of a Government Inspector and Analyst, say at Montreal, whose duty it would be to grade all phosphate that is offered in the market; and all contracts to be made on the basis of his report and certificate. This would be the most satisfactory way of selling for the Canadian miner and equally fair to the broker.

There is a Government Inspector at the port of Montreal to grade wood ashes, and why a similar officer has never been appointed to guard the interests of the phosphate trade—of vastly greater importance than that of wood ash—is a mystery. United action on the part of mine owners would rectify this neglect in a very short time.

A. S. THOMPSON, M.D.

MONTREAL, April 18th, 1890.

The Editor:

SIR,—I have read Dr. Francis Wyatt's "intemperate and illconsidered denunciation" in the March REVIEW with considerable amusement. Dr. Wyatt is evidently very angry because Capt. Adams and I have dared to speak disparagingly of Maret's method for the estimation of phosphoric acid; and because I explained that it had been almost universally superseded by the Molybdate method. Dr. Wyatt presents a selection of figures from his laboratory note book, remarking "the figures speak for themselves." What do they say? What bearing has this selection on the question whether the Maret or Molybdate method is the one generally used by chemists in estimating phosphoric acid? One is forcibly reminded of the three tailors of Tooley Street, who began their petition, "We, the people of England!"

If Dr. Wyatt objects to what I have written concerning the widely extended use of the Molybdate method let him lay aside rhodomontade, let him ascertain what method is adopted by leading English, German and American chemists; let him disprove my statements if he can.

J. T. DONALD.

Mr. J. Lanson Wills, who left for London in the beginning of the year, is now en route to report on certain petroleum sources in Trinidad, Venezuela, and Ecuador, (S. A.), where he will in all probability be located for the next three months. Mr. Wills writes that when he left London the Phosphate Trust was fairly in the way of becoming serious and practicable, "but when it would be in activity and life was uncertain."

PHOSPHATE.

In General.

Mr. E. D. Ingall, with Mr. James White and party, will shortly resume their work on behalf of the Geological Survey in the phosphate region of Ottawa County. Last season, the geological work was found to concentrate itself chiefly on the broad and extended belt upon which are the considerable excavations of the Crown Hill, High Rock and Star Hill mines, time being also found to similarly investigate for some distance the belt on which are the openings of the North Star mine and adjacent properties, at which latter point, the belt being narrow and the bush and surface cover having been more thoroughly removed by clearance and bush fires, better facilities were afforded than elsewhere for acquiring the necessary data. "In this way," writes Mr. Ingall, "it is hoped to obtain a few thoroughly worked-out examples, which may serve as illustrations of the numerous similar belts in the surrounding country, and of their nature, associations and habits, thus possibly adding something to our stock of knowledge of the pyroxene belts and the associated apatite deposits. Such systematized knowledge, systematically applied, must necessarily be the basis of all intelligent mining ventures."

Freights.

Every preparation is being made for the resumption of ocean shipments, the port of Montreal at date of writing being entirely clear of ice, and the river, further down, fairly open. Our quotations for ocean freights are: Liverpool and Glasgow—Regular liners, 6/3; outside steamers, 5/-. Business is being done at these figures, although several outside steamers have been booked at 7/-. London—By regular liners, 10/-; no outside tonnage has yet been offered. Hamburg—Business is being done at 15/- over the season.

Markets.

Business has been done for German account at 1/4½ on 80% with rise. English manufacturers have not as yet paid this price. The lower grades are keenly feeling the competition of the Osso phosphates. English prices for phosphate may be quoted at 1/- for 70% and 1/3½ and 1/4 for 80%, with 1/5 per unit rise. The market is a little less firm owing to the expectation of a supply of Florida phosphates from the newly discovered beds, but much uncertainty exists as to the early availability of these deposits, and as to their average quality.

Templeton District.

At the McLaurin, work has begun on three different shanties; about 75 men will be employed here from this out.

The Blackburn mines, operated by the East Templeton District Mining Syndicate (Limited), are turning out a large quantity of ore.

Lievres District.

Mr. Walter Pickford, who has returned from his visit across the water looking hale and hearty, reports that mining operations at High Rock will be pushed with the utmost vigor. A new Ingersoll 5-drill compressor, additional boilers, and other plant is being added, and we may look for a substantial increase in the production from the pits of this company. A little over 3,000 tons will be ready for shipment by opening of navigation.

The pits of the Canadian Phosphate Co., although still troubled with water, are yielding excellent outputs.

Mr. S. P. Franchot, of the Emerald, arrived home from the other side on the 17th inst.

There will be sold at the office of Registrar for the County of Ottawa at Hull, on 27th May next, by order of the Sheriff, the phosphate lands owned by "La Société Française de Phosphate du Canada." The properties comprise:—In the township of Portland East: Lot thirteen (13) in the first range; west half of lot two (2) and north half of lot three (3) in the second range; west half of lot two (2) and north half of lot three (3) in fourth range; lots eight, nine, twenty-two and twenty-four (8, 9, 22, 24) in the sixth range; lots seven, eight, nine, ten and twenty-one (7, 8, 9, 10, 21) in the seventh range; lots six, nine, ten, eleven sixteen, seventeen and thirty (6, 9, 10, 11, 16, 17, 30) in the eighth range; lots four, five, nine, eighteen, nineteen, twenty, thirty, thirty-one (4, 5, 18, 19, 20, 30, 31) in the ninth range; and the mining rights existing on lots one and two (1, 2) in the third range, the south half of lot one (1) in the fourth range; on lots three, seven and ten (3, 7, 10) and north part (39 acres) of lot one (1) in the sixth range; on lots twenty-

seven and twenty-eight (27, 28) in the seventh range; on lot twelve (12) in the eighth range; on lot seventeen (17) and the south part (75 acres) of lot sixteen (16) in the ninth range. In the township of Portland West: Lot twenty (20) in the fourth range, and the mining rights on lot three (3) in the tenth range.

It is reported on very good authority that Mr. George Stewart, now in London, has been successful in placing the Brazeau property, in conjunction with his lots at the High Falls, at a good figure, and that arrangements are being made on this side for an early commencement of work.

Kingston District.

Mr. Adolph Lomer, of Montreal, has acquired from the Anglo-Canadian Phosphate Co. the Bob's Lake mines in Bedford, Ont. A steam tug has already been transported to Bob's Lake; and a barge is in process of construction. This fine property will thus be made readily accessible in summer as well as in winter, and it is intended to put a strong force immediately at work to produce phosphate.

Mr. Lomer has also arranged with the Anglo-Canadian Phosphate Co. to work their Battle Lake mines in Templeton, P.Q., upon royalty.

The Anglo-Canadian Phosphate Co. has discontinued contract mining at the Otty Lake mines in North Burgess, Ont., and has resumed the system of days' work under the charge of Mr. Robert Cordick. They have been so fortunate as to strike several new veins at the outset of the renewed efforts, one of which shows a width of over ten feet of solid phosphate and others have a continuous breadth of three or four feet. Over three hundred pits have already been opened on this property, and it seems that the surface workings are still in good supply.

The Foxton mine is turning out phosphate in large quantities, and will employ about 50 men during the season. The shafts are being worked with steam drills day and night and a third shaft is being sunk.

MINING NOTES.

Nova Scotia.

Miscellaneous.

The next regular meeting of the Gold Miners' Association of Nova Scotia will be held at the Halifax Hotel on Tuesday, 6th of May, at three o'clock in the afternoon. At this meeting will be presented the report of a special committee appointed at the April meeting to devise ways and means for utilizing the Association, and the recommendation of this committee will be brought before the meeting for immediate action. It is understood that the report will deal with the re-organization of the Association in a radical and very important manner.

The output of Limonite ore from the mines of the New Glasgow Coal, Iron and Rail Co. at Springville is estimated to have been about 3,000 tons.

From Londonderry, the returns show 40,823 tons extracted.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S,
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

At Brookfield, Colchester, about 1,700 tons were mined for use at Londonderry. The vein was found too narrow going east, but going west it was proved to have a thickness of at least 30 feet.

The Eastern Development Co. at Colchester are building a railway and smelters. The county of Cape Breton has released the company from taxation on all real and personal property for 25 years. Below ground the shaft has been deepened about 50 feet, and more cross-cuts driven, which have proved the continuation in depth and quality of valuable veins. The ore extracted in the underground levels has been dressed, and the quantity now in stock is about 2,000 tons.

During the past summer two companies began to work the iron ores of the East River of Pictou. One of these, under the management of Mr. H. V. Leslie, of New York, has begun the construction of a railway from Sunnysbrae to New Glasgow, which is projected to extend to the harbour of Liscomb, on the Atlantic coast. The second company, under the management of Mr. Graham Fraser, of New Glasgow, has also surveyed a line of railway from the iron mines of the I. C. R., near the fork of the East River, and vigorously pushed the development of the mining areas. The mining has been done on a large vein of excellent limonite, which follows the contact of Silurian and Cambro-silurian rocks with carboniferous limestone in the valley of East River.

Fifteen Mile Stream.

The Egerton Co. under the new management is pushing work. The new compound condensing engine, tandem type, built by I. Matheson & Co., of New Glasgow, is on the ground ready for erection, and extensive alterations in the surface are under weigh. Mr. Jas. A. Fraser, M.P.P., is the managing director of the new company.

Killag District.

Mr. Geo. Stuart has gotten out his supply of cordwood for the ensuing year and this month commenced active operations. The new lode discovered late last fall will be developed this summer. The paragraph on this district in the Mines Office report for 1889 (just issued) would lead to the supposition that a mill had been built last year; such is not the case, as the property has had a very good mill, equipped with the Nissen batteries, for several years.

Lochaber District.

Reports from this district are most discouraging, it being evident that the ores, whether assaying well or not, are free from milling. The management of the property is in good hands, but is handicapped by the character of the deposit.

Beaver Dam District.

Mr. Turnbull and associates have gotten out the timber for a new mill of the Homestake type, to replace the old Yeadon mill. It is understood that the order for the machinery has been placed, and that the work of erection will begin this month.

Salmon River District.

The lode in this famous mine has pinched somewhat, but has been enriched in consequence, the returns for March showing 173½ ounces from a little over 400 tons, or an average yield of about 8½ dwts. per ton. The Mines Office report for 1889 is also in error as regards this district when it states that the plant is giving satisfaction; on the contrary, the mill is to be remodelled, as are also some parts of the mining plant. It is understood that the services of Mr. Wm. MacPherson, the veteran millwright, have been secured.

Whiteburn District.

So far this year this district has produced only 93 ounces, coming from the Graves mine. The new management here is busy in getting the property into working shape, and is changing over from underhand to overhand stoping as fast as possible.

Goldenville.

Mr. Robt. McNaughton has discontinued work in this district, and at present has a small force working on the middle lode at Wine Harbour.

Stormont.

On Thursday, the 31st of March, work upon the Palgrave Co.'s property on Hurricane Island, was closed down indefinitely. On Friday morning at 9.30, under the personal direction of Mr. H. K. Fisher, the president of the company, the work of removing the entire surface plant was commenced, and by 7 p.m. that day the entire pumping and hoisting plant, with all the buildings, had been removed. On Saturday, the old mining leases were surrendered and new ones obtained, and before midnight that day Mr. Fisher had effected services of arbitration notices on a majority of the parties claiming surface rights on the island.

This action was the result of a prolonged litigation as to the ownership of the surface rights, etc., and is, we

Believe, the quickest piece of dismantling work on record in Nova Scotia.

The company have a fine property here, and will rebuild a very superior plant just as soon as the question of damages can be settled.

Pictou County.

At No. 1 and 2 Slopes of the Intercolonial Coal Co., work has been for some time attended with some degree of danger, owing to a "creep" which seemed to imperil the safety of some portions of the mine. "I am of opinion that the danger of that is past, as no indication of any serious nature has been seen for the past few months in the year, and a large percentage of coal is now being successfully won. The air is kept well up to the workmen, of which a very large volume circulates in this mine."

Work has not been carried on to any large extent at the Scott pit. During the latter portion of the year twelve men were started to work with a view to pierce through a fault in the east side, and there test the quality of the coal. This was done, and the coal proved satisfactory, the fault being an upthrow of some 16 or 18 feet. Since that time no work has been done.

The Acadia Slope (Acadia Coal Co., limited) is now down a distance of 3,560 feet, a new lift having been sunk this summer of 440 feet. A considerable quantity of gas is met with in this lift, but every precaution, as hitherto, is taken to guard against every possible accident. No powder is used in the new lift or in any portion of the mine. A new overcast airway, as well as air returns, are completed, and a steady flow of air circulates freely round the different portions of the mine. The air and regulations were all that could be desired.

The McGregor pit has been kept steadily to work all the year, and the workings extended to the deep. The North Slant, which is down now a distance of 2,760 feet at the top dip at an angle of 16°, and at the bottom 25°. Pillar working, which in all mines is attended with danger to the immediate workmen, has been prosecuted successfully, and a very satisfactory percentage of coal is being had.

The English Slope (Cape Pit Seam, Stellarton) is down about 1,700 feet. During the latter part of the year some gas has been met, and, in consequence, safety lamps are used. In the distance gone down two-fourths have been encountered in the coal measures.

At the Foord Pit, after much perseverance and difficulties, they have succeeded in clearing the bottom of the Square Pit, and their large pump is now in effective condition. Very serious obstacles have been met and overcome in doing this much, and we trust that ere long this fine mine will again be in working order.

At the Vale colliery, Thorburn, improvements have been made during the year in the air passages by making connections between 1,600 feet level and 1,800 feet level, thus decreasing the distance air has to travel, and consequently increasing the air current around working faces.

Mr. Madden describes the operations at the Black Diamond as follows:—"In January they began drawing the pillars to the rise, and extending the bords westerly to the dip, and subsequently began drawing the pillars in the lower lift. At present it is all pillar work, which is being done very well. The tunnel mentioned in last report driven to test underlying seam was driven about 120 feet, when they struck some heavy feeders of water, they then stopped driving and put up a wooden dam three feet thick to prevent the water escaping into the workings, as they connect with the Acadia mine and were causing them trouble and expense to keep the water out. The wooden dam proved too weak to sustain the pressure, which is calculated to be about 300 lbs. to the square inch. A brick dam 2 ft. thick with 16 inch of a curve was subsequently built and likewise proved too weak. A third dam is now under course of construction; it is built in two sections. The inside section is 16 inches thick from pavement to 3 feet high, thence 12 inches thick to roof 5 feet; a space of three feet is left when the outside section is built three feet thick. Clay is rammed in the space between the sections."

Cumberland County.

We are indebted to the Annual Report of the Commissioner of Mines for the following extracts referring to the operations of the various collieries during last year:

The production of the Springhill Mines was 425,149 tons. The fire in the Syndicate Slope was successfully extinguished by damming water up against it. It is proposed to utilise it for the present as an up-cast and travelling road. The New or No. 5 Slope shows the turn of

the measures toward Amherst. It is now down about 1,200 feet, and the levels going north show coal of good quality. It is reported that not far from the north-west corner of the old General Mining Association's area, a coal outcrop has been found. If it dips toward Springhill it will complete the structure of a basin. If the dip should be northward, the Springhill Basin is either complete or the northwardly dip of the crop would show that there is in Springhill a basin subsidiary to the great basin of the coal-field. As these mines give off more gas than in former years, the management are introducing safety-lamps at several points.

The sales to the Province of Quebec from this county were 177,461 tons, compared with 182,927 tons during the year 1888.

In April, at the Joggins, they began sinking a new lift in the slope, and also drove a place to surface from the top-lift for an airway. They are now down a distance of 600 feet, and have levels driven in some distance, and a back balance completed. In extending levels on 1,500 feet lift they crossed three dikes or troubles in the coal measures, two down—throws and one up—throw. The coal is now pretty well extracted from the old lift, and owing to so many faults on the 1,500 feet lift, the output of coal has been retarded. The work is now in fair order, and we may reasonably anticipate the output to be materially increased next season.

The management of the Chignecto Colliery have driven a plane from the present lower lift out to the surface on the east side of the mine, inside the old original fire, and are using it as a return airway and travelling slope, and during the latter portion of the year have begun operating on the east side of the mine. Some small fires during the year have originated from spontaneous combustion, but have been all built off and appear to have died out. They have been extracting pillars, but the angle or dip of the coal being so steep makes it a rather difficult job in this mine. Ventilation has been always satisfactory.

Mr. Hall, who for 16 years has successfully managed the Springhill collieries, Nova Scotia, has resigned. Under his careful management these collieries have been well developed. It is understood that he will still reside in Springhill.

Cape Breton.

The total sales in 1889, as per Mr. Neville's official report, were 751,997 tons, against 738,250 tons in 1888, and 715,442 tons in 1887.

The home sales were 700,182 tons, compared with 190,508 tons in 1888.

The sales to Quebec were 381,074 tons, against 381,012 in the year previous.

At the Sydney mines the management are fitting up a new underground forcing pump of 36 in. cylinder and 5 ft. stroke to force the water from pit bottom in one lift of 700 feet to the surface, and thus take the place of the large Cornish set of pumps. A stone engine house with arched brick roof is being built at the pit bottom for this pump. On surface, tressel work is built to the outer side of the coal yard, and an apparatus put up by which the tubs of coal for banking are drawn out to the bank by an engine. A screen is erected for screening the coal on the outer side of the heap, and a branch railroad to this screen from the main line.

At Victoria mines work was brisk during the whole of the season. West levels were extended 550 yards, and the east levels, 450 yards. East slope has been straightened and graded. The length of the slopes at present from the surface to the low levels is about 1200 feet. A new Blake pump has been placed at the bottom of the lower lift, which discharges to the upper pump and lodgment. Its dimensions are as follows: cylinder 15 inch, 12 inch stroke, 6 inch plunger, calculated to throw 130 gallons per minute. A new trolley has been made and placed on the slopes for the men to ride on, ten at a time. The management say they intend to put another on, so there will be one for each slope. The screens and bank have been roofed and covered in.

At the Reserve mines the east slope has been driven three hundred and ninety-six feet down, and levels turned off. North level driven six hundred feet, south level driven five hundred feet. In the main or west slope fifteen rooms were worked, some of them driven to the barrier. Six pairs of men to the rise of this were kept splitting and drawing pillars. The old furnace has been pulled down and a new one built in place of it, which is

about six inches wider and higher than the old one. The management say that it is their intention this winter to drive the east slope down six hundred feet further in order to gain another lift.

The coal at the Intercolonial seems much improved, being more free from impurities and the seam thicker. In order to test the Ross seam under this area, a slope has been driven into the crop of it about one hundred feet. The coal is five feet seven inches thick, and appears to be a good quality.

There has not been much change in the workings at Little Glace Bay, except that the levels on the north side have been driven about five hundred feet into the Campbell area, which they now control. Also, the level on the south side of the pit has been driven five hundred feet. On surface, a new locomotive shed has been built, and the railroad wide-gauged from pit to wharf. New four and a half ton cars built and put on the track instead of the pit tubs. The bank and screens have been roofed and covered in. A new shed for a saw-mill has been built, and a steam saw-mill placed therein.

At the Caledonia, work has gone on as usual both at the dip and rise; dip levels have been extended on the east and south side, and rooms worked off; a few pillars have been split and drawn from the south side of the rise workings. On surface, a new No. 3 Manville windmill and Starr pump has been placed over a well twenty chains north from pit, which supplies the reservoir with water and gives good satisfaction.

The main dips of the Gowrie mines have been driven down 750 feet, which now makes them, 1,800 from shaft level; from that point levels are turned off east and driven 900 feet. Also the west levels from the upper dip have been driven 300 feet, which makes it about 1,800 from the landing. A pair of slants is being driven from the level to come out on the west level near the pit bottom. The coal from the west side is to be drawn up this slant this season; a new pump has been placed at the bottom of the low lift, which delivers water from there to the lodgement and pumps of No. 1 deep.

New Brunswick.

"Peat bogs are numerous and well developed near the bay of Fundy coast and in many places inland. Those near Musquash, Popelogan and Digdeguash Rivers are quite extensive. Lying just east of Musquash Harbor is a bog covering an area of 450 acres and 20 feet in depth, which is now about to be utilized in the preparation of "moss litter." This in an article used in stables as bedding for horses. Owners of studs in the United States have for some time been looking for a material for this purpose sufficiently light and porous to be an absorbent of the liquids, moisture and ammonia which collect in stables, and which could afterwards be used as a fertilizer in gardens, &c. A few capitalists from St. John, St. Stephen and other places have formed what is known as the Musquash Moss Litter Company, and having purchased this bog, are now erecting buildings and machinery there for the preparation of this article, which, it is claimed, is well adapted for the object intended, and as good as the imported European moss litter. The kind of peat used is not the upper or living peat, nor the deep-lying, decayed material, but that between the two, in which the mosses and rootlets are only partially decomposed, and which has the fibres nearly whole. The chief process in its preparation is depriving it of the water, of which it contains 90 to 95 per cent. This is done by a plunger, by pressing it between rollers and by evaporation. When thoroughly dried it is packed in bales for shipment, and is worth \$15 to \$17 per ton in the principal United States cities. This new enterprise promises to be successful. This paragraph has been gleaned from Mr. Chalmers Report to the Department of Interior."

The same gentleman writes as follows regarding the Brine Springs and Salt deposits found at Sussex: "Brine springs are found at Sussex, at Salina, on Salt Springs Creek, and at Bennett's Brook, near Peticodiac. Five or six hundred bushels of salt per annum are manufactured at Sussex. This is all consumed locally, and used chiefly for table and dairy purposes. Several springs occur near the site of these salt works. A boring 125 feet deep was recently sunk at one of these springs—13 feet of it through surface deposits and 112 feet in rock. The object was to find the salt rock, but nothing of the kind was met with. The strength of the brine, I was informed, increased slightly till the solid rock was reached; beyond that it did not perceptibly change. At Salina an attempt was made some years ago to manufacture salt from the brine of the surface springs there, but was discontinued. Possibly a series of borings might result in improving the quality of the brine, but none have yet been made. At Bennett's Brook nothing has been done to utilize the springs there, to my knowledge. In all these places the

brine contains a considerable percentage of sulphate of lime or gypsum. There appears to be less, however, in that of the Sussex springs than at Salina or Bennett's Brook. The salt manufactured at the Sussex works is said to be of a superior quality."

Quebec.

Our latest advices from the asbestos districts show that unusual activity is prevalent at all the mines of Thetford and Black Lake. The raw material continues in strong demand, and supplies are insufficient to meet the wants and uses of consumers. Consequently a considerable advance on our last quotations has to be reported, one large producer having predicted that the prices for crude No. 1 will go as high as \$250 per ton before the season closes. It would appear by this that the foreign trade is prepared to absorb the whole of our asbestos production at profitable rates. Additional and improved machinery, and largely increased working forces are notable at most of the mines, and with favourable weather there should be a large advance in the year's production.

There are four copper pyrites mines in this district actually in working operation now, viz., the mine of G. H. Nichols & Co., of New York, the Eustis mine at Capelon, and the Moulton Hill and Howard mines.

The Nichols and Eustis mines have been producing for a term of years; they produce a grade of pyrites which burns freely, and is well adapted for the manufacture of sulphuric acid.

The Moulton Hill and Howard mines have been opened up within the last year, and the work has been mainly development.

At the Howard mine, shafts have been sunk, and drifts and cross-cuts made to a depth of some two hundred feet, and a large amount of ore opened out, which will be broken when the developments are sufficiently advanced.

At the Moulton Hill mine about the same amount of work has been done, and in addition a plant has been erected, calculated for raising, dressing and shipping from 100 to 200 tons of ore daily. The ore-ground is as yet broken except incidentally in the shafts and drifts. The shipments of the company to date from ore incidentally met with amount to some 2,000 tons.

Ontario.

The Bill respecting mining regulations and also that amending the General Mining Act have both passed their third reading. A third Bill respecting mining claims, (having relation to staking off mining claims,) was withdrawn after its second reading, as it is desired to make it more extensive, and to embrace matters not now included in its present shape. It is desired, also, to have the benefit of the report of the Mining Commission before dealing with that subject.

We learn from Dr. Bell, one of the Commissioners, that the Report of the Royal Mining Commission will not be issued for at least two weeks yet. Surely, after so much tinkering, we may expect something good and to the point. Let us hope so.

Mr. H. P. Brumell, of the Geological Survey spent a portion of last season in a visit to the counties of Welland, Lambton and Essex, in all of which drilling is being actively carried on. In his preliminary report he describes these workings as follows:—

In Welland county a company has been in operation since the month of June last, and had, at the time of my visit, completed one well, which attained a depth of 846 feet, and had begun a second. From the first well a flow of gas of \$1,000,000 cubic feet had been obtained, though subsequent to my visit this well was shot, and the flow increased to about 1,750,000 cubic feet. An accurate log and specimens were obtained of this well, and also of others in the Niagara Peninsula. In August last eight wells had been completed in the Peninsula. Of these, three are at Port Colborne, two at Niagara Falls South, and one each at Thorold, and at St. Catharines and in the township of Bertie. A very small flow of gas was obtained in the well at St. Catharines and at Thorold, while from the wells of Port Colborne there is a total production of about 50,000 cubic feet per diem. It is understood that the burningspring at Niagara Falls is being supplied with gas from one of the wells recently sunk at that place.

At Bertie and Port Colborne the gas was obtained from the upper beds of the Medina formation, which is reached at these places at a depth of 735 feet respectively. At Niagara Falls the gas comes from a depth of 201 feet, at which depth the bore is in the lower beds of the Niagara shales, while at Thorold and St. Catharines the

flow is obtained from the lower part of the Trenton series, in the former place at a depth of 2,394 feet or 489 feet in the Trenton limestone, and at the latter in a sandstone at a depth of 2,185 feet, or 13 feet below the limestones of the Trenton series.

Two more wells have been drilled in the townships of Bertie and Humberstone, to a depth of 851 and 836 feet respectively, having a flow of gas of about 500,000 cubic feet per diem each, the flow in both cases being from the Medina sandstone.

In Lambton county the oil fields of Enniskillen township are still being extensively drilled upon. A number of drillers living in Petrolia and Oil Springs were interviewed, and logs and information regarding wells throughout the province were obtained from them.

In Essex county exploration for gas is being continued, It has, however, been obtained in quantity but in one well, namely, "Coste No. 1," which has a daily flow of 10,000,000 cubic feet. This well, drilled to a depth of 1,031 feet, is situated in the township of Gosfield, lot 1, concession 3, eastern division. Wells had recently been completed at and near Kingsville and at Comber, and drilling was, in September, being carried on at Amherstburg, Essex Centre, Marshfield, Kingsville, Leamington and Blytheswood. The well at Marshfield, being sunk for Messrs. Walker & Sons, of Walkerville, will be watched with considerable interest, as it is the intention of the firm to carry this drilling down as far as the Trenton limestone.

Sudbury District.

By recent changes in the United States Tariff Bill, nickel ore is admitted free into that country. This will please Mr. C. J. Ritchie and his Ohio stockholders in the Canadian Copper Co. as well as the other concerns now operating the copper and nickel mines in this promising district.

Messrs. H. H. Vivian & Co., Swansea and Birmingham, England, who are operating here, are seeking Incorporation.

On the 4th inst., while a car load of rock was being hauled to the surface in one of the pits of the Canadian Copper Company, the cable snapped, precipitating the car with great violence to the bottom of the shaft and instantly killing three miners at work there. Accidents due to carelessness and negligence are far too frequent in some of our mines, and call urgently for an efficient service of Government mine inspection.

The Ontario Government has granted \$1,000 to build a road to the north of Sudbury six miles, to reach the Dominion and Stobie mines, \$1,500 to extend the road west to a French settlement at Chelmsford, and \$1,000 to open a road from Whitefish Station seven miles to the timber limits on Lake Penago.

At the mines of the Canadian Copper Company mining development continues brisk. The Stobie track is now clear, and operations at this mine will be resumed at once on a large scale. The ore from this place is largely used as a flux for smelting.

At the Evans mine this company is putting in a new 10 drill Rand air compressor to replace the 6-drill Ingersoll. The new boarding houses at this mine are now fully occupied; they are well laid out, commodious and comfortable. The rock-house—one of the best in Canada—was brought from the Calumet and Hecla mines. The output runs from 90 to 100 tons per day, and average from 8 to 10% copper and from 3 to 4% nickle. It is first brought to rock-house, where it is crushed and sorted, then dumped into bins and taken to the roast-yard at smelter and roasted.

At Copper Cliff the ore in 5th level west continues rich and in large quantities, it being estimated that quite 3,000 tons of 12% Cu. and Ni. ore are in sight in this new level. A new compressor will shortly be added to the plant at this well equipped mine.

At the suggestion of Capt. Jones the diamond drill was set to work at a point about half a mile from this mine, and the results of the operations have been extremely favourable, proving beyond doubt that the virgin ground contains even richer deposits of nickel than that now operated. The new find has been named the "Great Jones Mine," after Captain Jones. The drill is still boring.

Both smelters have been shut down for a week in order to admit connections of blast pipes to one engine, thereby

saving fuel and use of extra engine. At date of writing the company has just shipped 6 cars of matte in bulk to Joseph Wharton, of Philadelphia, the large nickel refiner.

Mr. Duncan McIntyre and a number of gentlemen connected with the Dominion Company visited their mines and works during the month, and expressed their approbation of the progress of operations there. The management are carrying in their coke by rail, and will soon be ready to commence smelting.

The Murray mine (H. H. Vivian & Co., Swansea) is making slow but steady progress in development.

Rat Portage District.

The building of the new reduction works at Rat Portage proceeds apace, and the engines are now being placed in position. A number of American capitalists are in the district with a view to securing claims.

Port Arthur District.

The action of the Ontario Government in placing the sale of mining lands in the hands of the local agents will be a great boon to the investors and explorers, who will now be able, on arrival here, to learn exactly what lands have been taken up and what lands are available for entry, and be able to conclude on the spot all transactions necessary to secure a title.

The Torrens title system, we understand, has also been amended so as to accommodate the requirements of our mining districts.

The railway into the mining region is getting well into shape, so that in a few weeks trains will be running from Port Arthur direct to the famous Beaver and Badger mines, and by 1st October to Silver Mountain. Everything is being done to expedite matters as the waggon roads are at present well nigh impassable.

The rush of prospectors has begun unusually early this spring, many having already gone out, although the snow is still deep in places. The iron fields are at present attracting the most attention, and commencement of work on the branch line of the C. P. R. to the Atikokan iron range will doubtless create a rush into that valuable gold and iron section.

The Badger mine is working an increased force and continues shipping high grade ore. Better results will doubtless follow the improvement of the stamp mill, and the operations of the air compressors are now being arranged for. Drifting is being carried on westward on the lower level, and is now in 300 feet in the shaft. The vein increased from 4 feet at the shaft to 7 feet at the drift, and is carrying good pay ore, composed of blende, argentite and native silver. As soon as the compressed air plant is installed, the working force will be largely increased. At present seventy men are employed.

On 9th inst. a deputation consisting of Messrs S. J. Dawson, M.P. Conmee, M.P.P. Senator Clemow and others waited upon Sir John Macdonand, and urged a grant to aid in the extension of the last 15 miles of the P. A. D. & W. Ry. Sir John promised to give the matter careful consideration. As soon as it is absolutely known that aid has been granted by the Dominion Government for this much needed branch, work will commence on at least six of the different gold lodes in that section of country.

Capt. Hooper, of the Beaver mine, is making preparations for stoping out the 20,000 tons of ore now in sight. The engineers are pushing the repairs to the mill, and expect to have everything in readiness to start it up by the 15th of April. Its capacity is ten head of stamps, and will be doubled about the 1st of May, and if the developments turn out as they are expected to at the North Bluff vein its capacity will be trebled. The increased amount of water necessary for its increased capacity will be brought by syphon from a lake on North Bluff as soon as the mill starts. The force of miners will be largely increased, and there are facilities for hoisting 30 tons of ore per hour. The shipments during last month are expected to realize \$20,000.

The Shuniah Weachu Mining Co. held its annual meeting last February, and the report shows a more prosperous condition of affairs than in 1888. Shipping of rich ore still continues, and the dumps are accumulating an enormous quantity of mill rock.

The West End Co., although in very rich ore, are working only a small force, which they are arranging to increase so soon as the roads improve or the welcome whistle of the railway engine is heard.

The Elgin mine still continues in rich ore, and is steadily advancing in favor.

The Crown Point mine is making good progress, and the ore continues to improve.

The Silver Glance and Mink Mountain mines are reported to have been lately bonded to Belgian and American syndicates for large sums.

The Star, Stirling, Black Hawk, Medicine Bluff, Lone Pine, Y4, are all being developed, and although only in their infancy are attracting considerable attention—showing up well in silver.

The Murilla mine pumps being unable to overcome the rush of water, the mine has been temporarily closed down.

The copper deposits in Blake Township so ably referred to by Dr. Lawson, late of the Geological Survey, in the *American Geologist* for March last, are showing up better as developments proceed.

Several bids have been received by parties holding mine properties, and the Black Bay lead and silver deposits will this spring be actively worked.

The following are the Custom House returns of silver exports from Port Arthur for quarter ended 31st March, 1890:—

1890.	SILVER ORE.		Total.
January.....	27 tons	\$18,050	\$18,050
February.....	1 "	1,525	1,525
March.....	100	100
So far as rep't d			
Total.....	28 "	\$19,675

North-West Territories.

From returns received by the Dominion Lands Agent's, the number of applications for Coal Lands during the year 1889 was 125, and 26 of the applicants were given the privilege of purchasing, within a specified time, the location for which they applied, and 43 of the applicants were given permission to prospect thereon. Only two of them bought the land applied for, or a portion thereof, and 4 of the applicants being homesteaders were permitted to mine coal by paying 5 per cent. royalty on coal mined.

The revenue for the year derived from the sale of coal lands was \$1,662.50, being \$73,037.50 less than the previous year. The total area of coal lands sold up to date is 12,261.63 acres, and the total amount received therefor \$126,171.32.

Ten leases for twenty-one years were issued in 1882 and 1883, of land within the Souris Coal District, but as the lessees had not complied with the provisions thereof these leases have been cancelled.

By an Order in Council dated the 11th of July, 1888, the regulations for the disposal of coal lands in the Province of Manitoba and the North-West Territories were made to govern the disposal of Dominion coal lands in the Railways Belt in British Columbia.

By Order in Council dated the 17th September last, several amendments have been made to the coal mining regulations, and provision has been made for the disposal of coal and other minerals under lands patented, the mining rights of which have been reserved. By the same Order in Council, all patents from the Crown for lands in Manitoba and the North-West Territories shall reserve all mines and minerals which may be found to exist within, upon or under such lands, together with full power to work the same. This is an extension of the Order in Council of the 31st of October, 1887, which made the same provision with respect to lands in Manitoba and the North-West Territories situated west of the Third Meridian.

Returns from the Dominion Lands Agents show that during the past year 41 entries were made for mining locations other than coal. The revenue from mining lands other than coal for the year was \$184,15, received in

payment for fees for entry, and for registration of assignments. The total area of mining locations sold up to date is 108,086 acres, which realized \$5,406.50.

No amendments have been made to the regulations since October, 1887, with the exception that the regulations do not now govern the disposition of gold and silver under Dominion lands in the Province of British Columbia.

The North Western Coal and Navigation Company at Lethbridge has very considerably extended its operations by completing the shaft for hoisting, and making new galleries, levels or drifts, further switches, &c., so that although the output for the past twelve months may not have increased very considerably over the year preceding, the company is now in a position to increase its output to probably 1,000 tons per diem, and in a short time to double that quantity should the demand increase to that extent. It is anticipated that there will be during next season railway connection to the south, giving access to the reduction works at Great Falls, Helena, Butte and Anaconda in Montana, which will afford this company a large and profitable market for its coal.

Mining at Anthracite point has not until recently been pushed with the energy with which it was formerly conducted, the hesitation being caused by negotiations which have been going on with a view to disposing of this property to a strong English company. These negotiations have not yet been completed, and the present owners have for the past three months been pushing as vigorously as possible new slopes and galleries, so that in a year the output can be worked up to 1,000 tons a day if necessary. In doing this the output of the mine has been greatly reduced temporarily, but in the near future it can be increased. The present proprietors have unlimited faith in this property, and even should the negotiations referred to fail, there is no doubt that capital will be forthcoming to work the mine, and, in about one year, to quadruple its previous output. During the past season three new seams have been discovered at Anthracite, two of which, so far as one can judge from their present openings, are from five to seven feet in thickness and of first class quality. The third would appear to be thinner and possibly not of so good quality, but it has not been opened sufficiently for a correct idea to be formed.

At Stair, near Medicine Hat, two companies are in existence. The old mine at Stair, originally known as the Woodworth, subsequently the Stair coal mine, has, within the past few months, passed into new hands, and mining and shipping coal has been in progress to some extent. Opposite this mine, on the south bank of the river (South Saskatchewan), a company, known as the Medicine Hat Coal Mining Company, has certain land on which, during the past season, a shaft was sunk to enable mining operations to be carried on. No mining of any appreciable extent has, however, been done, nor can it be done with profit till a branch line of railway, some six miles in length, is constructed, connecting this point with Medicine Hat. The construction of this switch or branch the company states, will in the near future be proceeded with.

The development or output at the Cochrane mines here formerly owned by Messrs. Chaffey and Vaughan and also by Mr. T. B. Cochrane, has in the case of the former been nil, in that of the latter not appreciable. A company has been floated in England with, it is reported, a capital of about half a million dollars to purchase and develop the properties of the latter gentleman at Cochrane, which, besides mining property, represent also some lumbering interests. This company has now a mining engineer from England making examinations as to the most economical means of development, and also respecting the establishment of coking furnaces, it being anticipated that next season will see a demand for coke for smelters to the west.

Considerable development has taken place near Canmore during the past season, and the number of seams which have been brought to light and their dimensions border on the marvellous. One cannot realize it without a personal inspection, and if late reports are reliable, the area of the coal basin in the Bow River, west of the gap, is very much greater than was heretofore supposed. The output has not been extensive; but sufficient explorations have been made to enable the proprietors to acquire a correct estimate of the quality, of the enormous quantity, and also of how to open out the works to the best advantage.

There has been considerable local excitement manifested on the east slope of the Rocky Mountains, north of the

49th parallel, respecting the discovery of petroleum; but development will be required to enable one to estimate the value of the discovery. In this connection it is worthy of consideration whether it is not advisable in the public interest that petroleum lands should be treated in the same way as coal lands: that is, sold outright at a fixed price per acre. The ordinary regulations requiring on each claim development equalling \$5 per acre per annum does not meet the case. To put down a test hole means an expenditure of several thousand dollars; anything less would be a mere waste of labor and money, and no one will go to that outlay unless a considerable area be secured.

At two points on the Canadian Pacific Railway line, viz., Langevin and Cassils, gas wells have been in existence for nearly six years; the flow has not preceptibly diminished though the wells were piped for water not gas. The probabilities are that if thorough tests were made, combined with correct piping, it would be found that gas exists in sufficient quantity for fuel and lighting purpose. The impetus which the establishment of this fact would give to the progress of the district would be great.

The contract for sinking the new shaft of the North-West Coal Co., at Lethbridge has been awarded to Messrs H. and A. Kerr at \$47.50 per yard. The site for this shaft is situated about three-quarters of a mile north of the station, and the shaft will be sunk three feet below the coal, about 300 feet altogether. The new air shaft is going ahead well. It is down now over 60 feet, and the windlass has been replaced by a gin worked by horsepower. Two more shafts are to be sunk, one an air shaft, almost immediately.

The Line of Railway to connect the Medicine Hat Coal Co. Mines to the Canadian Pacific Railway will be begun at once.

"Owing to the heavier fall of snow this winter, says the Edmonton Bulletin," it is not likely that the opportunities for mining on the river in the spring will be as favorable as last season, as the water will probably be higher. There will, however, be a considerable number of miners at work in any case, and no doubt if high water covers some of the bars so as to prevent their being worked it will prevent the working of others which could not be worked in low water. It is estimated that last season between \$15,000 and \$20,000 worth of gold dust was taken from the Saskatchewan, of which about \$6,000 was taken from the immediate vicinity of Fort Saskatchewan. Several hundred dollars also were taken from the Macleod river, a tributary of the Artabasca, about 125 miles west of Edmonton, on the trail to Jasper House. The gold of Macleod is in even lighter flakes and is of lighter yellow color than the gold of the Saskatchewan. The skimmings of its bars are fairly rich, but it does not promise so permanent diggings as the Saskatchewan. Thomas Smith, of Edmonton, is now in Eastern Canada preparing to make another attempt at mining on the Saskatchewan by machinery. The attempts hitherto made have always failed, but as Mr. Smith has more practical knowledge of the requirements of the case than other promoters of like enterprises he has that much better chance of success.

Major Stewart reports that by the end of next month the anthracite mines at Banff will in all probability be in active operation again, mining having been suspended pending negotiations for the transfer of the company to the English syndicate. It is thought that the new machinery will be in place by that date, and everything in readiness for a renewal of active work. The new concern will be styled the "Pacific Anthracite Coal Co."

British Columbia.

Vancouver Island.

The coal exported from Nanaimo, Departure Bay, and Comox, was shipped principally to San Francisco and ports in California; other shipments were made to Oregon, Alaska, Petropavloski, Hawaii Islands, China and Japan (per C. P. R. Steamers). H.M. Navy and U. S. War and Revenue vessels have been supplied with coal, and ocean mail steamers and other vessels calling for fuel.

The returns of the collieries show about 124,574 tons under the head of consumption in 1889, as against 115,953 tons in 1888; but it should be understood that the coal used in collieries is in most cases included in such returns.

The following statement of output and export of coal from 1887 exhibits a very gratifying rate of progress by the coal industry of British Columbia in the year 1889, viz:—

Mr. Bowron writes hopefully of the quartz interests of this section, which he thinks must be regarded as the main source from which the future wealth of this district

must flow. The successful treatment of the quartz from the Black Jack Mine, to which some reference is made elsewhere, proves conclusively that the Cariboo ores will repay the attention of capitalists. The destruction of the Government Reduction Works at Barkerville was most unfortunate, and is greatly to be deplored, inasmuch as their rebuilding will occupy fully a year's time, and miners who were awaiting their turn to test their ores will be compelled to wait until the new works are completed.

The Black Jack Quartz Mining Co., commenced crushing ore on June 1st in their one stamp Kendall Mill, and managed to put through 202 tons before the frost compelled them to close down. The ore averaged \$4.50 in free gold and \$13 in sulphurets per ton of rock crushed. In blasting the rock in the shaft the sulphurets were shattered very fine, which then mixed with the waste rock, and it was found almost impossible to separate the ore from the waste, so that nearly all the rock taken out was sent to the mill, and accounts for the low grade of the ore. The endeavour in this case was to develop the mine, and to mill what ore was taken out to pay running expenses. Sinking the shaft and milling the ore from it cost more than double what it will cost to mine and mill the ore when the mine is thoroughly opened. A shaft was sunk 42 feet deep, and a drift of 22 feet run on the ledge, when it was found that the ledge changed its course, which made it necessary to stope up an incline shaft to the surface, from which the ledge can be worked to better advantage. The incline shaft had reached within five or six feet of the surface when the mine was closed down for the winter.

Gold Mining as an Industry.

Gold mining as a speculation has received a shock; why not try it now as an industry? It suits the unscrupulous promoter and the gambling operator to manipulate a gold mine, but the investing public's interest lies in its being scientifically and honestly worked. The present position of South African gold shares in the market is a telling although painful illustration of the first method; some of the Indian gold mines may be taken as an apt instance of the second.

The mad rush to acquire claims in the Witwatersrandt, to float companies in Johannesburg or London, to set up standing machinery, to crush the best and most easily got at ore, to send home the highest returns of gold extracted, to declare fancy dividends, and, as the end and aim of all, to rig the market, has ended, as was inevitable, in wreck and ruin to many an unwary speculator. It is an old story, which will continue to be repeated until mining for the precious as well as every other metal is carried on as an industry, or, in other words, on commercial principles. As businesses are not built up by those at their head always keeping their eye on the Stock Exchange, so gold mining is not likely to be successful while the directors and managers think more of the market quotation than the steady development of their property. Mines apparently rich—such as the Salisbury, which extracted over 2,000 ounces in one month a little over a year ago—have now to stop milling, in order that necessary work which should have been done at the outset may now be undertaken. This is by no means a solitary instance of palpably bad management, reflecting as it does upon the skill, if not the honesty, of those in charge. Mining engineers may not have always a free hand, and may be required to do many things against their better judgment; but they too not unfrequently add to a want of knowledge and practical experience a desire to make a brave show, to the eventual undoing of those who place their dependence thereon. A determination to go straight through with the work, opening up and developing the mine as they proceed, doing the dead work that is essential at the outset, will not produce bloated dividends, but it will, if the conditions are favorable, make the property a steadily remunerative one, and add to their own reputation in the long run.

Gold Bricks from Barkerville.

Below we present our readers with illustrations of the first two gold bricks—the advance guard it is hoped of a host of others—the result of the treatment of one hundred tons of quartz from the Black Jack Mine, near Barkerville. The test was the only complete one made by the Government Reduction Works before their destruction by fire. The value of the small bar is \$405.21, the gold being .837 fine and is that saved on the plates from the free-milling ore. The larger brick is that extracted by the chlorination process from the concentrates, its value being \$2,018.80, the gold being .990 fine. Included

in the 100 tons treated were some 20 tons of concentrates previously treated, but from which only 60 per cent. of the gold had been taken. These were again treated and

another 30 per cent., or about \$325.00, secured. This would make the value of the Black Jack ore per ton to be \$21.00, a price at which it would pay well to work. Ninety per cent. of the gold in the concentrates was se-

cured by this process. These results prove conclusively that the ores from Cariboo will repay the attention of capitalists, for that they can be profitably worked is placed beyond question. We are indebted to the courtesy of the publishers of the *Colonist* for the use of the cuts represented above.

The Training of a Geologist.*

By John C. Branner, Ph.D.

The fitting of a young man for his work in life is worthy of our serious study and consideration, and while much that I may say is equally applicable to men in any calling, I can only undertake to speak of some of the demands that the times are placing upon geologists.

It is to be expected, of course, that there are plenty of persons of intelligence in the world who have no conception whatever of a geologist's duties, those who imagine that geology as a profession can be picked up just as the duties of certain civil offices, or of clerical positions, may be readily learned and performed by any man of ordinary intelligence. Among the applications I have received for employment one man gave as a reason why he should be employed that he was a consistent member of the Presbyterian church; another that he was a graduate of a famous military school; another was interested in geology and had read many books upon the subject, among which he cited some of the vaporings of Ignatius Donnelly; still another used to be acquainted with Professor Winchell, and another was in poor health and thought field work would be good for him. At least half of the applicants have asked for employment because they understood ordinary land surveying, and one of them admitted that he had no other qualification than that he was "a good hand to camp out."

The general academic training of a geologist during the first two or three years of his college course is not essentially different from that of any man of culture. I am not disposed to side with those who think that if a man is to be a specialist the sooner he begins his specialty the better. In a general way this proposition is correct, but in making such an admission it must be distinctly understood that all things which tend to broaden a man's scholarship form essential parts of his specialty.

That a man should have a knowledge of history, philosophy, social science, and of literature in general goes without saying. But as bearing directly upon his professional career he should understand, of the languages, at least the Latin, French and German. In mathematics he should have the general instruction required by civil and mining engineers, and should give special attention to astronomy and geodesy. In chemistry the more thorough his training the better, and beside the usual work required of students of chemistry, in which especial attention should be given to inorganic chemistry, he should be a skilled mineralogist and should be well acquainted with metallurgical processes. In physics the student should give attention to optics, especially as employed in the construction of mathematical instruments; to hydraulics and hydrostatics, to dynamics, and to hypsometry.

I have sometimes thought that to be a good and successful geologist one should first be a good civil engineer and then a good mechanical and mining engineer. This thought has been suggested to me by the fact that among the students I have had to train in geological work those from the engineering courses have, almost without exception, proven themselves by far the best qualified. This is due to the fact that a large part of a field geologist's work consists in tracing out in the field, and the delineation upon maps and cross sections, of structural features. In this work topographic features—the elements of horizontal and vertical distances—have to be so constantly dealt with that unless the student has pretty thorough training as an engineer he will find the work very tedious. I should make it plain, however, in referring to the desirability of a geologist having an engineer's training, that I do not mean to imply that an engineer can always step into geology and make a success of it, for it is only the very young engineer who can or will make the proper use of his technical training. As a rule, the man who has been a practising engineer for a number of years is no longer sufficiently pliable in habits of work and thought to make a successful geologist. In geology various degrees of detail are required. Sometimes our measurements need to be made with a micro-meter, at others with a foot rule, while at other times an error of several feet is of no consequence, but a civil engineer who has been accustomed to the degree of accuracy required in railway construction can not always bring himself to use now a less accurate method, and now, another of great precision, just as circumstances may require. But whether the student receives the full training of a civil and mining engineer or not, he will need to acquaint himself with practical and theoretical land surveying. He should have practical knowledge of the various methods of doing topographic work and of map making. He should be a good draftsman; he should be so trained in drawing that he can, if necessary, make his own drawings and sketches, and will know, at least, how to direct the work of others. Careful attention should be given to the preparation of rock slides and their microscopic study. In paleontology he should not only be instructed

* Presidential address before the Indiana Academy of Sciences.

in the best methods of investigation in and the application of paleontology to geologic work, but he should also have a pretty thorough acquaintance with fossil forms and their range in the geologic column.

I take it for granted that no one in this audience has any doubt in his mind about the necessity of laboratory work in training a naturalist, and I would not refer to this point at all were it not that within a couple or three months the faculty of a prominent educational institution in this country "after an exhaustive debate of three and one-half hours, decided by a vote of 6 to 5 that laboratory work in the scientific courses should not be abolished as requested by the professors of languages." Of course, one would as well try to teach a student swim without letting him go nigh the water, as to undertake to teach him natural history, chemistry or physics without laboratory work.

Besides laboratory work there is, perhaps, no branch of natural history which more emphatically demands field work for its students than does geology. This is due largely to the fact that the little indoor or laboratory work the geological student can do is directly and entirely dependent upon his field work. Then, too, in other studies we can have and do have our laboratories in which nearly all the student's observations are made. In botany and in zoology, in histologic studies and in chemistry and physics, the materials may be successfully studied in the laboratory, but the geologist, whose studies are often valuable in proportion to the range of his direct observations, can not take his stratigraphy and his topography into a laboratory. His laboratory, except in certain parts of petrographic and biologic studies and in the office work on his maps, is out of doors.

In its professional bearing the most essential part of a geologist's training should be to the end *that he observe well, and that in his deductions he properly subordinate his facts.* His preliminary technical training should therefore be for the purpose of teaching him accuracy and detail. The necessity of accuracy should be so deeply impressed upon his mind that accuracy will become a part of his nature. After this lesson is learned he must be taught speed, without sacrificing in the least his accuracy.

I believe Dr. Chamberlin, president of the University of Wisconsin, recently delivered an address before the Western Society of Naturalists upon multiple working hypotheses. I have not seen this address, but I can readily imagine that he presented in detail the advantages of this method of scientific investigation, in the use of which I am, myself, greatly Dr. Chamberlin's debtor. In my own experience I have found it of the greatest value, and I know of no better way of developing the reasoning powers or of anticipating difficulties, or of reaching right conclusions than by the proper use of hypotheses. As the whole professional training of the geologist is for the purpose of enabling him to reach correct conclusions, he should be trained in the use of every method of investigation that will aid him, and among these aids I count as of great importance that of multiple working hypotheses.

Besides having a broad general culture, a geologist must be *par excellence* a geologist, and besides being a geologist he ought to know more about some particular branch of geology than anyone else. The material progress of our times is due largely to the division of labor which enables each individual to perfect his skill. Progress in science is due in no small degree to a similar division in scientific work. Though I can not dispense with a knowledge of chemistry, specialization by my neighbor who devotes himself to chemistry relieves me of the necessity of devoting a large part of my time to chemistry; the devotion of another to physics gives me my time for geological work proper, which, without the specialist in physics, I should be obliged to devote to physical studies. The astronomer hands me the results of his special investigations and saves me my time for geology, which, without his help, I should be obliged to give to astronomy. And so it is all around. On the other hand I trust that my attention to geology will, in its turn, come to the aid of the chemist, the physicist and the astronomer.

In saying a word for specialties I am fully aware of all that has been urged against this kind of scholarship. President White, of Cornell University, said to me in a private conversation a few years ago, that he had his doubts and fears about the outcome of this modern tendency among scientific men to specialization. Said he: "If this thing goes on, we shall have after a while, a man who will know all about the stripes on a trilobite's tail, but he won't know anything else." It is very easy to ridicule a specialist, especially if the aims of his studies are not comprehended. Galvani studying the twitching of a frog's legs, Darwin breeding pigeons, and Agassiz planting sticks on a glacier, are inspiring or ridiculous in proportion as we comprehend the bearing or end of their studies. Whether studying the twitching of a frog's legs or the stripes on a trilobite's tail is an unworthy and contemptible occupation for an intelligent man depends, therefore, upon the ultimate objects of the study. And

in regard to special work by those who aspire to broad culture in science I can only repeat what I have always held upon this subject: that a man who is incapable of doing and has not done special investigation is not capable of taking a broad view of science in any of its relations. Mr. Darwin has done some of the best generalizing of our age, but before he did it he had done some of the best of specializing, and that, too, on such unpractical, uninteresting and useless animals as the barnacles.

A lofty structure can not be built upon a narrow foundation, neither can a man be great in science who hasn't broad culture. And as only close attention to minor details in the material used can secure a great building against calamity, so care and skill in special investigation—in little things as it were—are essential to a great and broad-minded man of science.

You will probably exclaim that the requirements of which I speak and which I find essential are entirely too many to be complied with; that life is too short to allow one to undertake so much purely preliminary work. It can not be denied that to become a good geologist is a serious undertaking, and all I have to reply is that this is the kind of geologist I have been seeking and am still seeking. How many have you found? you will ask. Not many, I must confess. Indeed, men with such preparations are few, and when one finds them, he doesn't find them "looking for a job;" their services are always in demand. I may say, however, that it is not to be expected that the student should get all this training as undergraduate work. College men going into law, medicine and theology, if they get the technical training required by their professions, spend two or three years in law, medical or theological schools. The geologist must do what amounts to the same thing—that is, he must, beyond his general training, qualify himself specially for geologic work. When our geologists are so trained we shall have a better science, better geologists and better results all around.

The demands that are made upon a geologist require no particular kind of an intellect, save, of course, that it be a good one, but broad culture and broad mental grasp are essential to the pronounced success of any man in any calling. A man is wanted not to work up this or that deposit as it may occur in some limited area, or this or that formation, and much less some county or other artificial area, but who, in working up a topic, can and will take up the problem as a whole, and study it as a whole, not in one locality, but wherever it may be found in the world, who can work up the bibliography of his subject, and who can sift and put to good use the facts gathered by others in his deductions, and whose knowledge of allied sciences will enable him to draw proper conclusions from his facts, while his knowledge of affairs will render his judgment upon economic questions of the greatest value.

But it is not my purpose to confine any remarks to the technical training of the geologist, but refer also to certain general and ethical features of his work which call for a training or fitness to which educators give too little attention. I hardly know whether any instructor ever troubles himself to impress his students with the ordinary requirements of professional etiquette; I don't remember ever having heard the subject mentioned in a class-room. We seem to have depended upon men's instincts as gentlemen for shaping their professional conduct.

To be a successful geologist one must be a geologist very largely because he can't help it—because he can't keep out of it. I mean, of course, that the science must so fill the demands of his mind, his temperament, and his health, that in another occupation he feels that he is not where he can make the most of himself and of his energies. Such men will have that professional pride without which everyone is doomed to a fatal mediocrity. The man who goes into geology because there is money in it will, in nine cases out of ten, make a total failure of it. To be sure a living must be had, but he who has the right training and the right interest in his work will never lack for lucrative employment for any considerable length of time. It may sometimes happen, however, that a geologist is without such employment for a while, but it should be distinctly understood that such times are not to be given over to demoralizing idleness. The world is too full of problems of scientific interest for any man having a scientific spirit to stand idle for a single day or a single hour, and no one having such a spirit will stand idle.

In the balancing of the essentials and the non-essentials in the training of a geologist certain economic considerations have, almost without exception, to be faced. Those of us who devote ourselves to pure science are constantly being wearied with that most tiresome of all questions about the practical value of what a man reads about, thinks about, or does. So long as the young see around them examples of men who have become wealthy by the successful application of some law in science, by the invention or discovery of something that people are willing to pay handsomely for, just so long shall we have these young men asking how this and that study, this and that bit of training are going to be of any use to

them. As men who love science for its own sake, we get weary of such questions, and some of us feel driven, in order to emphasize our warnings, to avoid the useful altogether. Thus we occasionally have, on the one hand, men who have a horror of doing anything that is liable to be of practical value, and on the other, men who have no patience with an investigation which does not promise some tangible, material reward for their pains. My opinion is that there is little to choose between in these two types. One of them is just as far wrong as the other.

There are many pitfalls in the pathway of the geologist—many inducements for him to profit just a little too much by his experience. His duties are often of a very delicate nature. He is called upon to examine and report upon properties where large sums of money are involved, and where the information obtained in his professional work might be used by him for his personal advantage. The importance of a right way of thinking and acting in this connection is of the utmost importance, for if one does not conduct himself properly just here he is liable to gain a good share of the whole world "but to lose his own soul." I am reminded to quote the man who advised his son to avoid the appearance of evil: "Never mind the evil itself, but avoid the appearance of evil." This is, of course, a perversion of good advice. "Avoid the very appearance of evil and evil will avoid you," is good advice for the geologist, as well as for other folks.

I may say briefly that a professional geologist, especially if he is in a public place, such as State geologist, or is in any way connected with a State or national survey, has no moral right to have a personal interest in any mining property, or in any other property a knowledge of the value of which might come to him through his knowledge of geology. Abstaining from such interests is a duty the geologist in public employ owes to himself as well as to the public, and the public has the right both to expect and demand that its employees shall not walk off with the profits of its investments, just as a manufacturer has the right to demand that his employees shall not appropriate the articles they make. The geologist not in public employ who becomes personally interested in mining operations, even when he does it in the frankest, most open, and most upright manner, and with no idea of doing otherwise than as any citizen may honorably do, does nothing wrong in itself, but he must remember that he does so at the risk of his reputation and standing as a consulting geologist.

The man who is not willing—does not try—to save his energies, may be relied upon to not give the world the benefit of his best services. How often we see men who had an idea that there is some virtue in doing a thing the hard way, who, when suggestions are made for the purpose of saving their energies, assure us that that is all right, that they'll get it done, and if their way is a little harder, they are the losers by it.

A certain engineer has a three-sided scale in his drafting room. There are six different scales cut upon it. A person using this scale is liable in taking it up to turn the wrong division upon his line, and, in order to avoid this risk, and to save the time and thought that must be used in watching to see that one doesn't get the wrong side, a simple piece of metal has been devised to clasp it in such a way that it is impossible to use the wrong side. Some of his assistants remove this safety attachment, because they are not "used to it" and insist on running the risk of making mistakes and of using up the time they are paid to work, in examining their scale to see whether they have turned it over. Another man doing topographic work doesn't want to signal to his assistant, preferring to call out his directions to him at long distances, often more than a quarter of a mile, so that at the end of the day he has done three-quarters of a day's work on the topography, and the other quarter in yelling—a bit of labor the geologist can not utilize. These mistakes are unpardonable errors of judgment, and young men should be warned against such. If we spend our time and energy in unnecessary work we shall have just so much the less energy for the essential. There may be some excuse for the man who isn't able to discriminate between the essential and the non-essential, but in such cases as those referred to, and indeed in the majority of cases that arise, there can be no such question. In his methods the geologist must always be willing to profit by the experience of others. Methods and appliances of research are constantly being improved, but these improvements are made, not by disregarding the experience of others, but by making every possible use of it.

There is sometimes a tendency among the newly fledged to imagine that those who have gone before them have not taken the greatest pains in their work, that their conclusions have not been warranted. They therefore begin with the idea that by the application of superior, or, at any rate, new methods of investigation, they are going to upset everything done before they began. Such persons often succeed in making asses of themselves, and end their careers before they begin them—that is, they make careers impossible.

I had occasion recently to go over the work of one of our older geologists—work done under the most adverse circumstances. This work had but a short time before been very sharply criticised by an aspiring young geologist, and I was prepared to find either one of them right. I not only found the work of the older geologist well done, but I was astonished at the clearness of his perceptions and the general reliability of his conclusions. The young man had committed a blunder from which his reputation can never recover.

The necessity of caution on the part of the young geologist in publishing conclusions that one feels to be open to criticism, or when he sees that important facts may be overlooked, can not be too strongly emphasized. The publication of facts is generally useful, but deductions can afford to wait until they are properly matured. A most valuable piece of advice once given me was to the effect that young people would better not begin pumping out their intellectual reservoirs before something has been pumped into them. Life is too short, and progress all along the line is too slow for us to cumber the march of science with verbose discussions which help toward strife and contention instead of towards truth and union. To be sure "ignorance is no reason with a fool for holding his tongue," but my advice is not intended for fools, who will be fools in spite of everybody and everything, but for those who, having sound sense, desire not to appear fools or to bring discredit upon themselves or upon the science to which they are devoted.

Science is not infrequently charged with vacillation. Apropos of this, one of our humorists has the following: "Science says—but no matter what science says, for the next time she says anything she'll say just the opposite." We cannot deny the justice of the criticism, but this bad repute is to be attributed entirely to premature utterances. We have some sad examples in this country of poor geologists whose premature conclusions, drawn from too hasty or incomplete work, have kept half a dozen good geologists busy for years in correcting their mistakes and in putting the truth before the world. Their excursions into geologic fields are like the inroads of lawless and unclean animals that require a score of persons to clean up and put things straight after them. These busy bodies have, almost without exception, an itching for notoriety that leads them to seek some scientific short-cut by which to arrive at distinction, but if there is a balancing of accounts either here or hereafter, these men are destined to have a distinction in the scientific world of quite another sort from that for which they are pining. They are usually men of good enough intentions, but, as one of my preceptors once reminded me: "we have a right to expect something more than good intentions of men." All people mean well; it is our business to do well.

Sensationalism has done and is doing great injury not only to geology but to other branches of science. There are certain features about every science that impress the ignorant with their novelty, and there are certain persons who are always ready to make capital out of them. This gives rise to a sort of "O my!" class of men, and to an "O my!" kind of science. Their delight in the startling. None of the more radical theories of science, theories put forward by the right thinking with great caution, stagger them. Man's descending from a monkey never troubled them; they always thought so, and can point out cases of dissent that would make Mr. Darwin or Mr. Wallace catch his breath. This skimming the surface, this dilettanteism is strong in our times. In the geologist's training the less we have of the sensational the better it will be for the science and for the man.

It is not a pleasant thing to be obliged to destroy the delusions which people hold so lovingly close to their hearts, but the conscientious geologist has a good deal of this disenchanting to do. And nobody even thanks him for it. The very persons he may hope to serve in telling them the truth, will, in all probability, never believe him and never forgive him. But a good geologist has to face a great many disagreeable duties, and if he hasn't the moral courage to tell the plain, unvarnished truth, and to take the consequences, when a white lie would smooth matters over all around, he will find his troubles increasing as time goes on. One lie, whether it is a white one or a black one, only makes room for two others, and the man who makes two lies grow where but one grew before deserves no good of mankind.

Those who are at once workers in science and teachers of science know how difficult it sometimes is to draw a sharp line between what we know and what we simply believe, but as far as possible this distinction should always be kept before the minds of students, and no effort should be spared to prevent that dazzling of their minds which prevents them from weighing evidence and from distinguishing between simple truth and simple figments of the imagination.

And now just a word about our responsibilities to our own intellects. Intellect is the tool with which the geologist has to do his work. If that tool is bent out of shape or dulled by improper use it cannot perform its

functions properly. It is highly essential, therefore, that he keep his intellect unimpaired. He should strive to keep his mind free from those tricks of logic, rhetoric and sentiment by which so many of us allow ourselves to be imposed upon. Those of us who are naturalists and investigators at heart, as well as by profession, are not satisfied with declaring, like the humorist, that we are "open to conviction," while parenthetically we add, but we'd just like to see the man who can convince us." We are bound by every sentiment of honesty to go where our evidence leads us, whether it takes us to a pleasant place or not. Truth must be our companion whether she be an agreeable or a disagreeable one—a handsome or an ugly one. We cannot honestly say to reason "thus far shalt thou go, but no farther." We can't reasonably follow the science of geology to a certain point and then abandon it for the divining rod or spiritualistic seances or clap-trap appliances of any kind. The man who has no notion of accepting the results of his reasoning would just as well not reason at all, while the man who undertakes to reason within certain limits insults his intelligence. All honest men are seeking the truth; and is it not our duty to help others in this search when we can? We may be sure that if we wait till all the world thinks alike, the world will never care what we think.

I have said that the profession of a geologist requires certain proficiencies that are common to successful men in any and all occupations in life. Good judgment, clear insight, business habits of thought, and promptness of decision and action are as essential in geology as anywhere else, and it has often seemed to me to be even vastly more so. It is enough that one should plod faithfully ahead with a task—though faithful plodding is not to be underestimated at all. The man who grasps a subject in all its bearings, takes hold of it with judgment and solves its problems with courage and logic is the one who really advances the cause of truth, the cause of science, and the cause of humanity.

Once upon a time a business house employed a young man whose energy and grasp of the business of the firm induced the head of the house to promote him more rapidly than an old and faithful employé. The old employé felt deeply hurt that this dapper young fellow, who parted his hair in the middle and wore eye-glasses, should be advanced over him, and he took occasion to complain of it to the senior partner. The senior partner felt it to be a case that he couldn't very well argue with so faithful and tried a servant. There happened to be a lot of waggons passing the door of their building at the moment, and, as if changing the topic for a minute, he asked the old clerk what was making all that noise. He went forward and returning told the partner that it was a lot of waggons going by. He then asked the clerk what the waggons were loaded with. He went out again and returned and reported that they carried wheat. He sent him again to know how many there were of them. He returned with the reply that there were 16. Again he sent him to ascertain whence they came, and he returned saying they were from the city of Blank. The senior partner then asked the clerk to be seated, and, sending for the young man complained of, said: "Will you see what the meaning is of that rumbling noise in front." The young man replied: "It will not be necessary, for I have already ascertained. It is caused by some waggons—36 in all—16 in this lot, & 20 more to pass to-morrow. They belong to Pinto & Rosa, of the city of Blank, and are loaded with wheat. They are on the way from Blank to Zee, where the supply of wheat is short, and is now fetching \$1.15 a bushel, while it costs but 90 cents at Blank. The waggons gets 15 cents a bushel for hauling it, and each one carries 100 bushels." The young man was then dismissed, and the senior partner, turning to the old clerk, said: "My friend, you see now why Mr. So-and-so has been promoted over you."

This illustrates the demands, not of business men alone, but of geologists, and of everyone who employs others, either directly or indirectly, or who associates others with himself in his work. We all want men who can not only do the very best and most comprehensive scientific work, but who comprehend their duties in all their relations, meet emergencies, with prompt and clear judgment, and save us and our energies for other affairs. And we don't want to be obliged, in order to get out of a man what there is in him, to stand over him constantly and to direct his every effort.

Coal Mining Machines.—Mr. G. Blake Walker at a recent meeting of the Federated Institute of M. E. of Great Britain, said that the function of all these machines was to undercut the coal in the same way as had hitherto been done by hand labor, but with more rapidity and less waste. So long as seams of fair thickness were worked, and skilful holers were obtainable, there was little advantage to be looked for in the introduction of machinery, but as thinner seams were opened out, and the skilled workmen became rarer, the amount of waste caused it to be absolutely necessary to adopt some

expedient, as under the old system half the output of a tender seam would pass through the screens. Mr. Walker went on to make a comparison of the actual cost of coal-cutting by hand and by machine, based upon experience. He assumed that in a 3 ft. seam, with a favorable holing material, the quantity of slack made when the holing was done by hand was 25 per cent., and when done by machine 15 per cent. In a seam 1 ft. 6 in. thick he had taken 45 per cent. for hand labor and 30 per cent. for machine, as in the case of so thin a seam the coal would be more broken, from the difficulties inseparable from its working. Actual experience pointed to 100 yards per eight hours shift as being a satisfactory performance when the ordinary conditions of working a coal face were in force. The general result showed a saving of from 8½d. to 1s. 6d. per ton, of which two-thirds roughly were obtained from the reduction of small, made when machines were used.

British Columbia Collieries in 1889.

Mr. Wm. Dick, Inspector of Mines for the Province of British Columbia, contributes to the report of the Minister of Mines a mass of interesting and valuable information respecting the progress of the coal trade during the past year. We reproduce his description of the various colliery workings:—

Nanaimo Colliery.

The coal in this colliery was in good demand up until the last two months, when the mines had to stop work, owing to there being no ships to take away the coal.

No. 1 PIT, ESPLANADE, IN NANAIMO.—This mine, forming part of the Nanaimo colliery, belongs to the New Vancouver Coal Mining and Land Company, Limited. The working in this pit is by what is known as the No. 1 and No. 3 North Levels. The No. 1 Level is in a north-westerly direction about one mile, and in this district of the mine there has not been much coal mined during the past year; but there has been some extensive prospecting done, and the company, to all appearance, is going to be rewarded for their perseverance, as they have now got into thick coal, that, from the prospect and regularity of the seam, I think, will prove to be a large and profitable coal field; they have now got into this coal 200 yards, and it averages about seven feet thick, clean and hard. The great part of the coal got out of the mine in the past twelve months came from No. 3 North Level, and in this level they have the prospect of getting into the same coal soon that they have got in No. 1 Level. Ventilation in this mine is very good. When I was down in December I found 49,000 cubic feet passing per minute for the use of 60 men and 14 mules. The motive power of the above air is a Murphy fan. There is very little gas now found here, the mine being free from dust; and there are pipes to conduct water when required.

No. 3 PIT (CHASE RIVER).—This shaft takes its name from being near to the mouth of Chase River; it is about two and a half miles from Nanaimo and forms part of the Nanaimo colliery. The coal in this mine has been, and is at present, hard and of a very good quality, although varying in thickness from four to ten feet. All the workings are by way of a slope starting from near the bottom of the shaft, the levels branching from the slope. The coal is worked here on what is termed the pillar and stall system, for which it seems well adapted. Ventilation is very good; motive power, a large fan on the top of the upcast shaft. When I last inspected this mine there was 46,800 cubic feet of air passing per minute for the supply of forty-six men and twelve mules, and it is well conducted into the face by brattice or otherwise. This mine has been free from gas since it started; the mine is also free from dust, being wet throughout. In this mine, as in all the other mines of the Nanaimo colliery, a deputation of men is sent to examine the mine, under section 79, general rule 31. The finding of the condition of the mine is recorded in a book kept for that purpose, and a notice is put up where all may see it.

SOUTH FIELD MINES, NOS. 1 AND 2.—These mines are now known as the South Field Mine, both places being worked into each other and have jointly one ventilating shaft. During the past year a few men have been taking out coal along the outcrop of the No. 1 tunnel, but the bulk of the coal came out of the No. 2 slope. This slope is down over 700 yards with an easy grade until approaching near the face, when it goes off with much greater pitch. About one-half of the output of the Nanaimo colliery came from this mine. The coal is of very good quality, and from a series of bore holes put down from the surface to the coal, some distance ahead of the working, they have proved that they have a great extent of coal yet before them. This is also mined on the pillar and stall system. There is now a long range of stalls in good coal.

Ventilation is very good; motive power a large fan on the up-cast shaft. This mine is ventilated on the separate split system, with two divisions to the east side

and one to the west side of the slope, the intakes being the Nos. 1 and 2 slopes with a shaft between the two slopes for the return. The last time I was down this mine I found that there were 67,500 cubic feet of air going past per minute for the use of 74 men and 7 mules. There is very little gas found in this mine, and it is free from dust, being damp throughout. Here the workmen also take the privilege of section 79, general rule 31.

No. 4, SOUTH FIELD MINE.—This is the new slope mentioned in a former report, situated about half a mile in a southerly direction from No. 3 pit. They have gone to a great expense here. The slope is now down about 700 yards, the coal being thin in some places, and at other times no coal; but it was reasonably expected that good coal would be found as in No. 3 pit, coming towards this slope the coal was hard and from five to nine feet thick; it is, however, to be hoped that they will come on the coal soon. **NORTH FIELD MINE.**—This is the northern part of the estate, owned by the New Vancouver Coal Mining and Land Company, Limited, and is situated in Mountain District. In the year 1888 the company put down a series of bore-holes to the coal, and among them was one near to their boundary line, which adjoins the Wellington property; the prospect they got seemed to justify them in putting down a shaft. The contract was taken by Mr. R. Scott to find the coal. Great preparation was made, clearing away timber and levelling off the surface, and a steam engine was erected. Everything being in order, work was commenced in the shaft on the 8th January, and continued without any great stoppage or drawbacks, when on the 31st July, coal was struck, the same as is known both here and in California as the Wellington coal. This was at the depth of 424 feet from the surface. In passing through the coal they found that it was of very good quality and hard; there were three plys of coal with rock between them, making about seven feet of coal. The shaft was continued until they got down 445 feet from the surface. Everything having been got in order both on top and at bottom they then started in the coal, when they found they had a small fault; but now that they are getting fairly started with levels and a slope opening out to both sides they find that the coal varies in thickness from three feet eight inches to four feet four inches, and is very hard and of a good quality. They have got out a few thousand tons of the coal and it looks well. When Mr. Scott had the shaft finished he received charge of opening out the mine, which is to be carried on, on what is called the long wall system; and it appears as if it should work well, as the roof is stronger than the roof of this vein generally is.

Ventilation is good; motive power, a fan on the Murphy principle. The last time I was down there were only four men in the mine, so that they had the fan running slow; but at that time there 10,000 cubic feet of air passing per minute. There has not yet been any explosive gas found in this mine, and everything is being done to make the workings as safe as possible.

The shipping place from this mine will be Departure Bay Point, where a large wharf has been erected by the company, so that the largest ships may load at any stage of the tide. From this wharf to the mine, with sidings, there are five miles of railway of standard gauge. There is also a railway in connection with the Esquimalt and Nanaimo railway.

In starting a new work like the North Field Mine, a large outlay of capital is required, and it is desirable that the enterprise shown by the company will meet with the success that it deserves financially; it will also give new life to this district. I may here be permitted to remark that the prospect of the company for coal in their several mines for the coming year exceeds any that I have ever seen them have, and I trust that it will continue so.

Wellington Colliery.

No. 3 PIT.—This is the pit mentioned in a previous report as being in the valley of the Millstone River, and, as I have stated in former reports of this mine, is all by the way of a slope on the south side of the shaft.

The coal was worked on the pillar and stall plan, which is the general method in this colliery. There are now very few stalls being worked, but there is considerable mining being carried on at the pillars, which will last for quite a long time, as the pillars are fully one-half of the coal.

Ventilation is very good. When I was last down, in December, upon taking it I found that there were 40,000 cubic feet of air passing per minute for the use of 37 men and 6 horses. The mine is ventilated on the separate split system, going direct down the slope and returning by way of the pillars and stalls; motive power, a large fan. In ordinary times there is little gas found, but sometimes, when the roof breaks when they have taken out the pillars, then considerable gas comes away. When, however, there is the least danger the men are sent out of the mine. Here, as in the other extensive mines of the Wellington colliery, a deputation from the men goes through the mine once a month, to examine all the mine to know its condition as to its safety, and the

result of their examination is recorded in a book which is left open so that any person may see it.

No. 4 PIT.—This pit is put down on the top of the bluff which overlooks the Millstone River Valley. They have been working steadily here the greater part of the year. The coal is worked from what are known as the north and south side workings. All the working in this mine has been on the pillar and stall principle, excepting a small place in the south side, which is now back again to the old style. The coal generally in this extensive mine has been very good, yet the mine has not been without its faults. This mine and No. 3 pit are connected at different places with open roads from one to the other, that is, on the south side. Beside the connection they have their fan shaft, by which men could be taken out if emergency required it.

Ventilation is very good; motive power, a large fan on the top of the upcast shaft, worked by a steam engine. This mine is ventilated on the separate split system—the two main divisions at the shaft and again further in the workings. The workings here are very extensive, spreading over a great area, but the air is well kept under control by the overman, so that one district is not overdone at the expense of another. After the air has travelled round its several districts, it is again merged into one volume, and then ascends the up-cast shaft, worked by a steam engine. Sometimes I find the air passing a given place at the velocity of 1,500 (one thousand five hundred) feet a minute, and the last time I was down, in December, I found that there was 110,000 cubic feet of air passing per minute for the use of 150 men and 10 mules and horses.

This mine gives off some gas, which comes from the roof where they are taking out pillars, but is not allowed much chance to collect. The fireman, in going his rounds in the mine, seldom finds any gas in the stalls. The mine is free from dust, as there is throughout the mine, where they may be required, a regular system of pipes, so that water can be turned on at any time, either to lay dust or in case of fire.

In addition to the overman and fireman, there is a staff of men called shot lighters. They use and have only safety lamps to ascertain if a place is safe and if a shot is properly prepared before they will light it. In this mine there is a monthly examination by a deputation of workmen made in the manner before described.

No. 5 PIT.—This is the only pit of the Wellington colliery which has a railway connection with the Esquimalt and Nanaimo railway, and it plays a good part in supplying the Victoria market with this famous coal. This is now about the most extensive mine in the district. The coal is brought to the shaft from the east and west levels incline from the south, and a slope on the north side. In all those places the coal has been and is now very good, and they send out fully 500 tons in one shift. The workings here have all been on the pillar and stall principle, except a small piece in the slope, which seems to work very well.

Ventilation is very good, and well conducted into the face and where they are taking out pillars (coal) by brattice or otherwise. When I was down in December I found that the instrument registered 118,420 cubic feet passing per minute, that is to say: 45,230 on the east side, 51,460 on the west side, and 21,730 cubic feet per minute passing in the slope, but the above mentioned currents of air are again divided further in the workings so that each district will have fresh air. The total number of men employed here on one shift is 195, and 14 mules. This mine is free from dust, and no expense is spared to keep it so. They have a regular system of water works or pipes to take water to any part in the mine where they think it may be required, and, as I have said in a previous report, the mains are along the levels and main roads, with small pipes and hose to the stalls, with sprays of water blown off at different places in the mine, the air carrying the moisture along, so that everywhere it is not only damp but wet in top, bottom, and sides. The pipes are supplied with water from a large reservoir on the surface, the pressure being the depth of the shaft—260 feet.

This mine is examined monthly by a deputation from the miners here, and chosen by them, to look into and examine every part of the mine under the section and rule already referred to.

No. 6 PIT.—This pit was mentioned in a former report as No. 6 Sinking Shaft, about 900 yards east of No. 4 pit. They continued at work without anything serious happening, when, about the 1st of May, coal was struck at the depth of 340 feet from the surface. The coal was found to be eight feet thick, very hard, and of the usual good quality of the Wellington seam. Since that time they have been opening out to all sides, and have now got quite a distance away from the shaft all around. They are mining on the pillar system, as this seems to be adapted to the purpose, all things being considered. The coal has proved to be very regular and good, some places not quite so thick, but other places much thicker. This is now a valuable mine, and is proving an acquisition to this district, there being a large number of men working here.

Ventilation is good; motive power, a steam jet, but they are now preparing to erect a fan. They are at present restricted to a certain number of men, so that the output of coal is small to what it will be in a short time, as they are mining with all haste to get a connection with their No. 5 pit. Then we may expect to see the output of No. 6 pit come to the front, for, from what can be seen, they have here got the coal to work on.

No. 2 SLOPE.—This is a new mine started by Messrs. Dunsmuir & Sons in the Sabiston and Horne property in Mountain District, and to the east of the East Wellington colliery. This slope is now down 150 yards. At the top they soon got into the coal, which was about five feet thick, good quality and hard; but after going some distance they got down through it, which put the coal away below the line of the slope which continued in the rock. They now again expect to get into the coal soon. If it is as good and as thick as it was above the fault, and there is no reason why it should not be, it will make a valuable work in this locality, and is not far from Nanaimo.

East Wellington Colliery.

This is the property of the East Wellington Coal Company. In this colliery there are two shafts known as No. 1 and No. 2 pits, although both are connected by their workings underground. By the windings of those works they are 1,400 yards apart, but by a direct course they are only about half a mile distant. The No. 2 is west of No. 1.

In the west side of the No. 1 shaft they are not now doing much mining, as they are only employing a few men, coal being thin. What coal they do take out is of a first-class quality, with a strong roof, well adapted for long wall work, which has been their method of working since they started. In the east side they have during the past year done much prospecting, which is looking favourable for having good coal on this side, although they have drifted through considerable bad and barren ground.

On August 24th there was a serious fire in this shaft. Everything went on as usual until away in the afternoon, when volumes of smoke came out of the shaft, shortly after followed by flames. Then it was apparent that the ventilating furnace had set fire to the timbers of the shaft, and in a short time the head gear was on fire, and a large bin of coal near the same, while the machinery and boilers were only a few yards off. The men were got out by No. 2 shaft, that being afterwards covered and thus shutting off the air from below. By this time the fire engine was brought out from Nanaimo, and after placing it in the bed of the Millstone river they commenced work. It then became evident that the fire on top was not going to last long. As soon as possible they got No. 1 shaft covered, and in this way the fire was put out. Considerable damage was, however, occasioned by the fire burning out some of the shaft timbers, and also to the head gear, which took a few weeks to put in working order.

No. 2 PIT, EAST WELLINGTON COLLIERY.—In this pit work has been going on steadily all the year, except for a few days when the fire was at the No. 1 pit. The coal here has been kept good and continues so. The roof, however, is not quite so strong, yet it is well adapted for long wall work, and this is the system that has been generally worked here.

Ventilation is good. Motive power up to the time of the fire was a furnace with a steam jet; since that time it has been a fan, worked by a steam engine, that does its work very well. When I was down in December, I found 20,000 cubic feet of air passing per minute for the use of 60 men and 6 mules, this being the air and men of both pits, No. 2 being the intake and No. 1 pit the outlet. This mine gives off some gas, but chiefly when the roof breaks. As the air goes along the coal face the gas has not much chance to collect and the works are well filled up. Every precaution is used to prevent accidents of any kind.

Union Colliery, Comox.

You will have seen in a former report that this colliery is the property of the Union Colliery Company. Their present mines are only a few miles from the flourishing Comox settlement.

In this property the coal is exposed in various places, and at present they are mining at three different places and in two veins of coal.

No. 1 and 2 tunnels go into the hill, being adit levels on the south side of the railway. They are in about 500 feet each, coal being about the same quality, which is very good and hard, and on an average three feet thick. This is worked on the long wall system. The roof is very strong.

Ventilation is good; motive power a furnace, the air going in by the level road and coming out by the way along the face of the workings. There is no gas found in here. The mine is free from dust, being wet throughout.

No. 1 SLOPE, UNION COLLIERY.—When previously reporting on this slope I stated it as being down 1,000

feet. It is now extended to about 2,000 feet. They have been considerably troubled with faults of one kind and another. The coal, when free from faults or troubles, is about four feet high, of good quality and very hard. The workings from this slope are at the present time by four levels, one to the south side, and three to the north side. In some of these levels the regularity of the coal has been, and is still improving as they go in.

Ventilation is good; motive power a fan on the upcast shaft, built on the Murphy principle and driven by a steam engine. The last time I was down there were only three or four men in the mine, and they had the fan running slow, as it was not required at the time to go fast, yet I found that there were 20,000 cubic feet of air passing per minute. This mine gives off some gas, but it has very little chance to accumulate. There is no dust in this mine, which is wet throughout. Everything is in good order.

NO. 1 SHAFT, UNION COLLIERY.—This shaft is about half a mile south of No. 1 Slope, and is about forty feet deep. There has been much prospecting done at this place, but they do not seem to have got right on the coal yet, although it has much improved of late, and to all appearance they will get on to a good seam soon. In this district the coal has not yet proved to be quite as thick as was expected, but the quality is all that could be desired. It is to be hoped that the company's expectations will be fully realized and that the coal may get thicker. They have put down to the coal a series of bore-holes. These bore-holes are away ahead and to the dip of the slope. In some of those holes they found a good and encouraging prospect. After the large expenditure of money here, and in view of the outlay still required to prove the property, it would be a serious matter for the province as well as for the company if these mines were not a success; but it is only a question of a short time in my belief, judging from the indications, when these mines will be successful and when there will be flourishing collieries in this district of Comox.

Tumbo Island Coal Mining Company.

This island, lying at the south-east entrance of the Straits of Georgia, is being prospected for coal by the above named company. They commenced by putting a bore-hole down close to the water's edge; in this they passed through about five feet of hard coal. This prospect so encouraged them that they went down to the dip and started to sink a shaft, in which they are now down fully 100 feet. They have a steam engine, pit head gear, and other necessary appliances. Owing to the location of this shaft being so far to the dip of the bore-hole they do not expect to get to the coal at less than about 600 feet from the surface. This is a large undertaking, and will take a large amount of capital to reach the coal and put everything in order. It is to be hoped that when they get the shaft down they will find the coal as good as expected.

Prospecting.

There has been some very extensive boring in this district during the past year. Amongst them was the continuation of the bore-hole referred to in my previous report in No. 2 Esplanade Shaft. This was put down to the depth of 1,263 feet, the depth of shaft being 617 feet, makes the total from the surface 1,880 feet. From not having struck any coal, there was another bore-hole put down by the same company in the South Field. In this bore they passed through a seam of hard coal 12 feet thick, at 469 feet from the surface. This bore has been continued till the present time, and is 1,460 feet down. This bore shows a good prospect, and is very encouraging.

Oyster Harbour Coal Company.

Exploration with two diamond drills has been in progress at Oyster Harbour and Chemainus Bay during nearly the whole of this year. The first bore, commenced in January, was put down at the head of Oyster Harbour, on the north-west side, and pierced a depth of 1,300 feet through sandstone and shale, and was stopped in a fine-looking sandstone. The rocks at this place are tilted at a high angle, the cores from the bore showing a dip of some 25 degrees. While in process of boring, inflammable gas extended from this hole in sufficient quantity to burn with a bright flame when a match was applied. A second bore was started on the eastern side of the harbour, which, after going down 690 feet, was stopped for want of water. The stream which fed the drill dried up and the machinery was removed. A third hole was bored on the north-west side of Chemainus Bay, close to the water's edge. This hole was sunk to a depth of 1,600 feet, using up all the rods available, and operations were suspended. The rocks, as shown by the cores, which are sandstone, mostly, with shale bandy, are all said to be of the right kind, and we may expect to hear more of operations in this neighbourhood. At Chemainus Bay, after getting down 300 feet, measures were found to be lying horizontally, and very nicely bedded the whole depth of the bore.

Outbursts of Gas in Metalliferous Mines*

(By Bennett H. Brough, Assoc. R.S.M., F.G.S., F.I.C.)

The recently published volume of the Reports of the Inspectors of Mines to Her Majesty's Secretary of State contains an account of a lamentable accident, caused by a fire-damp explosion, at the Mill Close lead mine, at Darley in Derbyshire, on November 3, 1887. This mine, which is the largest and most productive in Derbyshire, is one of the oldest in the district, the records of the quantity of ore raised going back as far as the year 1684. The vein is frequently many yards in width, and traverses hard limestone overlain by shale. Ore is also found extending into many of the beds of shale. Fire-damp has occasionally been found in this mine, but only in small quantities. In 1886, however, two explosions occurred, by which two men were burnt. Since that date the quantity of gas emitted from the shale largely increased, and led to the use of locked safety-lamps. The account of the recent explosion given by Mr. Stokes,† H. M. Inspector of Mines, is substantially as follows: On the morning of the accident, six miners went to work at a part of the mine called the forefield. They descended at midnight on November 2. Upon their arrival at their working place, the men tested for and found gas in and about the ends of the forefield. They thought, however, that the use of safety-lamps protected them from all danger. A shot was fired during the early part of the shift, and at 3 a.m. three shot-holes were bored, within 3 or 4 feet of where the gas was known to have accumulated. These holes were charged with dynamite, and ignited by touch-paper, and a fuse carried down from the upper to the lower workings. After lighting the fuse, the men retired to what they thought was a place of safety about 50 yards away in the lower level or waggon way. At this point they were joined by the two waggons, and all awaited the firing of the shots. Suddenly an explosion occurred, and immediately 5 of the 6 men were buried and killed by a large fall of timber and stone. The sixth man escaped with burns and serious bruises. This man stated at the inquest that the explosion took place immediately after he heard the first shot go off, and from his evidence there can be little doubt that the first dynamite shot fired the gas.

The Yoredale shale, whenever it occurs in beds of 25 to 35 fathoms in thickness, always gives off a little gas. Probably this gas had collected in the fissured limestone, and, becoming ignited by the shot, forced down the rock masses upon the unfortunate miners.

This illustration of the disastrous effects of a fire-damp explosion in a metalliferous mine clearly proves that fire-damp, unfortunately, is not confined to collieries. In a number of cases it has been met with in mines of lignite, salt, diamonds and metalliferous minerals. It has, therefore, been thought that it would be of interest to collect the records of cases in which outbursts of gas have been observed in metalliferous mines, with a view to arriving at an explanation of the phenomena.

Numerous cases are recorded in which, as at the Mill Close mine, fire-damp has been emitted from the Yoredale shales of Derbyshire. According to J. Farey,‡ in Eyam registry, there are records of men having been killed in Stoke sough (adit-level) in 1732, 1734 and 1778 by explosions of fire-damp. Pilkington§ records several men having been killed by an explosion of "inflammable air," in driving the famous Hillcar sough, near Youghreave. This adit-level passes through the Yoredale shale for two or three miles, and, with a candle at the end of a stick, up to a very recent date, visitors used to light the thin stream of gas along the roof. This would flash along almost the whole length of the level. The gas is now exhausted, or is present in very small quantities, but, when new ground is cut, there is a decided emission of gas.

The emission of fire-damp from the Yoredale shales can be easily accounted for when the bituminous nature of these shales is considered. The occurrence of solid and liquid hydrocarbons in the Yoredale shales, and in the veins near or under them, has been noticed for many years. Dr. T. Short,|| writing in 1734, gives the following account of the Huckle Edge vein near Eyam:

"It is remarkable that in the lead mines . . . was a bed of boulder stones, any one of which being broken into contains from half a pint to a gallon of soft bitumen like Barbadoes Tarr, it melts before the sun or fire to oil; there were also several springs in the mines, that took fire with a candle and would burn a week or fortnight, and all the water drilling through this stratum of boulder stones will take fire and burn many days. This bed was continued between two or three miles, all along Hucklewedge with its burning waters. Several damps have

happened at these mines without any preceding visible cause or sign, but all being serene and clear in the works without fog or mist; the sulphur in the air would fire at the miners' candles, the flame run from one end to the other, with a thundering noise, making the earth shake, and in two moments the sulphur was spent, the fire extinguished of itself, and all clear again. The only shift the workmen have is to clap down on the earth instantly on their faces till it is over."

The explosions here recorded are undoubtedly similar to that at the Mill Close mine. At the latter mine, a hard, black, brittle variety of bitumen is of frequent occurrence.

Similarly, the fire-damp explosions that have occurred in salt mines are due to the presence of hydrocarbons produced by the decomposition of vegetable substances. The grey or blue colour so frequently met with in rock salt is due to the presence of bitumen. In several localities, notably at Stassfurt, in Prussian Saxony, and at Wieliczka, in Poland, the salt contains bubbles filled with various compressed gases (hydrogen, carbonic acid, and carbonic oxide), which, when the salt is dissolved, give rise to a crackling noise. Liquid inclusions in rock salt are extremely frequent. Some are visible to the naked eye, others are microscopic. The enclosed material is usually a hydrocarbon. According to J. N. Bremer,* combustible gas was evolved in large quantities from a fissure in the marl in the rock salt at the Sztatina mine, Marmaros county, Hungary, and was used for lighting the workings. At Gottesgabe, near Rheine, in Westphalia, the gas evolved was used in 1826 for lighting the workings, and even conducted through wooden pipes to the manager's house, and there used for lighting and for cooking purposes. Similar outbursts of gas were utilized at Zugo, near Klein Saros, in Transylvania; and at the Bex salt mines in the canton of Vaud, Switzerland, fire-damp has, according to Brunet,‡ been used for lighting the workings, being received from the fissures in sheet iron pipes. The gas probably comes from the enclosing limestones, which are possibly bituminous. It is a curious fact that the first fire-damp explosion recorded is shown by Professor F. Posepny,|| to have occurred at a salt mine at Hallstadt, in Austria, on September 9, 1664, twenty years before what is generally supposed to be the first historical evidence of the presence of fire-damp, given by Robert Plot,§ in 1684.

In iron mines, several explosions of fire-damp have been recorded. A. Daubrée¶ met with fire-damp in the mines of pisolitic iron ore at Gundershoffen and Winckel in Alsace. At Gundershoffen the pisolitic iron ore, which was worked up to 1825, occurs disseminated through a yellow clay overlying marls of Upper Liassic age. The ore-bed is covered by a greyish blue clay, some twenty yards in thickness. In the bed, numerous nodules of gypsum are met with, and the clay immediately above the deposit is impregnated with grains of iron pyrites. In the bed, which was worked in 1818 at a depth of 33 yards, insignificant gas explosions were of frequent occurrence. In 1824, however, a serious explosion occurred, by which a number of miners were seriously injured. The Winckel bed is deposited in a hollow in white limestones of Upper Jurassic age. The pisolitic iron ore is disseminated through a grey clay, and the whole is overlain by a limestone conglomerate. In 1832, an explosion occurred when some workings, that had been suspended for a time, were entered. Wooden planks were ejected from the shaft and thrown to a distance of 10 yards from the mouth, and the only workman in the mine at the time was badly burnt. An explosion of a less serious character occurred on June 27, 1846. At the end of a level, a great influx of water was observed, and in raising his light to see whence it proceeded, the captain ignited the gas, and was thrown violently to the ground and slightly burnt.

Castel** mentions an explosion of fire-damp which occurred on November 15, 1853, at the Voulte iron mine by which many miners were seriously burnt. The ore-bed at Voulte is enclosed in black marls of Middle Jurassic age, underlain by mica-schists in unconformable stratification. The gas was ignited by a spark from a miner's pick. In this case the presence of gas appears to be due to the existence of a gaseous lignite in the marl at a slight distance from the ore-bed. In mines working true fissure veins, numerous explosions have been recorded. In March, 1845, an explosion occurred in old workings that had not been entered for some years, at the now abandoned copper mine of Grand-Saint-Jean, near Giromagny, in Alsace. Gas has been noticed on several occasions at Pontpéan, in Brittany, where it is

still occasionally met with.^{††} The vein consists of argenteriferous galena and blende, and traverses, in a north and south direction, the ancient clay-slate. As there is a dislocation that has brought a portion of the deposit to the level of the Tertiary strata, it is possible that the gas outbursts are due to the influence of lignite deposits, which may exist in these beds.

Charlton* reports the occurrence of inflammable gas in the copper pyrites deposit of Rocca Federighi, in Tuscany. In 1875, a timbered level that had been abandoned for two or three years was encountered by a cross-cut. On holing, large quantities of water were ejected, and, immediately afterwards, an explosion occurred by which three workmen were seriously burnt. Again, in 1877, at the same mines, an explosion occurred on opening an old adit level that had been abandoned for fifteen years. In this case a thin parting of rock separated the old level from that in which the men were working and matter having an unpleasant odour percolated through. A piece of the roof fell, and the captain, raising his lamp to see what was the extent of the disaster, exploded the gas, the three men in the level being very seriously burnt. From this description it appears that, under certain conditions, the decomposition of wood in water or in moist air may give rise to the formation of inflammable gas in exactly the same way as marsh gas is produced in stagnant pools. The explosions that have occurred in some of the Saxon mines when old workings were entered, may be explained in this way. The archives of the Royal Saxon Mining Bureau, quoted by Tittel,[‡] record several explosions of this kind. At the St. Johannes mine, at Rehhübel, in the Schwarzenberg district, a cross cut was driven from the Urbanus adit level, at a distance of 760 feet from the mouth of the adit. On March 11, 1872, two miners were working at the end of this cross-cut, and at noon a quantity of water burst through. At 3.45 p.m. an explosion of gas occurred. One of the miners, though badly burnt about the head, face and hands, found his way in the dark out of the adit and escaped. The dead body of the other miner was found at a distance of 643 feet from the mouth of the adit. It was subsequently found that the water from an old shaft accompanied by marsh gas, which had in all probability been formed from the decaying timbers, had burst through an aperture, and become ignited by the miners' lamps.

At the Churprinz Friedrich August mine, at Grossschirma, in 1859, a brick dam was put in to keep out the surface water. In 1882 the system of drainage was changed, and the dam was bored through in order to insert an iron pipe provided with a cock for letting off the water as required. While the boring was in progress water and gas burst through, and an explosion followed by which the miners engaged were seriously injured. Similarly, at the Alte Hoffnung mine at Schonborn, a dam built in 1868 was opened in 1870 in order to ascertain whether there was as much water as formerly. The gas issuing with the water, ignited, and the flame extended for 20 feet and burned for several seconds. Behind the dam, the level had been timbered for some 30 yards.

The presence of fire-damp in metalliferous mines cannot always be traced to the decomposition of timber under water. There was very little timber in the Winckel levels, and none at all in the Giromagny mine. In many mines, too, containing an enormous quantity of timber partially submerged, no trace of gas has been observed. This was the case at the Alter deutscher wilder Mann mine, near Grund, in the Upper Harz. This mine was under water for 200 years, and was visited by the writer in 1882, immediately after the water had been pumped out.

Another explanation must be sought for the presence of fire-damp in the Monte Catini mine in Tuscany, where in 1845 many miners lost their lives by an explosion, and in the celebrated Van mine near Llanidloes. The latter mine is the most productive lead mine in the United Kingdom. The vein occurs in rocks of Lower Silurian age. The occurrence of gas at this mine has been noted by Dr. C. Le Neve Foster.[‡] Fire-damp was found at the adit, and in nearly every level below while tapping or making the first drivages on the lode. The gas rushes out with the water, making a great noise, and always appearing to come from below. The miners regard it as a sure harbinger of lead ore. The quantity has sometimes been sufficient to cause slight explosions, by which miners have had their hair and beards singed. It is not improbable that sulphuretted hydrogen has also been emitted.

T. Macfarlane[§] describes the occurrence of fire damp in the Silver Islet mine, situated on a small rocky island

in Lake Superior. On December 28, 1875, while a party of miners were engaged in drilling a hole in the end of the drift at the 8th level, the drill suddenly broke into a crevice, from which water at once commenced to flow, but not in great quantity, and not being aware that it was accompanied by an emission of gas, one of the miners took a candle to look at the hole. The gas instantly took fire, sending out a flame of more than forty feet in length. The hole was subsequently stopped with a wooden plug, and when a lighted candle was applied to the imperfectly plugged hole, the gas again ignited, giving a jet of flame about a foot in length, which continued to burn for several weeks.

In these cases, it appears probable that the gas has been derived from beds beneath the ore-vein, from which it has ascended through fissures into the workings.

Sulphuretted hydrogen has, in many places, been engaged in sufficient quantity to become ignited. This occurred during the sinking of a well at Gajarine, near Conegliano, in Lombardy, and is described by L. E. F. Héricart de Thury.[†] The explosions described above cannot, however, be attributed to this cause, for if sufficient sulphuretted hydrogen had been present it would at once have been detected by its characteristic odour, and by the odour of the sulphurous acid formed on its combustion.

The oldest description of the occurrence of sulphuretted hydrogen in mines is given by A. A. Barba, the director of the mines at Potosi, in Peru, who in 1640 published a Spanish treatise on mining.[‡] The description, as given in the Earl of Sandwich's translation as follows:—

"Some do think that there is some matter in the bowels of the earth so stinking and abominable, that it doth correspond with the ordure of animals: the truth is, that there be places in the earth that instantly kill, with a pestilential smell. And setting aside the stories of this kind, both ancient and modern in remote countries, I shall relate two examples, where I myself was present, which was at the discovery of the rich country of San Christoval de los Lipos; at that time, in a beautiful high hill, that together with others encompass the dwelling of the miners, two Galleguares found a mine, which at first they called after their own names, but ever since, to this present, it is called from its effects, *The stinking Mine*. At first they got out of it very rich ore between white chalk; and as they began to sink deeper they were forced to give over by reason of a most abominable ill smell they met withal, which killed several of the miners, Indians; and so it lay unwrought for four or five years; after which time another miner (I being then in the country) undertook to proceed in the working of it; thinking that having lain so long after its first opening, the ill quality would have been evaporated; but that experiment cost the lives of two Indians more, whereupon they forebore the work, and have done so unto this day. The which I have not so much wondered at, as to see with my eyes the ground opened in several other parts of the mountain, at a great distance from the forementioned mine, and in digging scarce a yard deep, such a stink came out of the ground as forced the labourers to give over; and as I passed by those pits a few days after, I saw divers birds and serpents dead in them, having been intoxicated by that poisonous smell."

"In the famous country of mines, Verenguela de Pacages, in which the Indians procured a patent to dig, before that of Potosi was in use, because its veins were esteemed much richer than Potosi, and upon trial were found to be so; and the ore gotten there inferior to none in the Indies. In the hill of that country, called Santa Juanna, a miner followed a very rich and plentiful vein of silver, and intending to discover more of the like, he determined to break a hole into an old vault, and set two Indians upon the work, who after a few blows discovered a vacuity, out of which came so pestilential a stink, that killed the two Indians presently, and almost stifled others that were at a distance from them in the mine, who nevertheless ran out and told their master what had happened. He made haste to the mine, hoping to save the Indians, but at first entrance into the ground, upon the stairs by which they went down into the mine, he fell down dead, and his body remained there, nobody daring to go down to take it away to bury it."

In these cases, the gas was probably produced from the decomposition of pyrites ores. This decomposition may be detected in many old mines. The writer has observed the presence of large quantities of sulphuretted hydrogen in abandoned workings at the Rammelsberg mine in the Harz, at the Falun mine in Sweden, and at several of the Hungarian mines. In other cases, the acid waters produced by the oxidation of pyrites act on limestone and produce carbonic acid. Emanations of carbonic acid in the iron ore mines of the Upper Erzgebirge are described by H. Müller.* Similar outbursts have been observed at the mines of Massa Maritima, in

Tuscany, where a thick vein of pyrites and quartz traverses clay slate enclosing limestone beds. The hanging wall of the vein is formed by a band of clay that conducts a quantity of water into the workings, and serves as a receptacle for gas, principally carbonic acid, probably produced in the manner indicated. A similar reaction may have produced the large quantities of carbonic acid given off from crevices in the south wall of the lode at the Foxdale lead mines in the Isle of Man. In 1883, when the writer visited these mines, the amount of gas given off at the eastern end of the 185 fathom level was so great that, notwithstanding the large volumes of compressed air continually forced in from two air pipes, candles would not burn and the work was carried on under great difficulties.

In the same way, carbonic acid was met with in 1875 in the Johann Stehenden vein, in the Himmelsfurst mine, at Freiburg, in Saxony. Here, too, lights would not burn before a freshly opened cavity.

Carbonic acid, produced by the action of acid waters on limestone, is of not unfrequent occurrence in the Derbyshire lead mines. At a mine near Voulgreave, the writer has seen this gas being raised in buckets attached to a windlass. An early account of the occurrence of carbonic acid is given by William Hooson, a Derbyshire miner, in a quaint work* published in 1747. The effect of the gas on the miners is described in the following terms:

"All miners both ancient and modern give this account, that they never feel any sensible pain or disorder, but after a most pleasant way, it takes the whole use of all their limbs, and they settle down, as a man falling asleep, feeling nothing at all, but an extraordinary sweet and luscious taste and smell, that beguiles and ravishes the senses in a moment."

"This is the whole account that we the miners can give of it; and this so far as the memory continues, after being seased or tapished with it, and being drawn up by the heels for dead, yet have recovered; but never could such men remember, or give any account of the least pain they ever felt in it. And now give me leave to tell you the best preservative we miners know of, and verily think is of great force against it, we have it delivered to us by the old miners, and many I have known to confirm the same; but here are two examples, the first I was not present at, being more than two miles from where I then was; the other in our Liberty, and my brother one of them, the former was thus: Two miners sinking a shaft in hard shale near 20 yards deep, it happened the ground-damp bred in it; one of them went down, his partner of a considerable time after hearing nothing of him, and knowing it was windless, began to suspect the matter, and forthwith calls his next neighbours, and tells them what he feared; having now some company, down he goes to see what the matter was, and soon was damped likewise; and now more company coming in, one young bold man ventures down and has the same fate; and after him (the depth of the shaft being so small) two more, and those damped likewise; this put the whole company to a stand, and as they were considering to carry wind down in trunks, by chance a tinker seeing a crowd of people, turns out of his way to see what was a doing there; having heard the matter, he said it was no difficulty to fetch them up; (the man had been drinking all night, he feared no danger, nor could any persuasions stay him from his design) he throws by his budget and pulls off his coat, and down he goes, ties the dead men in the rope one by one by the heels, and after climbs up himself, without any damage, only when he came up again into the fresh air, he vomited most violently, and was most deadly sick; therefore it was concluded that the fumes and strength of the ale preserved him, according to the old miners' opinions."

In the second case described, an old miner ties the bodies of three miners, suffocated by the gas, to the rope, and finally comes up himself. "This man," writes Hooson, "had been drinking all the day before, and most part of the night, so that it should seem not to work so soon upon a man well steeped in ale. Many men's lives have been saved after this manner, which seems to be an act of Providence rather than any foresight, or care that a man has of himself, and indeed I never yet knew nor heard of any man that was sober, durst be so bold to take a sufficient dose of ale on purpose that he might the better encounter it."

SUMMARY.

From the various records collected in this paper, it is believed that there is sufficient evidence to show that the gas outbursts, that have been observed in metalliferous mines, are not all due to the same cause, and may be explained by the following hypotheses:—

1. The decomposition of timber in a mine, in a similar manner to the decomposition of vegetable matter in marshes, may produce fire-damp which would accumulate in cavities that are ultimately broken into. This is evidently the explanation of the explosions in the Saxon

mines, and in the Rocca Federighi mine.

2. In iron mines, where the iron is not entirely in the state of peroxide, water might be slowly decomposed, and hydrogen be produced. This, if the ventilation of the mine was defective, would accumulate in the upper portions of the underground excavations. This is a possible explanation of the explosions at Gundershoffen and Winckel.

3. In these cases, however, it is more probable that the gas was fire-damp, which emanated from beds beneath the ore deposit, and found its way, through fissures, into the workings. The gas would thus be produced in the same way as the natural gas of the United States, China, and other countries, where it is given off from rocks of varied age enclosing bitumen. The Upper Liasic marls on which the Gundershoffen deposit rests are often sufficiently bituminous to enable them to be burnt. At Winckel, however, no such beds are met with below the deposit, though they occur in the Jurassic rocks of the vicinity. The same explanation is therefore feasible. At the Mill Close, and other mines in Derbyshire the gas is derived from the Yoredale Shales, which are undoubtedly of a bituminous character. Bituminous matter has occasionally been found in mineral veins, and would appear to have been derived from the adjacent rock at the time of the filling of the vein fissures. In the Snailbeach lead mine in Shropshire, small nests of bitumen abound in the vein, and the writer has found the same substance in geodes in some of the abandoned metalliferous mines of Alsace, near Mollau and St. Amarin, in the Vosges. The explosions at Monte Catini, Silver Islet, and the Van mines would appear to be due to natural gas derived from adjacent rocks.

4. Fire-damp may be produced from the decomposition of organic matter, in the same way as the hydrocarbons met with in salt mines. At Pontepan, and at the Voulte mine, the fire-damp was apparently derived from beds of lignite in the vicinity.

5. Explosions have in some cases been caused by outbursts of sulphuretted hydrogen, produced by the action of acid waters on pyrites ore.

6. The outbursts of carbonic acid met with at Foxdale, Freiberg, and Massa Maritima, may have been caused by the action of acid waters, produced by the oxidation of pyrites, on limestone or metalliferous carbonates.

The Quarter's Yield from Nova Scotia Gold Mines, as per Official Returns.

Facilities in the Engine-Room.—Owners of buildings and machinery are, frequently, thoughtless respecting the requirements in an engine-room. However costly the plant, however carefully erected, however elaborate in detail and perfect in finish, however intelli-

gent and skillful the engineer, there will always be occasions when something in the repairs, adjustment or alteration will have to be done and done quickly. Just then it is no time to cast about for tools and appliances. These should be on the premises. We have heard complaints from many engineers about the parsimoniousness of their employers when tools, materials, stores and appliances were highly necessary in the engine and machinery department. Those corporations and wealthy mill-owners who practice extreme parsimoniousness and an impolitic policy in the care of their machinery plants, act upon a penny wise and pound foolish system which is discreditable to modern engineering. Repairs are often done promptly and well at little expense by an engineer and his fireman when the appliances and materials are at hand. No engine-room should be without its vise, bench, and drawer full of files, chisels, taps, dies and drills. Give engineers a chance to save money for their employers by a constant use of machinists' hand-tools, and, where circumstances permit, to keep their engines and engine-rooms in the neatest and cleanest manner possible. A noisy engine and a slovenly engine-room indicate that there is more than one screw loose somewhere.

Four Big Boilers Made in Canada.—The Polson Iron Works Company, of Toronto, 28th ult., shipped to Owen Sound the last of four large boilers constructed by them for the car ferry they are now building at their shipyard there for the Canadian Pacific Railway Company. These boilers are the largest ever made in Canada, and also the largest ever carried by rail on this continent. They are of the cylindrical return multitubular type, and are 13 feet 3 inches in diameter and 14 feet long, weighing 37 tons each. The shell-plates are 11-16 of an inch in thickness, and were specially rolled in Scotland. The tubes are of German manufacture, and are 4 inches in diameter, 11 feet long, and 148 in number. There are in each boiler three of Fox's corrugated furnaces, 42 inches in diameter and 10 feet 11 inches long. The Government test showed an allowance of 94 pounds working-pressure. The riveting of these boilers was done by a Tweddell hydraulic riveter, with a gap of 8 feet 4 inches, lately erected in the company's shops. The boilers, when completed, were lifted bodily on to the cars by a large overhead traveling crane, which has a lifting capacity of 50 tons.

A Great Steel Plant's Record.—The union of several rolling-mills and steel works into the Illinois Steel Works, which was effected last year, illustrates once more the advantage of joining conflicting or mutual interests. The following splendid showing is the immediate result: The total value of finished products shipped in the eight months of 1889 after its organization was \$15,275,529. The company received a total of 2,048,688 tons of raw material, and shipped over half a million tons of finished products. The total pay roll amounted to \$3,660,888, and the purchase of miscellaneous stores and supplies of all kinds amounted to \$693,000. The company received 88,554 cars of material, and shipped 40,954 cars. There were employed directly at all the works on an average per day, 8,360 men, besides the employment given indirectly to a large additional force in the production of coke, coal, iron ore, limestone and other materials.

The Decreasing Cost of Aluminum.—Aluminum, one of the most valuable and useful metals, and at the same time one of the most plentiful in its crude state, is now being produced, by different processes, at a comparatively low price. When the metal was first shown in Paris, by Denille, in 1855, it was priced at \$15 per ounce. In 1857 it was sold at \$2 per ounce, and in 1884 its production had been so cheapened that the metal for the tip of the Washington monument was bought for \$15 per pound. At the close of last year it was for sale at \$4 per pound, and developments are now being made which still further reduce its cost. There are few of the metals that are of such intrinsic value, or that can be put to such a variety of uses as aluminum, and if its production can be cheapened to correspond with that of other metals, it will become one of the most extensively used and easily obtained articles of manufacture.

Graphite as a Blast Furnace Lining.—An experiment was tried at the Crown Point Iron Co.'s plant, some time ago, on the occasion of their relining and starting in blast one of their large furnaces. After the fire-brick were in place, a cheap article of graphite or plumbago was bought, reduced to a paste with water, and the interior of the furnace washed with the plumbago paste. It gave a slippery glaze—incident to the lubricating quality of the plumbago—to the fire-brick lining, which lessened the time necessary to a heat quite a percentage. The slippery surface refused to be coated with slag or other refuse, and the charge passed down in less time and left the lining free and clear. The Crown Point managers claim quite a success for their scheme. The expense of the trial was very small compared with the value of the result.

Iron Ore in British Columbia.

In one of his recent reports Dr. G. M. Dawson states that most of the ores hitherto discovered are magnetites, which occur in association with the older metamorphic rocks of the province. Clay ironstone, however, is of frequent occurrence in the coal series of Vancouver and Queen Charlotte Island, as well as in the tertiary rocks of the interior. The only iron ore deposits which have yet been worked are those of the south-west side of Texada Island, the largest exposures of ore occurring about three miles north-west of Gillies Bay. Here the ore mass is from 20 to 25 feet in thickness. It constitutes an irregular contact deposit between limestone and granite. The ore is magnetite of excellent quality, containing nearly 70 per cent. of iron.

At the principal deposit of the ore a wharf has been built. The ore is brought down from the quarry to the wharf by an incline, the height of the quarry above sea level being 250 feet, and the length of the incline $\frac{1}{4}$ mile. The shipments in 1885 amounted to 190 tons; in 1888 the quantity shipped was 7,300 tons, valued at £3,680. Magnetite is also found at the Queen Charlotte Island, the ore being, as a rule, very pure, and exceptionally good specimen yielding on assay 69.88 per cent. of iron. Very pure ore containing 71.57 per cent. of iron was also found at an island in the Walker Group, Queen Charlotte Sound. Other deposits exist at Sooke Harbour, Vancouver's Island, and at a number of other places.

Persia: A Probable Field for Mine Managers and Mining Engineers.

Colliery Manager.

Manufacturers and factors in other industries are anxiously looking about for new markets; capitalists are everywhere in search of new countries in which they may more profitably use their means than in our own, and the rapid increase in our population causes thousands to sigh for, if not to look for, fresh fields of labor in which the number of workers shall not be so disproportionate to the work to be done. The reason for this state of things is that all our professions, trades, and occupations are sadly overmanned. In the industry we represent it is too painfully true that of those who have lately obtained, or who are now studying for, colliery managers' certificates of competency, the number who can secure satisfactory appointments at home will be comparatively limited.

These and other like considerations have invested the recent meeting of the Imperial Bank of Persia with great interest. Persia appears to be likely to furnish a fruitful field for our capitalists, manufacturers, and employees of every character and of almost every grade. It is not so much as a bank as in its capacity of a State institution that the Imperial Bank is likely to contribute to the commercial prosperity of Persia, and at the same time to assist in the development of mutually advantageous commercial relations between the Persian empire and Great Britain. The concessions possessed by the corporation are of a most comprehensive character. It has been granted the exclusive right of working throughout the empire the iron, copper, coal, lead, asbestos, and all other mines, which belong to the State and have not already been conceded to others. The corporation has thus virtually obtained the sole privilege of getting minerals in Persia, for all mines are State property, and the concessions made to others are few and insignificant.

These large concessions may be regarded as the most important part of the bank's charter, and while they are sure to be a source of considerable profit, they are also calculated to infuse a spirit of commercial enterprise and business activity throughout the empire. Fully alive to the requirements of the vast territory through which they have to deal, the board are now considering a road and transport service concession, which will require the formation of a company of an international character for its construction and management, and from which the bank will reap important direct advantages. This question of road making—especially the construction of a serviceable roadway from Teheran to the river Karun—is of the first importance, and is properly being dealt with at once, and affords an opening for the employment of a large amount of imported skillful aid. But the point to which we desire to call the attention of our readers is the development of the vast mineral wealth of the empire. The directors of the Imperial Bank, upon whom this development now devolves, have the assistance of General Houtum-Schindler, a mining engineer of considerable experience, and who has long been employed by the Shah. He has reported that coal is very abundant, and that there are many places in which it can be economically worked. It is, in fact, already being mined in the neighbourhood of Teheran, and the returns are said to be good, although the arrangements and appliances are of a very indifferent character. Many causes, some of

them local, are likely to render a native supply of coal most useful, and consequently very profitable. It has already been found necessary to import fuel from India, so that the mining of coal will be of immediate advantage. It is also within the range of possibility that the development of the coal deposits in the locality of Bushire will provide supplies for steamers calling there. Coal for that station is now sent from Great Britain. The importance of coal production on a large scale will be understood when it is remembered that there are, according to recent reports, prolific veins of copper, iron and lead. Copper smelting is carried on now, but with such imperfect apparatus that plates are imported on a large scale. A large supply of coal will induce extended and improved smelting operations. The getting of coal abundantly and economically must be a first consideration where it is so essential for the successful treatment of the numerous other minerals which abound. There is a bright future for the Persian empire if coal deposits and iron ores are found in such convenient juxtaposition as is reported.

The Imperial Bank will not—indeed, we think we are right in saying it cannot, according to its constitution—undertake the development of mines on its own account. It is certain, however, that it will speedily concede the right to do so to some other body, and there will, we think, be an opportunity for many mining engineers and colliery managers to obtain advantageous engagements in Persia, who may have to wait many years before any come within their reach in Britain.

Loadstone in Sweden.—In the western portion of the Timansberg mining field has been found magnetite exhibiting the unusual property of attracting magnetism, fragments some 132 lbs. in weight being able to support a needle $2\frac{1}{2}$ inches in length.

Removal of the Tariff on Imports of Mining Machinery.—In the present state of the industry the best possible machinery should be got with the least restriction possible, and the Government has decided to allow the importation, duty free for three years and no longer, of such mining machinery as is not made in Canada at the time of importation.

The Treatment of Wire Ropes.—"Under this head" writes T. H. Deakin, "I would call attention to the fact that rope manufacturers pay a high rate of railway carriage, to ensure the rope being kept dry and conveyed with care to its destination. It is equally necessary that in arriving at the colliery it should be stored in a house where it will be kept perfectly free from wet, steam, and noxious fumes. I have heard of a rope suddenly breaking after being in work but a short time, and when there appeared to be no apparent reason for the failure, unless it be that it was kept at the colliery stores for a long time prior to its being put to work. If ropes are kept in stock any length of time, they should be in the dry and turned over and oiled from time to time with a good and pure oil, to insure them against rust. When wanted for work, the rope should be placed on a turn-table or reel so that it may be uncoiled. If treated in any other way the strands are certain to be more or less opened, and there is great risk of damage to the rope by kinking; and if a slight kink is once made, that portion of it is irretrievably damaged. The rope having been kept free from rust while in the stores, it is important to keep it so as far as possible whilst in use. This can best be done by making up a thick oil, and as the rope is being wound slowly on the drum, and before it becomes wetted, this mixture should be applied, and care taken to work it well into the crevices of the rope, so that it has the appearance of a solid bar. Ordinary rope oil should then be applied for a few days consecutively, and afterwards, under ordinary conditions, an oiling once a week will keep it in good order. If this course be adopted, it will be found to add immensely to the life of the rope. Some people object to having the ropes greased, because they say broken wires cannot be detected; but I, for one do not subscribe to this doctrine. Ropes, will of course, stretch considerably on being first put to work, and for a time the engineman should be careful to start gently, so as to feel the load, before putting on much strain."

Failure of Steel Flat Cars.—The Cleveland, Akron & Columbus Railroad recently ordered five hundred coal cars for that line, and the first cars were delivered last fall. The cars are quite handsome in construction and captivate at sight. Some years ago an attempt was made to build iron cars, but they went to pieces so much quicker than wooden cars that the manufacturers were obliged to discontinue their construction. The builders of these new coal cars believe they have surmounted obstacles in the way, and have placed trusses and braces at every conceivable point to give the cars strength. The trusses and supports give them the appearance of an iron bridge. It seems, however, that there is a difference between an all iron bridge on wheels and an all iron

bridge which remains stationary. It is now only about four months since these new cars were placed on the road, and the car inspector, Mr. Chrisman, reports that they require constant repairing. The truss-rods are shearing and the nuts falling off on every trip. The average life of a wooden coal car is about seven years, but these new cars will not last half as long with constant repairing. This seems to settle the question whether all steel can take the place of a combination of wood and steel and iron in cars, waggons or harvesting machines.

The Proper Care of Boilers.—To clean the boiler, remove all the covers of the manholes; scrape, or if there is much hard incrustation, chip the interior surface, thoroughly loosening and removing all sediment and dirt. Pass a quantity of clean water through the manhole. Examine and clean all feed-water and other pipes periodically; remove and scrape fusible plug, and renew if necessary. Keep all flues or tubes thoroughly clean and free from soot, &c. Examine all cocks and fittings, and see that they are in order and free from leakage. Examine the flues and see that the boiler seatings are dry, and that there is no leakage either from the seams or from the roof. Tubular boiler tubes should be swept once a day, or twice if the fuel be bad. This can be readily done with a jet of steam.

Production of the Victoria Gold Field.—The Victoria gold field up to the present time had produced 64,000,000 ounces through a period of thirty-eight years, chiefly alluvial gold—but the quartz reefs promise to yield gold profitably for more than a hundred years, reports the Government geologist who is of the belief that the quartz mines may be worked profitably to 2,000 feet and made to supply at least as much gold in the future as the placers have done in the past. It is not generally known, we fancy, that the largest single silver mining property in the world at this time is the Broken Hill Proprietary Company's property in Queensland, upon upon which more than 800 men are employed underground alone. A vast quantity of ore is exposed. Some of the lodes, kaolin carrying silver, are 230 feet wide. There is every indication that untried ground owned by the company will prove equally rich with any as yet worked. Thousands of tons of ore are ready for the ore-dressing mills before being sent to the smelters. At some points are large bodies of massive lead ore that does not require dressing. Carbonates and galena abound, there are also seams of native copper met with. The underground openings are enormous.

Life Preserver for Miners.—Mr. A. Upward, an Englishman, has invented an apparatus for ascertaining the contiguity of water or gas to workings in mines and for passing food to imprisoned miners and for rescuing them. *The Colliery Guardian* thus describes the invention:—"The apparatus for ascertaining the state of a mine as regards approaching danger is firmly held to the face of the coal by means of struts and a piece of timber fixed vertically to the rear between the roof and the floor of a mine. It consists of a chamber fitted with a slide valve, which can be opened and closed at pleasure. Through a stuffing-box in the chamber on the working side passes a boring tool, with which the miner drills a hole in the coal to the distance inwards to which he intends to work. Assuming this to be, say eight feet, when he has reached that distance he withdraws the boring tool, and if neither gas nor water has made its appearance he knows he can safely work so far in. Should he tap water or gas during the boring there would be an inrush of the one or the other into the chamber of the apparatus, and its presence would be indicated by a pressure gauge. The boring tool would then be withdrawn as far as the stuffing-box, the safety valve would be closed in front of it, and steps would be taken to ensure safety in the workings. It is proposed by Mr. Upward that the detector should be used each day when the men proceed to their work, in order to ascertain whether or not the elements of danger are present, and only waiting the stroke of a pick to be released. The further modifications of this apparatus relate to the passing of food to imprisoned miners and to their bodily delivery. The apparatus in each case is similar in principle to that already described, but much larger. By means of the first a large hole is drilled through the coal, the drill is withdrawn and a tubular vessel containing food and messages is passed through. By the second a larger hole is bored and a larger tubular chamber passed through, into which the imprisoned men can creep, and thus be rescued one after another. Mr. Upward proposes that a testing apparatus should be kept at every colliery, and that depots should be formed in the different mining districts where relief and rescue apparatus should be deposited, and from whence they could be rapidly forwarded to any spot when required. These depots are to be furnished with medical and surgical appliances adapted for mining casualties, and with such stores as experience of the district suggests as being the most useful in cases of mining accidents."

The Enormous Strength of the Forth Bridge.—As showing the immense size and strength of the Forth bridge, in Scotland, a prominent English engineer has made a contrast in the following simple terms: As a grenadier guardsman, put at the average height of 5 feet 10½ inches, is to a new-born infant, about 19.34 inches, so is the Forth bridge to the largest railway bridge yet built in this country. To give an idea of the material used in the construction of the bridge, it may be mentioned that it included about 51,000 tons of steel, of two qualities—one to resist tensile and the other compressive strains, having strengths, respectively, of 30 to 33 and 34 to 37 tons per square inch of tension—and, as we stated before, upwards of 21,000 tons of cement, 707,000 cubic feet of granite, 117,000 feet of masonry and concrete for the foundations and piers, while 1,000,000 cubic feet of timber were used for temporary purposes. As many as 3,800 men were employed at one time in the construction. The stability of the bridge is assured, as far as human foresight can make it, and this will be apparent when it is mentioned that Mr. Baker, one of the engineers for the work, considers that half-a-dozen ironclads could be hung from the cantilever ends. Experts stated that the gale to which the Tay bridge succumbed did not give a higher pressure than 30 lbs. per square foot. In the case of the Forth bridge, a pressure of 56 lbs. per square foot has been allowed for acting over the whole surface—greater than ever has been experienced in this country. As to the cost, it is estimated that £2,250,000 has been spent on the bridge and the north and south railway approaches, but, including the construction of various connecting lines, nearly £3,000,000 (say \$15,000,000) will have been consumed.

FOR SALE DYNAMO AND ENGINE

One 6 h.p. Engine No. 1099, manufactured by E. Leonard and Sons.

One 25-hamp Dynamo.

Above machinery having never been in use is entirely new. For particulars apply to

Mining Review, Ottawa.

Charles M. Rolker, — LESSEE, — New York Ore Milling & Testing WORKS.

Office, -- 18 Broadway, New York.

Cable Address:—PHAPTRY, New York.

Consulting Mining Engineer.

Examinations made and reports rendered of mines and mining property, metallurgical works and pro.

Ores can be practically tested by any known process and the necessary plan of reduction determined. Works are complete in every respect for practical testing of Gold, Silver and Concentrating Ores and Tailings. ANALYSIS of ores and furnace products, etc.

MONEY ORDERS.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion and Newfoundland; also in the United States, the United Kingdom, France, Germany, Austria, Hungary, Italy, Belgium, Switzerland, Portugal, Sweden, Norway, Denmark, the Netherlands, India, Japan, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4.....	2c.
Over \$4, not exceeding \$10.....	5c.
" 10, " " 20.....	10c.
" 20, " " 40.....	20c.
" 40, " " 60.....	30c.
" 60, " " 80.....	40c.
" 80, " " 100.....	50c.

On Money Orders payable abroad the commission is:

If not exceeding \$10.....	10c.
Over \$10, not exceeding \$20.....	20c.
" 20, " " 30.....	30c.
" 30, " " 40.....	40c.
" 40, " " 50.....	50c.

Post Office Department, Ottawa.
1st November, 1899

LEDOUX & COMPANY, 10 CEDAR ST., NEW YORK, Engineers, Metallurgists & Assayers.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

Standard Powder Company

MANUFACTURERS OF ALL KINDS OF

GLYCERINE EXPLOSIVES

NATIONAL COLONIZATION

Lottery!

UNDER THE PATRONAGE OF

THE REV. FATHER LABELLE.

Established in 1884 under the Act of Quebec, 31 Vict.,

Chap. 36, for the benefit of the Diocesan Societies of Colonization of the Province of Quebec.

CLASS D.

DRAWINGS ON THIRD WEDNESDAY IN EVERY MONTH AT 2 P.M.

Prizes value \$50,000

Capital Prize: 1 Real Estate worth \$5,000.

LIST OF PRIZES.

1 Real Estate worth	\$5,000	\$5,000
1 Real Estate worth	2,000	2,000
1 Real Estate worth	1,000	1,000
4 Real Estates	500	2,000
10 Real Estates	300	3,000
30 Furniture Sets	200	6,000
60 Furniture Sets	100	6,000
200 Gold Watches	50	10,000
1000 Silver Watches	10	10,000
1000 Toilet Sets	5	5,000

2307 Prizes worth..... \$50,000

Tickets, \$1.00!

Offers are made to all winners to pay their prizes cash less a commission of 10 p. c. Winners' names not published unless specially authorized.

S. E. LEFEBVRE, Secretary

Office: 19 St. James St., Montreal, Can.

TENDERS.

SEALED TENDERS marked "For Mounted Police Provisions and Light Supplies," and addressed to the Honourable the Minister of Railways and Canals, Ottawa, will be received up to noon on Tuesday, 3rd June, 1899.

Printed forms of tender, containing full information as to the articles and approximate quantities required, may be had on application at any of the Mounted Police Posts in the North-West, or at the office of the undersigned.

No tender will be received unless made on such printed forms.

The lowest or any tender not necessarily accepted.

Each tender must be accompanied by an accepted Canadian bank cheque for an amount equal to ten per cent. of the total value of the articles tendered for, which will be forfeited if the party declines to enter into a contract when called upon to do so, or if he fails to complete the service contracted for. If the tender be not accepted the cheque will be returned.

No payment will be made to newspapers inserting this advertisement without authority having been first obtained.

FRED. WHITE,

Comptroller, N. W. M. Police

Ottawa, April 22nd, 1899.

WANTED.

Any of our readers having spare copies of January, February and March issues of the Review for this year, will confer a favor by returning them to this office.

Mining Legislation in Nova Scotia.

During the session of the local parliament just closed, several enactments were passed of a character to interest the miners. No State or Province on this side of the Atlantic has paid as much attention to the education of the coal miners as Nova Scotia. The limited resources available for this purpose have been carefully expended. This year the Board of Examiners for candidates for certificates as underground managers has been re-organised. It is to consist of the Chief Inspector and nine persons conversant with coal mining, three Mining Engineers, three Colliery Managers and three Colliers. The Province is divided into three Districts for examination purposes. The papers of the candidates are forwarded for a general meeting of the Board when the proper certificates are granted. There are at present in the different mining localities, nine instructors engaged in preparing candidates for the examinations. There is no fee paid by the pupils. The rooms, light, etc., are furnished by the Government, and the instructors are paid a fee for each candidate passing successfully.

The course of instruction comprises surveying, ventilation, mine management, methods of working, etc., and no restriction is placed on the attendance of young men who are under age, but are anxious to improve themselves in the higher walks of their calling. These schools of instruction are peripatetic so that in rotation they visit every locality where pupils may offer.

It was to be expected that in the case of coal miners, who are obliged to work at an early age, there would be many who were qualified by experience although deficient in familiarity with the rudiments of scholarship, and the principles under-lying the practice of mining. As this became apparent from the reports of the Board of Examiners and the Instructors, a further step was decided on, and during the session of this year, legislation was passed to the following effect:—

First.—That in any community where there are twenty-five or more persons of the age of fifteen years and upwards, wishing instruction in the ordinary branches of an English education, night schools may be established for their benefit.

Second.—That the Council of Public Instruction shall provide licensed teachers who shall be paid such salaries as are deemed adequate.

This legislation, although couched in general terms, applies more especially to those communities where the younger members are obliged to work at an early age, and are deprived of the educational facilities extended to their more fortunate brothers. And by its means it is hoped that cities, industrial and mining localities will be benefitted.

The Coal Mines Arbitration Act passed last session, having proved on trial to be in some important respects couched in ambiguous language has been repealed, and re-enacted. The principle remains substantially as before, that a majority of the employed must be desirous of arbitration before its provisions can be put in force. That a preliminary hearing must be had before the Commissioner of Mines who is to decide if there be *prima facie* evidence warranting a reference to the tribunal of arbitration or not. The Board of Arbitration consists of five persons, two permanent members appointed by the Government, one from the employers, one from the employed, and a fifth appointed jointly by the last two. The Act contains provisions for retention of wages, and for a deposit of an equivalent amount by the employer pending a decision of the Board. Proceedings under the Act cannot be removed by *certiorari* or otherwise into any court of record, and an appeal lies only to the Supreme Court in *banco*. The provisions of the Act appear to be drawn in favor of the employed, but presumably the great difficulty will be found in any attempt of the Board to decide what constitutes a financial condition of any company to warrant either an increase or lessening of wages when the rates paid are about the average.

During the passage of the bill through the local legislature, a measure having the same object in view was introduced in the Imperial Parliament, but its chances of passing are considered doubtful.

The gold mining areas in Nova Scotia are composed of multiples of areas 250 by 150 feet, and as errors are sometimes committed by surveyors, which give rise to disputes, and loss of mining ground, it has been sought to regulate this by requiring the adjoining lessees to be present in person or by agent during any survey ordered by the department. If no objection is raised when the representatives of all interested properties are present at the survey, the lines then laid down are to be taken as fixed. If any are absent through unavoidable cause, the survey can be repeated on the applicant, one of the interested parties, depositing with the commissioner a sum equal to the cost of the first survey. Should the check survey prove the correctness of the first survey, the applicant loses his deposit, but if the first survey proves incorrect, the expense of the second survey

is borne by the department and the applicants deposit refunded.

As the farmers living on the outcrops of coal seams have been in the habit of sinking small pits secretly, inside barns, in cellars, etc., and of extracting coal for their own use and for sale, considerable trouble has been caused to legitimate mines. These workings have frequently broken through the barrens of coal left by the lessees at the outcrops of their seams, and have deranged ventilation, admitted surface water, and caused damage by fire. To meet this state of affairs, power is given to the inspectors to enter any premises, and if such openings are found, the amateur farmer-miners are liable to a fine, are bound to fill up their pits, and make good all damages.

Hitherto, although adequate fines awaited the man caught selling coal unlawfully mined, it was as a rule impossible to identify the coal, and there was no provision for searching premises unless under definite information. It is to be hoped that these measures will be found sufficient to put an end to this surreptitious mining, which might at any moment cause the loss of a valuable colliery.

Royalties on Railway Lands in British Columbia.

With a view to promoting the construction of railways, the Local Legislature of the Province of British Columbia has enacted, during its last session, that any such new companies shall have the right to levy a royalty not exceeding 5 per cent on all gold and silver that may hereafter be discovered on the lands granted to them. In introducing the measure, the Premier stated that the granting of a royalty on the precious metals was an entirely new departure. He reminded the House that in the early history of the province there was an export tax levied of fifty cents an ounce on all gold taken out of the mines as a consideration for the heavy expenditure by the Government in the construction of roads. "That tax," he said, "although not an unjust one, proved to be extremely unpopular, and was ultimately abandoned." And so we venture to predict will also be the present measure. Everyone will agree with Mr. Robson that it is of the greatest importance to the development of the Province that railways should be constructed to make its rich mineral areas accessible, and if it is necessary in order to effect this to offer some inducements to companies or individuals, the Government must do its best to further and promote so desirable an end. Only on this ground can a land grant be justified, and even then the concession should be fenced round with every possible safeguard to prevent the gift being used for speculative purposes. In Germany, Great Britain, and most European countries, and also in our own Province of Nova Scotia, the minerals are rightly regarded as belonging to the Crown, and a large

yearly revenue is derived therefrom. In this way the development of our mines proves directly beneficial to the country. But to grant monopolies to companies or individuals in the manner indicated by the Hon. Mr. Robson's measure will surely prove hurtful and injurious. It places a burdensome premium on the work of the explorer and the prospector. As the *News-Advertiser* very well points out:—"The management of a railway company has got to do the best it can for its shareholders, and if the miner, after discovering a vein of the precious metal, cannot work it at a profit, taking the payment of the royalty into account, what follows? Simply that the owner of the royalty, the railway company, steps in and gets possession of the claim, and, being itself free from any burden of a royalty, can make a profitable undertaking of it. There is also every probability that the railway company will transfer these royalties to another or a secondary company, whose business it would be to develop and control these land and mineral properties—an eminently practical and proper arrangement from the railway company's point of view. With such a middleman the condition of the miner would be still worse and an incubus would be saddled upon our mining industry which would, within a short time, create a feeling similar to that which two years ago caused such an agitation throughout Manitoba and the North-West, over the 'monopoly clause' in the Canadian Pacific Railway Charter."

Again, as our contemporary contends, the rate of the royalty is excessive and burdensome. "It will result in the smelting company charging the miner the usual prices for the treatment of the ore, with five per cent. additional on the value of the gold and silver to cover the royalty which it will have to pay over to the railway company. A smelting company, with a capital of \$100,000 sunk in plant and machinery, can, if operated properly, turn out in the course of a year base bullion of the value of \$1,000,000 for the gold and silver it contains, besides that of the copper, lead, or other inferior metals. Now the royalty of 5 per cent. on this would be \$50,000, or exactly 50 per cent. on the capital of the smelter, instead of the one-half of one per cent. on the same that the hon. gentleman figured by his method. If he will take the trouble to enquire what have been the results of the operations of the smelting companies at Leadville, Pueblo and Denver for the last ten years, he will find that the imposition of a tax on them which would have amounted, during that period, to the enormous sum of \$20,000,000, would have compelled them to suspend operations."

Meetings have been called and a vigorous protest will be made by the miners against the imposition of any such scheme as that submitted by the Hon. Mr. Robson.

An important meeting of the Gold Miners' Association of Nova Scotia will be held in the Halifax Hotel, at three o'clock in the afternoon of 3rd prox. Business of considerable interest to the Association will be discussed, and every member should make it a point to be present.

Instructions on the Immediate Remedies to be Applied in Cases of Accidents.*

Asphyxia.

Asphyxia is a state of apparent or real death caused by the stoppage of respiration.

Any cause which prevents a sufficient quantity of air from reaching the lungs may cause asphyxia. Such is drowning, strangulation, the compression of the chest (by something falling, for instance), the existence in the air of unbreathable gas, etc.

The first duty to fulfil in case of asphyxia is to remove the victim from the cause which occasioned the accident. We will not dwell upon the manner of drawing out a drowning man from the water, or upon the necessity of immediately loosening the rope from around the neck of a man hanging, etc. A few words are necessary on the precautions to be taken by the preserver in case of asphyxia from unbreathable gas, to prevent his being struck down himself.

He should commence by making an opening from without if possible, by means of ladders and poles, breaking the windows where the accident occurred so as to renew the air before going in.

If this cannot be done, he should put over his nose and mouth a cloth saturated with vinegar and water, and should pass around his body a strong rope, which will enable him to be pulled out should he lose consciousness.

Before going into the place he should draw a long breath and try and hold his breath until he should have opened all the apertures so as to let in the pure air. In certain cases where sufficient air cannot easily be let in (as in cellars, etc.), he should also carry a rope, the end of which is held outside and on the other end of which is a noose which he should attach to the victim's clothes, and that being done, he should quickly retire while the assistants will draw out the asphyxiated person. (If the gas that has caused the accident arises from the combustion of coal or pit coal, it would be useful before entering the room to throw in large quantities of water mixed with slack lime.)

In a case where the accident is caused by illuminating gas, he must take great care not to enter the room with a light, that might ignite the gas and cause an explosion.

Immediate help.—The man is then carried into a well-ventilated room, moderately warm, and should have around him only those absolutely required. As a general rule, in cases of asphyxia as well as for all other accidents, if it be a woman, the assistance should be given, if possible, by other women, and the cnrious should be strictly prohibited from entering. The victim should be undressed quickly, or if this be difficult the clothes should be cut with scissors. He should then be placed on a bed, or on a simple mattress placed on a table, after having placed a bolster under the shoulders to raise the body slightly, the head falling backwards. He is then covered with a light covering, and for want of better, with straw or dry hay. These preliminaries having been quickly done, the mouth of the asphyxiated is opened and a small piece of wood is placed between the teeth, or a handle of a spoon or some other flat object, not sharp, is inserted; the jaws are kept apart by placing a cork between the large teeth, and the tongue is drawn out with the fingers which are covered with a handkerchief or a cloth. With the finger or with the feathered

end of a feather, the nostrils, mouth and throat are cleared from mucus and froth that obstruct them.

All this is done quickly but methodically, while the assistants try to restore warmth and the circulation by dry rubbing, with hot bricks and irons and with hot smoothing irons wrapped in flannel and passed over the body. Rubbing with spirits with a flannel, a rough towel or a handful of straw is useful.

A lighted match should frequently be placed to the nostrils and a cork still wet with alcohol whose sharp penetrating vapour produces salutary irritation.

If, notwithstanding these manœuvres, the body still remains inert, and the respiration does not return, artificial respiration must be resorted to without too much delay.

Artificial Respiration by the Sylvester process: This process consists in producing, by movements of the arms, the play of the muscles that raise and lower the chest.

The operator places himself at the head of the asphyxiated who is lying on his back and raises his shoulders with a blanket or an article of clothing rolled up. The feet are supported and held by an assistant so that the body remains immovable.

Fig. 1.

It is needless to say that all the preceding precautions which have been described should have been taken, that the nose and the mouth should have been cleaned and that the tongue has been drawn out. In case of need, it is kept in this position by passing a handkerchief under the chin in such a manner that it is pressed between the teeth.

The operator then places himself at the head, he grasps the arms of the asphyxiated close to the elbows, the forearm being bent on to the

Fig. 2.

arm (Fig. 1), and having pressed them rather tightly on the sides of the chest, he then raises them quickly but without violence over the head, making them describe the arc of a circle (Fig. 2). He then brings them back to the first position and recommences the manœuvre, imitating the beats of normal respiration. The operator ceases

*Summary Extract of Chapters II and III of the work by Messrs. E. Ferrand & A. Delpéach, at Messrs. J. B. Baillière et Fils, 19 Rue Hautefeuille, in Paris.

after a few movements in order to judge the effect he has produced, and begins again if the respiration is not established of itself.

During these manœuvres the assistants continue rubbing under the covering or over the dry clothing; they renew the application of hot flannels, or bottles of hot water, or of hot bricks placed along the body, to the feet, or under the armpits.

As soon as there are signs of life we give the sick person a few spoonfuls of cordial, hot wine, grog, &c. If there be nausea we aid the vomiting by passing over the uvula an oiled feather.

Then we place the sick person in a warm bed, his head being slightly raised, and care should be taken to allow air to circulate well around him. It will not be long before he will fall asleep, but his sleep should be watched in case new symptoms of asphyxia should manifest themselves. We have seen persons asphyxiated return to life after a very long period (several hours); therefore we must, so long as any hope remains, continue to practice the artificial respiration, changing the operator so as to prevent fatigue.

Here are some of the signs by which we may know that all hope is gone:

If, on applying the ear to the chest in the region of the heart, we hear no beating; if a glass placed at a short distance from the mouth be not tarnished; if a hot coal, placed at the end of the toes, produces no sign of feeling or no blister.

Loss of Consciousness.

The loss of consciousness is due to various causes. Besides those we have already described as being caused by asphyxia, we will mention among the most ordinary cases: concussion of the brain (see farther on), overcome by heat, apoplexy, epilepsy (or *haut mal*), syncope. (We call syncope the state of a person who is ill either on account of emotion, weakness, loss of blood, etc.)

Immediate help.—Send away the curious; loosen the collar and belt; give as much air as possible.

If the face is pale (syncope) lay the sick person down flat, the head low, throw a few drops of cold water on his face, make him inhale vinegar, ammonia or ether, and rub the temples and forehead with vinegar and water, eau de cologne, etc.

If the face is highly colored (congestion, apoplexy) place the sick person on a bed, the head high and the legs hanging, and place on the head cloths dipped in cold or ice water. If there be vomiting, turn the head on one side to prevent the matter from being breathed into the lungs.

In case of epilepsy (which we distinguish by convulsions which accompany the loss of consciousness) all the cure consists in securing the sick person from the violence of the shock and the fall; put in the tongue, which might be caught between his teeth and bitten. We must then wait patiently until the workings cease of themselves.

Bruises.

CONTUSIONS.—They are the result of a violent shock against some body that will not yield (such as blows, falls, &c.) and are characterized by pain and swelling of the part affected, the skin remaining intact. A violent contusion without any of the vital organs being injured brings on syncope. (See what is to be done in such case.) Finally the contusion of some important internal organ, such as the brain, the lungs, may entail the most serious consequences and cause, according to the organ injured, the loss of consciousness, spitting of blood, &c.

Immediate help.—In cases of slight contusions apply wrung out cloths dipped in cold water or *eau blanche*. If the accident is more serious, carry the wounded person into a well-ventilated room, put him on a bed or mattress and be careful to remove everything that can interfere with his breathing. And while awaiting the doctor, keep, on the part injured, compresses of ice water, and renew these frequently.

WOUNDS.—Wounds are of different kinds according to their causes, such as a piercing, a shock, an incision, a tearing; their gravity depends on their extent, their depth and above the particular organs injured, such as blood vessels, lungs, heart, etc.

Immediate help.—Take scrupulous care not to touch the wound with dirty fingers, dirty cloths, sponges, and cover them with lint or cob-webs, &c.; all manœuvres that might introduce into the wound bad germs might be the cause of poisoning, and consequent blood poisoning and death. Clear the wound from anything that may soil it (such as sand, earth, &c.) by washing it thoroughly with pure water and better still with phenic water, and with the aid, if required, of a clean piece of linen such as a napkin, a handkerchief, &c.

While waiting for the doctor you should never permit any one to remove anything that has penetrated into the wound and which offers any resistance to a slight pull, we should not pull off either the pieces of skin adhering or the clots of blood which the water could not remove.

Cover the wound with a compress cold water, or, better still, phenic water, and keep it in its place by a napkin or linen band.

HEMORRHAGE.—Hemorrhage or loss of blood, which accompanies every wound, may assume such proportions as to necessitate immediate remedy.

Immediate help.—When the blood is thick, of a dark red color and flows gently and not by starts, it is generally sufficient after having removed everything from the wounded part that could interfere with the circulation, such as clothes, garters, etc., to press on the wound with the aid of the fingers or by means of a piece of linen moderately light.

Fig. 3.

This process is insufficient in the greater number of cases where a small artery is injured. In each case vermillion red blood flows from the wound by starts corresponding with the beatings of the heart, and death is imminent unless the hemorrhage is stopped. Compression of the principal artery of the limb, while awaiting medical aid is always the surest means of saving the life of the wounded.

It is important to know the places where this

operation can be more easily performed and consequently with more chance of success.

We will now enumerate them.

For a wound in the forearm or the hand seek the artery above the elbow in the inside of the arm besides the biceps muscle. (Fig. 3.)

Fig. 4.

For the lower limbs in the middle and a little above the fold in the thigh. (Fig. 4.)

For a wound in the head, seek the artery (carotide) near the middle of the neck on the front side of the principal muscle, which, from behind the ear, extends to nearly the middle of the chest and press it from the front to the back of the vertebra of the neck. (Fig. 5.)

Fig. 5.

The cessation of the hemorrhage will indicate that we have found what we sought.

If we do not succeed in stopping the blood in this way we must try and produce with compression by means of elastic bands (such as suspenders, etc.) bound round the injured limb above the wound. Should it be required, we should use a cloth folded like a cravat, the ends of

Fig. 6.

which we fasten in a knot and under which knot we pass a piece of wood (a cane, etc.), sufficiently long that by turning it we succeed to tighten the cloth and compress tightly the limb. (Fig. 6 and 7).

Fig. 7.

WRENCH (SPRAINS).—*Immediate help.*—Apply fresh water in the form of a bath, running water, or compresses frequently renewed.

DISLOCATIONS.—There is dislocation every time that the extremity of a bone comes out of its natural cavity to take a wrong position. We are notified of the dislocation by the characteristic malformation of the place when compared with the symmetrical one, by the change in the length of the limb and by the inability of the injured person to perform certain movements. These dislocations are caused by falls, violent movements made in abnormal positions, sometimes by blows.

Immediate help.—It would be dangerous to attempt the work of replacement, which to be of any use would require accurate anatomical skill. We must then content ourselves by the exercise of palliative measures that will soothe the patient and stop the swelling of the part, until such time as the doctor arrives.

We must simply apply compresses of (eau blanche) sugar of lead water and keep the sick person lying down in the least fatiguing position possible.

FRACTURES.—The immediate symptoms of a fracture are the impossibility or difficulty of

Fig. 8.

moving the injured limb, the change more or less great from its natural position, and the rubbing of the two ends of the broken bones. We may notice also in the parts that are held

together by a single bone, such as the arm, an unnatural bend, and the individual movements of the two parts which form the bone.

Immediate help.—We must avoid all protracted attempts to assume ourselves that there is really a fracture and apply the remedy indicated as if we were positively certain. The first thing to be done is as simple as possible, and is intended to keep the limb immovable in its normal position. It is formed of small pieces of wood (splints) which are cut the necessary length and thickness, and pieces of thick cardboard. While these are being prepared the injured limb should be covered with a compress dipped in cold (eau blanche) sugar of lead water. Then the splints covered with wadding or a soft thick cloth, are put around the limb and then fixed with bands or several handkerchiefs.

The figures 8, 9, 10, 11 and 12 render it unnecessary for us to enter into further details.

Fig. 9.

Fig. 10.

Fig. 11.

Fig. 12.

When the fracture is rendered worse by wounds, we must commence by attending to these as has been indicated; and after having covered the wounds with compresses, we apply the provisional remedy.

The doctor should be called within the shortest delay. He alone is authorized to make a thorough examination of the injured limb, to unite the fracture and apply the final application. To wait too long entails much trouble; the painful swelling of the muscles next the fracture is an obstacle to the putting on of the bandage, which delays and interferes with the cure.

In case of a fracture of the arms, the injured person should, if his strength is sufficient, seek his own dwelling or that of the doctor, that is if the distance to travel is not too great. See on Fig. 11 the position of the sling used to support the arm.

If the fracture be in the lower limbs the patient should not in any case be allowed to walk.

To carry the wounded we must use a stretcher or upon something made to resemble it.

A plank, a shutter or a door can be used; it should be covered with a straw bed or dry grass, and care should be taken, by some means or other, to keep the head raised.

BURNS.—*Immediate Help.*—When a person's clothes are on fire the first thing to do is to smother the flames by whatever means may be at hand; you should at once cover them with a cloak, a blanket, a quilt, a carpet, &c., and wrap it closely around him. The fire being extinguished, we should relieve him of his clothes, using scissors if necessary, so as to prevent the rubbing which might pull away the flesh and cause intense suffering. If pieces of the cloth remain stuck to the flesh it is better to leave them than to try and remove them.

Open the blister by a prick from the extreme point of a pin; but take great care to protect the skin that covers the sore and prevent direct contact with the air. Apply on the burned parts a linament which is obtained by shaking in a corked bottle a mixture in equal parts of oil and lime, or if this cannot be obtained, use olive oil, butter or any other grease spread on cotton.

When the burns are caused by *chemical caustics*, we should be careful not to use water in the first instance; it would only excite the corrosive action, causing intense suffering; we must try, on the contrary, to extract what remains of the caustic by touching it gently with wadding or lint, until the drying up of the sore, and then only should there be frequent washing with

alkaline water (a solution of carbonate of soda, etc.), soap suds, lime water. If the burn is caused by acids, then wash with vinegar water; if by burns from potash or soda, ammonia or quick lime is used.

FOREIGN BODIES INTRODUCED INTO NATURAL CAVITIES.—If a foreign body has penetrated the eye, the nose or the ears, and if it cannot be pulled out very easily, we should await the arrival of the doctor.

When a foreign body has entered the throat which, leaving aside the inconvenience and discomfort, might cause suffocation and even asphyxia, we should try and remove it with the aid of the finger.

If this means is not successful, we must try and drive it down by making the patient swallow small balls of bread crumbs, or pieces of cooked potatoes, as large as possible. If there be suffocation, try and make the patient vomit, by making him drink warm water or by tickling the palate.

POISONING.—*Immediate help.*—While waiting for the doctor, for whom we must send quickly, try and remove the poison as quick as possible, by causing vomiting. For that purpose, make him drink large quantities of lukewarm water, tickle the throat with the finger or a feather.

Give him, moreover, emollient and softening drinks, such as milk (which should be given in the first place) and albumen water (which is made by beating the whites of four eggs in a pint of water) gum water, etc.

If it is known what poisons have to be dealt with, the following substances may be given:—

In poisoning with *acids* (sulphuric acid, or vitrol, nitric, etc.) carbonate of soda, pounded chalk, magnesia, etc., dissolved or soaked in a good deal of water is used.

In poisoning with *alkalies* (caustic soda or potash, etc.) water slightly flavored with vinegar or acidulated milk with the juice of lemon is used.

With *arsenic*, magnesia mixed with water.

With *salts of mercury* (corrosive sublimate, etc.) the white of an egg.

With *phosphorons*, magnesia and over and above, ten drops of the essence of turpentine in milk every half hour.

Avoid oil and fatty substances.

Finally, if we have to deal with *vegetable poisons* (such as opium, belladonna, etc.) administer strong black coffee and spirits, and apply compresses of cold water to the head.

CONTENTS OF AN AID BOX.

Bottle of ammonia (volatile alkali).

do spirits of camphor.

do extract sugar of lead.

To prepare (*eau blanche*) mix 2 tablespoonfuls of extract of sugar of lead in a pint of water.

Bottle of 100 grammes of high wines and phenic acid at 90 per cent.

To prepare phenic water (*l'eau pheniquée*), mix 2 tablespoonfuls of that solution in a pint of water, and shake the mixture so as to dissolve all the phenic acid, which commences by separating in the form of oily drops.

Bottle of vinegar.

do oil of almonds.

do lime water.

An empty bottle to prepare the calcareous liniment.

Bottle of *eau de melisse*.

do hydrate of magnesia.

A few linen hands; a few rolls of lint for dressing.

A few splinters of wood (splints) for fractures.

The Belgian Collier's System of Benefit Organization.

The Mariemont and Bascoup Coal Companies employ over 6,000 persons of the working class.

In the work of mining the system of sale and that of premiums have been in use for the last fourteen years and have proved eminently satisfactory to the interest of both master and workman.

Sales.—Certain kinds of work with mines, the condition of which rarely change, may be put up to auction. Herein the workman finds many advantages, a settled price for his work during a certain period of time agreed upon, the security it gives him, the power of choosing as partners in his work, workmen of the same ability as himself, and the chance of his wages increasing in proportion to the work done, provided work is regular and favorable, &c.

Bargains.—The care of the underground ways, the different repairs to be made and especially the cutting of coal are all subjects of bargaining; that is the price discussed between the engineers or their assistants and the workmen.

Premiums.—Since the system of premiums has been introduced for all workmen loading, driving or drawing the coal from the pits, their wages now consist of one fixed part, and of one proportionate part in accordance with the number of cars that have passed through their hands, or with the quantity of coal taken from the pits. This system is a real stimulus for the workmen, and a certainty for the owner, of coal being mined with regularity.

Contracts.—In dealing out the material from their repair shops, stores, &c., the organization of work by the job has been extended to all workmen without distinction, although in certain classes of work, such as drawing up coal and repairs, difficulties are incontestably met with. Its results are an increase of wages of 20 per cent. with a proportionate decrease in the price of returns. The greater part of the yearly work such as the driving of machines, the repair and the care of the material are all contracted for, the contracts not extending over a year. They are signed by the coal companies and the bands of workmen who accept them. The amount for which they are accepted is frequently based on the quantity of coal extracted. All the risks of the work, which very often varies in quantity, are accepted by the workmen. Past experience shows that, though the coal company may at times advance money, and at others the workmen may advance work, in the end the compensation is about equalized. Besides, the profits made by the contractors show that the confidence in the results was not misplaced. They have, in fact, signed new contracts under conditions entailing reductions of 20, 30 and even forty per cent. in favor of the companies. If, therefore, their wages have not diminished it must be because they have worked harder, or they have improved their manner of working, making it more intelligent and have thus seconded the efforts made by their superiors in providing improved implements.

Colorado's Mineral Palace.—The mineral palace now being erected at Pueblo, Col., will cost about \$250,000. It will be of handsome design, the exterior being a series of square columns and beautifully polished stone. The carving will be ornate. All parts of the building will be made of the products of Colorado's mines, the owners in all the counties in the State having sent in their choicest and richest specimens. In the interior will be seen every variety of mineral production, from stone and coal to pure gold, the value of which will be at least \$750,000. The expense of developing this grand and brilliant conception will be assumed by the public spirited citizens of Colorado. It is intended to be a permanent exhibit, open every day the year round, and its originators desire to have the choicest specimens of mineral wealth from every State in the Union represented side by side with the resources of Colorado. Building stone, granite and marble are also desired. The building will be lighted by 3,000 incandescent electric lights. It is the intention to reproduce this in duplicate of design and brilliancy of decoration and display, but somewhat reduced in size, as the Colorado mineral exhibit for the World's Fair, in Chicago in 1892, should that scheme materialize.

Gold Mining in British Guiana.—The last shipment of gold—3,483 ounces, valued at \$62,000 in round figures—is the largest on record in the Custom house books, the largest exports by a single mail hitherto having been those of 2,263 ounces a few weeks ago, and 2,514 ounces in December last. Including the latest shipments above mentioned, the gold returns for the year show 12,884 ounces, valued at \$231,632. Last year, up to 15th April, there had been sent away 5,846 ounces, declared to be worth \$100,171, from which it will be seen that, as far as it has gone, this year's export has been more than twice as large as that in the corresponding period of 1889. The gold royalty for 1890 stands at present at the respectable figure of about 11,500 ounces.

Meeting of the General Mining Association.

The annual general meeting of the proprietors of the General Mining Association, Limited, was held at the offices, Blomfield House, London Wall, E.C.

Mr. J. Duke Hill, who presided, formally moved the adoption of the report and account, and that a dividend of 6s. per share be declared.

Mr. F. W. Bigge seconded the motion.

Mr. Descou complained that the meeting had not been called earlier. It seemed to him that four months was a long time to wait to complete the accounts of the association. He also suggested that the proprietors should be furnished with a report of the affairs of the Association more often than once a year.

Mr. Swan stated in reply that the preparation of the accounts at the mines took some time to complete, and then they had to be sent to London. It would be useless for the board to send reports out as often as Mr. Descou had suggested, as there would be nothing to communicate to the proprietors.

The motion was then put and carried.

After the re-election of the retiring directors, a vote of thanks was given to the chairman for presiding.

The Immense Profits of the Tharsis Sulphur and Copper Co.—In spite of the fall in the price of copper, the net profits earned last year by this company amounted to no less than £249,189 15s. 6d., enabling the directors to maintain the previous year's dividend of 20 per cent. Over and above this immense profit the company has a claim against the Société de Métaux for £263,915 1s. 6d. It may be of interest to add a line as to the dividends that have been paid by this company. In the first year of its existence (1868) it paid a dividend of 10 per cent.; in 1869 5 per cent. was paid, but this rate advanced till 40 per cent. was reached in 1872. Since then the rate has averaged exactly 20 per cent., 27½ per cent. being paid in the two years 1882 and 1883, and 7½ per cent. in 1886.

'Eiffel' Tower for the World's Fair at Chicago.

—M. Eiffel, who erected the great Eiffel tower, which formed such an important and successful feature of the recent International Exposition in Paris, has made a proposition to the World's Fair directors to erect a similar structure in Chicago, and to provide the entire capital needed for its construction, should the directors approve of his proposition. It will be the joint enterprise of M. Eiffel and Thomas A Edison, and the tower will be higher than the original structure by at least 500 feet. Mr. Edison, it is said, will place a million incandescent lights of various colors upon the structure.

A Dry Machine for Alluvial Gold.—The Whitty machine which was successfully tried at Johannesburg the other day is thus described: It is a green looking affair of perhaps seven feet in height; simple enough in its working and doubtless meritorious enough to ensure something of the boom anticipated by the American company who are introducing it. The machine was at work the other afternoon in the yard to the rear of Messrs. Turner's premises in Simmonds St., Johannesburg. According to Mr. Whitty—and as was pretty plain to all—the machine was simplicity itself. The virgin soil is first put through the clod breakers, which are fixed with screws so as to reduce the wash to a proper size to enable it to run through the separator. It is then placed in a hopper with an automatic feeder, which distributes a thin layer over the amalgamating plates, so constructed as to hold continuous walls of mercury in the shape of rifles. All the finer gold is amalgamated on the first plate; the coarser gold and pebbles falling into the concentrator beneath—a specific gravity plate of rough canvas on which is laid the mercury charged rifles. An intermittent force of air comes from the bellows, behind which, striking the canvas plate, drives the tailings on to the floor, the rougher earth and probable gold being held in tow for the examiner. Which, being interpreted, means that the dry earth is poured into a box at the top of the machine, is allowed to drop through by automatic action on to the sensitive plate beneath, where cascade fashion, it dribbled down to the bottom, leaving its golden wealth (if any) behind in finer particles and taking the rougher and more acceptable nuggets to the plate beneath. This plate being of canvas is blown at by an automatic Boreas behind, the result being that while the superfluous earth is blown to the ground as tailings, the pebbles and nuggets remain, attracted by the gridiron arrangement, topful of irresistible mercury. Then when the business is over for the day, these concentrates are swept off in a pan, and the nuggets picked out as easily as winkles. The hand power of the machine, it was stated, will treat between 15 to 20 tons of earth a day—a fact which, contrasted with the present method in use, speaks for itself. The earth must be dry—the dryer the better—before it can be treated; and the machine itself is adapted either to hand labor or working by steam.

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

No. II.

Mr. H. S. Poole, General Manager of the Acadia Coal Co. (Ltd.), Stellarton, N.S.

Mr. H. S. Poole, General Manager of the Acadia Coal Company (Limited), and formerly Inspector of mines for the Province of Nova Scotia, was born at Stellarton, N.S., in 1844. He is the son of the late Henry Poole, a well known mining engineer, who managed the Albion mines for fourteen years prior to the surrender in 1887 of that company's monopoly of all the minerals of the province, and who also reported for the Government on the newly discovered gold fields in 1863, and still later was manager of the Caledonia Colliery in Cape Breton.

Mr. Poole is a graduate of King's College, Windsor, and is an Associate of the Royal School of Mines, London, where he studied under the well known leaders in science, Professors Hoffman, Huxley, Tyndall, Smith and Percy. He has been a Fellow of the Geological Society since 1866 and is a member of several other scientific societies, to which he has contributed papers. When the Canadian Society of Civil Engineers was formed he was honoured with a seat at the first Council Board. Having finished his studies in London and returned to Nova Scotia he was employed under his father's management at the Caledonia Colliery, Cape Breton, where Mr. David MacKeen, M.P., is now Managing Director and part owner. There he remained until 1870, when he went to Utah and Nevada, mainly to benefit his health, but also in a professional capacity, to report on some silver mines. As an episode in this portion of his career, it should be stated that he was for a month with a Japanese Commission at Washington, at the time when that wonderful people were boldly casting off their venerable civilization for that of the more restless West. Afterwards he spent a year among the silver mines of Utah. In 1872 he once more returned to his native province to succeed Mr. John Rutherford as Inspector of Mines, and this position he filled with great credit to himself and to the province for a period of six years.

As Inspector he marked his term of office by inducing the Government of that day to adopt for the better regulation of the mines an Act based on that of England, and he added thereto, with Government concurrence, special clauses having in view the preservation for future miners of approaches to the large submarine coal field that extends off the Cape Breton coast. He also remodelled the forms on which information is annually given to the public in the official reports to the Department, giving them the

shape they continue to have to-day.

Nova Scotia owes much to Mr. Poole for the fearless conscientious discharge of his duties as inspector during the years in which he held this office, for his efforts to enforce the authority of the law and secure that discipline and attention upon which the safety of the mines depends. Of the Annual Reports we can only speak in terms of unqualified praise. The work of the Department was not limited to the collection of royalty from the mines or to the publication of statistics of the yield, value and destination of their products, useful chiefly to the economist and historian. The Inspector was by training and experience quite competent to instruct owners as to the best means of opening and work-

Yours Truly
H. S. Poole

ing mines and of utilizing and marketing their products, and to recommend modifications and improvements in mining practices which had been adopted elsewhere. The reports became valuable memoirs on the great mining industries of Nova Scotia, descriptions of the coal, iron, gold, manganese, antimony, copper, lead, gypsum, barytes, limestone and other economic ores and minerals; of their modes of occurrence, of every question of practical application to their extraction; of the cost of production, the labour and materials employed. Methods of mining were compared with those in use in other countries; a complete history was given of the growth, progress and condition of every mining district, and suggestions made for their future development.

In his first Report, which contains numerous carefully compiled statistical tables, references to mining practices abroad, to appliances for coal cutting, to the use of dynamite in the gold mines, Mr. Poole urged the necessity for greater attention to the condition of the mines and for the enforcement of stringent rules to guard against the recklessness with which miners will expose their lives to dangers which, although known to be imminent, are familiar, invisible and temporarily doubtful. He insisted that immediate revision of the law relating to mines was preferable to waiting until some appalling accident, from which happily the province had hitherto been free, too plainly should point to the necessity for legislative interference. The warning was not too soon. This report was written on February 15th, 1873, and on May 13th occurred the disaster at the Drummond colliery, an explosion of gas in a fiery portion of the mine by the careless use of powder, which resulted in the loss of sixty lives and a greater destruction of property than in any previous similar occurrence in America.

The next annual Report recommends some improvements in the handling of coal, points out the necessity for complete and accurate plans of underground workings, and further advocates that the law should require that those in charge of mines, all colliery officials such as managers, deputies and firemen, should be men in whom trust can be placed, men who by practical experience and professional education are fit to fill the positions they hold, and should be required to possess certificates according to their positions. It condemns the Arab-like wanderings in the gold fields of irresponsible tributaries who try new places, open up old mines and again abandon them, stripping the outcrops of the leads and making them reservoirs for water, and but temporarily securing the openings. Interesting sections are given of one of the leads in the Montague district, to show the distribution of gold in different parts of the workings.

Among the questions considered by Mr. Poole in subsequent reports is that of the duties of the inspector and the extent of his responsibility as compared with that of those in charge of the mines, whose constant care and watchfulness, coupled with good discipline, he shows to be the only safeguards against accidents. The history of royalties and a comparison of the custom of Nova Scotia with that of other countries, leases, spontaneous combustion of coal, colliery machinery, ventilation, explosions in mines, submarine workings, review of the coal trade, boiler incrustations, treatment of gold-bearing ores, tables of analyses of iron ores—these and other cognate subjects of practical interest are concisely treated with extraordinary ability in his reports.

In 1876 he contributed much valuable information to the Royal Commission, of which the Rt. Hon. Mr. Childers was chairman, and it is published in their report on the spontaneous combustion of coal in ships.

In 1879 Mr. Poole resigned his position as Inspector of Mines to take that of manager of the Acadia colliery at Westville, made vacant by the failing health of the late Mr. Jesse Hoyt.

Previous to 1886 there were four active coal companies competing in the Pictou Field, whose operations did not always result advantageously to their respective shareholders, and in that year three of them—the Vale, the Acadia and the Halifax—were amalgamated. Mr. Poole, who previously had acted for the Acadia company alone, was placed in general charge. The amalgamation consolidated leases cover some 13 square miles, of which but a portion is at present known to contain workable beds of coal. The management of this property involves the consideration of many serious problems, the record of the district being anything but enviable; calamities by explosions of gas, irruptions of water, and loss of pits by subterranean fires, which have continued to smoulder and occasionally break out destructively, have marked that of the past twenty years.

The pits in Pictou County are the deepest in the Province. The Acadia pit has workings under 1,500 feet of super-incumbent strata, with depth not only is the cost of pumping water and winding coal seriously increased, but the resulting pressure adds to the expense of maintaining the necessary roads.

Thorough, painstaking and careful, intimately acquainted with everything about the mines, as manager he inspires confidence in his professional knowledge; not readily swayed by prejudice or passion, solicitous for the welfare of the miners, affable and easily approached, he is liked and respected, but permits no disobedience of orders. His managers at the Acadia and Albion mines, Messrs. James Maxwell and J. G. Rutherford, are instructors in the Government schools for miners, while Mr. W. B. Moore and T. M. Turnbull are in charge of the Vale. The mine with which he has been longest connected is the most successful in the district. The importance of these coal mines is shown by the prosperity of the neighbouring towns of Pictou, New Glasgow, Westville, and Stellarton, and of the whole county of Pictou. To win the coal at great depths in fiery mines from beds thicker than are worked elsewhere, but of changeable character, highly inclined, interrupted by faults and having often a dangerous roof; to recover or avoid breaking into old workings, are problems which tax to the utmost the powers of the mining engineer entrusted with the lives of hundreds who are engaged in a perilous occupation, he must foresee and guard against danger and loss, and husband the resources of the mines. The responsibility is heavy, but in every crisis Mr.

Poole has done, and will do, all that coolness, skill and promptness to plan and execute can effect.

As the observant practical miner and mine engineer often makes a good geologist, Mr. Poole has also set himself with equal success to solve certain vexed questions in the geology of a province which has produced many geologists. In 1873 he read before the Nova Scotian Institute of Natural Science a paper on the geology of the Nevada silver mines, the great American desert, the gravel benches, hot sulphur springs and changes of level of the Great Salt Lake. In 1879 followed a contribution to the Geological Society of London, of which he has been a member for more than twenty years, "On the Gold Leads of Nova Scotia," in which he agrees with Dr. Selwyn of the Geological Survey in regarding these leads as true mineral veins, rather than as beds of contemporaneous age with the quartzite and slate in which they are enclosed, as assumed by Professor Hind and Dr. Hunt, thus "rendering a most useful service to geology in completely upsetting the theory of the bedded origin of the leads." He maintains also that the granites of the gold fields are of intrusive origin and not merely highly metamorphic rocks. In other papers he has discussed the question of the glaciation of the country and the origin and course of the drift.

In 1881 he read before the Institute of Natural Science "Notes on the Ice Storm of January 24th, 1881"; in 1885, before the American Institute of Mining Engineers, a paper on "The Pictou Coal Fields," including, besides particulars regarding the machinery and methods of working at the different mines, an account of the geological structure of the coalfields, of which he has since that time made a much more thorough survey; and in 1889, before the Canadian Society of Civil Engineers, "The History of One of the Oldest Railroads in America—that between the Albion Mines and the loading-ground."

It should be stated that Mr. Poole is also Vice-President of the Nova Scotia Steel and Forge Company of New Glasgow, a concern that has spent \$400,000, chiefly of local capital. As is well known this enterprising company is doing a large business, and is now proposing to include a blast furnace. The products are open-hearth steel, nail plate, machinery steel, car axles, &c., &c.

We hope to include in our next issue a sketch of Mr. Archibald Dick, Chief Inspector of Mines for the Province of British Columbia.

The Canadian Rand Drill Company give notice of an application for incorporation. The applicants are:—Addison C. Rand, of the Rand Drill Co., New York; S. W. Jenckes, of the Jenckes Machine Co., Sherbrooke; J. M. Jenckes, Sherbrooke; F. A. Halsey, Mechanical Engineer, and Wm. Farwell, Manager of the Eastern Townships Bank, all of Sherbrooke. The capital stock will be \$18,000, in 180 shares of \$100. The company will manufacture in Canada, Rand Drills, Air Compressors, General Mining Machinery and supplies.

In General.

Mr. G. C. Lomer, of the firm of Andrew Hunter & Co., London, has arrived on this side for a short visit, and will make a trip through the mining districts.

Markets.

The European market is weak on account of a drop of one penny unit in Charleston, and the lower freights that are ruling. Manufacturers are busy on the other side at present in manufacturing and shipping manufactured goods, so that they are in no humor for purchasing.

Shipments.

Messrs. Lomer, Rohr & Co., Millar & Co. and Wilson Green have been making regular shipments to Europe since resumption of navigation, from the port of Montreal. Full particulars of quantities exported per ocean freight will be given in our next issue.

The shipments of ground phosphate from the Ottawa Valley to United States, from 1st January to 30th ult., have been:—

Month.	Quantity.	Designation.
January.....	7½ tons.	Holyoke, Mass, US
February.....	340 do	Holyoke, Mass, US
March	100 do	Holyoke, Mass, US
April	200 do	Holyoke, Mass, US

Kingston District.

The Kingston Phosphate Mining Co. has been registered in London, with a capital of £5,000 sterling, to acquire and work the property adjoining the Foxton mines. Messrs. Lomer, Rohr & Co. have been appointed agents in Canada.

Active operations have been begun under the new management at the Bobbs Lake Pits, formerly operated by the Anglo-Canadian Phosphate Co., and from present indications a large output is expected.

Templeton District.

At the McLaurin Co.'s pits work progresses satisfactorily. About 100 tons per week are being mined from the Blackburn.

Freights.

Messrs. Lomer, Rohr & Co. report having made contracts for London and Liverpool at 5s. per Tramps.

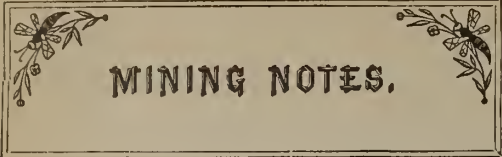

Lievres District.

Operations at the North Star, High Rock, Emerald and Central Lake Mines are being pushed vigorously, and satisfactory shipments are being made.

The Anglo-Continental Guano Company, operating the Aetna Hill and Lansdowne properties, purpose to submit to arbitration the dispute respecting the line dividing their property from that of the Ottawa Mining Co. A re-survey by independent surveyors will probably be made. The Anglo-Continental Company estimate that about 2,000 tons of ore have been taken out of the workings on their side of the line.

The Canadian Phosphate Company expect to have a large increase in their shipments this year. The pits are all doing well at present. A full report of the annual meeting of shareholders is given in another portion of this issue.

The annual general meeting of the Dominion Phosphate Company was held at Montreal on 20th inst. The report of the year's operations was very satisfactory, inasmuch as a very large output of high grade phosphate was made, resulting in a most satisfactory profit to the shareholders. Mr. R. N. Hall, M.P., has returned to London to complete the negotiations for the transfer of the mines to the English syndicate by whom they have been acquired. At date of writing Messrs. Charles Kyte and John Williams, of New York, directors of the company, are visiting the mines. Capt. Williams and a small force are placing the property in good shape for transfer.

MINING NOTES.

Nova Scotia.

Strong winds have at last driven off the drift ice, and Pictou Co. is prepared to ship coal, but no craft has yet loaded for Montreal; all shipments so far have been local. Mining questions have for the present been laid aside here, and local politics absorb all attention, the election being on the 21st inst.

During the session of the Nova Scotia House of Assembly just closed, the Committee on Mines and Minerals made a report recommending the separation of the Department of Public Works from that of Mines. This separation would be in the interest of the mining industry, and has been advocated for some time by the Gold Miners' Association. The public have suffered for years from the lack of proper clerical force in the Mines Department, and from the lack of a Commissioner who could devote his whole time to that Department. The business of the Mines Office has grown wonderfully in recent years, and is still increasing, and its receipts are nearly one-third of the total revenue of the Province. Under these circumstances the Government could pass no single measure which would meet with more approbation from those concerned in mining than that recommended by the report.

The Committee also inquired into three petitions which claimed damages for mistakes and errors committed by the Department. In the petition of Hemeon no claim was allowed; in the petitions of Thompson and of Cameron damages were recommended to be paid.

The Nova Scotia Steel and Iron Company, New Glasgow, N.S., operating under a new charter granted by the Legislature of Nova Scotia, have issued a prospectus relating to their business. The authorized capital is \$2,000,000. The company are now employing about 450 men, and look to increasing the number as soon as they get to work building their blast furnace, etc., which will be immediately.

The steamer *Eveline* which was to have opened the St. Lawrence coal trade with a cargo from Cow Bay got on the rocks and is being repaired at Halifax.

The miners at Cow Point have returned to work, the management having abolished the weighing complained of, and it is expected that an advance in coal cutting rates will also be conceded.

Mr. John McIntosh, Stellarton, has secured the contract for erecting twenty coke ovens for the Intercolonial Coal Company, Westville. The ovens will be of the beehive pattern. It is said after these are built more will be constructed.

Mr. A. R. McDonald, who has spent some time prospecting for coal near Little Harbor, claims to have found a promising outcrop near Woodburn, New Glasgow, and is forming a company with a view to further explorations thereon.

Wine Harbor District.

New hoisting and pumping machinery is now erecting on the properties operated by Mr. H. T. Harding, of Truro. These properties for some time have required more powerful machinery, and when the new gear is in place the output will be materially increased. The engine was built by W. W. Howell & Co., of Halifax.

Mr. Robt. McNaughton has begun work on the areas immediately east of the Harding property. A shaft in the middle lode has been cleaned out and is now sinking.

Sherbrooke District.

Work in the Peninsula Co.'s mines has been temporarily discontinued.

At Goldenville little or nothing is doing. The exorbitant prices at which idle properties, which are really nothing but prospects, are held, are effectual barriers in the way of reviving this district.

Beaver Dam District.

Mr. Turnbull is erecting a small saw mill to cut the lumber for his new stamp mill. A large portion of the iron work and machinery is on the ground, and the work of erection is going forward steadily.

Yarmouth District.

It is reported that F. W. Christie has obtained a working lease on the old Cowan property. It is also rumored that a suit has been instituted by some creditors of the old company for non-payment of debts.

Gay's River District.

M. B. Gladwin, acting for a syndicate, has put down a shaft through the conglomerate in this vicinity and found gold-bearing material below. The shaft lies at some considerable distance from the old mines, and to the northward.

Nothing is yet doing on the Anderson-McDonald property, formerly McClure's, but it is understood that work will be resumed this summer.

Stormont District.

The Palgrave Co. are still idle, awaiting the issue of some legal matters.

The North Star lode is looking well. The lode runs from six to ten inches in width, and is reported worth \$40 per ton. A new wharf is under construction near the property, and arrangements have been made with the packet steamer to land at that wharf.

Renfrew District.

C. H. North, the owner of the "Empress" mines in this district, has decided to unwater and prospect the old "Ophir" lodes upon his property. These lodes, particularly the South Ophir, were the chief producers some fifteen years ago, and are opened to a depth of about 400 feet. Mr. D. S. Turnbull, superintendent of the Empress Co. is putting in dams and a Vulcan wheel, the object being to transmit all the power required for unwatering and developing from the falls in Meadow Brook to the Ophir shafts, a distance of some 700 feet. Mr. Turnbull will use a 1/2 inch endless wire rope, the slack being carried on idlers, three feet in diameter. The driving pulley will be 10 feet in diameter, and the driver 6 feet in diameter.

Malaga District.

The Malaga Mining Co., Ltd., have reduced their force of miners.

The Parker-Douglass Co. have about completed their surveys for the transmission of their power from Wildcat Run. The Truro Foundry Co., which is the only concern in the Province having any experience in this matter, are making estimates on the transmission by wire rope. The Sprague Electric Motor Co. are in correspondence with reference to transmission by electricity.

Quebec.

Quite a number of new engines are being added to the different plants in the asbestos region. Bell's Co. have a new hoisting engine, and Messrs. King Bros. are putting in a complete plant of hoisting and air compressing machines.

The Anglo-Canadian Asbestos Company at Black Lake is working ahead full swing and making good progress. Recent operations have exposed some very good ground to the rear of the property adjoining that of the United Asbestos Company. A new hoisting plant has been put in to extend the workings at this point, and the management contemplate some still further additions to their plant.

The Beaver Asbestos Co. have their machinery on the ground and it is being put in place with all speed. Very little work has as yet been done on the property of this company, but the openings that have been made, show numerous veins of fine clean asbestos of the usual Thetford quality.

The Thetford Mining Co. have resumed operations at their pits. Work on this property was suspended in the autumn.

Work at the pits of all the companies is being pushed with the usual energy and all are striving to improve on last year's output, as is evidenced by the addition of new and improved working plants.

At Black Lake, Bell's Co. Southward mine has not yet been opened.

On the property of the United Asbestos Co., (limited) new ground is being opened and all the pits look very promising. There are at present four pits working.

Messrs. King Bros. have commenced work on their property near the Black Lake Station. The asbestos shows in good quantity and the veins are good sized.

The American Asbestos Co. (limited) are working a good force and their pits look very nice. On the hill they are putting in a new hoist to be run by compressed air. They are laying down larger pipe and will put a large Receiver on the hill so as to command a better supply of air. A vein taken from one of their pits a few days ago measured about 7 1/2 inches in width. This is perhaps the largest that has ever been found at any of these mines. Several pits situated at too great a distance to be operated by their own machinery are being worked by contract.

The Exploration Co. of D'Israeli are erecting a building on the Lot adjoining the Laurier Co. and are also doing some exploring.

Some exploring has been done on the Lot taken by the Laurier Mining Co.

We are much pleased to learn of the formation of a union of the asbestos mine-owners and managers, to be styled "The Asbestos Club," with head-quarters at Black Lake, Que. The aim and objects of the club, are:—

- To promote meetings of persons directly or indirectly interested in the mining and manufacturing of Asbestos, in order to discuss matters of mutual interest.
- To keep on file a selection of suitable newspapers, periodicals, books, etc., for the use of members.
- To give impartial information about mines and properties, to the benefit of asbestos mining in general.
- To try to adopt such measures which will enable the various mining companies to insure their employees against accidents, etc., on a co-operative system.
- To act as arbitrators whenever called upon to settle disputes between parties connected with the club.
- To promote social intercourse of members and their friends.

The new club starts with a membership of 35, including not only the local managers, but others interested, directly or indirectly in the industry, resident in New York, Boston and other outside points. We heartily commend the club to those who may not already be enrolled among its members and wish it every possible success. A suitable building has been secured and is being comfortably fitted up. Visitors to the asbestos region will find the club a most useful institution and an excellent medium for imparting reliable information regarding the mines and the resources of the district. The formal opening of the club will take place on the 24th inst.

The work of increasing the capacity of the Fertilizer Works of Messrs. G. H. Nicholls & Co. at Capelon has been commenced. A building 200 feet long by 75 feet wide, three storeys high, with an ell attached 175 feet long by 65 feet wide, is under way. For the buildings 250,000 feet of lumber will be required.

The shipments of iron ore from the Bristol Iron Mines to the United States, from 1st January this year to date, have been:

	Tons.
January	923
February	1149
March	846
April	1279

The shipments were made to the Crane Iron Co., Catsauqua, Penn.

The project of utilizing the peat of the Ste. Brigid swamp has not yet been abandoned. The experiments by the Ste. Brigid Peat company show samples of carbonized or compressed peat of the density of coal, and said to be equal to coal in heating properties. Mr. Aikman, the manager of the company, has confidence in the ultimate success of the works, and declares that manufactured peat can be turned out f.o.b. cars for \$2 per ton. Mr. Taylor, an English mining engineer, recently examined the beds and works, and gave expression to his conviction that the swamp lands of Ste. Brigid will yet prove to be of commercial value. There is a report that a syndicate will shortly be formed to push the enterprise.

Commenting upon an announcement of the meeting of the shareholders of the White's Asbestos Company called for 2nd ulto., the London *Star* has the following:—"There is to be a meeting of the shareholders to-morrow, but we are informed that it is to be of a strictly private nature." We can understand that, and the public can draw their own inference as to why the directors are unwilling to give publicity to their statements respecting the position of the Company. Exactly a year ago, when this concern was placed on the market, we called attention to certain exaggerations and mis-statements respecting the value and capacity of the properties to be acquired and we warned investors to look carefully and cautiously into the scheme before putting their money into it. We are now curious to know just exactly how much asbestos was raised from the South Garthby lots, about the value of which the promoters made so much ado in their prospectus. All is not gold that glitters, and all serpentine is not asbestos bearing is an adage the full mean-

ing of which the shareholders of the White's Company no doubt, now fully realize. It should be the endeavor of every one engaged in legitimate mining to discourage any attempts that may be made to flood the market with undeveloped and sometimes unprofitable areas, at figures which even the most profitable mines at the present time would scarcely warrant.

Ontario.

The Wright lead mines at Temiscamingue have, we have good reason to believe, been acquired by a strong New York syndicate. Mr. John Williams, M.E., of New York, is now at the mines putting the plant in order, and making arrangements for a resumption of active operations.

Just as we go to press we have received a copy of the long looked for Report of the Royal Mining Commission. We will make some extended reference to the work of the Commission in our next issue. An edition of 7,000 copies, bound in half leather, has been issued.

The manufacture of "Portland cement" from clay and marl, obtainable near Kingston, will be undertaken by Mr. Lenderoth, a German specialist thoroughly acquainted with the business, provided the necessary capital and a suitable site are obtainable. The inexhaustible supply of the best raw material, and the cheapness of manufacture, with best facilities for shipment, should be inducements to favor the project; and it is to be hoped Kingstonians will not be slow in affording the country an opportunity to buy at home so valuable an article, without sending \$200,000 a year to Britain and Belgium for this building material.

Port Arthur District.

The chief matters of interest are the proposed subsidies by the Dominion Government to the extension of the Port Arthur, Duluth and Western Railway to the gold areas in Moss Township, and to the Kakabeka Falls town site. With these branches, and the extension of the C. P.R. line to the Atikokan iron range, the output of ore from this port would assume an importance which would undoubtedly bring this section rapidly into notice as a most desirable field for investment, especially for the extent and variety of its mineral resources.

There is nothing of special moment to note in reference to successful development and output of the various silver mines. A company is now being organized here, assisted by English capital, to secure options on promising properties, and make such necessary preliminary outlay as will determine their probable value, with a view of promoting companies for the purchase and operation of such as warrant such a course. A company of this nature, composed of honorable, experienced men, would be of great service in enabling explorers and others to have their finds tested and sold—a very difficult matter when we consider that the majority of explorers are men without means. Many valuable properties which now lie dormant would spring into life.

At the Badger, two shifts are at work south of Badger mountain cross-cutting for the vein. Explorers are at work prospecting the whole of this company's property, and it is expected that the new work, in connection with the energetic developments carried on at the old workings, will make the Badger output for this year fully up to its excellent record of the past.

The Silver Glance property, north-west of Whitefish Lake, and adjacent to the Silver Fox and Mink Mountain properties, reported sold last week, is, we understand, finally secured by a French Banking Company. Your correspondent has taken silver from this vein, and seen magnificent samples of native silver, which would indicate that this French organization have secured such a property as will induce them to take hold of other claims. Work will commence almost immediately.

The new manager of the Shuniah Weachu mine—Mr. Macdonell—is daily expected out from England to take the place of Capt. Thos. Tretheway, who is moving into Port Arthur.

Several locations of manganese have been taken up lately, and, in connection with adjacent iron finds, may prove of great value. Another new metal has also been discovered, said to be a silver ore, which has puzzled the local experts. Samples have been sent to mineralogists for determination.

A new mining map of the mining districts between Port Arthur and Hunter's Island, and including the Atikokan iron region, is being prepared by Messrs. Russell & Co., Land Surveyors, Port Arthur, and will shortly be lithographed. The want of a reliable map of this region has been a serious drawback for a long time past.

The Black Bay silver lead deposits are being inspected and worked by Duluth capitalists, on option, at good figures.

The directors of the Silver Glance Company are M. Ed. Schuberth, Consul de la République de Nicaragua, 139 Cannon St., London, E.C., M. C. Kuss, of the firm Messrs. C. Kuss & Co., London, M. L. de St. Giniez, of the firm G. de St. Giniez & Co., Banking Agents, London, and Messrs. S. J. Dawson, M.P., Walpole Roland, M.E., A. R. Lewis, J. J. O'Connor and Mayor Squier, all of Port Arthur, Ont. We understand that some 550 odd shares of \$5 have been subscribed for in Port Arthur alone, and fully paid into the bank within one week of issue; and this, in a district where the chief aim is supposed to be the discovery, development and sale of mines, must be regarded as a very favorable sign in favor of the new company. The mine has been very favorably reported on by Dr. Selwyn, Walpole Roland, M.E., Capt. Tretheway, M.E., A. Falco, M.E., and others competent to judge of its value. The property is favorably situated for economic working, being about 1½ miles north of the line of the P. A. D. & W. Railway, now in course of construction. Development has given evidence of promising results. The capital of the new company is placed at £60,000.

Operations with the diamond drill have been discontinued on the property of the Beaver Mining and Milling Co. Four holes were drilled to a depth of 128 feet. The first hole struck the vein 12 feet below the surface of the rock, which at that point is 60 feet below the surface. The developments made with the diamond drill have been so satisfactory that Captain Hooper did not deem it necessary to go any deeper with it at that point. He will at once commence sinking a shaft at the junction of the two veins, and put that part of the Beaver property under active development. Some of the cores brought to the surface by the diamond drill were literally full of sulphide of silver, the average going about 40 ounces. The mill is now in readiness, and will be started in about one week, just as soon as the tramway from the mine can be put in shape. The mill will treat 25 tons per day, which, when the richness of the Beaver ore is considered, will run into large amounts per month. Capt. Hooper expects to double, and possibly treble, the capacity of the mill about the middle of summer.

Manitoba and North West.

The company which is developing the Turtle Mountain coal beds has asked the Manitoba Government for aid to build a railway from Deloraine to their mine, some fourteen miles. This coal has been recently distributed for trial and found satisfactory, and it is expected will be sold in Winnipeg from 5 dols. to 6 dols. per ton. The coal is got 45 ft. from the surface, in a five-foot seam. It is neither hard nor soft, makes no clinkers, and is a good steam coal.

Coal exists in large quantities on the shores of Hudson's Bay. On Long Island, opposite Great Whale River, 650 miles from Churchill, is an exposure of anthracite, containing by assay 94.91 per cent. of fixed carbon and only 35 per cent. of ash. It is probable that other seams of similar character are to be found on the adjoining mainland, where the stratification is similar. On the Missinaibi River, 150 miles from Moose Factory, there are no less than five exposures of lignite; and Dr. Robert Bell says:—"In the interval between one and two miles above this seam the whole bed of the river appears to be underlaid with lignite." On Melville peninsula, coal has been found on the shore in small quantities, but no exploration has been made to determine the situation and extent of the veins. Amongst other minerals discovered on Hudson's Bay, Professor Bell reports gold, silver, copper, soapstone, mica, plumbago and lead. Steam navigation is easily possible with such coal deposits available.

Messrs Geo. H. Campbell and H. E. Crawford, who have been to New York negotiating for money to build the railway from Deloraine to the Turtle Mountain coal fields, returned to Winnipeg on 10 inst. It is understood that their mission was successfully accomplished, but they will not make any of the details public for a few days.

The Alberta Coal & Railway company began operations at their Lethbridge colliery on the third shaft on the 15th of May. The other two are progressing favorably. Progress on the American side of the Alberta railway is being rapidly made.

British Columbia

The Slate Quarries at Golden are to be opened up and worked this summer. The quarry is located by the side of the railway track. The pitch of the slate is such that it can be quite readily mined and placed on the cars. Two colors of slate are found, one a light the other a dark blue. Experts pronounce it a very superior article,

equal to the best found in the east. It is expected that a market will be supplied from the Golden quarries, extending east as far as Winnipeg, and to all points on the coast. Contracts have been entered into for supplying the slates for the Catholic and Methodist churches, now under course of construction at this point, and other large buildings to be erected this year will also likely be shingled with the slate. It is expected that slate shingles will be sold at the rate of about \$8.50 per thousand in Victoria, and though they will cost more than double that of sheet iron for roofing, yet their durability will more than compensate for the extra cost of placing them in position.

Work has been resumed on the properties of the Gordon Hydraulic Company at Leech River. A large sluice, three feet wide and two feet deep, has replaced the old ditch, and there is at present ample water for piping. The company are determined to fully test the ground and feel assured that when a clean-up is made in the fall they will have good returns. When work was begun in the face of the hill last year, two days piping gave a return of \$16. If the mine proves a paying venture, other ground will also likely be worked, fully five miles of good looking ground being available. There has been considerable adverse opinion concerning probable results at Leech River. "Far off fields are greenest," and perhaps it is because Leech River is so near Victoria that so much pessimism prevails about its gold-producing character.

The Hamilton Powder Company of Montreal, with a view to a further extension of their business on the Pacific Coast, are making extensive additions to their works near Northfield.

It is expected that the Cottonwood Gold Mining Company will employ about 200 men during the summer. Work is to be prosecuted with vigor.

It is reported that the Island Mountain Quartz Company will commence crushing rock this summer in Cariboo. All the old miners are looking forward to a lively time in that section, this season.

Arrivals from the Kootenai mines state that the Canadian Pacific has about 250 men at work constructing their line from Sproat's Landing to Kootenai Lake, and which will open up all the mines near the lake. A desperate effort will be made by that corporation to get the bulk of the traffic of the ores northward, which will insure cheap transportation to the miners from the start, as competition from the south is only a matter of a few months. The Canadian Pacific people propose to have their line completed in three months.

Last week Dr. Hendryx struck his large vein at a depth of 210 feet from the surface, and at a distance of 575 feet from the mouth of the tunnel. The ore looks most promising—at least 60 per cent. lead, or a high grade of silver. This is the ledge which he cross-cut last fall a width of 86 feet. The Skyline, at a depth of 175 feet, looks better than it ever has before. The ore which has hitherto been shipped from this mine yielded in Montana over \$300 net per ton. The owners of this mine will erect a concentrator during the season. The Spokane Co., the Pearl Co., on Woodbury Creek, the Neosho Co., and a few others, are showing up good bodies of ore, and will score a point during the summer.

Information from Omnicca advises the discovery of pay ground in a creek twenty miles south-west of Vital Creek. The diggings are shallow, about two and a half feet deep, the bed-rock comparatively smooth where prospecting has been done. From three pans of dirt over ten dollars in gold was taken. It is "lead" gold of fine color, and experts state that it is worth \$18 per ounce. Chemical tests of the ground are being made.

The Hall Bros., of the Eagle Creek Gold Mining Co., have shipped 400 tons of ore to Bute and Denver, and have obtained a result of 299 oz. of silver to the ton and 30 per cent of copper.

A new mining company composed of English and American capitalists, and several residents of Vancouver has made arrangements to mine on Siwash Creek. They have purchased from the Siwash Bed Rock Flume Company the right to mine for six miles along the creek. An experienced engineer has made a careful examination of the ground and found that it was very rich. The new company which is called the Anglo-American Mining Company, will put a \$5000 plant on the ground and begin operations in a very short time. A saw mill will be erected, two steam derricks and one and a half miles of steel pipe put in.

The managers of the Great North Western Railway have finally decided to build west from Great Falls, Montana, by the northern route by way of Flathead Lake and Kootenay River. The reason the northern route has been chosen is said to be because the people connected with that road own extensive coal fields near Flathead Lake, which are yet undeveloped. This coal is of very fine quality and is known as coking coal, and exists in large quantities. This road will bring this coal to the Kootenay and Spokane smelters, and it is claimed it can be laid down at \$5 to \$6 per ton.

Report of the Committee on Mines and Minerals to the Nova Scotia Legislature.

The Committee on Mines and Minerals beg leave to submit the following report on the several matters referred to them:—

No. 1. A petition from Mr. Jas. Hemeon, of Queens County, which sets forth that in April 6, 1887, a certain Mr. N. Hammett took out a prospecting license on Malaga Barrens, Queens County, covering nine gold mining areas in which the petitioner was interested; that on the 3rd day of October of the same year, the petitioner filed an application for renewal signed by himself and a W. B. Philips, that the license was renewed to the petitioner, the name of W. B. Philips not being accepted by the Department of Mines because his transfer was not filed, that April 6, 1888, A. M. Hemeon, M.P.P., called at the mines office on behalf of the petitioner with reference to a renewal of the prospecting license, or with the object of taking them under lease in whole or in part, it does not appear which, and was informed by Mr. Carman, a clerk in the office, that they had been taken the preceding day under prospecting license by Messrs. Wade & McGuire. The petitioner further states that on one or two occasions he wrote or caused to be written letters to the Department of Mines enquiring about the areas in question, to which no answer was received. Of these illegal letters no record can be found, nor does any person in the Mines Department seem to remember anything of them. The petitioner afterwards received a letter from the Department dated Sept. 19, 1888, marked No. 1, which is appended hereto, and in October of the same year he received from the same source another letter dated October 18th, which is also appended and marked No. 2. In this letter (No. 2) he was informed that what was told A. M. Hemeon, M.P.P., April 6, 1888, to the effect that the license under which the areas in question had been held by the petitioner, had expired on the 4th April, two days before, was misleading, inasmuch as the prospecting license under which the areas were then held, did not expire until April 6th, that Messrs. Wade & McGuire did not acquire legal title, and that Mr. Hemeon, M.P.P., should have been told to come again in the following day, April 7th, when the ground would be vacant. The petitioner claims that for those reasons he was deprived of his areas, and prays that the title to them be given back to him, or an equivalent in money.

Your committee find that the prospecting license granted to Wade & McGuire was clearly illegal, and as a title, of no value whatever, and was so considered by the head of the Department of Mines, and that were it not illegal it was not renewed, but expired on October 5, 1888. The fact being that these disputed areas remained vacant from April 7, 1888 to October 18, 1888 of the same year, when they were taken by Messrs. Wade & McGuire, and are now held by them.

That though it is admitted that Mr. Hemeon, M.P.P., was misled by information tendered him by a clerk in the Mines Department, your committee, while not excusing the carelessness which induced said clerk to render such misleading information, are of opinion that the petitioner should not have been misled thereby, for he had correct information given him in the receipt he received from the department for moneys paid by him and Hammett for the prospecting license; that information was sufficient to show him when the license expired, and he should have been guided thereby. Your committee, therefore, do not consider the department of mines liable for damages for any loss which may have been sustained by the petitioner.

No. 2. Is a petition from Jas. Thompson, builder, of Halifax, and Kinsman Randolph, merchant, of Bridgetown, in which the petitioners state that on the 20th day of September, 1887, they made application for nine mining areas in Mt. Uniacke gold mining district; that October 2nd, 1888, they got a lease of said areas, that said areas were adjoining certain other areas held under lease by certain Withrow & Hartlen; that prior to the date of the lease given to the petitioners, the areas leased to Withrow & Hartlen were surveyed by B. Blois, a crown land surveyor; that when the petitioners took possession of the areas leased to them, they found the north-east corner of the areas owned by Withrow & Hartlen, marked by a stake placed there by said B. Blois, and also that the east line of Withrow & Hartlen's areas

was blazed out and cut through the woods, that there was thereby a clearly definite line of division cut and marked between the areas held by the petitioners and those leased Withrow & Hartlen.

That for the same reason that the bed rock was nearer the surface, near the said division line, the petitioners sunk a shaft over 40 feet in depth within a few feet of said division line, and afterwards sunk another shaft 70 feet deep, thirty-seven feet east from the first shaft, and fifty feet from said division line, and for purposes of ventilation, they cut a cross tunnel 37 feet in length connecting these shafts, that said shafts and tunnel were intended for permanent use.

That after the petitioners commenced work said Withrow & Co. began operations on their areas near said division line and they afterwards claimed that said line was not correctly laid down, and they then began working to the eastward thereof.

That a short time ago another survey was made by F. W. Christie, Crown land surveyor, of the areas leased by Withrow & Co., under the direction of the commissioner of mines, and by that survey it was found that the lands leased to Withrow & Co. were 39 feet short of what they were intended to be, and that the said surveyor located said north-east corner, and the eastern boundary of said Withrow & Co. areas 39 feet further east than they were previously located by B. Blois; that Withrow & Co. have taken possession of that portion of their areas, between the old and the new lines, and at the date of the petition were working the same.

That by the moving of the line the petitioners first mentioned shaft was taken from them; that the air tunnel is almost wholly on that portion taken by Withrow & Co.; that the second shaft sunk by the petitioners will be available only as an air shaft; that they will have to sink a new shaft further to the east, and that they will have to cut a new air tunnel.

That owing to the dip of the rock, the new shaft will have to be sunk to a depth of over 125 feet (125) before the petitioners can work as advantageously as they were able to do before the re-location of the division line.

That they will have to move certain buildings and plant from off that portion of the areas taken by Withrow & Co.

That their loss by reason of the change of said division line will be over \$2,400.00.

For these reasons the petitioners pray that such relief may be granted them as may be just and right, and that they may be recompensed for the loss of the piece of ground in question and their improvement thereon.

As the result of investigation your committee find that the statements of the petitioners regarding the location, removal and re-location of the boundary line between the areas held by them and those held by Withrow & Co. are substantially correct; but regarding the equity of the damages claimed, your committee are not able for reason of want of knowledge other than that afforded them by the evidence of the petitioners, to judge.

Your committee therefore recommends that the Commissioner of Mines have the alleged facts regarding the shafts, tunnel, removal of buildings and plant, also whether the petitioners have profited by gold extracted from ore mined out of said shafts and tunnel, examined by some person expert in such matters, and if it be then found that the petitioners have a *bona fide* claim for any damages, that such be awarded them.

No. 3. Is a petition from John Cameron of Melrose, in the County of Guysborough, setting forth that on the 29th of August, 1888, the petitioner obtained from the Department of Mines a prospecting license of certain gold mining areas, on the west side of Ecum Secum Harbor in the County of Halifax, for which he paid the usual fee; that on prospecting said areas he discovered a valuable lead of gold bearing quartz thereon; that thereupon he sold a one-half interest in said areas to one Peter Graham of New Glasgow, the consideration being \$200 in cash, an undertaking on the part of the said Graham to erect machinery on and invest capital in the development of said areas, one-half of the profits of the venture to accrue to the petitioner; that the petitioner also sold to one David Smith, for services valued at \$100; a one-tenth interest in said areas to one Donald McLean; a one-twentieth interest for \$25 to one Thomas Campbell; a one-twentieth for \$40, and to the aforementioned Graham a further one-tenth interest for certain services rendered in connection with said areas.

That on the 8th day of February, 1889, the petitioner obtained a renewal of said prospecting license.

That while the company so formed were proceeding with the development of said areas and on or about the 10th day of May, 1889, the petitioner was informed by the Inspector of Mines, Mr. Gilpin, that the areas enumerated on said prospecting license were held under lease by a certain company known as the Pittsburg Co., that the said Pittsburg Co. soon afterwards transferred their lease to a certain firm composed of John Yorston of Pictou, and the aforementioned Peter Graham, who dispossessed the petitioner.

That the petitioner claims that he is entitled to be paid by the Commissioner of Mines, as follows:—

To cash paid for license and renewal.	\$ 15 00
" " claimed from petitioner by P. Graham.	200 00
" " " " Smith.	100 00
" " " " McLean.	25 00
" " " " Campbell.	40 00
" 10 days measuring and prospecting, etc., at \$2.00.	20 00
" Coach hire from Sherbrooke to Ecum Secum.	6 00
" Supplies and Sundries.	10 00
" Damages for the loss of one-fifth interest by petitioner.	2,000 00
	\$2,416 00

That on the 13th day of November, 1889, the petitioner petitioned the Governor-in-Council for relief, and craved, in the event of such relief being refused, to be permitted to prosecute an action in the Supreme Court of the Province against the Hon. Commissioner of Mines therefor, when thereupon, the petitioner was directed to bring his claim by petition to the notice of the Legislature; the petitioner therefore prays for such relief and damages as in the nature of his case may seem meet.

Your committee upon investigation have found that the alleged facts of the petitioner having obtained the said prospecting license; of his having transferred certain portions of the areas covered thereby to the persons named in the petition; of the areas having been at the time, without the petitioner's knowledge, held under lease by the aforementioned Pittsburg Co.; of the lease being transferred by the said Pittsburg Co. to the aforementioned John Yorston; of the petitioner being dispossessed by the said John Yorston; and of the petitioner having suffered loss by being deprived of the title, were substantiated by evidence tendered during said investigation. Your committee therefore, inasmuch as the petitioner was misled by reports from the Mines Department, and was in consequence put to considerable expense and loss of time, and was also deprived of valuable property which he had reasonable excuse to suppose was his own, recommend that he be paid by the Province the sum of five hundred dollars, said sum of five hundred dollars to include the monies paid by him for licenses and renewals thereof.

Your committee also beg leave to report that during the investigation concerning the petition of John Cameron, aforesaid, it came to their notice, and was afterwards found to be true, that Mr. Carman, a clerk in the Mines Department, had been acting as agent for the said Pittsburg Co.; that as such agent he promised the transfer of certain areas at Ecum Secum, among them being those given under the said prospecting license to the petitioner to the said John Yorston; and that it was on account of misleading data furnished by the said clerk that the said areas were given to the petitioner in the first instance, and that from a letter written by the said clerk to John Yorston, which was produced and read before your committee, it appeared that the said clerk was at once misleading the Department of Mines and the Pittsburg Co., for one of which he was confidential clerk and for the other he was acting as agent.

Your committee deeply regret to find a person employed in such an important department as that of Mines, and in which he is a very prominent official, acting in a double capacity; they therefore deem it their duty to bring the matter to the notice of the Legislature, and also to that of the Government.

In view of the large and rapidly increasing amount of important business coming daily before the Department of Mines and Public Works, and in view of the mistakes that, perhaps necessarily, occur on account of such increased business, your committee take the liberty of recommending that the Department of Public Works be separated from that of mines, and that each be placed under a distinct departmental head, or, if such is impracticable, that the PUBLIC WORKS be placed under a DEPUTY HEAD, and that it then be transferred to one of the other departments, either that of the Attorney-General or that of the Provincial Secretary.

All of which with the papers connected therewith are respectfully submitted.

JAMES A. FRASER.
T. R. BLACK.
R. L. BLACK.
Committee. ALLAN HALEY.
JEFFERY MCCALL.
DANIEL MCNEIL.
WM. MCKAY.

I agree with the above report with the exception of the recommendation in reference to the Department of Public Works and Mines. (Sgd.) WM. MCKAY.

At a miner's meeting at Revelstoke, on the 19th inst., the Premier confessed that his policy of granting power to railway companies to collect a royalty of 50 per cent. on minerals found on their lands imposed a hardship upon the miners which ought not to be. He stated that he now had information which he did not have before, and he should not lay a straw on the back of the prospector saying "I can see how badly it works, and that it will seriously retard mining in the Railway Belt." He promised to have the matter adjusted.

transferred to the Pension Fund, all the remainder was left subject to their discretion, and independent of the offer of 2 per cent. of salary made by the Company.

Reward Fund.—Every year, grants are made to workmen distinguished for length of service, punctuality, civility and good conduct. These rewards are made in about the proportion of one-tenth of the salary.

The account of the donations of the Coal Mining Company of Bessèges in 1888 reached the sum of \$69,000, equal to \$28.59 for each workman.

The Annual Meeting of the Canadian Phosphate Co. (Limited).

The annual general meeting of the shareholders of the Canadian Phosphate Company (limited) was held at London, 26th ultimo. Mr. Edward Packard, jr. (the chairman) presiding. The following is an excerpt from the report for 12 months ending November, 1889, submitted to the shareholders:—

"In presenting the following report for the year ending November 30th, 1889, the Directors regret that although the output for the past year is about 50 per cent. larger than that of the previous one, the accounts do not show a corresponding profit. On the other hand, however, a large amount of development and prospecting has been carried on, of which but a small part has been charged to capital account, and the mine has now been placed in proper working order.

"The exact quantity of ore produced during the twelve months was 6,560 tons of uncobbed ore, as compared with 4,036 produced during the eleven months ending November 30th, 1888, and the shipments to the U.S.A., Canada and Europe, during the same period, amount to 5,710 tons. Nearly 2,000 tons sold for shipment during 1889 had to be held over, owing to the scarcity of tonnage in Montreal caused by the London Dock strike.

"The main working of the old company, viz. the Big Pit at Star Hill, proving too expensive had to be abandoned last April, much to the regret of the directors, seeing that in past years very large quantities of ore had been produced therefrom at a low cost. Another old working, namely, the Bridge Pit, was pumped out and proved very remunerative, thus partly recouping the company for the loss sustained in working the Big Pit.

"Four new pits have been opened, viz., Nos. 1, 2, 4, and 6, all of which are working, with the exception of No. 1, where work has been suspended during the winter months, as the pit is entirely open and unprotected.

"The Crown Hill Mine has been fairly productive, but the ore produced having been very soft, the proportion of second quality has been much larger than was anticipated, and the falling off in profits is attributable to this. This has been especially the case with Pit No. 18, which was opened in May, and produced nearly 1,000 tons of ore before November 30th.

"The mill situated at Buckingham on a siding of the Canadian Pacific Railway has been doing good work, but the plant is insufficient at present to deal with the quantities of mill stuff produced at the mines, and a considerable part of this material has been ground at a neighboring mill. The consumption for ground low grade ore in the U.S.A. and Canada is increasing rapidly, and new contracts have been entered into at higher figures.

"The prices ruling for phosphate during 1889 were about the same as during the previous year, but since the autumn the market and demand for phosphates has expanded very materially, and the price is now from 20 to 40 per cent. higher, according to quality, and likely to remain so, owing to the scarcity of high test phosphate.

"During the last six months of 1889 the directors have been enabled to introduce some important economies in the management and working at the mines, which are now giving a much better profit, and they feel confident in being able to show a great improvement in this year's results.

THE CHAIRMAN said: Thereport is so full as regards the work that has been carried on by the company during the past year, that I do not know that any very lengthy comments are at all necessary upon it. The directors feel a considerable amount of regret that they are not able to propose that we should pay a dividend this year; but we have had a great many circumstances to contend against which were certainly unexpected, and which have militated against the successful operation of our company at the mines. One does not like to cast any reflection upon our servants, or any of those who have been in our employ, nor do I desire to do so, but I must say that I hope the difficulties which we have experienced have not been assisted to any great extent by the managers which we have employed up to the present. I may say that I feel pretty confident that the arrangements which have now been made will result in much more satisfactory work, a much more satisfactory output of phosphate, and a much more satisfactory result as regards the cost of getting that phosphate. We all know that mining operations are uncertain in their action, and that

is the only certain thing which is known about mining operations. There may be, when we open up our deposits, something very profitable to work out, or it may mean that there is a considerable expenditure compared with the actual amount of phosphate produced. That the mines have been productive is proved by the statement in the report that no less than 5,710 tons have been shipped. I think we exported during last year just about one-fifth of the total export of phosphate from Canada, and I think the total export is something like 27,000 tons. As regards the demand for phosphate, there is no doubt that at the present time it is exceedingly satisfactory, especially for the class of phosphate which we have been enabled to produce. There seems to be no doubt that we shall be able to sell any quantity that our mines may turn out, and at a remunerative rate in future, as the demand is very considerable. The phosphate that we produce is, I think, in more demand than any other kind of phosphate at the present moment, and we must find a ready sale both in this country and elsewhere. We state in the report that the prices have improved. We are looking for a much better and more profitable return in the future. To what extent we can succeed in increasing the output of the mines very much depends upon the point to which I have alluded—whether we are successful or not in hitting this vein of phosphate which will be more or less productive. If anyone is particularly interested in it, and they will refer to the plan which has been made, which indicates all the workings at present going on, they will see how very important is this property. If we can succeed in decreasing the cost of output and increasing the price of material which we turn out, we shall have a much more successful time in the future than we have had in the past. I do not think it necessary for me to say very much further, except to assure the shareholders of the very great attention that the directors have been giving to the affairs of the company. The thanks of the shareholders are especially due to Mr. Millar, who has given up a considerable amount of his time in visiting the property, and who has made arrangements which, I am sure, will be very conducive to the future improvement of our position. He will be able to tell you more than I can as to the actual position of matters at the mines, because he has been there, and has taken an active part in seeing the work that is going on; so I think I must refer to him for any statement that can be made with reference to the actual work, and the methods employed in carrying it out. I beg now to move the reception and adoption of the report and balance-sheet.

MR. C. C. HOYER MILLAR, in seconding the adoption of the report and balance-sheet for last year, said: I may be able, owing to my personal knowledge of the mines, to speak rather more fully, perhaps, than your chairman about the causes of delay in getting the company into a dividend-paying state. At the time of my first visit to the mines, during January two years ago, I was unable owing to the depth of snow, to see more of your property than the three pits actually being worked at that time. It was apparent, however, that the late company, owing, no doubt, to their knowledge of the formation of the present company, had not been carrying on the work in a systematic manner. The result of this has been that the present company was considerably handicapped at the start. It must also be borne in mind that your company is really carrying on two separate mining undertakings, one at Star Hill and one at Crown Hill. At the latter place work had only been started some six months, and the first year of this company's time was mostly occupied with putting up the buildings, fixing the plant, and laying down the tramway, and it was only last year that the mining operations there began to take proper shape. I visited the mines again last October, and made a thorough investigation of your property, and the results of my examination were most satisfactory. I also visited all the other mines in the same district, and I may say that your property can compare most favourably with any of them. A considerable amount of developing and prospecting has been carried on simultaneously with the mining operations, and the company is now well situated for producing good future results, as many showings have been discovered, and have been partially opened up, and which can be worked to advantage as opportunity occurs. It must be remembered that the Canadian phosphate mining industry, though it has been carried on for more than 15 years in a desultory kind of manner, is still in its infancy, and it is only during the last few years that any systematic methods have been followed, and some of our neighbours have recently pumped out old pits abandoned years ago, as at that time they had not the necessary machinery for working at a depth. Improved machinery and greater continuity of working are being adopted at the present time, the results of which are apparent in the increased outputs from the larger mines, and much less ore is now wasted than was the case during the earlier mining operations. Your directors have had some unforeseen difficulties to contend with, the most important of which has been the difference of the way in which phosphate has occurred in many of our new pits, and what

was formerly thought to be the rule has proved to be the exception, by which I mean to say that one cannot expect in Canadian phosphate mining to be continually coming across large bonanza deposits of apatite, though such do occur from time to time; but that the true calculation is that by moving so many tons of rock one can reckon, on an average, on so many tons of ore. When extracting from large pockets, the phosphate comes out clean and free from impurities; but when the leads narrow down or get intermixed with feldspar, calcite, or mica, the proportion of high testing phosphate will be smaller and much more expensive to cob. We made a good many experiments with this mixed phosphate before we could determine the best method of treating the same, but I am glad to say that we have at last arrived at a process which considerably improves the quality. Had it not been for the large quantity of second and third qualities produced, the profit and loss account would have shown surprisingly different figures.

Turning now to the question of the transport arrangements over which your company has control, I may say that the same are most complete. The tramway at Crown Hill, from cobbing-house to the Du Lièvre River, is a great success for the economic and rapid loading of the scows. On the river we have our own steamer and four scows, and at Buckingham Landing we use steam hoisting apparatus for discharging from the scows into the railway cars. There are certain difficulties at the Little Rapids during the low water in the summer months; but thanks to the excellent arrangements we have been able to make with our neighbours for towage on the river and the loading at Buckingham, we have been able to reduce the anticipated trouble to a minimum; and I take this opportunity of thanking Mr. Hilton Green, of Montreal, and Mr. Walter Pickford, of the High Rock Mine, for joining hands with us over these arrangements. The mill at Buckingham has been steadily grinding the third-class quality, but owing to the excessive production we had considerable quantities ground at the neighbouring mills, and we have just concluded negotiations for a further quantity to be ground over the next 12 months. The demand for this ground phosphate in Canada and the United States is steadily increasing, and we are now getting prices nearly 20 per cent. higher than those of two years ago. I may mention that we had at the mines a large pile of what we call debris, i.e., phosphate mixed with rock in such a shape as to make it impossible to be cobbled, but that we have now been able to turn same to account by the installation of a Blake crusher, and the results are much better than was anticipated, so much so the stock valuation of this pile on November 30 will be increased on realisation by some £800. As regards the general system of work at the mines, there are some alterations that I should very much like to see carried out in the way of more permanent and fixed machinery; but until our financial position is improved your directors cannot see their way to increase the capital expenditure. Your profit and loss account for last year is certainly disappointing, but I may mention that during the first year's working we received about £2,000 under an arrangement made with the former company, and that the freights for last year cost the company nearly £1,000 more than was anticipated. It was during the months from December, 1888, to June, 1889, that the mining operations were unsuccessful. I calculate that about £3,000 was lost in those six months. The last six month's working, however, made up this loss and showed a few hundred pounds to the good. As regards future prospects, I think the company has all in its favour. The expenses of management have been greatly reduced, and the cost of extraction is considerably lower. The production since December 1 to date has increased about 15 per cent. on the corresponding period of the previous year, and the wages sheet, which is the heaviest item in the accounts, shows a reduction of 10 per cent. In addition to this, I am most pleased to be able to report that the quality of the ore has improved, and we are now getting a higher proportion of first quality, with a corresponding decrease in the production of the mill stuff. This point is really the most important of all, for the mill stuff does not pay the cost of extraction, and on last year's prices there was next to no profit on the second quality, so that it is really the 80 per cent quality which has to earn the dividends. Prices are very materially higher and freights are lower, so that I do not doubt but that this year we shall be able to make some return to the shareholders, who may rest assured that the directors have done, and will continue to do, their best to make the undertaking profitable.

The motion was then put and carried unanimously, without discussion.

Mr. Millar proposed the re-election of Mr. W. H. Williams as director of the company, which was seconded by Mr. Foly and carried.

On the motion of Mr. Winkfield, Messrs. Hibberd, Bull and Co. were re-elected auditors of the company.

Mr. Winkfield then proposed a vote of thanks to the chairman, which was seconded and carried.

The chairman briefly acknowledged the compliment, which closed the meeting.

Meeting of the Excelsior Copper Company (Limited)

At the annual meeting of the Excelsior Copper Company, Limited, held on Tuesday, 22nd ultimo, the chairman, Colonel Malleon, stated that the expenses of the mine amounted to £7,689, while the sum actually realised in England was £1,165, in addition to which they had on the dumps—on the ground—ore estimated at £10,000, the result being a profit of about £3,000. At the conclusion of the chairman's remarks, the secretary, Mr. Fenwick, read the report of Captain Davey, which dealt in an exhaustive manner with the work done at the mine, and subsequently Captain Davey himself addressed the meeting with regard to the present position of the property. During the year he said that they had raised 20,000 tons of schist ore, and from thirteen assays that had been made the lowest yield was 3.90 per cent. and the highest 9 per cent. They had already sent to England about 100,000 tons, which had realised at Swansea from 8 to 9 per cent. They had hundreds of thousands of tons of this schist ore, and he guaranteed what they had on the dumps would give a profit of £10,000. With regard to the better class of ore, he said that would give them 35 to 60 per cent., and they had got that in pockets of 10, 20, 30 and sometimes 50 tons. On the conclusion of the ordinary meeting a special court was held to consider the following resolution, which was carried:—That for the purpose of, and to enable the directors to further develop the property of, the Company, may be, and are hereby, authorized to raise the sum of £20,000 by the issue of debentures secured on the property and plant of the Company, bearing interest at the rate of 7 per cent. per annum, payable half-yearly."

THE CHAIRMAN, answering a question, said the directors had not received £2,054 12s. 2d. for their fees. The amount stated in the balance sheet was an amount put there by the auditors as a matter of account, because the directors were entitled to that amount. During the last seven months, however, the directors had not drawn a single farthing.

A SHAREHOLDER.—What was the money subscribed by the public? I was told it was about £8,000.

THE CHAIRMAN.—It was £8,000.

A SHAREHOLDER.—Seeing that £150,000 was wanted, I think £8,000 is too small a sum for the directors to go to allotment on. (Applause.)

THE CHAIRMAN.—I would ask the shareholders to reserve their cheers until I explain to you how the directors were perfectly justified in going into allotment on that sum. Out of an expenditure of £7,689 we have realised an amount which is tantamount to £11,065, and if it had not been for untoward circumstances we should have been in a better position, I am in a position to prove to you and to give you the opinions of experts, that we were perfectly justified in going into allotment on £8,000. I beg to call your attention to that paragraph in the prospectus where the vendor states that he had such confidence in the mine that he was willing to take full payment in shares.

A SHAREHOLDER asked who was the original vendor of the company.

MR. GREENSHIELDS.—I am the original vendor and I shall be pleased to answer any questions you may put. I have not sold one single share. (Applause.)

A SHAREHOLDER.—You asked an exorbitant price for the property?

MR. GREENSHIELDS.—That is a matter of opinion. If a dividend had been paid at the beginning of the year, you would not say it was an exorbitant price. These things are to be shown by their results.

THE CHAIRMAN.—I think you do not realise the fact that mining is a speculation. I venture to state you can point to no mine which has been in a better state in the first year of its work than this is. The balance sheet shows it has actually realised more money than has been expended on it.

A SHAREHOLDER.—It has not been realized.

THE CHAIRMAN.—It is virtually realized. The stuff is at the mine.

A SHAREHOLDER.—Can you declare a dividend?

THE CHAIRMAN.—I cannot, but let me tell you one thing. All the directors of this Board are original shareholders. The collective directors hold a larger number of shares, probably, than any other shareholder. Shares which they bought at par value, and which they intend to make worth ten times the amount.

MR. RAWCLIFFE.—May I ask to what circumstances the directors owe this state of affairs?

THE CHAIRMAN.—What state of affairs?

MR. RAWCLIFFE.—Not carrying out the promises in the prospectus.

THE CHAIRMAN.—I will leave Colonel Gay to answer that.

COLONEL GAY said soon after the company was started the price of copper went down very much. It kept on going down. It then became a question as to whether it would be well to go on shipping the ore, or wait for better times. It was thought advisable to go on and get out more copper, with the idea that the price of copper would augment. It did augment to a certain extent, but it never came to the price to pay to send it. If they had more money they could have gone on smelting, and they would have had more copper in England than in Canada. They had no more money, therefore they could not do it.

CAPTAIN DAVEY, in addressing the meeting, said so valuable was the mine that if he had the money he would most gladly purchase. But the shareholders must be sure of this. If they did not choose to work it, those on the other side would, and be only too glad of the chance. It would not remain idle very long. He had seen a great many copper mines, but he had never been struck with a property as he had been with this. (Applause.)

THE CHAIRMAN'S motion was then put to the meeting and carried with one dissentient.

The retiring auditors were re-elected.

An extraordinary general meeting was then held for the purpose of considering the following resolution:—

"That for the purpose of and to enable the directors to further develop the property of the company, they be and are hereby authorized to raise the sum of £20,000 by the issue of debentures secured on the property and plant of the company, bearing interest at the rate of 7 per cent. per annum, payable half-yearly."

THE CHAIRMAN said this was a matter on which the future of the mine depended. They wanted money for the development of the mine. He would ask the two gentlemen from Canada to give the meeting the benefit of their opinions.

MR. GREENSHIELDS said that he had visited the mine on two or three occasions, and he was satisfied that with proper and economical working the mine could be made to pay. It was for that reason that he, when the property was put upon the market, accepted and agreed to take, if necessary, his entire consideration price in fully paid up shares. He had not sold any of his shares except the shares he parted with to his friends to provide the working capital for the mine for the last few months. So far as he and his friends were concerned they were ready to subscribe 30,000 or 50,000 shares for the development of the property, because they believed that by the expenditure of more money to strike this ore, which had been spoken of by Captain Davey, they could make the mine a success. He did not wish that this property should fall into the hands of American investors, but that the English shareholders would carry it on and reap the rewards. The property they possessed consisted of some 4,000 acres of land, which covered a valley and two mountains on either side. The range of mountains running through the country was proved to possess large mineral deposits. What they desire to do was to purchase a diamond drill in order to test the property. With that drill they could go down 1,000 feet. They proposed to go to the bottom of the Kent shaft and sink 1,000 feet, and sink another hole at the bottom of the Sayles shaft, which could be done at a comparatively small expense. He had faith in the mine, and believed it would prove a success.

MR. ROOME also expressed his absolute faith in the property. He had, himself, consulted several experts and they had all come to the conclusion that the company had a valuable mine. It was, however, necessary to sink lower and this they intended to do by means of a diamond drill. For there were very rich deposits of ore below, and it was absolutely necessary to get at them.

On the motion of the Chairman, seconded by Mr. Greenshields, the resolution was carried with but one dissentient.

The usual vote of thanks brought the meeting to a close.

Iron Ore in Newfoundland.—A correspondent, writing from Bay St. George, Newfoundland, states: "On the south side of this very beautiful bay there is a large and rich deposit of iron ore. It is seven miles and a quarter from a good harbor. It is estimated that there is about a half a million tons in sight which can be mined, or, in fact, quarried at a cost of not over 20 cents per ton. A deep ravine cutting through this mountain of ore exposes it on both sides, and affords facilities for its being easily worked. Analysis by Professor Pike shows the ore to contain 65.5 per cent. of metallic iron, equivalent to a composition of pure magnetic iron ore of 70.3 per cent.; silica in the sample showed 5 per cent., and sulphur and phosphorus none, and titanic acid 4 per cent. The proposed railway which is now being constructed to Hall's Bay, on the east coast will, when finished from Hall's Bay to Bay St. George, run within four miles of this mountain of ore. I may further add that coal fields have been discovered in the same neighborhood and are likely to be worked the coming summer. It is high time that the mining resources of this colony were more extensively opened up."

Report of the Commission upon the Mineral Resources of Ontario.

The Commissioners appointed to enquire into and report upon the mineral resources of the Province, and measures for their development, have to state for the information of your Honor, that at their first meeting held in the city of Toronto, after conferring with the members of your Government on the nature and scope of their duties under the terms of the Commission, the following scheme or plan of enquiry was agreed to, viz.:

i. The geology of the Province, with special reference to its economic minerals: assigned to Dr. Bell.

ii. Detailed description and maps of the working mines and important undeveloped mineral occurrences of the Provinces, together with all matters which appertain to mining engineering: assigned to Mr. Merritt.

iii. Trade in mineral products, showing exports and imports, shipping facility for ores, building stones, etc., and a general enquiry into the causes of depression in the mining industry of the country; assigned to the Chairman.

iv. Information and suggestions on the subject of mining laws and regulation, with a view to the giving of greater encouragement to our mining industry: assigned to the Secretary.

v. An enquiry into the best means of promoting the metallurgical industry, with special reference to the smelting of iron and other ores: assigned to the Secretary.

vi. Other measures for the aid and encouragement of the mining and metallurgical industries, embracing: (1) The organization of a bureau of mines for the Province; (2) The founding of a geological and mineralogical museum; (3) The collection and publication of mining statistics; (4) Technical instruction in its relation to mining and metallurgy. The first of these subjects was assigned to Dr. Bell, the second to Mr. Merritt, and the third and fourth to the Secretary.

It was also agreed to as part of the scheme of the report that the evidence of witnesses should be arranged, as far as practicable, under the foregoing heads, so that each subject or section should be complete in itself, and that the distinctive features of the evidence of each witness might appear in their natural and appropriate relation.

Sessions of the Commission for hearing evidence were held at thirty-seven places in the Province, from Ottawa in the east to Rat Portage in the West, and one hundred and sixty-four witnesses were examined under oath, comprising among their number explorers, prospectors, miners, mine and quarry owners, mine captains and superintendents, mine brokers, mining engineers, civil engineers, land surveyors, geologists, assayers, chemists, metallurgists, scientists, iron founders, brick makers, tile, terra cotta and pipe manufacturers, iron makers, copper and nickel smelters, mechanics, lawyers, bankers, merchants, capitalists and speculators. Mines, mining locations and works in the vicinity of places where the Commission met were examined, and careful enquiry respecting them was made.

Several other important districts and places were also visited by members of the Commission, with the object of procuring special or desirable information. The extensive magnetic iron ore range in the region west of Lac-des-milles-lacs and the Black Bay lead region on Lake Superior were explored by Dr. Bell, while Mr. Coe, Mr. Merritt and the Secretary made a journey to the iron ranges in northern Minnesota, near the Ontario boundary. Mr. Merritt also visited the Michigan School of Mines at Houghton. The Chairman and Secretary in the latter part of 1888 visited the Columbia School of Mines in New York, the office of the Geological Survey at Washington, and furnaces and steel works at Pittsburgh, Pa., at Chattanooga, Tenn., and at Birmingham, Alabama. Another object of the visit to Birmingham was to enquire into the merits and witness the operation of the Henderson process for eliminating sulphur and phosphorus from iron and converting it into steel. An accident to the machinery prevented their observing this process, but they were fortunate in arranging for a careful test and report upon it to be made by Mr. Garlick, of Cleveland, Ohio, a metallurgist whose experience in the manufacture of iron extends over a period of twenty-five years. His report appears in the Appendix. The secretary also visited, during the summer of 1889, the laboratory of Mr. Edison at Orange, N. J., to witness the operation of an electrical machine invented to purify and concentrate magnetic iron ores, the Sheffield Scientific School at Yale College, and several iron furnaces and mines in the vicinity of Port Henry on Lake Champlain.

The data of the report are original and historical. The Commission has not followed in the footsteps of others, but has pursued the course marked out for itself, and it professes to present no inference, opinion or statement of fact which is not warranted by the evidence, the study and observation of its members, or the testimony of the highest authorities.

In the Section devoted to the geology of the Province a systematic account is given of each one of its rock formations. This part of the report could not be prepared

without employing geological terms, but the simplest expressions have been used, and a glossary of many terms has been appended in order that it may be the more easily read by persons unfamiliar with geological science. To make the description more complete and intelligible, it has been deemed necessary to sketch some of the general geological features of North America beyond the borders of Ontario and to touch upon a few of the leading characters in connection with its geology. The aim throughout has been to make a statement of facts only, disregarding everything of a purely theoretical character. This section has been written with the advantages of a full knowledge of the work of the Canadian Geological Survey from its inception up to the present time, and it embodies the results of the latest researches not only of members of that service but of various other investigators. In its preparation advantage has also been taken of any new or hitherto unpublished information known to the writer.

The reports of the Geological Survey of Canada, although of much value for reference as to details in the various Provinces, are too numerous and too voluminous for the use of any one who can spare only time to acquire a general acquaintance with the geology of his own Province. Moreover, as these reports extend back through a period of nearly half a century, most of them are inaccessible to the public, and much of what was stated in the earlier volumes has been superseded, modified or largely supplemented by more recent investigations. The limits of the Province having been recently extended far beyond those which were formerly recognized, any previous account of its geology would now be incomplete, even if the data in reference to the added territory had been available. But no pretence is made to cover the field in this work. A full account of every branch of the subject, or of any locality, has not been attempted; that would occupy several volumes, and the aim of the Commission has been to present in compact form information upon all matters coming within the scope of its enquiry. The Geological Section, however, embraces the most recent and the best established views on all points, and gives prominence to the Archean rocks, which cover the greater part of Ontario as now bounded, and which are important from the occurrence in them of various economic minerals in the Huronian and Upper Laurentian systems. The description of the various formations of the Cambrian, Silurian and Devonian systems is briefer, the fullest account being reserved for those which are richest in mineral. Such are the Animikie, yielding silver ore; the Nipigon, in which native copper occurs; the Trenton, which produces petroleum and natural gas; and the Onondaga, which holds the beds of salt and gypsum.

The classification of rocks which has been followed is that of the late Sir William Logan, the accomplished founder and for twenty-seven years the director of the Geological Survey of Canada. The geology of the mining districts is described in greater detail than that of other parts of the Province, and the geological relations of some of the principal mineral products are given as examples to illustrate their general character in the districts referred to. Additional facts on these subjects are mentioned in the section on mines, especially on the occurrence of iron ores and phosphate of lime in the eastern part of the Province, and much new information available for these purposes has been collected by the Commission or supplied by the testimony of witnesses. A supplementary account of the geology of the Sudbury district and of the mining operations there, brought down to the month of October, 1889, is given in the Appendix.

A practical business basis has now been reached in the development of a number of our minerals, as for example in the production of salt, petroleum, phosphate, mica, cement, gypsum and building stones, and in the manufacture of bricks, terra cotta, tile and sewer pipe. The silver and copper and nickle mines are also being worked with much skill and energy, and at the few locations where deep shafts have been sunk and galleries have been driven the existence of large ore bodies has been demonstrated. Iron mining has been intermittent hitherto, but its operations will doubtless assume a permanent place as a source of one of our largest mineral products when we shall have the steady demand of a home market to provide for, beside such foreign markets as we may be able to secure. It may also be confidently hoped that gold mining will become one of the established industries of the country, especially if attention be given to our refractory ores and should the economic treatment of them be satisfactorily solved.

The cost of mining machinery, much of which is not yet made in Canada, is a matter of common complaint with mine owners, as is also the high freight charges on machinery, supplies and ore; but these are losses of advantage which the enlightened good sense and liberality of our Governments and our railway companies may be expected to overcome. In no other way can a country add more directly to its wealth than by raising and utilising its minerals, assuming it to possess them in commercial quantities; for not only are manufacturing industries of many kinds created to treat them, but the raw material may itself be said to be created by the labor expended in

searching for and mining it. Whatever lessons the cost of raising minerals and whatever facilities their shipment to the best markets are the most obvious means of aiding the industry; and in so far as governments can remove burdens imposed on themselves, or reduce the cost of carriage by building or granting aid to build roads or railways, they to that extent make the success of mining operations possible.

Explorers and prospectors are the pioneers of mining enterprise. They have already proven that our Province contains almost all of the economic minerals in workable quantities except coal, and that it has vast possibilities of mineral wealth. Yet the tolls upon trade and the want of facilities for cheap transportation are a hindrance so serious to the employment of capital that a number of the most promising of known mineral properties are either lying idle or are being worked in the face of great odds. Encouragement of the industry, not its discouragement, is the office and duty of the governments. Explorers, prospectors and miners deserve just consideration and liberal treatment. Mineral lands should be held for development, not for speculation. Mining enterprises should not be weighted with restrictions imposed by trade policies, and should as far as possible consistently with a fair consideration of the claims of all other interests of our country be secured the advantages of the home markets. Confidence in mining as a business should be established by yearly reports of progress made and work done. To instruct, to inform, to ascertain and publish facts, to lighten the industry, to enlighten the men employed in it and deal with them in a generous spirit—such, in the opinion of the Commissioners, is the true national policy for governments to pursue in promoting the development of our mineral resources.

The evidence that Ontario possesses great mineral wealth is abundant, and is constantly accumulating. In the central and eastern counties are magnetic and hematitic iron ores, gold, galena, plumbago, arsenic, mica, fibrous serpentine, apatite, granite, marble and freestone. In the Sudbury district copper and nickel mines are being worked on a large scale. In the township of Denison rich specimens of gold-bearing quartz and extensive deposits of copper and nickel are found. Along the north shore of Lake Huron, from the mouth of the French river to Sault Ste. Marie, gold and silver-bearing veins, iron, copper, galena and immense quarries of marble have been discovered. North of the height of land and extending towards James Bay prospectors report a promising mineral region. North of Lake Superior locations of gold, silver, copper, iron, galena, plumbago and zinc ores have been taken up, besides which there are inexhaustible supplies of granite, marble, serpentine and sandstone. West of Port Arthur is a silver district which, judging from the explorations already made, promises to be an argentiferous region of great richness. Beyond this district, to the northwest, are found veins of gold-bearing quartz and extensive ranges of magnetic iron ore, while to the southwest is believed to be a continuation of the Vermillion iron range of northern Minnesota. The partial examination already made inspires the hope that here will in time be developed an iron region of great value. Upon Sultana island and other islands in the Lake-of-the-Woods, and in the region adjacent to that lake, gold-bearing veins of good promise have been discovered, and now that the question of title has been settled an early development of some of the properties may be looked for. But knowledge of the extent of our resources is necessarily imperfect. The area of the Province is vast, many districts have not been prospected at all, and therefore it may be reasonably presumed that only an inconsiderable portion of our mineral wealth is yet known to us.

But notwithstanding the extent and variety of our mineral resources, the statistics and tables presented in Section III show conclusively that in Ontario as well as elsewhere in the Dominion the mining industry is making slow progress. The value of the metallic and non-metallic mineral products of Canada for 1887 was \$11,896,793, whereas the value of the same class of products in the United States in that year was \$542,284,225, being nearly four times greater in the latter than in the former country per head of population.*

The United States is the principal customer of Canada for products of the mine, the value of our exports to that country for the seven fiscal years 1881 to 1887 being \$18,567,710, while to all the rest of the world it was only \$4,828,313. The value of the mineral exports of Ontario alone to the United States for the twenty fiscal years 1869 to 1888 was \$14,329,330, and to all the rest of the world it was \$3,342,894. These figures present

in a striking light the natural commercial affinity which exists between the two great Anglo-Saxon divisions of the continent, and open a field of speculative enquiry as to what might have been the volume of the business if trade restrictions had not clogged its movement. The great store of ores and structural materials possessed by Canada and the transportation facilities by land and water for placing them upon the markets of the United States could not fail to build up a trade of immense extent in mine and quarry products but for the duties which have served in a more or less perfect degree the purpose of preventing commercial intercourse.

Everywhere among men interested in mining operations, with the exception of those engaged in producing and refining petroleum, the Commissioners have met with expressions of an earnest desire to see the American markets opened to the admission of Canadian minerals free of duty upon terms equally fair to both countries. The amount of iron ore exported from Canada for the fiscal year 1888 was 13,544 tons, valued at \$39,595, all but ten tons of which was mined in Ontario and exported to the United States. For the calendar year 1888 the shipment of iron ore from the lake Superior mines of Michigan, Wisconsin, and Minnesota to lake Erie ports amounted to 5,023,279 long tons, or three hundred and seventy-five times as much as the entire export from Canada. This ore was worth \$15,000,000 at the ports of shipment; about \$6,000,000 was earned by the lake marine in its transportation to lake Erie ports, and a large but unknown amount by the railway companies over whose lines it was carried to furnaces at Pittsburg and elsewhere. For the calendar year 1889 the total output of the lake Superior mines was 7,292,754 tons, showing an increase in ten years of 5,917,063 tons, or 430 per cent. Ontario undoubtedly possesses large quantities of iron ore that might be delivered at all the furnaces of Ohio, Pennsylvania and New York as cheaply except for the duty as the ores of lake Superior, but her mines are almost absolutely idle.

The increase in the world's production of iron from 1800 to 1888 has been nearly thirty-fold, it having grown from 825,000 tons in the former to 23,194,500 tons in the latter year. Of the product of 1888 Great Britain furnished 34 per cent. and the United States 28 per cent. The world's product of steel for the same year was 9,630,477 tons, and of this amount Great Britain furnished 35½ per cent. and the United States 30 per cent. Yet in the vast movement of industrial forces connected with the manufacture of iron and steel, over three-fifths of which centres in Great Britain and the United States, Canada has relatively an insignificant part, its total amount of wrought and puddled iron in the calendar year 1887 being only 31,501 tons and of steel 7,326 tons, while its make of pig iron in the fiscal year 1888-9 was only 24,822 tons.

Our situation naturally suggests comparison between ourselves and our neighbors, and when we observe the rapid increase of mineral development in the United States, the great stream of capital flowing in upon the mining districts of the north and south, and the transformation of regions but lately almost uninhabited into scenes of industrial activity, the conclusion seems to be irresistible that if we could succeed in directing enterprise to our own mineral districts results of like kind would surely follow. More than one-half of the capital now invested in the mines and mineral properties of this Province is held by Americans, in spite of the repellent conditions imposed by trade policies upon both sides, and the extent to which it might further be attracted may be conceived by observing the growth of the industry in neighboring States.

The numerous complaints heard by the Commission respecting the mining laws of the province made a careful enquiry into that subject necessary, and in addition to the information given and the suggestions offered by many witnesses the mining laws and regulations of the principal countries of the world have been examined and digests of them prepared, so that our own laws might be considered in the light of a wide experience. It does not appear to your Commissioners, however, that very radical changes are demanded. The provisions of the Act which relate to "mining claims" are found by experience to be unsuited to the occurrence of minerals in this province, where no alluvial deposits of minerals are known to exist, and it does not appear that any properties are being secured under them. It is only in the provisions which relate to "mining locations" that changes in the law are felt to be desirable.

The custom of terming a mining location a mine is itself misleading and mischievous, and unfortunately the terms are synonymous as defined by the Act. Mining men and capitalists have not infrequently met with disappointment in this province by being brought to see a "mine" which has turned out to be only an undeveloped location, and to prevent the recurrence of such mistakes it is desirable that the term should be clearly and accurately defined.

The prospector and the explorer have special claims for consideration at the hands of the Government, for without their services many years may elapse before the

*The table of the Canadian Geological Survey includes in the list of mineral products such articles as brick, charcoal, coke, fertilisers, glass and glassware, iron, iron ore, pottery ware, sewer pipe and tile, steel, sulphuric acid, terra cotta and tile, but as these are not embraced in the United States table their value is struck out of the Canadian total so that a fair comparison may be made. The statistics of 1888 show that the value of the metallic and non-metallic mineral products of Canada in that year was \$12,048,421, and of the United States \$584,550,676, being for the former country \$151,628 and for the latter \$42,266,451 more than the value of their respective products in 1887. See Appendix N.

mineral riches of the country are made known. They should have easy access to sources of information; geological and topographical maps of the territory they propose to examine should be placed in their hands if available; records of every transaction in mining locations should be open to their inspection, and they should be permitted to file and prove claims at the local agencies. The right of staking out claims might also be conceded in unsurveyed districts, under proper regulations. But in all cases it is desirable that proof of discovery of a mineral vein or deposit within the limits of the location applied for should be furnished before a claim is filed.

The extent and number of locations which one person or company may claim or hold cannot easily be regulated in practice, and while in all cases the tenure of mineral lands should be subject to working conditions, it does not seem to your Commissioners that a wise or useful purpose can be served by a provision the effect of which would be to bar the profitable investment of capital. One strong company, if not hindered by a too narrow area, may employ more men and raise more minerals than half a dozen weaker concerns. But prospectors, explorers and miners deserve to be encouraged in the acquisition of locations of small area, and if their conveniences are better suited with the privilege of buying forty or even twenty acres instead of the present minimum of eighty acres, subject to working conditions, the country stands to gain rather than to lose by the sale of the smaller area.

The Commissioners have been impressed with the danger which threatens one of the chief sources of revenue possessed by the Province in prospecting for minerals. They were struck with the appearance of many scenes of desolation where forest fires had swept over wide districts, leaving blackened tree trunks and fire-scorched wastes in the place of hills and valleys once covered with valuable timber. The loss to the Province from this cause has reached many millions of dollars within the last thirty years, and constant danger of further disaster attends the business of prospecting for minerals in forest regions. Moss and leaves often conceal mineral veins, and in addition to the danger arising from carelessness there is reason to believe that unscrupulous persons sometimes set out fires and burn valuable tracts of timber-land merely to facilitate their own work of search for minerals; and still oftener fires are started by the carelessness and even recklessness of sportsmen, tourists, missionaries, surveyors and others. This new danger to our forest wealth is one which may well engage the attention of the Government and the Legislature, and perhaps there is no simpler plan of keeping a check upon prospectors and explorers than to require each one to take out a license at the nearest land office, upon payment of a nominal fee, granting him permission to search for minerals within a district of defined boundaries.

The Act contains no provision for the health and safety of miners, and although no law can ensure workmen against the occurrence of accidents or the effects of foul air, it is none the less necessary that every possible precaution for their health and safety should be taken. Neither is there any provision for the recovery of claims against employers, such as is found in the mining Laws of many other countries, but it may be that the general statutes afford sufficient facilities to mine-workers in the collection of wages without special provision being made to suit their particular circumstances.

The mining industry may be carried on in a country, as it is in many sections of countries, without the smelting of metallic ores being undertaken. Great Britain imports large quantities of iron ores for her furnaces from Spain, Elba, Sweden and elsewhere, and almost the whole of the iron ores raised in the mines of the lake Superior ranges are shipped to furnaces in Chicago, Detroit, Cleveland, Pittsburg and other centres of iron-making in the United States. This practice has the advantage of enabling iron masters to make mixtures of ores suitable for free smelting, as well as to produce the various grades of iron required by the manufacturers. But wherever the conditions are favorable, mining and smelting may be carried on most advantageously as the complements of each other. If sufficient supplies of fuel, flux and a suitable quality of ore are found close together the best location for a furnace is at the mine, especially if there are facilities for shipping the product to market. It is unquestionably in a country's interest not only to smelt its own ores, but to refine and manufacture the metals providing always that the various operations can be carried on economically and without taxing other interests indefinitely for their maintenance.

The history of the iron industry in Great Britain proves conclusively that its growth and prosperity have depended upon a knowledge of methods and processes. Towards the middle of the last century, before mineral fuel began to be used in blast furnaces, the total yearly make of pig iron in that country did not equal the production of one furnace of medium capacity at the present day. The industry was threatened with extinction, from which it was saved by the genius of Abraham Darby, who discovered the means of using bituminous coal as furnace fuel by converting it into coke. He worked out the problem

in the sweat of a sleepless brain, and the narrative of his achievement is one of the most touching in the long story of the triumphs of man over matter. Darby's discovery was the beginning of Britain's career as the chief iron producing and iron manufacturing country of the world, and she owes that position to the service of processes and appliances begotten by the ingenuity of her sons. The cylindrical bellows of Smeaton, the steam-engine of Watt, the puddling process and the puddle rolls of Cort, the hot blast of Neilson, the steam hammer of Nasmyth, the various processes of Huntsman, Heath, Bessemer, Mushet, Siemens and others for the conversion of iron into steel, the utilisation of furnace gases and the improvements in furnace construction, mark every step in the progressive stages of the industry along its wonderful course. And it is mainly upon a knowledge of processes and skill in the use of them, conjoined with capital and prudent enterprise, that we must rely if a prosperous and stable iron industry is ever to be established in this country. We may begin with the best appliances, and with skill and capital we can start upon even terms with the iron men of the United States and Great Britain. But we should begin right—with experienced management, the best working plant, a sufficiency of capital, and not unmindful of the wants of the home market or our trade relations with other countries. The industry is of first class importance, and every proper means should be taken to secure its establishment in Ontario.

The course which a wise policy would naturally suggest is, to begin with whatever branch of the industry promises to give the largest profits and surest results. We have neither anthracite nor bituminous coal, and if one or other of these fuels were used it would require to be hauled long distances at a charge for freight dependent on our ability to furnish return cargoes. Besides, the margin of profit on coke and anthracite iron is never large, and the price is subject to frequent fluctuations as a consequence of the great capacity of British and American furnaces to produce supplies. With charcoal iron the case is different. The supply is limited, the demand is usually constant, superior quality causes it to be indispensable for certain purposes, and where ore, fuel and flux are found in proximity the margin of profit may be regarded as fairly liberal. From data presented in Section v, some of which have been furnished by metallurgists and others by iron masters or the managers of furnaces, it appears that the cost of producing charcoal iron in Ontario would be about \$13.60 per long ton, the figures of ten estimates ranging from \$9.08 for a hot blast furnace of 60 tons daily capacity to \$18.50 for one of five tons capacity. There is no charcoal iron made in Ontario however, and all that is required for the manufacture of malleable castings is imported from the United States at a cost ranging from \$26 to \$38 per long ton according to quality—freight and duty paid. These prices ought to be considered as affording a liberal margin of profit on the cost of production, especially when the statement is made upon expert authority that a furnace of 9,000 tons yearly capacity would earn ten per cent. on a capital of \$200,000 at a profit of \$2.25 per ton of pig iron produced. Furnaces located at favorable points should be able to supply the home market with all the charcoal iron it wants, and, besides, keep out much of the poorer coke iron imported from other countries. The iron masters might even hope to make sales at good prices in the British and American markets, notwithstanding the freight charges on shipments to the one and the high duties which guard entrance to the other.

The most promising mineral works in the Province at present are the mining and smelting of copper and nickel ores in the vicinity of Sudbury. The Canadian Copper company began operations there in the latter part of 1886 and shafts were sunk on three separate locations, one of which had reached a depth of over 500 feet at the close of 1889. The ore body is proven to be very extensive, and large quantities have been raised at each of the mines. One water-jacketed furnace was set up by this company in 1888 and a second in 1889. Each has a capacity of smelting 120 tons of roasted ore per day, producing a matte which carries about 13 per cent. of nickel and 18 per cent. of copper. Computed upon the basis of work in 1889, the annual yield will average 500 tons of refined nickel and 700 tons of refined copper per furnace, and for nicked alone this represents a market value of \$500,000. During 1889 mining operations were commenced in the same district by the Dominion Mineral company of Montreal and Vivian & Co. of Swansea, Wales, the latter being owners of the largest copper smelting and refining works in the world. It is understood that furnaces are being erected by these companies at their respective mines, and that smelting operations will begin at an early day.

The experiments recently carried on in England and Scotland with alloys of nickel and steel, to which reference is made in section v, cause great interest to be attached to Ontario's deposits of nickeliferous ores. If the results already obtained are verified by further tests, and if the claims made for the alloys are fully borne out by practical application in the metallic arts, the importance of the inventions to this Province can hardly be

over-estimated. The ranges already discovered in the region north of Georgian Bay are more extensive than any which have been found elsewhere, and only a small portion of the formation carrying nickel and copper ores has yet been explored. It does not appear unlikely, indeed, that in spite of its unattractive aspect this may prove to be the most valuable portion of territory in the whole of Ontario, and your Commissioners venture to recommend to your Government the importance of carefully investigating its resources and encouraging by every legitimate means their development. The construction of new railway lines may be found necessary for opening new locations; and possibly a practicable scheme can be devised whereby not only the smelting of ores may be carried on upon a large scale, but also that the matte may be refined in the country instead of shipping it to distant places, and that our rich magnetic ores may be utilized in the manufacture of nickel steel.

In order that the mineral resources of the Province may be successfully and economically developed it is desirable that measures should be taken for the practical and scientific training of all who may engage in the industry. Prospectors and explorers are found to be very deficient in the kind of information which would enable them to prosecute their arduous labors to the best advantage, and your Commissioners recommend for that purpose the adoption of a scheme such as has been tried with gratifying results in the colony of New Zealand, and fully explained in Appendix L. But for the education of mining engineers and metallurgists a thorough system of instruction is called for, which can only be provided by establishing a School of Mines or enlarging the course of studies at the School of Practical Science in connection with the Provincial University. It is the opinion of your Commissioners that if the duty of providing instruction of this character devolves upon the Government the obvious plan is to take advantage of the means which are available in the University courses of study, and to make such additions of instructors and appliances as may be necessary for a thorough equipment. And for economic and educational purposes of the first importance your Commissioners further recommend the establishing of a bureau of mines for the purpose of making a complete geological survey of the Province, and a museum of geology and mineralogy to represent its rock formations, minerals and metallurgical products, together with an efficient plan for the collection of yearly statistics of the mining and metallurgical industries of the Province, as indicated in Section vi. of their report herewith respectfully submitted for Your Honor's consideration.

Signed John Charlton, Chairman; Robert Bell, William Coe, Wm. Hamilton Merritt, Archibald Blue, Secretary.

Toronto, April, 1890.

Note on the occurrence of Native Copper in the Animikie rocks of Thunder Bay.

By Andrew C. Lawson, Ottawa, Ont.

Among the rock formations of lake Superior, the Keweenaw or Nipigon series has long been recognized as strongly characterized and differentiated from older and newer rocks, by the occurrence of deposits of native copper. So distinctive have these features appeared that a common synonym for the series is "The copper-bearing rocks." No occurrence of native copper in the Animikie rocks has, so far as the author is aware, been recorded. Any facts therefore, which indicate that native copper is not peculiar to the Keweenaw series, but occurs under somewhat analogous conditions in association with the Animikie rocks, which underlie it, will be received with interest both by geologists and miners familiar with Lake Superior. Such facts have come under the notice of the writer during the past season, and it is here proposed to give a brief account of them since it will be some considerable time before a systematic report of the geology of the region can be published.

Field occurrence:—Along the west side of S. W. $\frac{1}{4}$ Sec. 8. Con. VI. in the township of Blake, District of Thunder Bay, runs a north and south trending ridge which presents an abrupt escarpment about two hundred feet high facing the east. To the west of the brink of the escarpment the surface slopes gradually to the old Pigeon River road. The section exposed in the face of the escarpment is very characteristic of all the numerous similar escarpments of this portion of the country and consists of about 150 ft. of nearly flat lying black shales and thin gray siliceous beds of the Animikie series, capped by about 50 ft. of vertically columnar diabase trap. Near the south end of the quarter section, there is an indentation or bay in the face of the escarpment affording a steep slope whereby it may be ascended from the valley to the east. At the foot of this slope some Indian prospectors found some pieces of amygdaloidal trap carrying native copper, which were brought to my notice at Port Arthur by Mr. C. Johnson, who had become interested in the find. In company with Mr. Johnson and his Indian guide I visited the ground last October, and

found extending up the surface of this slope a dyke-like ridge of cupiferous amygdaloid. The surface had not been stripped, but was covered with soil, forest loam, brush, tree roots and moss. There were, however, four or five outcrops along the ridge from the bottom of the slope up to an elevation of 100 ft. These lay in a line which, by the compass, had a bearing of N. E. and S. W., which is the strike of the deposit provided it be a vertical attitude; but this question cannot be determined till farther stripping and exploring has been done. If the deposit has a dip or lode, the true strike, which is of importance as a guide to further exploration, would have some other direction than N. E. and S. W. The outcrops show very clearly a width of at least 15 to 20 ft., though nowhere is the contact with the country rock exposed. The trap has a much more pronounced amygdaloidal structure at the base of the slope than higher up, but does not carry so much visible copper. The whole appearance is that of a dyke filling a fissure in the Animikie strata. Whether the amygdaloidal trap cuts the diabase trap cap which rests on the shales, cannot at present be determined. It probably does not.

There are, however, some circumstances which, in view of the meagreness of the exposures, render other explanations possible, and the conclusion that the formation is a dyke can only be held tentatively. These are (1) that at a level of 100 ft. up the slope there is a small outcrop of a fine-grained, brownish red sandstone such as is common in the Keweenaw series, but which has nowhere been observed by the writer in the Animikie; (2) dykes do not usually present a highly vesicular or amygdaloidal structure which is rather the characteristic of surface flows; (3) the supposed dykes are much more vesicular and the vesicles are larger at the foot of the sloping line of outcrop than at the top, which is contrary to what we would expect with reference to the formation of vesicles in any molten mass of rock, the mass being usually more vesicular toward the top where the pressure is less. The other possible explanations, none of which are supported by any direct field evidence, are (1) that the supposed dyke may be a small piece which has been let down within the Animikie by faulting from the Nipigon, which may be supposed to have once covered the Animikie here as it does elsewhere; or (2) it may be the infilling of a fissure in the Animikie formation from above by a surface flow of vesicular lava which brought down with it portions of the Nipigon sandstone; or (3), least likely of all, it may be a small outlying patch of the Nipigon resting on the surface of a pre-existing slope of the Animikie.

A little exploration and mining would soon set at rest these questions as to the precise nature of the formation. We have this fact at least, that it is a rock of the same facies as the amygdaloids of the Keweenaw or Nipigon similarly charged with copper, well within the Animikie slates and apparently cutting them. In this respect the formation differs from the amygdaloids of the Keweenaw, which are interbedded and contemporaneous with the other rocks of that age, while the formation here discussed is apparently of later age than the Animikie, and may very probably be of Keweenaw age, though associated with Animikie rocks.

Character of the Rock.—The rock in which the copper occurs is a fine textured purplish-brown trap strongly amygdaloidal in some portions and only feebly so in others. The least amygdaloidal portions when examined in thin section prove to be typical diabase. Slender idiomorphic plagioclase crystals lie embedded in allotriomorphic masses of purplish to yellowish gray augite and in yellowish green masses of chlorite which is doubtless the result of the alteration of the augite. Yellowish brown iron oxide partly opaque and partly translucent occurs in profusely scattered grains.

The more amygdaloidal portions show in thin sections a finer texture but an equally strongly pronounced ophitic structure. Augite is not so abundant and plagioclase is the dominant mineral. A portion of the base appears to be glass, being colourless and isotropic; and the augite is probably represented in part by the glass and in part by certain decomposition products interstitial between the feldspars. Magnetite and brown iron oxide are generally distributed. The crystals of plagioclase are arranged tangentially to the periphery of the amygdaloidal cavities. The latter are filled with calcite or dolomite and a brightly polarizing fibrous or lamellar mineral doubtless a zeolite. In the thin section examined no copper was detected, but microscopically it may be seen scattered through the rock in small grains which do not appear to fill up the round vesicles, but to be more irregular in shape.

The brown red sandstone above referred to is very fine textured and could not be identified as a sandstone with certainty in the field. In this section it is seen to consist of an aggregate of rounded, pear-shaped and angular grains of feldspar, pyroxene, chlorite and quartz, all the grains having a coating of iron oxide. A good deal of the secondary matrix appears to be feldspar, probably albite and orthoclase, and it is full of slender colourless needle-like microlites. Twinning lamellæ of the secondary feldspar are in some cases distinct, but for

the most part are not apparent. Some of the rounded clastic grains of feldspar show feeble traces of secondary growth.

Proportion of Copper.—A few specimens of the rock were collected with the view of ascertaining its average value as a copper ore. Four of these have been submitted to Mr. F. L. Sperry, chemist to the Canadian Copper Co., at Sudbury, who has very kindly analyzed them. These specimens taken from different parts of the outcrop at an elevation of 64 feet above the foot of the slope, and one from the lowest outcrop gave the following percentages of copper:—

Sample No. 1, 64 feet level.....	1.32% Copper.
" No. 2, lowest outcrop.....	0.27% "
" No. 3, 64 feet level.....	2.88% "
" No. 4, ".....	3.57% "

Besides this occurrence the writer was also shown other specimens of amygdaloidal trap carrying native copper, which were said to come from the township of Crooks; but although the locality was carefully examined the deposit could not be found as the services of the guide who knew its whereabouts could not be secured. Later in the season Mr. Hille, mining engineer of Port Arthur, secured the necessary guide and proceeded to the place where these specimens were taken, and he has since informed the writer that he succeeded in locating a dyke-like formation of amygdaloidal trap carrying copper in sec. 4, con. II of Crooks. But enough has been advanced to show that the Animikie rocks of Thunder Bay are worth careful prospecting for copper.

Peculiar Working of a Blast-Furnace.*

By N. G. Wittman, Birdsboro, Pa.

The working of blast-furnaces is always of interest to many members of the Institute, for which reason I present an account of the working of the furnaces of the E. and G. Brooke Iron Company, of which I have had charge for the past four years. Although there are no phenomenal runs to record, there have been long periods of satisfactory work, and also periods—altogether too long—when one of our furnaces has behaved in a way which may be described as "nagging." All the conditions were apparently normal, but only a very light burden could be carried, which of course resulted in a high fuel consumption to the ton of iron, as well as increased cost of labor.

The two active furnaces of this company have the following dimensions and equipment:

	No. 2. Feet.	No. 3. Feet.
Height.....	55	60
Diameter at Bosh.....	15	16
" hearth.....	8	7½
" stock-line.....	10	9½
Height of bosh.....	23	23
" tuyeres.....	5½	5
Diameter of bell.....	7	6
Front.....	closed	open

Both furnaces are blown with I. P. Morris condensing engines, similar in all respects save one, the engine of No. 2 having a steam cylinder of 45 inches diameter, while that of No. 3 is 50 inches. In both the diameter of the air cylinder is 90 inches, and the stroke 84 inches.

In both cases the stock is raised by an air-hoist.

In No. 2 the blast is heated by three Durham stoves of 28 pipes each, the pipes being 14 feet high and 8 inches inside diameter. No. 3 has two Kent ovens, 40 pipes in each, 14 feet high by 7 inches inside diameter.

The ore mixture, which is practically the same for both furnaces, consists of 75 per cent. magnetites and 25 per cent. Lake Superior or foreign hematites.

About 40 per cent. of the magnetic ore is similar in character to that of Cornwall, except that it carries a variable amount of free calcite, ranging from nothing to 8 per cent. The sulphur in it is also very inconstant, the extreme range being from 1 to 4½ per cent., probably an average of about 2½ per cent. There appears to be no definite relation between the percentage of free calcite and sulphur, the latter being in the form of pyrites, agglomerated with the ore, while the former occurs in loose pieces, varying in size from grains of sand to masses weighing several pounds.

The general gangue of the ore is hornblende, with which the calcite is sometimes associated intimately, as it seldom is with the ore.

This ore is the only one used which is inherently troublesome to work.

The points of difficulty are, that the calcite being variable, it is impossible to flux it with any degree of certainty as to the composition of the cinder, and that a large portion of the sulphur is oxidized to sulphuric acid, and combines with the lime, forming calcic sulphate or gypsum, so that it is only practicable to reduce the sulphur about one-half by roasting.

The ore disintegrates very rapidly, and there are several soft veins in the mine, so that a considerable portion of it is fine, like sand.

It is a well known fact that an ore carrying sulphur in material quantity, cools the hearth of the furnace, probably by dissociation of calcite sulphate, and "buckshot" results, while the hearth is "built up."

The fuel used is anthracite, with as much coke (usually from 20 to 30 per cent. of the fuel charge) as the price of coke will permit.

Dolomite of very uniform composition is used as a flux, for the reason that no calcite of good quality is available.

About 1.8 tons of ore are required to the ton of iron, and 0.8 ton of stone is added to form a cinder of approximately 35 SiO₂, 12 Al₂O₃, 33 CaO and CaS, and 20 MgO.

As an instance of satisfactory work may be cited the record of furnace No. 3 for nine consecutive months, during which time 18,422 tons of iron were made, being an average of 472.36 tons weekly, on a fuel consumption of 1.19 tons to the ton of iron. The best week's output was 531 tons, made with 1.05 tons of fuel per ton of iron.

This furnace was filled and blown in as follows: Three stands of oak wood were put above the tuyeres, and the hearth was packed full of light dry pine, saturated with oil. On top of the wood was put, as a blank, 26 tons of coke, with about 2 tons of good gray furnace-cinder to flux the ash of the coke and wood. Ore-charges were then commenced with 2,000 pounds fuel (½ anthracite and ½ coke), 1,300 pounds ore, and stone calculated to form a slag of 39 per cent. SiO₂. The burden was increased 200 pounds every six charges, until the stack was full, after which the fuel-charge was 66½ per cent. anthracite and 33½ per cent. coke. The furnace was lighted at the tapping-hole and tuyeres. The wood burned well, and as soon as bright coke appeared at the tuyeres the blast was put on, and everything went off smoothly. The volume of blast was increased so that in ten days the maximum was attained. This furnace continued in blast over three years; had all sorts of mishaps, due to break-downs in machinery, which necessitated long stoppages without preparation; yet always worked without trouble, and, for the greater part of the time, with very satisfactory economy in fuel. It will be remembered that the lines of this furnace are by no means modern.

Furnace No. 2 was blown in, as nearly as possible, in exactly the same way, and went off equally well; but the work for the first nine months of the blast—which is the present one—was vastly different.

The general features of the process were normal; the stock settled evenly all around; tuyeres bright; gas good and plentiful; cinder hot and of proper basicity; but there was no indication that a heavier burden could be carried. The charge at the time of blowing-in was: fuel, 2,000 pounds; ore, 2,600 pounds; stone, 1,240 pounds. After a few days an attempt was made to add more burden, although the iron was only an ordinary gray-forged; but after the additional ore—60 pounds—came to work, the iron was closer in grain, and evidence was soon given that the furnace was overburdened. The only abnormal feature was low pressure of blast, the gauge registering only 4½ pounds per square inch for two or three weeks after blowing-in, and gradually rising to 5½ pounds, where it remained for about three months. The usual pressure with ¾ anthracite and ¼ coke (the fuel-mixture then in use) is 7 to 8 pounds, and the low pressure indicated the possibility of working up the center, or "ring-scaffolding." To ascertain whether this was the case, and at the same time endeavor to correct it, a fuel-blank of 20 tons was charged, with scrap enough to keep the iron from becoming too gray.

When this had been in the furnace about ten hours, the speed of the engine was reduced three revolutions, so that there might be a tendency of the blast to work up the walls and loosen any matter which adhered to them, and get it into the hearth about the time the extra fuel reached there. The presence of the blank in the melting-zone was manifested by the cinder in about twenty hours after it was charged at the tunnel-head, and after 60 charges or rounds had been put in on top of it (the volume of which would occupy the space between the stock-line and bosh), showing that the melting-zone was in the region of the bosh, and that no considerable accumulations were on the walls. The working of the furnace was not at all improved by the blank, or changed in any way that was perceptible. During the time from blowing-in, November, 1888, to March, 1889, the best week's work was 445 tons of iron of 1.3 tons of fuel per ton of iron, and the average production for five consecutive weeks was 431 tons, requiring 1.3 tons of fuel per ton of iron. The pressure still continued low. After some time it was discovered that the collars connecting the pipes in the mains in the hot-blast stoves had "raised" in all the ovens, and that several of them were split, so that it became necessary to give them a thorough overhauling, which occupied the greater portion of three weeks. While these repairs were being made two ovens were used, and the volume of blast had to be diminished in order to keep up its temperature. It may be mentioned here, as a tale of misfortune, that when one oven was off, and about twelve hours before it could be ready for service, a violent rain storm occurred; a water-

* Washington meeting of American Institute of Mining Engineers.

conductor, which passed over one of the ovens, became disconnected at a joint, and the water poured on the roof of the oven and found its way between two plates, which had warped somewhat, in a sufficient quantity to crack a piece out of one of the pipes. The piece was large enough to cause the hot-blast valve to drop, and the furnace being full of cinder at the time, the belly-pipes, all filled. This necessitated a stop of about four hours to clean them out, after which we were obliged to run twelve hours with one oven of twenty-eight pipes and a blast-temperature of 600°. Finally, the ovens were all in good shape again, and some improvement was noted in the working over that immediately preceding the time when repairs were commenced, but not nearly so much as I had hoped for. The pressure had gradually risen to 7 pounds, but the fuel-consumption per ton of iron remained high, and it was not long until the production fell off to less than before repairs were made, and the fuel rose to still higher figures. The pressure remained at 7 to 7½ pounds per square inch.

During the months of July and August the results were most discouraging. The average production for five weeks during that time was 361.8 tons, each requiring 1.508 tons, of fuel. The worst week's work was: iron, 356 tons; fuel-rate, 1.6 tons.

The only abnormal feature apparent was that, during casting, the cinder would run out very hot and fluid, separating perfectly from the iron, until about one-third of it had run; then a mass of "buckshot" would follow, often choking under the skimmer, and causing iron to run out into the cinder-runners. This was followed by about an equal amount of hot, fluid cinder entirely free from buckshot. At some casts no buckshot was made, but when it did appear it was almost invariably in the way stated. This was a very unusual thing. In our previous experience with buckshot it had made its appearance with cinder visibly cold, the hearth would soon build up, and iron would be thrown out of the cinder-notch during flushing. In this instance, however, the cinder which preceded and followed the buckshot was hot and fluid, the hearth did not build up, and no iron was thrown out of the cinder-notch. The appearance of the cinder was unusually good. It is our practice to ladle out a sample of each flush of cinder while it is running, and pour it into a scorifying-mould, so that buttons from the various flushes can be compared. At this time there was scarcely any difference noticeable between flushes. One sample would represent the entire day's work; yet at some casts two or three tons of buckshot would run out and at others none. The top of the furnace was as cool as could be expected with such a light burden—about 600°, when the fillers were at work, which would increase to 700° or 750° when they stopped for an hour.

No gas-analyses were made, but the gas was clean and good. No firing was at any time necessary under the boilers, and the bleeder was seldom opened. The slides on the gas-valves of the hot-blast chambers were seldom moved. Everything seemed right, yet the results showed that something was seriously wrong.

The coke strike occurred about the time we were most troubled with buckshot, and it was necessary for several days to increase the proportion of anthracite to 87½ per cent. This resulted in less iron and more buckshot. I mention the fact, as it will have a bearing later on. During the first week in September a slight improvement was noticed; no change had been made in any particular, and there was no reason to think that it was more than a temporary relief, after which a relapse might at any time be expected. The relapse, however, did not come. There was no more buckshot, and the iron indicated that more burden could be carried. The iron, at the time when the improved working commenced, was peculiar. It was only a good gray-forged iron, but there was an appearance about it difficult to describe, though familiar to those who grade iron by its fracture, which indicated that it was very much grayer than the grain would lead one to suppose. Burden was added in 40-pound lots, with stone in suitable quantity, and when it came to work, evidence was still given that a little more could be carried. This was done in 40-pound lots at first, and 80-pound after there seemed less danger of overdoing the matter, until 800 pounds more ore was carried by 2000 pounds of fuel than had been possible during the summer. The period of transition from light burden to heavy occupied about three weeks, during which time the iron only varied in grain from very gray-forged to close gray-forged. The volume of blast, measured by piston-displacement, was steadily maintained, and the production increased for the five weeks ending with October to an average of 464.6 tons of iron, made with 1.206 tons of fuel per ton of iron. The best week was 507 tons of iron, made on 1.18 tons fuel-rate. On October 1st, when the price of coke advanced, the proportion in the mixture was reduced to 20 per cent. with which the best work was done. It was further reduced to 12½ per cent., which had caused much trouble during the summer; but at this time it had no such effect, and 488 tons of iron were made in a week with 1.2 tons of fuel. After running two weeks, however, it was deemed advisable to return to 20 per cent. of coke,

the production having dropped to 453 tons; and now the production averages 69 tons daily, and the fuel is fairly constant at 1.2 tons per ton of iron. During the summer, when the results were most distressing, the process appeared singularly uniform, and no evidence of scaffolding could be detected. Now there is no uniformity whatever; the stock slips sometimes from 4 to 6 feet at flushing; the cinder varies from bluishwhite with stony fracture to black with vitreous fracture, yet is always hot and fluid. The iron varies from foundry to mottled between casts; and the cinder is but a poor guide, as the gray cinder sometimes makes close iron, and the dark glassy cinder does not always make hard iron. There is much more evidence of scaffolding now than there was during the summer, but the cost-sheet has a much healthier look.

It is likely that, apart from atmospheric conditions, the ordinary causes which affect irregularities of working are: arching of the stock, thereby forming a temporary scaffold; dropping of unprepared stock, which has been adhering to the walls as a fixed scaffold; and filtration of fine ore through the coarse stock, reaching the hearth in the state of ore and desilicizing the iron, thereby lowering its grade.

I was unable to detect any form of scaffolding, and as the proportion of fine ore in the mixture has not changed, it is not likely that it influenced the process. When a furnace does not work economically, it is customary to say there is a scaffold; but it has seemed to me that this term is often applied to express an abnormal condition, the cause of which is obscure. Scaffolds, in order to exercise a material influence on the process, must occupy considerable space; and, although our means of estimating the working capacity of a furnace between the stock-line and the melting-zone are very crude, it is at least possible to ascertain whether there is a very considerable contraction in the cubic capacity contained between the stock-line and bosh or not.

In furnace No. 2, large fuel-blanks have been discharged, from time to time, when it seemed desirable for any reason to do so; and after 58 to 64 ore-charges were on top of the fuel, its presence became apparent in the melting-zone. There has been no variation observed in this respect at any time during the blast. At one time, during a former blast, when the furnace was working badly, a fuel-blank would work after 27 to 30 charges were on top of it. It was not difficult to determine then that the melting-zone was high, and that a scaffold existed.

It has been my practice to maintain a uniform volume of blast, measured by piston-displacement, under all circumstances, and to distribute the current according to the manner in which the stock settles on top. If the settling is even, tuyeres of equal area are used all around. If there is a marked tendency to settle faster on one side than another for a few days, nozzles are put in the tuyeres under the low side, and the blast, flowing in the direction of least resistance, naturally goes in greater volume through the large tuyeres, and cause the furnace to work faster on the side which was high. In this way incipient scaffolds are moved, and dangerous ones are not likely to form suddenly.

The practice of reducing the speed of the engine whenever the cinder becomes sharp I have always regarded as likely to form scaffolds on account of alternately raising and lowering the melting-zone, and, as I could never see how heat could be generated by diminishing the rate of combustion, I have avoided it.

The working of the furnace in question has been a mystery to me, and this account of it has been written in the hope that it may meet the notice of some among the members of the Institute who have had similar experience, and, more fortunate than I, have ascertained the cause. It is not usual to proclaim one's poor work in all its details and confess ignorance of its cause; but if one cannot get light without opening the windows, they had better be opened, though other people may thus be enabled to look in.

The Royal Mining School of Freiberg.

Of the numerous mining schools of Europe, probably the Royal Saxon "Bergakademie" of Freiberg has trained the largest number of successful miners and metallurgists, and the title of M.E. of that school is a guarantee of excellence, and serves as a recommendation of the greatest value. The reason of this is obvious when we know that the system of instruction carried on here is a thoroughly practical one, so that the students are brought into actual contact with the operations on a large scale. The object of this time-honored institution is to give a complete scientific education, both of a theoretical and practical character, to young men intended for metallurgists or mining engineers. Admission to the school for Saxons and Germans is made dependent on having passed the Maturitäts examination of a gymnasium or first class Real-school, but foreigners are received without examination, provided they bring certificates of competence from some recognized scientific or educational institution, and this liberality on the part of the Saxon Government has been

largely availed of by many distinguished English and American metallurgists and mining engineers. Regular courses of study are laid down, extending over four years and differing according as the pupil desires to follow the mining or the metallurgical branch of the profession. Higher mathematics, descriptive geometry, spherical trigonometry, physics, chemistry, mineralogy, geology and mechanical drawing form the groundwork of the studies, to which are added, in the second and succeeding years, the special subjects of mining and metallurgy, and all their allied branches of science, taught by lectures, laboratory practice, by working and surveying in the mines, and by practical metallurgical instruction in the smelting works of the Saxon state.

The collections of mineralogical and geological specimens are most complete, and with the libraries and museums of mining machinery are open to all the students of the school. Many of the professors have been men of European fame—Werner, Plattner, and now Richter and Weisbach, are names known to and honored by all students of science. The lectures of Richter on the blow-pipe are unique, and those of Prof. Weisbach on mineralogy are most valuable. But the most important respect in which Freiberg excels is the practical experience which the students can gain in the operations of smelting conducted on a large scale in the government smelting works (the Müldnerhütte and that at Halsbrücke) as well as in those of mining by visiting the neighboring mines belonging to the Saxon government. As these mines now yield ore of only the poorest quality the operations have to be conducted with great care, and hence offer to the student of mining training of an exceptional character, while the number of metals present in the ore (gold, silver, copper, lead, bismuth, arsenic and antimony) and worked up at the smelting works afford a no less valuable one to the student in many branches of metallurgy. The cost of living in Freiberg, including the fees payable to the academy, need not exceed £100 per annum. The average number of students in training for the last ten years: Saxons and Germans, 64; foreigners, 58. Freiberg does not, however, afford practical instruction in iron mining or smelting; the mining school specially adapted for the study of the metallurgy of iron is that of Leoben in Styria under its veteran head, Prof. von Tunner.

The Invisible Costs in Quarrying.

Those unacquainted with the stone business are apt, like novitiates in other lines, to underestimate the costs. They see a body of stone accessible, and they know what it will cost to extract a given number of square yards of it. They also may know how much a given number of men with a given number of gangs of saws may saw up in a given time. If they base their costs on this, they will see a profit where old quarrymen claim a loss. But usually they seldom reckon on the "invisible costs" which, like Banquo's ghost, will rise to confront them at most inopportune moments.

In the first place novitiates seldom reckon on the loss their quarry beds sustain. Every foot of stone taken from a quarry represents an irretrievable loss to it. It can never be replaced, and as time goes on acres and acres of territory are denuded of their wealth, until finally they are exhausted. The costs of quarrying it do not represent this loss, which must be added, or the time will come when the operations must cease, or the profits of the business must provide means for the purchase and opening of new territory.

Again, the young quarryman will start out with a full complement of derricks, channeling machines, drills and power plant, all new. But from this instant they begin to wear, and the time rapidly approaches when the profits of the business must guarantee a new outfit; or else new devices are invented that lead to the same result, or the business must join the long list of the unprofitable.

Again, in placing the stone on the market, are a number of unforeseen adverse conditions. A piece of stone worth hundreds of dollars will get broken, to be reproduced without pay. A favorite and prompt-paying customer goes bankrupt (and this will occasionally happen to the most conservative manager). Then are added costs of delays, breakage and derelictions of railroad companies, and the costs of their own agents, none of which figure in the cost of extracting numberless yards of stone in quarry.

Every penny of waste, every penny of cost, every cent for repair down to the last drop of oil, will soon or late rise up for liquidation. Yet they are invisible in the estimate of cost for a given number of yards of quarry production. And it will take nearly 20 per cent. added, and it may take 33, to make the items of cost equal the items of receipts where these various losses are considered.

When a young quarryman begins he rarely considers these invisible but constant losses. He sees the older men charging more than he figures he can take out a given number of cubic yards for, and he concludes there is a bonanza in it, and all he has to do is to get on the market, even if at the loss of a few cents, which he con-

ceives he can make out of these great "profits." He finds out his mistake—he has learned the invisible costs, but meantime he has forced the older men to reduce theirs in order to retain the market they have already earned. He has destroyed his own profits, and reduced those of his competitors, and the result is the entire trade is lowered in tone, capacity and profit.

On the other hand is the old quarryman who either has, or conceives he has, a quarry so easy to work that competition with him is fruitless, and who may from this fact further improve his sales by reducing his prices. Failing to pocket the profit that his good fortune assures him, he strikes at the income of his neighbour. It is notorious that the consumer is paying the contractor prices out of all proportion with what the quarryman is getting, and which a well-understood basis or organization could easily remedy. If a portion of the profit in the stone business now going to the contractor and other middlemen were divided with themselves and consumer, advantage to both would result, and the use of stone greatly extended, while the quarryman, with much more business, at the same time would reap a higher price.—*Stone.*

The Superphosphate Works at Smith's Falls.

The following description of the Standard Fertilizer and Chemical Co.'s works at Smith's Falls, Ont., is given by the Commissioners in their Report just issued:—

Various grades of superphosphate are manufactured for fertilizing purposes, and acid phosphate is also made at the works which is used for baking powder, etc. The sulphuric acid used in the process is manufactured from brimstone imported from Sicily, and costing at Smith's Falls one cent per pound. The apatite is ground very fine by burrstones, after which it is conveyed into a vat by means of a fan. The coarse dust falls back to the stones and is reground. The apatite requires to be pulverized to such a degree of fineness that if bolted it would go through a 120 mesh, or at least an 80 mesh. The charge is weighed out, moistened with sulphuric acid and run into the mixer, and thence into an air-tight bin that has a wooden funnel above to carry off the hydrofluoric acid which generates. The acid and phosphate of lime work in this bin and solidify in twenty-four hours. It is then broken up by a sort of disintegrator, and after being mixed with various proportions of hydrochloric acid, ammonium, potash, ammonium sulphate and nitrate of soda, it is ready for shipment. The following grade of fertilizers are manufactured:—

No. I.....	\$ 32.00 per ton.
No. II Standard.....	35.00 "
No. III Special.....	40.00 "
No. IV. Fruit Tree.....	42.00 "
Plain Superphosphate.....	26.00 "

Acid phosphate is also manufactured by this company. Only the purest ground phosphate is used for its production, which is carefully sorted by hand. After the acid has dissolved the phosphate the charge is leached off, and the product is the liquid phosphate. This is then evaporated down to a syrupy condition, is mixed with starch and dried, after which it is ground. It is used as a substitute for cream of tartar, and chiefly as a baking powder. The phosphate used at the works comes from Burgess and from Buckingham. The high grade (83 or 84 per cent.) used for acid phosphate costs \$17.50 at the factory, and the low grade (65 per cent.) costs about \$9.60. Farmers use about 300 pounds of the fertilizer to the acre, and that quantity is claimed to have the same effect as 25 wagon loads of well-rotted barn-yard manure. Market gardeners use 800 to 1,000 lbs. per acre. The ammonium sulphate costs \$60 per ton, and \$11 worth is put in a ton of the fertilizer. This and the potash are imported from Germany. Of the output of the works about seven-eighths of the grades is special and standard, and the price obtained averages \$35 per ton. The lead chambers in the works cost about \$10,000, and the pure sulphur is said to be much less severe upon these than when iron pyrites is used. The sulphur also occupies less room, and a boy can look after the furnace. The cost of producing sulphuric acid is about 70 cents per 100 pounds.

New Use for Mica.

The principal use to which mica has been put heretofore was for stove doors and for decorative purposes, such as bronzing, wall-papering, etc. When properly prepared, it can be used for a variety of purposes, and the discovery of this fact has led inventive genius to supply a process whereby it can be so utilized, and machinery has been brought out for the purpose of handling the mineral.

The new field thus opened to this mineral is as a lubricant for railroad purposes, and its value for this purpose lies in the fact that it is absolutely anti-friction, and it is claimed that with its use hot boxes or journals are simply impossible. A company has been incorporated in Denver, Colorado, under the name of the Railroad Mica Lubricating Company, with a capital of \$200,000, and they have purchased the machinery, together with the process of manufacture, all of which are covered by patents. A visitor to the factory thus describes operations:—

The mica comes to the factory in carloads, just as it is taken from the mine. It is fed by boys into two machines, which cut it into fragments about half an inch in size. By a system of pneumatic tubes the mica, so cut, is delivered to the atomizing machines, which grind it into powder.

These machines one must see to fully realize their peculiar action and construction. Each machine consists of two steel shafts three feet long, with a series of gun metal spirally arranged beaters, which revolve in a closed case forming a figure. When in operation these machines make from 5,000 to 7,000 revolutions a minute. The beaters on the revolving shafts are so arranged that the fingers on one pass between the fingers on the other shaft, so that when the material is passed through the pneumatic tubes from the feeding machine to the atomizers at a velocity of 15,000 feet a minute, the work of atomizing is instantaneous.

The mica, now reduced to atoms, continues its course at the same velocity through another set of pneumatic tubes to the sifting bins. Here the current is so retarded by the peculiar mechanism that it causes the material to settle in the various compartments, of which there are six, at the same time grading the material according to its fineness. The powdered mica is now settled in the hoppers or bins, immediately over the mixing pans. Here the several grades are drawn into the pans, which are provided with mechanical mixers, and the lubricant is made up by the use of the proper percentage of oils, mica and such other ingredients as the company uses in the manufacture of the product.

Directly over the hoppers are located the oil tanks, which supply the mixers by a pipe running down on the outside of the hopper, on the end of which is a faucet.

At the south end of the bins there is located a large cylindrical machine four feet in diameter and ten feet high, that is called a dust arrester. Any of the material that is so light and fine that it will not settle is driven into this machine by air currents, which thoroughly separate the mica dust from the air, where it settles in the bottom of the machine and is drawn off as needed.

It is stated that the capacity of all machinery heretofore made for pulverizing mica has been from 300 to 400 pounds a day, and then the material has not been sufficiently fine for lubricating purposes. It is claimed for this new concern that it can pulverize about five tons a day, or in ten hours running.

Estimating the Cost of Foundry Work.—In a paper read before the American Society of Mechanical Engineers, Mr. G. L. Fowler observes that the expense of moulding is the basis upon which all estimates and calculations should be founded, coupled with a careful consideration of the weights and cost of the iron and fuel. The author classifies the expenditure under various heads, and then determines in what relationship they stand to one another. The various ratios having been determined, the timekeeper should every day take the time of each moulder and the work on which he has been engaged. This gives the necessary basis for the calculation of the cost. The various ratios already determined are added together and multiplied by the wages paid; to the product is then added the wages, and the cost of the iron in the casting. The result is the cost of the casting. The author gives the following example; 40 cents is paid for moulding a grate-bar weighing 100 lbs; the sum of the several ratios is 1.2, and the cost of iron and fuel was 1 cent per lb. of casting, then:—

Sum of all ratios multiplied by the moulder's wages.....	\$0 48
Moulder's wages.....	0 40
Cost of iron.....	1 00
Total cost of the grate-bar.....	\$1 88

The author states that this method of calculation has been employed for the last seventeen years by Mr. A. Messerschmidt at Essen, Germany. The author, too, has found in his own experience of the practical application of the method, that it is of very considerable commercial value.

Safety cages—A good many years ago what are known as safety cages were not uncommon in England, and on the Continent they were compulsory by law. Their action is simple; so long as the load is on the rope the catches on

the cage are out of action; but when a rope breaks, and the load goes off, the catches come into action, grip the conductors, and hold the cage. There were two advantages which these safety cages formerly had—the speed of winding was slow, and the conductors were of wood, affording facilities for gripping. Now the speed of winding is very rapid, and the conductors, a good many of them, are of wire. There is some danger of such cages acting when they should not, and not gripping when they should. It is a fact that safety cages are not now as numerous in proportion to the collieries as formerly, and on the Continent are not now compulsory. Safety cages are intended to act when ropes break; but those who do not care for them say that ropes of proper material, well made, worked on proper machinery, and not overloaded, ought not to break, and will not break. It must be remembered also that even with a safety cage we have nothing to prevent the lower part of a broken rope falling down the pit and doing injury.

Coal Mining by Machinery.—In Illinois in 1888 there were 272 machines at work for mining coal. With them, 3,088 men produced 2,243,210 tons of lump coal, or 20 per cent. of the total production. Of these machines, 245 are of the Harrison type, 17 are the Legg or Lechner machines, and 10 are the Yock machines. Owing to the thorough division of labour which the use of machinery induces, it is more likely that both timbering and blasting are efficiently performed.

Shaft Sinking by the Kind-Chaudron Method.

M. J. Chaudron (excerpt from *L'Industrie*), gives a list of shafts sunk by the Kind-Chaudron method since 1878. There are five in Belgium, three in France, one in England, and seven in Germany, or sixteen altogether. Full details and illustrations are given of three of the more important. A new departure was made at the collieries of Gneisenau, Westphalia, by lining the shaft only where it passes through water-bearing strata. This was done by closing the lining with a diaphragm, both at the top and bottom, so as to obtain an air-tight vessel into which water could be admitted as desired to control its buoyancy. In order to be certain of stopping out all the water, the lining was carried upwards for a distance of about 82 feet above the water-bearing strata, which were 142 feet thick.

At the salt mines of Thierderhall, Brunswick, great difficulty was experienced owing to running ground. No less than eight separate linings had to be used, each one just overlapping the next, so that the shaft is reduced in diameter from 13 feet 9 inches to 10 feet 3 inches, at a depth of 354 feet.

The Kind-Chaudron method of boring shafts has been successfully carried out, for the eighth time in Germany, at Leopoldshall. Several attempts to sink a new shaft having failed on account of the influx of water, the Kind-Chaudron method was adopted, and the shaft completed in 17 months. The small shaft was sunk with a borer 8¼ feet in diameter and about 16 tons in weight. For the subsequent boring down to the impermeable strata, a tool, 14 feet in diameter and 20 tons in weight, was employed.

Lignite Briquettes.—In a paper read at the German Mining Congress at Halle, the uselessness of attempting to dry the lignite used in the manufacture of briquettes is pointed out by Vollert, experience having shown that the presence of from 15 to 20 per cent. of moisture in the briquette greatly increases its resistance to atmospheric action and to disintegration during transport. Great care has to be taken to prevent the collection of dust during the manufacture of the briquettes, owing to its liability to explode. The numerous arrangements which have been adopted to prevent danger from such explosions are referred to by Schrockner, who shows that, whilst in 1875 there were in North Germany only twenty-nine briquette presses, consuming annually two hundred and fifty thousand tons of lignite, there are, at the present time, 186 such presses at work, each giving employment to 10 men, with an annual consumption of 2,250,000 tons of lignite, and a production of 1,250,000 tons of briquettes. Unfortunately, this manufacture of lignite into briquettes is accompanied by considerable danger, owing to the evolution of hydrogen and other gas, and to the explosive character of the dust produced in the manufacture. This dangerous deposition of dust takes place partly during the preliminary drying of the fuel, but more especially during the transport of the dried material to the press. In conclusion, the various mechanical arrangements which have been introduced to prevent such dust deposits are referred to.

Government Assistance to Schools of Mines.—The Mines Department of New Zealand has imported from London, for the use of the schools, chemicals and apparatus to the value of about £400. It has also procured from Germany eleven collections of ores, rocks, and other minerals for distribution among the schools of mines. Each of these collections cost about £35, and includes 200 specimens of metallic ores, 50 specimens of rocks and 30 specimens of minerals that accompany the metallic ores and indicative of the same, besides an assortment of minerals to show degrees of hardness, and 110 samples for blowpipe testing, with blowpipes for same.

The Petrolia Oil Wells.—The wells are drilled 4½ inches in diameter, and where casing is put down it is rimmed out ¾ or ½ of an inch, the casing being 4½ inside and 5½ inches outside diameter. The hole is put down in about five or six days, and costs from \$150 to \$160. In the early days the cost ranged from \$1 to \$3 per foot, and the time occupied from two to six months. Wooden rods are now used altogether instead of cables, a steel drill 3½ inches in diameter and 25 to 30 feet long being attached to the lowest section. Two shifts of three men each form a drilling gang. These Petrolia drillers are very expert, and are called for all over the world, much work being done by them in Europe, Asia and Australia.

Charles M. Rolker, — LESSEE, — New York Ore Milling & Testing WORKS.

Office, - - 18 Broadway, New York.

Cable Address:—PHAFTRY, New York.

Consulting Mining Engineer.

Examinations made and reports rendered of mines and mining property, metallurgical works and processes.

Ores can be practically tested by any known process and the necessary plan of reduction determined. Works are complete in every respect for practical testing of Gold, Silver and Concentrating Ores and Tailings. ANALYSIS of ores and furnace products, etc.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for supplying Coal for the Public Buildings, Ottawa," will be received at this office until FRIDAY, 23rd inst., at noon.

Specifications can be seen and forms of Tender obtained, on and after Friday, the 16th instant, at this office, where all necessary information can be had on application; also at the office of James Nelson, Architect, Montreal, and at the Dominion Public Works Office, Post Office Building, Quebec.

Each tender must be accompanied by an accepted bank cheque for the sum of \$300, made payable to the order of the Honourable the Minister of Public Works, which will be forfeited if the party decline to enter into a contract when called upon to do so, or if he fail to complete the work contracted for. If the tender be not accepted, the cheque will be returned.

The Department will not be bound to accept the lowest or any tender.

By order, A. OBEIL,
Secretary.

Department of Public Works,
Ottawa, 13th May, 1890.

LEDoux & COMPANY, 10 CEDAR ST., NEW YORK, Engineers, Metallurgists & Assayers.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

NATIONAL COLONIZATION

Lottery!

UNDER THE PATRONAGE OF

THE REV. FATHER LABELLE.

Established in 1884 under the Act of Quebec, 31 Vict., Chap. 36, for the benefit of the Diocesan Societies of Colonization of the Province of Quebec.

Vol. IX. JUNE, 1890. No. 6.

The Report of the Royal Commission on the Mineral Resources of Ontario.

Canadians have become so used to reading ancient history and obsolete explorations and statistics in Government reports, that it is a genuine surprise to peruse the work that bears the above title, and to find it, in the main, fresh in its data, practical in its investigations and wise in its conclusions. Taken as a whole it might be said that no work has ever been issued of such vital importance to Canada; for its treatment of the mining industries is so minute in its investigation and far-reaching in its application, that its information and suggestions are capable of yielding untold benefit to the whole Dominion of Canada. To the Government of Ontario is due the credit of instituting this commission of enquiry, and of setting an example of intelligent research which is a model to all Governments, and which even the Geological Survey of Canada might emulate with profit.

As our readers would see from the summary published in our last issue, this Commission held sessions in 37 places, and examined 164 witnesses under oath. The Report derives great value from the statement of the views of these practical men in their own words, giving the reader the opinions of those best qualified to judge of the condition of each industry, while the summarizing of these voluminous and sometimes conflicting statements is performed with admirable skill and wisdom. This work refutes the oft-made assertion that no good can come out of Government undertakings, and that men can only work effectively under the stimulus of trade competition. It is difficult to see how private enterprise could have made more thorough examination of the various subjects treated, or have reached more definite conclusions. In this case certainly the existence of a Government Commission has been justified.

After an important introduction, a fairly valuable condensation of geological knowledge is given in terms suited to the ordinary reader; then follow descriptions of the various mineral resources of Ontario, and one is amazed at their extent and importance. The list of those specially investigated include iron, gold, silver, copper, nickel, building materials, marble, clay, charcoal, gypsum, phosphate, lead, mica, natural gas, petroleum, platinum, plumbago, salt, zinc and arsenic. Statistics of each industry are given, and the difficulties that each has to encounter are pointed out and discussed. The mining laws of the principal European and other countries are collated in a most instructive manner,

and wise deductions are made from their suggestions. The smelting of ores receives attention in a whole section, and the closing portion gives attention to "Measures for aiding and encouraging Mineral Development." Among these are, the establishment of a Provincial Bureau of Mines under control of a geological officer (who must be a practical mining engineer), the founding of provincial and local museums, the collection of mining statistics and technical instruction in schools of practical science. In an Appendix many valuable papers by eminent writers give valuable information upon the minerals referred to in the Report, with instruction upon methods for their determination and treatment. An exceedingly important paper treats of technical instruction, and gives information about the leading mining schools and museums of the world. This excellent compendium of information closes with a glossary of geological and mining terms, and carefully arranged indexes, giving reference to all the names of witnesses and to general topics. The lion's share of the work in its preparation fell upon the shoulders of the painstaking and hard working Secretary, Mr. Archibald Blue, and the public is largely indebted to him for much of the thoroughness of the compilation.

Elsewhere we notice in detail some of the main features and recommendations of the Commission. Our remarks on the consideration given to our iron ores and interests are however unavoidably held over until a future issue.

The Report on the Mining Laws of Ontario.

Much diversity of opinion existed among the witnesses examined by the Royal Commission on the mineral resources of Ontario with reference to needed changes in mining laws and regulations, but there were a few points of general agreement which deserve notice. It is evidently desirable that the prospector and discoverer of minerals, who is usually a poor man, should have the opportunity to work his finds, and for this purpose the sale of small locations, or the lease of lands upon royalty, is recommended by many witnesses. The monopoly of land by speculators is felt to be a great hindrance to development, and all agree that ownership should involve compulsory working. Men are ready enough to spend money in the expenses of operating mines, but the preliminary outlay of a large sum for the privilege of possessing a location for what is usually a somewhat doubtful experiment acts as a serious deterrent upon enterprise. The evidence given by the representative of the CANADIAN MINING REVIEW sums up the situation in these words: "I think our mineral lands should be reserved by the Crown. I think the present system of selling lands unconditionally is opposed to the development of the country. Development to a certain extent every year should be compulsory. Any mining regulations which permit the acquisition and control of large areas of land upon payment

of a merely nominal price is undoubtedly a most favorable arrangement for capitalists and speculators, but it is one which in every sense is opposed to the best interests of the people at large. At present, extensive districts are locked up in a few hands, and no one is permitted to operate upon them unless he can afford to purchase the land at an immense advance upon its cost. If capitalists were permitted to lease upon royalty just so much land as they could work, and only for such periods as they continued to work, and if the poor prospector could lease the area on which he had made a valuable find and be at no expense beyond the cost of working, then we should see a vast increase in mining matters; the revenue from royalties would be a constant and important source of income, and the people would cease to barter away their natural rights for a paltry mess of pottage."

The Commission deems reservation and royalty impracticable, owing to the influence of the United States system, and the fact that Ontario has already gone so far in the opposite direction. But surely a bad example and wrong practices are not a fair argument against reform. It is in this and a few other features, that the otherwise most admirable Report is least satisfactory. It says: "The best and perhaps the only remedy for the evil would seem to be that which has been adopted in New Zealand and South Australia, viz., the resumption of such unworked lands as are believed to be valuable for mining purposes, upon payment of a reasonable compensation, and holding them for re-sale, subject to developmental conditions." This applies to lands already sold, but there seems to be no reason why the unconditional sale of mineral lands should be continued. It is a policy at variance with the ideas of nearly all advanced thinkers, who maintain that the land and its treasures belong to the people at large, or, as we say in a monarchical country "to the Crown," and should only be parted with for "occupying use," and on terms that will give perpetual income to the nation. The Commission has rendered a valuable service in collecting the mining laws of the world, and a careful study of that portion of the Appendix may aid the suggestion of the wisest policy for Canada to pursue.

Attention is given in the Report to the laws relating to underground boundaries, the health and safety of miners and their claims as wage-earners, and to forest fires in mineral districts,—all important matters and worthily considered. The influence of this Report should be mighty in the direction of legal reform and wise legislative enactment.

Aids to Mineral Development.

The conclusions of the Royal Commission, resulting from their comprehensive investigations into the mineral resources of Ontario, must necessarily be regarded with great interest, and are entitled to the respect due to earnest and intelligent effort. The abolition of tariff restric-

tion between Canada and the United States is evidently regarded by them as the great desideratum, but there are many other improvements, which are at once within reach, that would be of vast advantage to the country. The Report mentions four ways in which valuable service may be rendered by the provincial government of Ontario:—

1. By a geological survey of the province with particular reference to its economic minerals.
2. By establishing a museum of minerals and mineral products.
3. By collecting and publishing yearly statistics of the mining and metallurgical industries of the province.
4. By provision for education in engineering, mining and metallurgy.

The purpose of a geological survey is stated to be mainly the development of mineral resources. A general survey of the country is now being made by the Dominion, and the time has come for the province to take up the work in more thorough and systematical detail, and to form a Provincial Bureau of Mines. The object of this Bureau should be not only to collect information to be stored away in its archives, but to diffuse knowledge, give useful advice and secure the promotion of industry. Complaint has been made that the researches of the Dominion survey have been too carefully guarded from the inspection of the public through a dread of favoring individual pursuits, and it seems important that all the knowledge obtained should be made available for every one who has the enterprise to ask for it. The efficiency of this Bureau must altogether depend upon the person in charge of it, who should not merely be a geologist, but also a well educated mining engineer, in possession of thoroughly practical experience in mining matters, well qualified to instruct owners as to the best means of opening their mines, and of utilizing and marketing their products, and also able to recommend modifications and improvements in mining practices—a man of weight and authority who will be respected, not one who will oppress enquirers with an outpouring of technical gibberish, but one who can impart practical common-sense ideas.

Museums of minerals are found to be serviceable means of instruction to prospectors and other persons interested in mineral development, and when in charge of officials able and willing to give information, valuable service can be rendered in the direction of research, and costly mistakes may be avoided. "It has been estimated that in Great Britain the money saved from the indiscriminate and fruitless search for coal alone where there could be no hope of finding it, such as had formerly gone on, has been more than sufficient to pay the whole cost of the exhaustive geological survey of the kingdom." We have record in this report of a cargo of pyroxene having been shipped to England under the misapprehension that it was phosphate. The influence of the Bureau and museum would tend to prevent such occurrences.

By making returns of mining statistics com-

pulsory, and by a prompt and intelligent compilation of them, great service might be rendered. Investment and operation would often be encouraged were accurate information obtainable as to the past and present conditions of industries.

The information collected with regard to schools of technical instruction is one of the most valuable features of the Report, and should stimulate the people of Canada not to be behindhand in the education of their youth in those departments of natural knowledge and technical skill which all progressive countries are now giving attention to. The cultivation of classical learning may be of value in increasing the culture of the wealthy classes, but what the youth of Canada need is not so much to know the mythologies of Greece or the history of Rome as to become aware of the natural resources of the country and the best means of utilizing them. By attention to these recommendations a mighty stimulus would be given to industrial progress, for "the most legitimate means by which people can really enrich themselves is to extract wealth from mother earth direct," and while many natural supplies are destined to decrease, such as timber and fisheries, the minerals furnish an unlimited source of wealth, and it is only by the well directed and intelligent effort that comes from observation and study that economic production becomes possible.

Minerals and Politics.

It would hardly be expected that a treatise on the mining industries of a country would prove to be a medium for political instruction, but the report of the Royal Commission on the Mineral Resources of Ontario contains the most conclusive array of facts and opinions in favour of Commercial Union or Reciprocity with the United States that has ever been presented to the Canadian public. It will wield a powerful influence from the circumstance that its compilation is entirely free from the influence of party politics, and is solely inspired by the earnest and unbiased consideration of economic necessities. The opinions expressed are not those of the Commission primarily, but of the numerous witnesses who were examined throughout the whole range of the country from Ottawa to Rat Portage. The report says: "At every point the Commission met with evidences of the great importance of securing wider markets. Everywhere the witnesses examined either felt impelled to allude to the importance of this matter of securing access to other markets or fully admitted its importance when allusion was made to the subject. Differences of opinion upon the questions of establishing mining schools, granting bonuses to promote iron production, changes in the mining laws, everything else in fact were in all cases developed; but upon the question of the desirability of obtaining free access to the American markets for our mineral productions there existed absolutely no difference of opinion so far as we could judge

among men interested in mining enterprises, except in the case of those interested in petroleum, and in one solitary instance in the case of a producer of salt. With the consciousness on the part of the intelligent men interested in mines, whom we met from Ottawa to Rat Portage, that with boundless mineral resources and a market the limits of which were exceedingly narrow, we were cribbed and dwarfed in our attempts to make developments, the cry everywhere was 'Give us the American markets; break down the barriers that separate us from 60,000,000 customers at our very door!' Whether this desire may possess the farmer, the lumberman and the fishermen or not, it certainly awakens the earnest longings of the mining population of Ontario."

The report goes on to show that the two countries are geographically one, and points out the natural conditions favouring commercial intercourse. "The energetic zone of North America may be said to be between the 38th and 48th parallels of latitude," and Ontario occupies a central position in its midst, with control over means of transit by land and water of incalculable value to both countries. The people of the two countries are essentially homogeneous in blood, and the populations are largely commingled. By restrictive tariffs on both sides Canada is placed in a false economic condition, and her experience under the reciprocity treaty proves conclusively the desirability of removing the barriers of trade. No department of business has experienced more painfully "the effect of commercial hostility and ruthless repression by tariff enactments" than has been done by the mineral industry. In turn each department is surveyed. The stagnation of the iron industry is pointed out, and the glowing picture of its probable development under free trade would arouse the enthusiasm of every lover of his country. Copper and nickel are next shown to be depressed by the United States tariff, by the United States tariff which reduces its price, and by the Canadian tariff that increases the cost of supplies. It is stated that the salt field of Ontario embraces an area of about 1,200 square miles, "the brine is the strongest and purest known, and the quality of salt produced is excellent." "The free admission of salt to the American market with free coal for fuel might speedily double our salt product, and secure continued and rapid increase beyond that point." Mountains of marble and quarries of building stone of great excellence are described, with easy access and cheap transportation to all the cities and towns of the lake region. "The duty alone has prevented the growth of trade in this direction."

After enumerating many of the direct hindrances to trade arising from the exaction of duties, the Report goes on to mention that the measure of repression is not to be estimated merely by the amount of money paid, but that consular certificates, custom house entries, disputes with appraisers combined with espionage

and exactions of officials who need care little for public opinion, constitute a system of vexation more appalling and deterrent to many men of business than are the mere duties levied. The testimony of the practical men who were examined must be read to secure a full appreciation of the vital necessity of free trade with the United States to the full development of our mineral industries.

The Report lays equal emphasis upon the repressive effect of Canadian duties upon mining machinery and supplies, and it is probably owing in great measure to these investigations that the Dominion Parliament at its last session made some arrangements for free importation of mining machinery. This action is the admission of a principle which, if consistently applied, would sweep away all tariff restrictions, and permit our natural resources to seek full development unhampered by artificial restraint.

The Commission carefully avoids vexed questions of party politics not of a purely economic nature, and there is not a word in the Report calculated to offend the loyalist or to give support to the annexationist. But it looks the facts squarely in the face, and deals with questions in a purely practical manner. This section closes with the following remarks: "The vast increase in mineral production in the United States has been pointed out. A state of great activity is the characteristic of the development of mineral resources in that country. In Alabama, Georgia, Tennessee, West Virginia, Virginia, Kentucky, Arkansas, and other States, scores of millions have been recently invested, cities are springing into existence, railway lines are being constructed, furnaces erected and great strides in development made. Why should Canada lag behind in this career of development? Why should the great tide of enterprise and business activity sweep by and leave us untouched? The tariff well serves like a wing dam to direct the current from us. Remove the dam and the current will reach us in full force. To the wealth and the restless activity of the United States we must look to a large degree for the capital and the skill to develop our large resources of gold and silver, nickel, copper and iron. Now we are looked upon somewhat as Siberia is; a land possessed of minerals, perhaps, but foreign and far away. More than one-half of our mining capital is now American, but it represents only a small fraction of the amount that would speedily seek investment in Ontario if the two countries were commercially one. The influence this change would exert would probably be felt in a more marked degree in the development of the silver and gold mines of north-western Ontario than even in the more seriously tariff-burdened industries of iron, copper, salt and structural material production.

"Examination into the character and extent of the mineral resources of Ontario shows even now, when we are only at the threshold of discovery, that they are practically without limit in extent and value. As to the best means of development, we must pick up the courage to make

that considerable degree of progress which present conditions will permit, and we must work and hope for the coming of the day when the war of the tariffs shall be a thing of the past, and we shall be able truthfully to say—

'No pent up Utica contracts our powers,
But the whole boundless continent is ours.'

Suggested Smelting of Canadian Copper and Nickel Ores in Ohio.

Mr. S. J. Ritchie, President of the Canadian Copper Company stated in his argument, before the Ways and Means Committee, for the free admission of nickel ore into the United States, that if this was done his company was favourably disposed to utilize the natural gas in the neighbourhood of Findlay, Ohio, for the manufacture and treatment of these ores—indeed, he said, "we are contemplating bringing in all our ores to that place to be smelted."

The Canadian Government has treated this company with the utmost liberality, having permitted it to import its machinery and coke for fuel free of duty. And in return what benefit are we to receive from these wonderfully rich mines? Absolutely none whatever, except, perhaps, in the employment of the men engaged at the mines. Large reduction and refining works for utilizing these ores will, according to Mr. Ritchie, be established in Ohio. The duty of the Dominion Government is plain. The American duty of 15 cents per pound upon the nickel contained in the ore and matte imported from Canada, and a like duty on the nickel oxide forced the Canadian Copper Company to establish its smelting works at the mines. Canada must now retaliate and levy an export duty on these products to a similar extent. Before doing so, however, it will be well to wait until Mr. Ritchie's scheme materializes. Perhaps it is only a bluff.

Artificial Foundations and Method of Sinking Through Quicksand.

Paper read Midland Institute of Engineers.

The depth of sand to be sunk through was about 18 feet, and it was wet from the surface throughout. The object was to sink the tubing to the solid metals on which the sand rested without withdrawing the water, so as to avoid subsidence of the various surface erections. Supports for the balks of timber for lowering screws were erected of sleepers in the form of chocks. On these chocks two trussed logs, each 17 inches square and 53 feet long, rested. Four transverse beams, 14 inches square, set in pairs, rested on the main balks, and to these were attached the lowering screws, 3 inches diameter, and four in number, which controlled the descent of the tubing. The water in the pit served as a guide to show any deviation of the tubing from the vertical. If such occurred, it was rectified by manipulation of the screws. When the friction arrested the descent of the tubing an excavation was made round the sides, and the sand therefrom thrown to the centre of the pit. When the bottom of the quicksand was reached the water was pumped out, the cutting edge of the tubing was rested on wall plates, and the sinking continued through the water-bearing strata, the bottom of which was reached at 54 yards deep. The water was then tubed back by a cement lining 3 inches thick behind brick walling. While sinking through water-bearing strata the water was pumped by two pulsometer pumps, suspended in the shaft. The feeders of water gave off more than 1000 gallons per minute. Boiler foundations were formed first of concrete, 7 feet thick, put on in layers 15 inches thick, on a bed of old sleepers. On the top of the concrete, rails of 70 pounds per yard were laid longitudinally and transversely, 4 feet 3 inches apart, and the ends of the rails bent alternately upward and downward, so as

to embrace the concrete and stonework above and below. On the top of the concrete was built a layer of stone in blocks, 6 feet by 4 feet 6 inches by 6 inches. The concrete and stonework were embraced by iron rails round and round horizontally, and so bound together as to form a foundation of uniform support. On this foundation was built the brick boiler-seating, with air passages above the stone work, with the object of preventing heating of the concrete and destruction of the cement. The engine-houses and workshops were built on beds of concrete 6 feet thick. No evidence of unequal settlement was observed. The results of a few tests of the strength of pit props are appended, showing very great variations in strength of trees of exactly the same size and length. Props 6 inches in diameter and 6 feet long supported pressures varying from 19 to 61½ tons, while chocks of elm, formed of pieces 24 inches by 6 inches by 6 inches, collapsed under strains of from 43 tons to 60 tons. There is also a short description of a method of sinking pillars through sand, in use at Calais Harbor Works. In forming dock walls there, the plan was to sink pillars in the sand by excavating the sand with water jets, and pumping it out suspended in the water. The pillars, 26 feet square, of rubble masonry set in cement, were built with an octagonal hole, 8 feet in diameter, in the centre, the bottom of which tapered outward and formed a kind of cutting edge. The pillars were built to such a height as was necessary to sink them—about 12 feet to begin with—and when cement was set sinking began. Jets of water, under pressure from flexible pipes carried down each angle of the octagonal central opening, were directed against the sand under the edge of the pillar, care being taken so to direct the jets of water as to keep the pillar sinking vertically. A centrifugal pump raised the water again to the surface, and with it the sand in suspension.

English Colliers at Home.

The best time to get the colliers at home is Sunday, for then is he not arrayed—to his own taste—like Solomon in all his glory? On week days, dirty with coal dust and wet with perspiration, he takes little heed of fine raiment, except perhaps after leaving the mine, to change his grimy working garments for something rather different; but on Sunday, when it may be said he is "at home," the good wife brings out all her man's fairest garments. On a Sunday morning, when the bells of the little Anglican church are clashing out defiance to the band of the local branch of the Salvation Army, you may see Geordie and his mates, ranged in grandeur, squatting in the cramped posture of the miner, with back against some wall not far distant from the public house where swings a brilliant signboard with an impossible lion. His costume, be the day the warmest in summer or the coldest in winter, never varies. He has a rough pea-jacket, thick and substantial, pants of imposing pattern, well shod boots, and, as the special and peculiar grace of his costume, a huge muffler twisted round his neck, tucked under the waistcoat and shooting out at its extremity. With a pipe in his mouth and the familiar dog "close handy"—an animal apparently half bull-dog, half Italian greyhound—he is furnished for the Sabbath. A story is told of a northern collier which accentuates the "clothing" aspect of the dog question. There had been a match between some dogs arranged at the town and a great deal of interest in it was excited among the miners. One sportsman was noticed to be absent, and, subsequently a friend meeting him, inquired the reason, "Now, Geordie, ha' ye na been ta toon." "Nay and ha na been ta toon, dawgie is deed, an a man looks so naked like gan to toon wi'out a dawg." But he who would see the pitman in his glory should see him and his 'missus' at a feast. One gains from such an experience a new conception of human possibility in the matter of consumption—liquid and solid. The preparations for such a banquet are on the grand scale; their bread and butter has no place in such a Broddingnagian feast. The cake, plummy and solid, takes rather the form of an ornamental tile than a "genteel slice"; tea, brown and strong, flows by the quart. "Ye mun fill thyself afore thee gets oop," says a brawny collier to his wife as he passes her the thirteenth cup of tea. And she does. There is no affectation among the good people; they mean to have a feast and a feast it is. A favorite form of entertainments in these parts is a "ham tea," where ham, harmony and religious addresses are combined. One of the most original of these quasi-religious gatherings occurred not long since in a little colliery town up north where the entertainment extended over two evenings. The first evening a grand performance of the Parable of the Prodigal Son was given. In order to make the representation thoroughly realistic a live calf was brought on the stage preparatory to being slaughtered in celebration of the return of the Prodigal. As the calf, bleating innocently and wholly unconscious of its approaching fate, was led off the stage, the chairman of the gathering came forward and announced that on the following evening a grand "veal and ham tea" would be held as a supplement and sequel to the parable.—*Cassel's Journal*.

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

No. III.

The Late William Plummer, Mine Manager of the West Canada Mining Company.

In the death of Mr. William Plummer, M.E., on the 18th ult., Canada loses one of her most prominent pioneers in the progress of mining in this country. His name is probably unfamiliar to many of the younger generation of mining engineers, owing to his having retired some years ago from all connection with the profession; but it is still a household word in the district of Algoma, the scene of his most active endeavors in the development of Canada's mineral riches, and its mention still meets with warm recognition in many an out-of-the-way corner of the continent by those who were amongst the "gang"—now scattered far and wide—who worked under him at Bruce Mines.

Mr. Plummer was born in 1819 at Mary Tavey, near Tavistock, in the County of Devonshire, England. This pretty little village is situated near to the line which divides Devon from the famous mining district of Cornwall.

On his mother's side he was connected with one of the old mining families of that district, which fact probably influenced him to early turn his attention to the subject, so that he studied his profession under the most favorable auspices in that classic district, famous all over the world since the time when the Phoenicians traded there for tin, and which has ever since been the cradle and training school of some of our best and most practical mining engineers and miners.

Here he served a thorough apprenticeship to his chosen subject, not only studying the scientific principles which underlie it, but by practice becoming adept at their successful application to the solution of the manifold and varied problems constantly confronting the mining engineer, and that in a district where the experiments and experience of centuries had brought the art to a high pitch of perfection, and where might be studied fully the characteristics of mineral veins and deposits as laid bare by the most extensive workings and thorough exploration.

Having thus acquired the necessary training and experience, he early in his career became connected with the well-known London mining firm of John Taylor & Sons, with whom he remained actively associated until he finally abandoned mining, and for whom he successively managed a number of mines in various parts of the British Isles before coming to this country. His first independent charge was at Castleward Mine, County Down, Ireland, and subsequently he had charge amongst others of the Goldscope

Mine near Keswick, Cumberland, Eng., and of the Lackanmore mine in County Tipperary, Ireland.

In 1859 he came to Canada as manager for the Wellington Copper Mining Co. (subsequently reorganized and known as the West Canada Mining Co.), bringing with him a wide experience of mining operations and mineral deposits. The veins which had been acquired by this company were adjacent to and a continuation of the group on which the old Bruce Mines had been operated for some years previous by the Montreal Mining Co., and were known as the Wellington and Huron Copper Bay properties.

Here he found many difficulties to be encountered in addition to those naturally incidental to

calling for the most desperate efforts to meet the difficulty, whilst at another a bush fire swept away nearly the whole of the prosperous village which had grown up round the mines. Further, if after the close of navigation any necessity arose for a visit to the outside world of civilisation, a tramp with dog teams and on snowshoes of some 250 miles around the shores of Lake Huron had to be faced, all combining to produce a state of things the full inconvenience of which can hardly be realised at the present more favored time.

Notwithstanding all this, owing to Mr. Plummer's experience and indefatigable exertions, extensive mining operations were inaugurated and carried on for years. The Company subsequently acquired the adjacent property of the Bruce Mine, so that all three mines were carried on under the same management, and at the zenith of their prosperity gave employment to a force of over 370 men and boys, whilst it was then estimated that the operations supported directly or indirectly some 1,800 people, of whom 1,500 resided in the village adjacent to the works.

After a period of some nine years of anxious and arduous effort Mr. Plummer began to find his health giving way under the strain, and resolved to take the position, offered him by the Government, of Visiting Superintendent and Commissioner of Indian Affairs for the Western District, so resigned his charge at the Bruce Mines in 1868. For five years he remained in his new position, residing on Manitoulin Island, being however moved to Toronto in 1873, where he was given the Superintendency of the Central District. In this new sphere also, in his treatment of the of the Indians and their affairs, he met with the same success that had characterised his former career, several kindly tokens testifying to the regard they had for him. In 1883 he was removed from Toronto to Ottawa to take the position of Commissioner of Indian Lands which he held until 1887 when his rapidly failing health, the seeds of which had been sown at Bruce Mines, forced him to seek superannuation. After two years of well earned rest he passed away on the S.S. Orinico whilst returning from Bermuda, whither he had been in search of alleviation.

The influence the operation of so extensive and long-continued an undertaking as the "Bruce Mines" group would have on the development, both mineral and otherwise, of a new district can hardly be over-estimated, and in this connection as well as in his later career Mr. Plummer rendered signal service to the land of his adoption, in whose progress he always took the keenest interest and an active part. He reported on and was instrumental in bringing into notice a great number of mineral deposits, all the way from the silver district of Port Arthur to the Eastern

THE LATE WILLIAM PLUMMER,
Mine Manager of the West Canada Mining Company.

the opening up of new mines. These were due to the wild and unsettled nature of the district in those days. Communications with the far distant settled parts of the country were only by water, and were, of course, therefore only available for the summer half of the year, and besides were even then bad and uncertain. So that not only was there constant difficulty in shipping away the product of the mines, but their supplies of material and provisions were also often jeopardized by the sudden and violent lake storms, so that at times the question of daily bread was often a cause of the greatest anxiety. At one time the whole winter's supplies failed to arrive,

Townships of Quebec, many of which are now known by names familiar to all Canadian miners, his reports being notable for good judgment and that spirit of fairness characteristic of all his actions. He leaves behind him a large family to carry out the traditions and motives he inculcated, so that the name is already connected with success in banking, commerce and other lines in Canada, whilst one son, by his eminently successful career as a mining engineer in the United States, still keeps up the credit of the name in connection with our beloved profession.

Although not actively participating in mining matters Mr. Plummer kept up his interest in it till the end, one of his last actions being the giving of valuable evidence before the recent Royal Commission of Enquiry into the Mineral Resources of Ontario.

His connection with the early political events at and subsequent to Confederation caused him to be widely known amongst the prominent men of Canada, amongst whom he had many warm friends, and in his death Canada loses a skilful miner, a loyal citizen and a kind and true-hearted gentleman.

Our portrait sketch of Mr. Archibald Dick, Inspector of Mines, Nanaimo, held over to the death of Mr. Plummer, will be published in our next issue.

A Trip to the Lieres Phosphate Mines.

(By Capt. Robert C. Adams, Montreal.)

It is considered a fortunate circumstance when business and pleasure can be combined, for business is usually drudgery, and pleasure that has not the element of service soon palls. There are few better opportunities of realizing this desirable condition than that which falls to the lot of one who has occasion to visit the phosphate mines of the Lieres River. Here nature has heaped together attractions which would make the fortune of any similar locality in Europe; and the industries of man have formed interesting centres amid the beautiful framework.

An afternoon in Buckingham affords hours of rare enjoyment. Walking to the riverside one comes to the saw mills of Messrs. Ross Brothers. There can be seen the great logs that have been cut during the winter 150 miles away and have floated down the stream, through cascades, down slides around the fall, and finally been gathered within the boom where, when their hour for transformation has come, they are guided on to the grip of the endless chain that carries them up to the mill on to a travelling platform that moves them to the circular saw or the gang saws, changes them into boards and deals, and they float away down a narrow chute for three miles to be piled up to dry and await shipment. Across the river are the mills of James McLaren, Esq., where similar work proceeds; and near by is his elegant mansion and attractive grounds overlooking one of the finest cascades in America. Between these mills is stretched an artificial dam over which the water pours in a clear sheet; but for a short distance only nature has here erected barriers of rock that break up the torrent, which thence rushes with tremendous roar and indescribable confusion through a narrow gorge. Such a tumultuous rush of waters is rarely to be witnessed, and it is hard to repel the fascination that would tie one for hours to the spot watching the ever varying forms that the cataract assumes as its torrents pour into the deep rocky gulfs and boil up again leaping aloft in myriad sprays.

Half a mile higher up the river is another dam and a cascade of great beauty, which, but for the majesty of the first would be deemed a sufficient attraction. Here has been erected a pulp mill. The spruce logs being cut into short lengths are held against a revolving plane that takes off the bark; after which they are pressed against grindstones flooded with water and are ground to pulp. This being fed to a paper machine is pressed into sheets and folded up ready for sale to the manufacturer of paper. Thus trees, brooks and stones combine to aid literature, fulfilling in another sense Shakespeare's words:—

"And this our life, exempt from public haunts,
Finds tongues in trees, books in the running brooks,
Sermons in stones and good in everything."

This beautiful spot has its charms dimmed by tragedy; for the villagers tell how twenty years ago a minister, burdened with the support of a crippled sister, tied a stone to her leg and drowned her through a hole in the ice.

The steamer *Agnes* is under command of Capt. George Bothwell, a skilled veteran in the intricate navigation of the Lieres River and the possessor of a genial disposition which is greatly appreciated by the passengers on this river omnibus, who require to get on and off at all sorts of odd places where the boat must run her nose into the bank or drift broadside to the shore while the passengers skip to and fro on the perilous shifting plank. Starting on the *Agnes* in the morning a most interesting trip up river awaits the visitor. The stream is narrow, and at first the country is undulating and of a good farming character; but further on the rugged hills arise and tell of stores of minerals awaiting the search of the adventurous prospector and the toil of the hardy miner. These woods skirt the banks and cover the hills, save where the farmers' clearance or the forest fires have made their mark. For picturesque beauty there are few river panoramas that will vie with this stretch of 25 miles, which culminates in one of the most attractive scenes on this continent—the High Falls.

About 8 miles above Buckingham the first sign of the phosphate mines appears in the new wharf of the lately opened Squaw Hill Mine, where English capital is being intelligently applied by Mr. Smith, who has come out from London to superintend operations. The Emerald Mine then comes in sight with its many signs of activity and enterprise, buildings, derricks, tunnels, tramways and great rock dumps testifying to the vigorous work that has been done, and suggesting the thousands of tons of phosphate that have been sent to Europe from this famous hill. The Little Rapids Mine is passed, and the slow progress of the canal, building on contract for the government, is commented upon with the remark that the work is indeed *little rapid*. Next appear the new buildings of what is locally called "the London Company," where Mr. Pielsticker has made an enterprising start which deserves good success. The landing for the famous North Star Mine, that cleared \$30,000 last year, is now passed, and upon enquiring if the sale to English investors, reported six months ago, is completed we are told "the mine is sold but the sale is not finally consummated," an expressive statement of a condition familiar to all who have tried to dispose of mining properties. Now the bare Ross Mountain looms up and we are told that the adjoining Lot has just been bought by some eminent Dominion Legislators. Crown Hill and High Rock landings are passed, and on the opposite bank are seen the piles of white mica and feldspar from the Villeneuve Mine. This feldspar through the sagacity of Mr. J. Keith Reid has been brought to the notice of the pottery makers and is pronounced the highest quality found on this continent. The river being high with the coming down of the north water, the steamer proceeds on the unwonted passage of the long rapids. With a full head of steam and an axe on the safety valve she struggles against the impetuous stream and after an uncertain conflict slowly gains ahead and wins her way to smoother waters. Landing at the Portage, the visitors clamber up and down hill to the foot of the High Falls, but are interrupted by a timber chute down which torrents of water are passing and through which shower baths are falling. Only a few adventurous men and boys endure the ducking and gain the best viewpoint. Some of the ladies, deterred by the precipice, give up the effort to get full sight of the cataract; but a few people ascend the rocks, climb rotten ladders and scale the old timber slide. At last a point is reached too perilous to be ventured upon and all return save one couple. A rotten and slippery timber stretches over a deep ravine having jagged rocks at its bottom. The lady's heart beats violently and she fears to cross; but her escort going in front reaches his hands behind and with fervid clasp her faltering steps brave the fearful danger. A few thrilling moments of peril that seem to involve ages are followed by a bound to the solid rock and the fervid clasp is changed in direction and increased in intensity. Though the Lieres has its tragedies it also has its romances! Standing alongside this immense cataract with throbbing heart and pulsing view, contrasting conscious safety with the rareness of deadly peril, one gazes upon the wild waters rushing down into the great calm basin encircled by almost impenetrable forests and realizes that words fail to convey the emotions and impressions and is content to say with Moore:

"How fair though art let others tell
While but to feel how fair be mine."

Only a year ago another tragedy cast its shadow upon this marvellous scene. A highly esteemed young minister, in spite of warnings, ventured near the rapids and was drawn towards the falls. Finding escape with the boat hopeless he was seen to plunge into the water in a vain attempt to swim, but the remorseless torrent bore him to destruction. The body was afterwards found with not a bruise visible upon it.

A party of four decided to stay over at the phosphate

mines and explore the famous range of hills that has yielded the great bulk of Canada's export of the fertilizing rock. On her return down stream, the *Agnes* dropped the party at Crown Hill, and they teiled up the tramway to a height of 350 feet, but the city man declared it was 15,000 feet measured by effort. Here are the mines of the Canadian Phosphate Co. and a hearty welcome is extended by its representatives, Mr. Thomas Lyons, superintendent, and Mr. Merrill, shipping clerk. After a good supper, the comfortable chairs in the sitting room received the wearied forms and amid a cloud of smoke the ear is regaled with the facts and legends of the mine. As the frogs set up their evening refrain the superintendent tells of the Irish lady, who after her first night at the mine went to the frog pond with a big stick in her hand "to hit them little ducks when they put their heads out." Wire mattresses afforded unwonted luxury in a mining camp, and the next morning found the visitors ready to explore the mines. It was Sunday, and the superintendent most kindly devoted his leisure to the edification of the party. The various pits were visited and descended. It was found that they were worked with small boilers and hoists placed at each pit, the mining was done with steam drills and in some wet pits steam pumps were used. The ore as it came out was placed in cars and drawn by horses to the cobbing house, where a complete system of separation was well provided. The ore when ready for shipment was drawn to the brow of the hill and thence lowered in cars down the steep incline by a wire rope over 2,000 feet in length, made in one piece without a splice. All the arrangements were pronounced to bear the impress of skill and good judgment. Telephones transmitted orders to distant points and saved the expense of messengers; and every economical device that could be readily applied seemed to have been thought of. But it is not enough to have a well equipped mine; minerals are a desirable feature in a mining property, though sometimes not duly considered by speculators, who, if they can sell a mine, have no concern for its future. It was with interest therefore that the existence of large deposits of phosphate was observed and it was seen that the extensive preparations for handling the ore were warranted by its presence. The green apatite was found to occur in irregular bunches all through the rock, so that the whole mass was more or less permeated with it and the hillside must be quarried down, the amount of phosphate now being proportionate to the tons of rock removed. "It's all through the rock," said Mr. Lyons. "Sometimes you'll put a shot into bare rock and the pit will be all strewn with phosphate and you wonder where it comes from. But," he sadly said with candor, "sometimes it works the other way and you don't see as much as you expected to!" After Crown Hill had been explored and approved by the self-constituted inspectors, the party drove and rode to Star Hill, three miles distant, the famous mine formerly operated by the Union Co., but now owned and worked by the Canadian Phosphate Co. The big pit that has yielded so many thousand tons of ore has been abandoned and the immense rock dump testifies to labor in vain and sinking of capital. But other pits have been successfully opened and large surface shows are being worked. A good output is being secured and a prosperous future seems certain. After dinner had been provided by the courteous manager, Mr. Cameron, who has charge here under Mr. Lyons' general superintendence, a charming walk was taken for two miles through the deep forest, verdant with the freshness of spring, and as yet unvisited by the baneful mosquito or black fly, two mysterious plagues whose existence if satisfactorily explained by the theologian might unravel the riddle of the universe. New workings are seen a mile away, proving that the deposits of phosphate occur all along this mountainous range; and the walk is terminated at the Central Lake mine, where a great cutting has been made showing the same rich green streaked rock that characterizes all the workings of the district. The enterprising owner, Mr. S. P. Franchot, also manager of the famed Emerald mine, has brought a steam boiler and hoist upon the scene, a striking intrusion of civilization upon savagery as it stands in the midst of the seemingly inaccessible wilderness. It will doubtless bring to the surface large quantities of ore and demonstrate the richness of the ground.

Some pits showing good veins of phosphate were then visited on the adjoining Lots of the Anglo Canadian Phosphate Co. On the highest hill, at a little distance, their lofty derrick stands in the weird solitude awaiting the slowly approaching completion of the *little rapid* canal, which will permit steamboats to come to these lots by the drowning out of the Long Rapids, when supplies can be brought and phosphate transported more cheaply and work can be profitably resumed. Here is a wonderful view of hills and vales covered with deepest forests, except in one direction where a German colony has made clearance in a valley and secured prosperous farms and comfortable homes. Amid the wildness of nature this glimpse of man's effort and supremacy brought feelings of satisfaction and cheerfulness. Getting back to Crown Hill in a drenching rain, arrayed in borrowed

garments, fed on the succulent baked bean, cheered by strains of banjo and fiddle, enlivened by the dance (until a visitor's head is punched by the hanging lamp), warmed by gymnastic tricks and with circulation quickened by slaps from a miner's bootleg, this energetically spent "day of rest" ends in a night of repose. Monday morning the electric bell summons the outsiders of the party to rally at breakfast and a walk is taken up hill for half a mile to the justly renowned High Rock Mine, which year after year turns out its five or six thousand tons and like Tennyson's brook sings:

Seams may come and seams may go,
But I go on for ever!

The great dog Mousettaire, an immense St. Bernard, accompanies the party, but the High Rock collie thinks he belongs to the best mine and pluckily insults the Crown Hill intruder. A terrific dog fight ensues, soon joined in by a Newfoundlander, and the three dogs are mixed up in an indescribable medley and uproar of tumblings and yells. Now Mouse has Collie by the neck, then Collie has Mouse, by the lip and the advent of the black dog on the top of the heap occasions a new diversion. The row stops at last, nobody knows how; the combatants are collared and are told that phosphate dogs should not delight to bark and bite.

Mr. Twidell the clerk of the mine now politely takes the visitors in hand. The three bears in the great cage are visited and caressed and are found to agree better than the dogs. Then the seven drill Rand air compressor is seen to be working well, saying in its puffs, so miners assert, "a dol-lar a min-ute." The Cap Rock pit is descended, where a great vein has been followed to a considerable depth and large bunches of ore are to be seen here and there all along the lead at the back of the hill; being lowered down in the tramcar, the famous No. 11 Pit is visited, and here is seen a real mine with its tunnel, shaft and drifts in which the air drills with unearthly roar pierce the rock. Wonderful bunches of phosphate are examined and the verdict is passed that High Rock is good for many a long year. The cobbing house is visited and all the transport system surveyed by which the ore is hoisted up the hill in tramcars, which then run by gravity for two miles down the hill and dump into the barges. The party are told that a 12-drill Ingersoll air compressor is to be placed at the river for the sake of cheapness of fuel, and the power is to be carried in pipes two miles to the workings. The pipes above, it is said, will cost \$6,000. May the day of electric mining be hastened when a little wire will carry the power!

After dinner at Crown Hill and a general boat blacking the party are lowered down the incline which the city man declares is much shorter one way than it is the other. Then the *Agnes* appears and steams into a floating raft to receive the wanderers. They depart, profuse in their expressions of gratification of the courtesy received and the enjoyment experienced, but yet loudly complain at the exorbitant charges, for when asked for "the hotel bill" the superintendent replies, "A thousand dollars and I won't take a cent less!" Of course no such sum is to be found in the pockets of the visitors, and they are generously and trustfully allowed to depart without any seizure of their gripsacks for security.

The trip down river with the current is quickly made, in spite of numerous stoppages for passengers and goods. But the sights of the region have not been exhausted. The next morning a walk is taken in the slides along the river for three miles. The water having been turned out to permit repairs, a dry plank walk is afforded through pleasant groves and near rushing cascades until the Basin is reached, where the Lievres pours tumultuously down its last rapids to mingle with the waters of the Ottawa. Here are three mills for grinding phosphate. The latest, owned by Messrs. Lomer, Rohr & Co., of Montreal, has a new system of separation, devised and erected by the Messrs. Taylor, father and son, who politely explain its workings. It appears that the long-felt need of mechanical means of removing the rock from the apatite, in place of the slow and ineffective methods of hand cobbing, has been in a measure realized and a great impetus is likely to be given to the phosphate industry by the ingenuity of the inventors and the enterprise of the owners.

Mr. Fred Wilson's team of handsome blacks now awaits to drive to Mr. Wm. McIntosh's successfully opened mine in Templeton, with a range of further possibilities of visits to famous mines most tempting to the explorer and excursionist. One who visits this region need fear no limitation of opportunities for research and enjoyment. Rod and gun have their mission abundantly provided for, and as evidence of the treatment the wayfarer may expect, it may be mentioned that taking refuge from a shower in the little log house of Mr. Robert Corner, the party was made to partake of dinner, for which compensation was refused, and the money left upon the table was brought to the carriage with the earnest remonstrance, "God forbid we should take anything for giving a body a bit to eat."

Such is a phosphate trip up the Lievres River and such is the hospitality and simplicity of the people. Surely

nowhere can the lover of nature, the seeker for adventure and the inquirer into mining industries and resources find a better field for an outing.

The Early History of Copper Mining on Lake Superior.

E. B. Borron, M. E. Collingwood, Ont. *

It would appear from what are called Indian diggings that the existence of native copper on both shores of Lake Superior must have been known to some of the inhabitants of this continent in very remote times. The only localities where these diggings have been found on the north shore are, so far as I know, at Cape Mamainse and upon Isle Royal. Although the occurrence of native copper on both sides of Lake Superior was mentioned a century before in the narrations of the Jesuit missionaries, it was not till the year 1770 that we hear of any active mining operations by Europeans. We learn that some three years before that date one Alexander Henry, an Englishman, engaged in trading with Indians, had passed the winter on Michipicoten Island and reported the existence of lead at Mamainse and of the grey ore of copper at that and various other places. In the year following, 1768, Captain Carver hazarded the prediction that "in future times an advantageous trade in copper will spring up." So far, taking in both shores, the gallant captain was a prophet; but in view of the magnificent canal and locks since completed, how primitive were his notions as to the best way of accomplishing this? For he goes on to say, "The metal will be conveyed in canoes through the falls of Ste. Marie, and thence in larger vessels to the falls of Niagara, and after being carried by land across the portage will easily be transported to Quebec." In 1770 Henry formed a company, in which the Duke of Gloucester and other prominent Englishmen were partners, to work mines on Lake Superior. They had a shipyard, it is said, at Port aux Pines, about six miles above Ste. Marie, where they built a sloop of 40 tons. A party of miners were in the first instance sent to Ontonagon river on the south shore, where it would seem to have met with no success. The force was then transferred to the north shore, somewhere it is thought about Pointe-aux-Mines or Mica bay. Here they sank thirty feet in the solid rock, but the vein, which at the surface was four feet in breadth; had, it is said, contracted in the bottom of the shaft to four inches, and under these discouraging circumstances further mining operations were abandoned. In one narrative it is stated that the shaft caved in and killed some of the miners, and that this, together with the difficulty and expense of transporting supplies, led to the abandonment of the enterprise. From other sources we learn that the drift which the miners were driving in soft ground caved in, owing to them neglecting to timber it properly. It is unlikely that such an accident would occur to a shaft sunk in the solid rock and not more than thirty feet deep. This circumstance, taken in conjunction with the fact that many other veins presenting a good appearance at the surface, in that section of the country, have subsequently been found to fail and become worthless at a comparatively shallow depth, leads me to think that the first account is the true one. Henry remarks that it was partly in hopes of finding silver in sufficient abundance to make the speculation profitable that the works were commenced. To Dr. Douglas Houghton, State Geologist of Michigan, belongs the merit of being the first to explore, and in his report for 1841, to make known the leading features of the region on the south side of Lake Superior, and to give reliable and definite information with regard to the rich deposits of native copper. With the enterprise so strongly characteristic of our neighbours, no sooner had the Indian Title been extinguished (1843) than a vast number of applications were made for tracts of mineral land, and the work for both exploration and development was carried on with great vigor, and in some instances with remarkable success. From the year 1773 till 1845 no mining whatever was done, as far as I know, on either the north shore of Lake Superior or Lake Huron. About the latter date, however, the attention of Canadians having been roused by the richness of some of the veins discovered on the south shore, they began to form companies with the view of exploring for and working the mineral deposits on the north shore, which it was thought might prove as rich as those on the American side. Among others was the Montreal Mining Company. The first steps towards the organization of this enterprising company were taken, I believe, in 1845, for I find on reference to a few rough notes taken from the annual reports that Mr. Forrest Sheppard left Montreal with a small party on May 2nd, 1846, for Lake Superior to explore for and locate mineral land for that company. This was followed by another and larger party on the 8th of that month. The whole, when ultimately assembled on Lake Superior, numbered between eighty and ninety persons, and were under the charge of Mr. Sheppard,

who had been highly recommended as well qualified for the position. The coast from Sault Ste. Marie to Pigeon river, upwards of 500 miles in length, was surveyed and more or less carefully explored. That the company were very sanguine as to the importance of the results of this costly expedition, and the great value of the mineral tracts thus acquired by them is evident from the first annual report of the trustees, wherein the north shore is described as "a region abounding in mineral treasures requiring only the hand of the miner to convert it into a source of perhaps inexhaustible wealth." Mr. Sheppard selected eighteen tracts, or mining locations, as we call them. Each tract was, in terms of the Crown Lands regulations of that day, five miles in depth by two in width, and contained ten square miles of land. These, with one or two exceptions were all obtained from the Government. The price then charged was I believe, £150 Halifax currency paid down for each location, and 4s. or 80 cents an acre, payable by instalments. I think, however, that the company obtained their land for 20 cents an acre. In 1847 the company's operations were confined to a re-examination of the locations on Lake Superior and to testing the veins upon several of them, in addition to which the coast of Lake Huron was explored from Sault Ste. Marie to Lacloche, and several other mining locations applied for, which, however, were subsequently abandoned. The company was greatly disappointed with the results of both the re-examination and the work done on their Lake Superior locations. They had failed to realize the hopes raised by the explorations of the previous season, and the directors naturally, but somewhat hastily, as it appears to me, blamed Mr. Sheppard for his selection, and the men who were employed to test the veins on the locations, for their supposed incompetence.

In justice to Mr. Sheppard it is only right to mention that twenty-one years later the celebrated Silver Islet vein was found to be included within the limits of one of the locations selected by him, and for aught we know other veins quite as valuable may be found in other locations. It was in this year that rich copper veins were discovered on what were afterwards known as the Bruce Mines and Copper Bay locations. The Montreal company, by the advice of their manager, Captain Roberts, an experienced miner who had been brought out from the United Kingdom, purchased the Bruce Mines location. So strongly was Captain Roberts convinced of its value that he recommended the directors to pay as much as £100,000 sterling, if it could not be obtained for a smaller sum. The amount actually paid was, I believe, about £40,000 Halifax currency. The company had previous to this completed its organization and obtained a charter but after the purchase of this property the stock was raised from 40,000 to 60,000 shares of £5 currency each, and the whole energies and means of the company were thereafter concentrated on the Bruce mines. In the three following years, 1848-49-50, work at the mines, both underground and upon the surface, was prosecuted with great vigor. Dwelling houses sufficient to accommodate several hundred persons, with offices, stores, warehouses, wharves, etc., suitable for mining on a very extensive scale, were built; a powerful engine and ore dressing machinery put in place, and large copper-smelting and refining works erected. Shafts had been sunk, levels driven, and a large quantity of ground stoped, the ore or produce of which was for the most part lying at the surface at midsummer, 1850. A great sum of money had been spent and no returns as yet obtained in a tangible form or shape from the mine. The ore, estimated to contain 6½% copper, as it came from the mine, owing to the expense of transport, was not marketable until dressed or separated from a portion at least of the rock with which it was intermixed. In order to do this a powerful engine and suitable machinery were necessary. These had arrived at the mines from England, together with an engineering expert, in the fall of 1848. This man very imprudently built an engine house of rough or imperfectly hewn stone in the winter, and before spring most of the machinery was in place. The consequence was that as soon as the spring thaw set in this large and costly building fell down. This misfortune, and a severe visitation of cholera, in 1849, delayed the completion of the ore dressing machinery and the possibility of obtaining returns until the summer of 1850. The company had now arrived at what may be regarded as the most critical period of its existence. The stockholders had been led to believe that the veins were extraordinarily rich, and that there was sufficient rough ore already mined and at the surface to yield when cleaned some 5,000 tons of dressed ore, worth at least \$200,000 or \$250,000 net. The opinions, estimates and reports upon which these sanguine beliefs rested were, now that both the ore dressing machinery and smelting works had been completed, to be tested by practical results. In order that nothing might be wanting to ensure success, the president of the company, the late Hon. James Ferrier, went to England and brought out a mining captain, a copper refiner and three furnace men. He also selected a gentleman for manager so highly recommended that the board of directors made an agreement with him for five years. Not-

* Evidence before the Royal Commission of Ontario.

withstanding all these precautions the result of the following years operations were a sad disappointment to all concerned. The ore dressing machinery was found to be incapable of crushing and cleaning properly more than one-half the quantity of ore the engineers had said it would do. The ore on the surface was found to yield when dressed little more than half the quantity and value that it had been estimated at, and the smelting of the ore by the Welsh process had proved a complete failure. Under these circumstances the anger of the unfortunate stock holders would seem to have fallen on their officers, all of whom either resigned or were dismissed the following year, 1851. In 1852 I was myself appointed manager of the Bruce mines. The mining captains still continued to report that the stopes were producing from two to three and in some instances four tons of 15 per cent. copper ore per fathom. Careful comparison of the total quantity of ground stoped or otherwise excavated, with the number of tons of dressed or marketable ore actually obtained therefrom, convinced me that the veins had not upon an average yielded more than one and a half tons of 15 per cent. copper ore per fathom. Hitherto the miners had worked under what is known in Cornwall as the "tut-work" system. Under this system they are paid according to the quantity of ground cut, but have no interest whatever in the ore. The other system is that under which the miners are paid so much a ton of the dressed ore. In Cornwall it is called working on tribute, and the system under other names and with modifications is adopted in many mines elsewhere. The "tributer" is deeply concerned in the richness of the veins; and while it is his interest in common with his employer to avoid all waste of ore, it is not his interest unnecessarily to excavate or stop away the wall rock or barren and unproductive portions of the vein. This system I determined, if possible, to introduce.

The miners were accordingly offered prices which would have enabled them to have earned considerably higher wages than under the former or tut-work system, if the estimates and reports of the mining captains in reference to the productiveness of the various stopes or pitches had not been excessive. All except a few refused to take bargains on the terms offered, and many left the mine rather than do so, most of them asserting that the estimates in question were too sanguine, if not greatly exaggerated. Some twenty miners, however, consented to take contracts in the richer portions of the veins under a modified form of the tribute system, at prices based upon our own estimates. By thus reducing the mining expenditure within narrow and safe limits, and at the same time keeping the ore-dressing machinery fully employed cleaning up the poor ores and waste, of which there was a considerable quantity, especially in the form of skimmings, or skimmings thrown off in the process of jigging, it appeared to me quite feasible to make returns which would for several years at least exceed the expenditure. This policy I concluded to carry out with the approbation of the President, then Mr. Hugh Allan, hoping that in the meantime some improvement in the mine, increase in the price of copper or reduction in the cost of producing and transporting the ores to market, might enable us to render a favorable balance permanent. Expectations were so far realized that in 1853 the directors felt justified in declaring a small dividend, followed by a larger one in 1854. In this the board, as afterwards appeared, acted precipitately, being moved thereto rather by what was hoped for and expected than by what had been really accomplished. I was myself sanguine that the returns in these first years of my management would exceed the expenditure, and although I did not advise that step, my reports may unintentionally have led in some measure to its being taken. In 1853 and 1854 the price of copper was exceedingly high, and I was strongly urged by the president to increase the output of the mine to its utmost capacity. To do this we were obliged to resort to the tut-work system again, as a limited number of miners only were willing to work on tribute. The result was again most unsatisfactory, and a serious loss was sustained in 1854 and 1855. This loss was owing to the necessity we were under of working the poorer stopes, and to the very high wages we were obliged to pay both miners and laborers in consequence of the demand for men not only at the mines on the south shore of Lake Superior, but at Sault Ste. Marie, where the canal was at that time under construction. It was, however, greatly aggravated by the total loss of the company's steamer late in the fall of 1854, with very nearly all the materials and machinery required for mining and ore dressing operations during the winter—a loss which could not be fully replaced before the next summer. It may be proper to mention that in 1853 I began to fear that the veins were becoming poorer, and that if they fell off generally as much as they had done in several of the deeper shafts they would soon become unworkable. These opinions were represented to the president, and I urged him repeatedly, in the interest of the stockholders, to sell the mine if anything like a reasonable offer could be obtained for it. This at length he attempted to do, but the price asked was so high that no one would even look at it. It was perhaps in anticipation of being placed in a better position to dispose of the mines on good terms

that the president was led to advise the payment of a dividend in 1854.

In the summer of 1885 the tribute system was again adopted and the mining operations on a limited scale were thus carried on without much loss I think till about 1864 or 1865 when the whole location was sold to the West Canada Mining Company, who had for ten years rented the western portion of it. In 1870 the Montreal company sold the whole of their immense Lake Superior property, inclusive of Silver islet. This unlucky sale was, I believe, brought about partly in the fear that the silver ore, of the existence of which they were fully aware, was a superficial or surface show only and would not go down to any considerable depth, and partly in the belief that situated as the vein was below the water of Lake Superior it would be exceedingly difficult if not impossible to work it, and that at any rate a large sum would have to be raised and expended and might possibly be lost; in addition to which they were threatened with law suits in regard to their title. Still if the patience and the means of the company had not been exhausted by twenty years of unsuccessful effort at Bruce mines they would undoubtedly, I think, have retained and worked Silver islet and been, if the reports of the working of that mine are to be credited, amply compensated for their previous losses and disappointments. In view of the fact that its directorate has included many of the shrewdest and most upright and honorable merchants and professional men in the City of Montreal, and that its officers have been men of at least average intelligence and experience, results so disastrous to the stockholders and discouraging to others call for explanation. There are several reasons why, in my opinion, the Bruce mines failed to realize the sanguine expectations of the company. The veins on the surface were large and showy, containing more or less of the rich grey and purple ores of copper in addition to the common yellow ore. The gauge of the veins, throughout which the ore was distributed was a pure white quartz, and the whole doubtless presented, a very fine appearance. Captain Roberts on first seeing the location reported as follows: "This vast deposit of copper ore at the outcrop of the veins is incalculable and almost unparalleled. It exceeds anything I have seen or heard of in Europe." Whether from a failure in the richness or in the quantity of the ore, or in both, we find that Captain Roberts one year later had modified or changed his opinions. There is no doubt that the rich grey and horseflesh ores gave place to the poorer yellow ore at a very insignificant depth, and it is probable even that in this short time the veins in some of the stopes had become less productive. A very careful examination of the mine by the late Sir William Logan at this time (1848) went to show however that the veins were still so rich that on the assumption that these was no further falling off in their productiveness, and that all the copper could be obtained in a marketable condition, a large profit might in his opinion still be realized from the mines. But it was in these very assumptions that the chief obstacles to the realization of the profit lay. So intimately blended was the ore with the matrix of the veins, and so inconsiderable the difference of specific gravity, that by no ore dressing machinery or process of separation by water then known was it practicable to obtain in a marketable state anything like all the copper contained in the rough ore or vein stuff as brought from the mine. In attempting to dress the ore to yield 15 per cent. of copper or upwards, not less than two-fifths of it I believe was lost in the deads, or skimmings, and in the slimes. Again as regards the deterioration of the veins, there can be no question whatever that they became poorer and less productive in depth, and that at a relatively shallow depth, as compared with veins in other mining countries, they ran out or became so poor as to be no longer worth following. Very little work has really been done below the 35-fathom level, and the deepest shaft at the Bruce mines was only about 50 fathoms. Thus, without attributing to the managers and other officers of the company either incompetence or deliberate misrepresentation, we find in these two facts, namely: (1) the failure of the veins or lodes in depth, and (2) the impossibility of obtaining in a marketable form much more than three-fifths of the copper actually contained in the veins, sufficient explanation of the almost unbroken succession of over-sanguine reports and estimates on the one hand, and of disappointed hopes and expectations on the other. In 1853 Mr. Sampson Vivian, a miner of Cornwall, England, who had spent some years in the United States, obtained from the Montreal Mining Company, at a royalty of one-twentieth of the dressed ore, a fourteen years' lease of the eastern part of the Bruce mines location. Several veins had already been discovered, and some little mining done by the Montreal Company, but the ore produced being poorer than that got in the eastern part of the location they had not been worked for several years. It was doubtless under the impression that the Bruce mines had been so named in honor of the Scottish patriot, instead of the Earl of Elgin, at that time Governor General of Canada, that Captain Vivian called his mine the Wellington mine.

The ensuing year the lease was assigned to an English company which he had succeeded in forming. It assumed the name of the West Canada Mining Company, and the general management was entrusted to the well-known firm of John Taylor & Sons, of London. Had the company's operations been confined to the lodes or veins of the existence of which they were aware when they commenced, I am persuaded that they would soon have abandoned the enterprise. It was not very long after they had started, however, when a teamster, named George Clarke I think, in searching for strayed cattle accidentally stumbled on a vein previously unknown. A recent bush fire had burned off the moss and vegetable matter, and left the lode exposed at one or two points where it had previously been hidden from view. When uncovered or stripped, this vein and another with which it formed a junction some distance from where it was first discovered, proved not only to be much larger and richer than those the company were then working, but far better than those at the Bruce mines, which the Montreal Company had retained in their own hands. As the uncovering of the veins was proceeded with it became evident to the managers of the West Canada Mining Company that they would, if they kept their course, cross the western boundary. They accordingly very judiciously secured a lease of the adjoining Huron Copper-bay location. I can only say, generally, in regard to this enterprising company's operations, that they were, so far as I had an opportunity of judging, carried on in a miner-like manner; such engines, machinery and ore-dressing apparatus as the large experience of the London managers suggested as being calculated to ensure successful results, were sent out and erected at the mines. So great were the difficulties, and so heavy was the cost of starting and opening up the mines, that notwithstanding the richness of the veins no dividends were, I believe, declared for the first six or seven years. In the next seven years, however, under the energetic and judicious management of their local agents, Mr. James Bennett and Captain William Plummer, several dividends amounting in the aggregate to a large sum were paid to the shareholders. In view of the early termination of their lease of the Wellington mine the company in 1864 or 1865 purchased the whole location, including the Bruce mines, from the Montreal Mining Company. The same difficulties which had been found insurmountable by the Montreal Mining Company and its managers, and under which they had been obliged to succumb, together with lower prices for copper, began to tell with increasing severity on the West Canada Company; and in 1867 or 1868 it would appear that the results had not been satisfactory, for at that period Mr. John Taylor, jr., of London, was sent out to examine and report on the property. He spent six weeks at the mines and his report, which was rendered on the 12th of September, 1868, is remarkable not merely for its ability, but for its general fairness. Mr. Taylor clearly apprehended the chief obstacles to the profitable working of the mines when he says:—"It is evident that the three main points you have now to contend with are (1) the very heavy cost of dressing; (2) the great loss of copper under the present system of washing; and (3) the high rate of freight from the mines home to England." He made two suggestions calculated in his own opinion to reduce the expenses and economize the waste of copper. These were, (1) to smelt the ore on the spot; (2) to reduce the copper by what is commonly known as the salt process. He himself favored smelting, but as in both the copper would be obtained in a metallic state, he estimated the saving in the item of freight alone would not be less than £7,000 or £8,000 sterling per annum. In addition, however, to the three points specially mentioned, another circumstance only slightly alluded to in Mr. Taylor's report must have begun before this time to exercise an adverse influence on the returns from the mine. No one who saw the size or richness of the veins at or near the surface in 1855-56 could fail to perceive, on perusing that part of the report which describes their appearance in the bottom of the various shafts and stopes in 1868, that there had been a great falling off both in the size and the richness of the veins at the depth of 40 or 50 fathoms. Mining operations continued to be carried on till 1876, when in consequence I presume of the continued unsatisfactory results, work was suspended and has not since been resumed. During the mining excitement of 1846-47 a number of other locations were taken up on the north shore of Lake Huron. Among them there was one near the mouth of the Whitefish river, on which at least one shaft had been sunk to the depth of 10 or 15 fathoms, so far as I could judge from the quantity of stuff produced, for I did not see it when open. It was known as the Wallace mine, and owned by the Upper Canada Mining Company. The vein contained copper pyrites and ore of nickel, but not in sufficient quantity apparently to justify further expenditure. I am inclined to think this company had a location on Michipicoten Island, where considerable work was done on a vein of native copper. Some mining was done at the Emerald mine on the Rankin location, near Sault Ste. Marie. The ore was the yellow ore of copper, and in such quantity that had

it been solid, and not so dispersed throughout the gangue of the vein, it would probably have received a more thorough trial. Several locations were also taken up by the late Mr. Killaly and others near Echo lake, on which there were good sized veins.

On two of these shafts were sunk, but which I think did not exceed five fathoms. It was the yellow ore in a gangue of white quartz, but so far as I can recollect it would not yield more than 2 per cent. of copper. Some work was also done at the Begley mine on the north side of Batchawana Bay, where the yellow ore of copper was found in good quantity but of low grade. At none of these mines, so far as known to me, was any copper dressed and sent to market. The Quebec mining company was a bona fide Canadian company organised about the same time as the Montreal Mining Company. The locations of this company were all situated on the north shore of Lake Superior, and on Michipicoten Island, at Point aux Mines or Mica Bay. Misled by surface appearances, and to say the least by the imprudent advice of their manager, they appear to have commenced operations with great spirit, or rather recklessness; a large number of substantial and comfortable dwellings for officers and men, and other buildings such as storehouses, offices, blacksmiths' and carpenters' shops were erected; a good overshot water wheel and ore dressing machinery were also put up; and to complete all one or two copper smelting furnaces were built. From the large force employed at the mine I should think that a good deal had been done under ground as well as on the surface, in the two or three years during which it was worked. In the fall of 1849 the mine was taken possession of for a short time by the Indians, who were dissatisfied because a treaty had not been made with them for the surrender of their rights; but a treaty was concluded in the following year, and no further trouble was occasioned by them. About this time the company tried to sell the mine in England, and an expert was sent out to examine it. He reported, I have been told, unfavorably. At all events the mine was not sold, and in 1850 or 1851 operations were suspended and have not since been resumed. The Quebec company must have expended more than \$100,000, and I have heard that only enough ore was got out to make three or four tons of copper. It is probable that there might be more or less poor ore that would not pay the expense of dressing and smelting. Be this as it may, for I only speak from hearsay in regard to operations prior to 1852, the returns obtained from the mine were unquestionably very small. Some work was done, I believe, on Michipicoten Island, but the result was not encouraging and operations were abandoned there also. About the same time a company called the British North American, I think, did some mining at Princess Bay.

The object of their search was also copper, but I was told by some of the miners who had worked there that it appeared to them more promising for silver than copper. It was also abandoned about the year 1850. I omitted to mention that in 1856-57 the Montreal Mining Co., on my recommendation, made a cautious trial of their location at Point Mamainse, on the north shore of Lake Superior. The veins so far as discovered were neither large, regular, nor well defined, but the display of ore on the surface was tempting, consisting as it did of native copper, grey and yellow ores of copper and galena or lead ore. In this last there was some twelve ounces or more of silver to the ton, and native silver was found associated with the native copper. As little as possible was spent on the surface, pending the result of the contemplated mining operations. Considerable prospecting was done and five shafts were sunk to depths varying from 14 to 60 feet on the most promising mines. From one shaft, which was sunk at a point where there had been an Indian digging, about 1,400 pounds of native copper was obtained. The largest piece weighed nearly 600 pounds, the biggest mass that had been got on the north shore up to that time, if not since. The vein, from the first small and without regular walls, ran out almost entirely at the depth of 10 fathoms, and as it was costing nearly \$200 a fathom to sink the shaft it was stopped at that point. Three other shafts were sunk on different veins on the same trap range as that which produced the native copper, but only grey and yellow copper ores were got, and these not in sufficient quantities to pay, even had there been ore dressing machinery on the spot. The fifth shaft was on a native copper vein on another range of trap some 150 fathoms to the east of that last mentioned—a strong bed of conglomerate being interposed between them. It produced at first some nice pieces of native copper, but at 25 feet in depth the vein was barren of metal, although still ten inches in width and carrying good mineral soils and spars. The vein of silver-lead was too small to warrant the expense of sinking more than a few feet on it. In view of the company's financial condition, and of the fact that a large sum would be necessary to thoroughly test the mine without assured profitable results, operations were suspended in 1857, the amount thus expended being about \$5,000. I am under the impression that the Silver Islet Company have, since their acquisition of the Montreal Mining Co.'s Lake

Superior property, done some work on this location, but with what results I am unable to say. Two English companies have engaged in copper mining on the north shore at a comparatively recent date. One of these properties is situated at Cape Mamainse, upon a location immediately adjoining that I have just described. The other is on the Island of Michipicoten. A large sum of money has been, I believe spent on both mines, but especially upon that at Mamainse. The shipments of copper have been relatively insignificant. That the results have been unsatisfactory, to the shareholders at least, may be inferred from the circumstance that at both these mines operations have now been suspended.

Of the copper mines at Sudbury I am unable to say anything, as I have not seen or examined them. This history of copper mining on Lakes Superior and Huron really includes all or nearly all that has been done in the Province. At least I am not aware of any other part of Ontario where copper mining has been carried on to any extent worth mentioning. That these enterprises have, almost without exception, resulted disastrously cannot be denied, however conflicting may be the reasons given by different parties before the Commission. Nor can it be denied that it would have been very much better for the stockholders in the various mines if the three million dollars worth of copper obtained therefrom had still remained buried in the bowels of the earth, and the four or five millions worth of gold, or its equivalent, expended in searching for and mining this copper, had remained in their pockets. Other parties may have benefited, but the men, for the most part Canadians, who furnished the capital clearly have not. But should anyone infer from the uniformly disastrous results of these premature mining operations that the mineral resources of Ontario, so far as copper is concerned, are unimportant if not worthless, I must beg decidedly to differ from him. In the district of Algoma, from the mouth of French river on Lake Huron to Pigeon river on Lake Superior, upwards of 400 miles in a straight line and nearly double that distance following the sinuosities of the coast, and from thence northward to the height of land, there is, I believe, no considerable area in which copper-bearing rocks do not occur. All along the coast, wherever these rocks are exposed to view, strings or veins carrying more or less copper may be found at short intervals. East of Goulais Bay the copper, so far as my experience enables me to speak, is always found in the form of sulphurets, chiefly copper pyrites, commonly known as the yellow ore. West of Goulais Bay we find the same ores, together with more or less native copper. On almost every considerable lake in the interior indications of copper may be seen if the copper-bearing rocks on the shores be examined carefully, and not infrequently good sized veins are met with, which, under more favorable conditions, would be considered if not rich at any rate worthy of trial. Supposing this belt in which copper-bearing rocks at least predominate to be no more than 50 miles wide, we have an area of 20,000 square miles of what may be termed copper-bearing country in the district of Algoma alone. It is true that many of the strings or veins are small and irregular, and contain so little copper as to be unworthy of attention, that many in which the appearance at the surface is promising fail at a trifling depth, and that even those veins which have been the largest, most regular and the richest in copper at and near the outcrop, have fallen off greatly both in size and regularity, as well as in the quantity and quality of the ore, at a depth of from two to three hundred feet. Nevertheless, we are confronted by the fact that a small strip of this copper-bearing country, two miles in length by about half a mile in breadth, or one square mile in all, has actually produced between 40,000 and 50,000 tons of dressed copper ore, worth in the English markets two and a-half and three millions dollars. Nor are the mines on this single section of land, though of course poorer, by any means as yet nearly exhausted. It is not pretended that deposits such as those at the Bruce mines, the Wellington mines and at Sudbury are to be found everywhere in this mineral belt, nor, in view of the extent and depth of the loose material under which the veins are in most parts entirely hidden, can it be expected that such discoveries will be of very frequent occurrence; but it is safe to assert that in all human probability a great number of such veins or deposits of copper ore do exist in this belt, quite as rich as, if not richer than, any of those already discovered, and that from time to time, as the country is settled, many of them will be found, accidentally or otherwise. I hold therefore that this field of the mineral resources of Ontario is immensely important and valuable; where so much copper in quantity and value has been obtained from such a limited area, how much may not be reasonably expected from the whole of this copper-bearing belt. It may be said, and with some show of reason, that, granting many millions of tons of copper ore may be contained in the rocks of this mineral belt, of what possible importance or value can it be to the province if it is so distributed, and the difficulty and expense of mining it be so great, that when obtained the cost of getting the copper shall be found to have exceeded its value. Now, although in a sense this may and doubt-

less does hold good, in regard to the present value of the copper in this belt, the prospective value to the province may nevertheless be very great.

Were we compelled to mine, dress and send to market this copper under the unfavorable conditions which have hitherto prevailed in this country, experience has demonstrated that it could only be done at a loss. But under the more favorable conditions that will surely obtain in the future it is morally certain that many of these deposits of copper may and will be worked most profitably, and thus prove a source of incalculable wealth to the province. In order to make this clear, let us suppose the Bruce and Wellington mines to have been situated in England, and we shall see how much more favorable the conditions would have been. The wages of the miners and the laborers would have been less than one-half, and the cost of mining would have been reduced in like proportion. The dressing of ores, which in England is done almost entirely by young women and boys, would have not been more than one-third of the cost of that operation in Canada. The expense of transportation to market would not, I consider, have been more than one-tenth of the sum paid for the freight of the ore from Bruce mines to Liverpool or Swansea; in addition to all which it would not have been necessary to bring up the ores by dressing to more than 8 or 9 per cent. of copper instead of from 15 to 20 per cent., thus saving not only expenses but a very large quantity of copper unavoidably lost in the process. Then again, machinery and all kinds of stores and materials, timber excepted, would have been very much cheaper in England. From all these circumstances I am convinced that had the vein at the Bruce mines and the Huron Copper-Bay locations or others of the like character and richness been situated in Cornwall, or almost any other part of Europe they would unquestionably have yielded the fortunate owners very large profits. Now the point I wish to make is this: If our Canadian copper mines be such that if situated in Europe they would have realised very large profits and been considered very valuable, it necessarily follows that to soon as those favorable conditions arrive in Ontario, then at all events, if not before, will copper-mining in this province become profitable, and the vast deposits of that metal in the copper-bearing belt north and west of the great lakes become in the fullest sense of the term valuable. The conditions most necessary to profitable mining, whether in respect of labor, of materials, or of transportation, are being surely, if not rapidly, evolved in the district in which the mines are situated. No one who has noted the growth of the district of Algoma in population and otherwise during the last 30 or 40 years can fail to perceive that fact. But on broader grounds I hold it to be absolutely certain that sooner or later all the disabilities under which in the past copper mining has labored will be removed, and that this country will stand in just as good a position as England herself in regard to the economical and profitable working of her mines. In addition to cheaper labor than was obtainable on the first opening up of the country, much may be expected from the employment of labor-saving machinery in our mines. The use of rock drills, worked by steam or water power, the substitution of dynamite and other more powerful explosives for gunpowder, the employment of galvanic batteries or electricity to discharge simultaneously a number of blasts so placed as to produce the greatest possible effect, are all calculated to greatly diminish the cost of mining, even if wages should remain the same. It is possible also that improvements may be made in the smelting or reduction of copper from its ores. In concluding my remarks as to our copper deposits, I would like to add a word of warning to all engaged or about to engage in mining enterprises, especially in districts where the character of the veins at a considerable depth has not been proved. Not a dollar beyond what is absolutely unavoidable should be expended on the surface, however promising the appearance of the outcrop may be, until one or more shafts have been sunk to a depth of at least fifty fathoms and levels driven each way. This is especially necessary where former experience goes to show that the veins frequently become smaller and poorer, if not altogether barren, at a very trifling depth. Surface expenditure is utterly wasted and becomes a dead loss when the mine itself fails. The fewer failures and the greater number of dividend-paying mines, the more attractive will be the industry to capitalists.

The Canadian Iron Bounty.—The Dominion Parliament has agreed to a proposal, submitted by the Government, for an increase in the bounties that are at present paid upon pig iron manufactured in Canada, with a view to further encouraging the industry. In 1883 a bounty of 1 dol. 50c. per ton (of 2,000 lb.) was granted for three years, and 1 dol. per ton for another three years afterwards. The bounty of 1 dol. 50c. was, however, renewed in 1886, the 1 dol. per ton being made to apply from 1889 to 1892. Under the new arrangement the present bounty will continue until 1892, but from that year it will be increased to 2 dols. per ton for a period of years.

Note on the Friction of Mine-Car Wheels.*

By R. Van A. Norris, Wilkesbarre, Pa.

The following tests were made, during 1889, for the Susquehanna Coal Company, to determine the relative efficiency of several styles of mine-car wheels in use at their collieries at Nanticoke, Pa.

The wheels experimented upon may be divided into two classes: The "old style" (Figs. 1 and 2), which are oiled at every trip; and the "new style" (Figs. 3, 4 and 5), which require oiling about once in two to four months.

Fig. 1 shows a section of a plain cast wheel, with patent annular oil chamber. This is held in position on the axle by a square, split cotter-pin. Fig. 2 is a similar wheel, with a patent cast bushing, which is readily replaced when worn. The lubrication is effected by a simple oil-hole, but the oil is delivered a little inside of the gauge-line of the wheel, where it is most needed. Figs. 3, 4 and 5 are sections of a "new style" patented, self-oiling wheel. In this, the outer end is cast closed, and the wheel is fastened to the axle by a spring cotter-pin, passed through one of the plugged holes. Dirt is prevented from entering the open end by a cap, with faced end and packing-ring, fitting over the end of the

hub. The lubricant is introduced into the oil-chamber through one of the plugged holes in the hub.

When the wheel is in motion, the lubricant is thrown by centrifugal force away from the axle, enters the two ports shown, and is carried through spiral channels into contact with the axle, the surplus oil being carried back to the oil chamber again. The lubrication appears to be effected by oil adhering to, and being swept back and forth along the axle, in the open zig-zag slit, when passing through the ends of the oil channels away from the oil-chamber, where the section and height of the channel are smallest, the back of the oil-channel being conical with the largest end out, and the radial height of the channel from the axle decreasing as it recedes from the oil-chamber.

All the wheels are of the loose outside type, 16 inches in diameter, mounted on 2½-inch steel axles, with journals 5¼ inches long. The axles pass loosely through solid cast boxes, bolted to the bottom sills of the cars, and are not expected to revolve.

Tests were made on the starting and running friction of each style of wheel, under the conditions of empty and loaded cars, level and grade track, curves and tangents. The instruments used were a Pennsylvania Railroad spring dynamometer, graduated to 3000 pounds, with a sliding recorder, a hydraulic gauge (not recording) reading to

10,000 pounds, graduated to 25 pounds, and a spring balance, capacity 300 pounds, graduated to 3 pounds. All these were tested and found correct previous to the experiments.

Most of the observations on single cars were made with the 300-pound balance. The two types of "old style" wheels were found to give results so nearly alike that they have been classed together in the table. Each car was carefully oiled before testing, and several of each type were used, the results being averages from the number of trials shown in the table.

In the experiments upon slow start and motion, the cars were started very slowly by a block and tackle, and the reading was taken at the moment of starting. They were then kept just moving along the track for a considerable distance, and the average tractive force was noted—the whole constituting one experiment.

The track selected for these experiments was a perfectly straight and level piece of 42 inches gauge, about 200 feet long, in rather better condition than the average mine-track. The cars were 41¾ inches gauge, 3½ feet wheel base, 10 feet long, capacity about 85 cubic feet, with 6-inch topping.

To ascertain the tractive force required at higher speeds, trips of one, four and twenty cars, both empty and loaded, were attached to a mine-locomotive and run about a mile

Summary of Friction-Tests on Susquehanna Coal Co.'s Mine-Cars, April, 1889.

for each test, the resistance at various points on the track, where its curve and grade were known, being noted, and care being taken to run at a constant speed. Unfortunately, only four of the "new style" cars were available on the tracks where these trials were made.

The remarkably low results for the twenty-car trips are attributed to variations in the condition of the track, and the fact that the whole train was seldom pulling directly on the locomotive, the cars moving by jerks, so that correct observations were impracticable. The hydraulic gauge was used for these twenty-car tests, and the needle showed vibrations from one to four tons and back. The mean was taken as nearly as possible. The gauge was rather too quickly sensitive for the work, and the Pennsylvania Railroad dynamometer was not strong enough to stand the starting jerks and the strain of accelerating speed.

The tests marked "rope-haul" were made on an empty-car haulage-system, about 500 feet long, with overhead endless rope running continuously at a speed of 180 feet per minute, the cars being attached to the moving rope by a chain, a ring at the end of which was slipped over a pin on the side of the car. The increase of friction on the heavier grades was due to the rope pulling at a greater angle across the car. Correction was not made for this angularity at the time, and the rope has since been re-arranged, so that the correction cannot now be made.

There were not enough curve-experiments to permit the deduction of any general formula for the resistance of these cars on curves.

The experiments on grade agree fairly well with those on a level, the rather higher values obtained being probably due more to the greater effort required in moving them and the consequent jerkiness of the motion than to any real increase in resistance. As the experiments on all styles of wheels were made in an exactly similar manner, the comparative value of the results is believed to be nearly correct, the probable error in each set of experiments, as computed by the method of least squares, varying from about 4 per cent. for slow start and motion to 12 per cent. for the rapid motion and twenty-car trips.

The general results, showing an economy in friction of nearly 40 per cent., led to the adoption of the "new style" wheels by the company. These results, obtained as carefully and accurately as the circumstances permitted, are now offered as showing the approximate frictional resistance of such wheels under the ordinary working conditions.

Comparison of Running Friction of Cars with Old and New Style Wheels on Straight Road, Level and Grade, under Similar Conditions. Average of 807 Tests.

*Transactions of the American Institute of Mining Engineers Washington meeting, February, 1890.

A Miner's Miraculous Escape.—A remarkable fall of a miner down 100 metres of a shaft (say 333 feet) without being killed, is recorded by M. Remneaux in the *Bulletin de l'Industrie Minérale*. Working with his brother in a gallery which issued on the shaft, he forgot the direction in which he was pushing a truck; so it went over, and he after it, falling into some mud with about three feet of water. He seems neither to have struck any of the wood debris nor the sides of the shaft, and he showed no contusions when he was helped out by his brother after about ten minutes. He could not, however, recall any of his impressions during the fall. The velocity on reaching the bottom would be about 140 feet, and time of fall 4.12 seconds, but it is thought he must have taken longer. It appears strange that he should have escaped simple suffocation and loss of consciousness during a time sufficient for the water to have drowned him.

Coal Production of the United Kingdom, 1889.—The official returns of the number of miners, the production of coal and the cost of life in that production, in the United Kingdom have been made known. Last year 176,916,724 tons were produced, some 6,000,000 tons more than in the preceding year. It is gratifying to notice the diminution in the loss of life—the general average being one life for every 178,227 tons.

Ocean Shipments.

The following are the official returns of shipments, per ocean freights, from the Port of Montreal to date:—

Templeton District.

The Blackburn mines, under the management of Messrs. Lomer, Rohr & Co., are being worked with much vigor, and an average output of 500 tons per month is being made; 100 men are employed. Five pits are under operation. As a great deal of development work has been done on the property, it is hoped to materially increase this output at an early date. Twenty-five teams are kept steadily at work hauling ore from the mine.

At the property of the McLaurin Phosphate Mining Company work is going on steadily on four different pits; a very large deposit on Lot 8 in the 17th is also being developed. Arrangements are being made to haul the ore to a shipping point immediately. The company expects to place at least 1,500 tons on the market this year.

Lievres District.

We are informed that Mr. Fred Wilson, Buckingham, has transferred his interest in his phosphate Lot adjoining the Ross Mountain to the Hon. J. C. Abbott and Hon. C. C. Colby, the consideration being \$8,000 cash.

Messrs. Lomer, Rohr & Co. have a gang at work picking over the dumps at the Emerald, and although the quality of ore thus obtained is necessarily of low grade, we understand that this enterprising firm are making a good thing out of their venture. Mr. S. P. Franchot who is now, we believe, the sole owner of these the oldest worked mines in the district, has a largely increased force at work underground, and from the quantities of ore being raised we should judge that he is again in bonanza.

Mr. J. B. Smith, M.E., manager of the Squaw Hill and Aetna mines has a force of some sixty men at work. The old "Grant" pit has been cleaned out and a number of promising pits uncovered. Mr. Smith is arranging for the construction of a tramway and the erection of a compressor and other mining plant. About 500 tons of excellent quality are ready for shipment.

At the Little Rapids mines, where operations have been mainly on the nature of development, and only a small force is employed, some good quality of ore has been raised, and about 300 tons are now ready for shipment.

Immediately adjacent to the Little Rapids are the operations of the Dominion Phosphate Company (of London) under direction of Mr. Gibbs. This enterprising company has erected suitable buildings and equipped the mines with an excellent working plant.

About 130 men are employed at the pits of the Phosphate of Lime Co. at High Rock under Mr. Walter Pickford. The yield to date has, we believe, been somewhat in excess of the figures reported during the same period last year. The extensive additions to the plant, including 12-drill Ingersoll Compressor, boilers and hoisting gear, will reach the mine by the end of the month, and when in working order will greatly increase the productiveness of these well equipped mines. By the way we regret very much to learn that Mr. P. C. Smith the genial mine manager at High Rock is under the weather again. For some time Mr. Smith's health has been anything but good, and he is now reluctantly compelled to seek a much needed rest and change. We are sure we join with all our phosphate readers in wishing Mr. Smith a speedy recovery and return to the mine, where his services are invaluable.

As stated in our last issue, the operations at the North Star are comparatively inactive owing to negotiations pending the transfer of the mines. The output, consequently, is not as large as last season, but Capt. Williams hopes to fill all existing contracts by the end of the shipping season.

Mr. S. P. Franchot has put up a large hoist and boiler, new Ingersoll drills, steam pumps and other gear at Central Lake. A tramline 2½ miles will also be built, but until this is completed the shipments from this mine must be merely nominal as hauling can only be done during the winter months.

The Messrs. Poupore, contractors on the new Locks at Little Rapids, are now making rapid progress with the construction of this important undertaking.

The grinding mills at Bassin-du-Lievres are running night and day turning out low grade stuff for the U.S. market.

Perth District.

The Anglo-Canadian Phosphate Co. is vigorously prosecuting day work at the Otty Lake mines. These pits have been put into operation and more will be opened. In six weeks, 110 tons of high grade phosphate, and 12 tons of seconds, were mined with an average force of less than twenty men. Thirty men are now at work and the number will be increased as fast as pits can be prepared. This property has been worked a good deal by contract and has over three hundred productive openings exposed. It was thought that most of the surface shows had been found, but recent efforts have discovered a number of new seams. Capt. Adams reports that his experience of contract mining is unfavorable. The men have every inducement to produce low quality and generally yield to the temptation, while their manner of working the pits is slovenly and injurious to the property. Henceforth the system of day's labor will be followed, for, though the output may cost more, the higher quality secures a better financial result.

Kingston District.

Summer hauling from the pits of the Foxton Mining Company at Sydenham has begun, and quite a number of teams are steadily employed in this work. Pit No. 1 has reached a depth of 190 feet, and the quality of the ore is found to continue first-class. Several new deposits are also being developed on the property.

Active operations have been begun on the pits of the Kingston Phosphate Mining Co. and the steam hoist and steam drills are now at work. A good output is expected from these pits. Kingston will be the shipping point for the ore from this mine.

Little or no work has been done at the Blake mines (Lot 11, 9th Con., Loughboro) since last summer, but operations were again resumed on the 21st ult., a small force being employed. The outlook is reported promising.

The Rock Lake mines, (Lot 21, 11th Con., Storrington) operated by Messrs. Bell and Claxton, on which a small force was employed during the latter part of last year have increased their working force to 30 men. About 500 tons have been raised to date. The ore is being hauled to a shipping point on Lake Opinicon, quarter of a mile distant from the pits. This is reported to be a most promising property, and the owners confidently expect to produce at least ten tons per day. The phosphate occurs in true veins—not in the "pockets" so characteristic of the mines of the district.

Messrs. Jas. Richardson & Son, Kingston, are working in a small way at their Orser mine (11 in the 11th Loughboro). This is a new property giving favorable indications of being a producer in the near future.

The Sydenham Mica and Mining Co. has resumed operations with a small force at the Eel Lake mines, Township of Loughboro.

Among the other parties mining phosphate in this district are:—Messrs. Swan Bros. at Gould Lake; the Gould Lake Mining Company (Grant & McLatchie) and Capt. Hibbard on Lot 10, 8th Con., Loughboro. An average number of 10 men is employed on these properties.

MINING NOTES.

Nova Scotia.

Miscellaneous.

The next regular meeting of the Gold Miners' Association of Nova Scotia will be held at the Halifax hotel on Thursday afternoon, 3d July, at two o'clock.

It is expected that the new railway from the Pictou coal field to Oxford on the Inter-Colonial railway, near Springhill, will be open in a few days. The saving in distance amounts to about 10 miles for coal going to Quebec as compared with the present route.

Work at the Cape Breton and Nova Scotia collieries continues good. The contracts made in the Province of Quebec are in excess of those made up to the same date last year. Freight and prices are also much about the same. The Cape Breton collieries bid fair to become an important source of supply to the European markets in the near future. Some delay in the transhipment of the coal at the wharfs at Montreal was occasioned by a strike, but this has happily terminated and unloading goes on briskly as usual.

Mr. E. R. Faribault, and party of the Survey, have resumed their examination of the gold areas and are now at work in the district of Musquodoboit.

Mr. Hugh Fletcher, who has done so much sound and thorough geological work in the province, will leave for the Pictou Coal fields in the beginning of next month.

The Tenny Cape Manganese Co. (Limited) which was incorporated last session of the Legislature, as its name implies is a company formed for the purpose of purchasing, mining, shipping and otherwise engaging in the manganese business. It has a capital stock of \$200,000 and is composed of several New York men of known standing and ability, together with several men from the province. They have purchased a large manganese property on the well-known belt of that mineral in Hants county and intend to operate immediately. The Tenny Cape and Chivirari districts contain the most continuous and best beds of ore now known in that province, and the property purchased by the above company has already been worked and has proved valuable which, together with its excellent location for shipping, guarantees them, with the outlay of some capital, a handsome return for their investment. The ore is of high grade and the demand unlimited.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

Dr. A. R. C. Selwyn, Director of the Geological Survey, is now in the province with the object, it is said, of having an investigation made by Dr. Bailey into the geology and minerals of Colchester County.

The Nova Scotia Steel and Forge Company, of New Glasgow, has been merged into the Nova Scotia Steel and Iron Company, with a capital of \$2,000,000, divided into 10,000 ordinary shares and 10,000 preference shares, and a debenture capital of \$600,000. The company last named has been formed to extend the present business, also to take over the iron areas, railway franchises and other franchises of the New Glasgow Iron, Coal and Railway Company, and to erect blast furnaces, mine iron ore, and carry on all work necessary for the operation of the furnaces and the manufacture of iron and steel in all its branches. The provisional directors of the Nova Scotia Steel and Iron Company are: Thomas Bayne, Halifax; John F. Stairs, Halifax; Frank Ross, Quebec; William Jacks, ex-M.P., Glasgow; James D. McGregor, James M. Carmichael, H. S. Poole, George F. McKay, Graham Fraser, Harvey Graham.

The Springhill colliery has been troubled with heavy water from spring rains, but their battery of six pumps has kept the workings clear. The Joggins colliery has started its season's shipments.

The Acadia colliery is running a double shift, pending the erection of a more powerful winding engine.

Salmon River District.

The Dufferin Mining Co. held a meeting on the 10th inst., and organized under the charter given by the Provincial Government, session before last. The mine is understood to be looking better than it has done for some years.

Oldham District.

The property of the Oldham Gold Co. was sold by a Master of the Supreme Court at public auction on the 10th inst. at Oldham. The property, consisting of some ninety-six mining areas, with stamp-mill, engines and a good mining plant, was knocked down to Mr. T. P. Putnam, of Lower Onslow, N.S., for the sum of \$22,850. This property has practically been idle for over two years.

The Standard Gold Co. at Oldham are erecting a new shaft-house on the Consolidation shaft, which will be equipped with pumping engine for the plunger pump, and also 20-h.p. hoisting engine for the skip. It is expected to have the new gear running by August 1st, when the old east shaft will be abandoned and all rock and water will be taken to the consolidation shaft. This company is reported to want good miners badly.

Waverley District.

The miners of the Lake View Co. were notified on the 2nd inst. that the mines were to be shut down for an indefinite period, pending the erection of the stamp-mill it is supposed. Manager Hayward is keeping the water out, but no men are employed under ground. A large force are employed in the mill.

The Palgrave property has passed into the hands of "The Nova Scotia Syndicate, Limited." Mr. Gowland has been superseded by Mr. MacDuff, who has taken the management of the Syndicate's property, and has begun vigorously a reformation much needed in the company's former methods and system.

Gold River.

The mines of the Neptune Co. have been closed for an indefinite period, and only a watchman is in charge of the property. Mr. C. E. Willis, the former manager, has his whole time occupied with the management of the Central Rawdon property.

Malaga District.

The Parker-Douglass Co. are still increasing their extensive surface plant, and are at work now upon the machinery for the transmission of power from the "wild cat" run to the mines. This company also intend equipping their latest purchase (in Whiteburn) with a new mill and other machinery.

The other properties in this district are in the category of prospects, but have a very promising outlook if development work is properly carried on. The district is a good one, but has had a set back through too vigorous and misdirected "booming."

Quebec.

At the annual meeting of the Dominion Lime Company the following directors were elected:—Frank Jones, Portsmouth, N.H.; F. P. Buck, W. B. Ives, M.P.; T. J. Tuck, J. G. Robertson, Sherbrooke; R. H. Pope, M.P., Cookshire; Geo. Van Dyke, Lancaster, N.H.; C. H. Sinclair, Boston, and J. P. Cook, of Salem, Mass. The affairs of the company were found in

a healthy condition, and with the increased railway connection the business outlook was most encouraging. The Upper Coos and Hereford railway, recently leased by the Boston and Maine railway, connects the works more directly with the large railway system of the latter road, and opens a wider market for the product of the kilns.

We are informed that the trade of the Bell's Asbestos Company, Limited, for the past quarter shows an increase of 1½ per cent. over the same period of last year, and that most of the large customers who had withdrawn their custom for a time are now returning. There is every expectation of a satisfactory interim dividend being paid both on the old and new shares next month. The raw material is being sold at as high as £45 per ton, as compared with £18 last year, and there is every prospect of getting still higher prices during the remainder of the year, the latest price received from New York being £53 per ton. Late advices from the mines are most encouraging, and point to a larger output this year than ever before.

Ontario.

Sudbury District.

Recent advices from this district show that work on the mines operated by the Canadian Copper Co., the Dominion Mineral Co., Messrs. Vivian & Sons and others is being carried on vigorously. In anticipation of the operation of new Ontario Mining Act, quite a number of prospectors have arrived, and an unprecedented rush of prospectors into the district is expected this coming season. Besides, a good many of the mining speculators, having found out that undeveloped properties cannot be sold at any price, are preparing to open their claims this year.

Port Arthur District.

Numerous new discoveries have been made of late in both the outside country and among the working mines. The new veins which have been traced and are being developed at the Badger and Beaver mine properties are extremely encouraging, some of them showing silver freely near the surface. Renewed activity is also taking place at the Porcupine mine, which was recently pumped out, and to which the roads are being improved with a view to active development by the Badger Silver Mining Co., by whom it has been acquired. The stamp mill at the Beaver mine is now busy day and night, and a long steady and valuable output will doubtless follow.

Development at the mines of the Badger Silver Mining Company is being vigorously prosecuted upon the new vein, 350 feet to the northward of the old vein, Badger No. 1. From all indications the new find is the main vein from which the old vein, out of which about \$250,000 worth of silver was taken in 1889, was a stringer. The new vein measures five feet in width, is heavily mineralized, and carries an average of 1,757 ounces of silver to the ton; as far as prospected, it is steadily increasing in richness and promises to exceed in value anything hitherto opened in this district. The same vein has also been discovered by cross cutting on the west side of the mountain, 2,500 feet from the discovery shaft. It has the same width there and carries equally rich ore with that at the point of first discovery. A steam hoisting plant has been put to work at No. 1 end or discovery shaft. Sinking and drifting is being vigorously carried on on both sides of the mountain. The force of miners has been largely increased, and the output of the Badger for the coming season may be expected to exceed anything in the history of silver mining on the north shore of Lake Superior.

The Silver Mountain mine is reported as showing extra vigor since the advent of the new manager. A new promising vein on this property will likely be tested and in a thorough manner shortly.

The Crown Point mine has changed hands, or rather a one-half interest has been purchased by some Duluth people, who already have considerable invested in Thunder Bay lands.

Other finds north-east of the Beaver are being eagerly taken up by capitalists who are anxious to try their luck in this well established section of country.

The Dominion Government are again recognizing the value of this section in a mineralogical point of view. No less than four members of the staff are now working out the geology and topography of the country west of Port Arthur.

The Silver Islet Co. has employed Captain Frethering to look over their numerous and extensive mineral locations around the north shore of Lake Superior. One of the directors of the company accompanies him in a tug chartered for the purpose.

The Canadian Mining Review

CONDUCTED BY . . . E. T. A. BEL

OFFICES:

UNION CHAMBERS, 14 METCALFE ST.,
OTTAWA.

Vol. IX. JULY, 1890. No. 7.

Special Notice to Subscribers.

In response to the requests of many readers of the REVIEW, particularly from those resident in the mining districts, who find it very inconvenient to remit the odd amount of our present subscription price, we have to announce that henceforth the rate per annum per copy of the REVIEW will be two dollars instead of one dollar and fifty cents as heretofore. All subscriptions, therefore, falling due on and after the 1st August next will be charged at two dollars. This change will not affect members of clubs and associations subscribing to the REVIEW under agreement. In view of the permanent enlargement of the REVIEW, and the many new and improved features which have recently been made, and are still further contemplated, we trust that all our readers will heartily coincide with this arrangement.

The Ontario Mining Operations Act.

The people of Ontario are acting wisely on the principle that prevention is better than cure. Although as yet this province is not prominent for mining, there can be no doubt that its progress in this line will be rapid, as research opens newer and more valuable deposits. An Act of this nature introduced now will work the more easily in the future, when those investing in or working ores find that there is an Act regulating their mining, already cheerfully acquiesced in by their predecessors. The Report of the Commission recently published shows that there is a wide and varied mineral field, that Government aid is needed, and that every effort should be made to attract domestic and foreign capital.

The Act passed last Session, and relating to the working of mines, is based on the British Act of 1872. The new English Coal Mines Act, which came into force January 1st, 1888, would have afforded several valuable suggestions to those engaged in framing this Act. The definition of the term machinery, which is made to include tools, is, when taken in connection with the section in the general rules requiring the fencing of dangerous parts of machinery, rather cumbersome. The fixing of the age of first employment of boys at fifteen is a good plan in the case of metal mines, but there can be no valid reason why women should not be employed at the lighter surface work. Attempts were recently made in England to prohibit women's work above ground, and the matter was fully discussed, but the latest Act makes provision for their employment, the regulation of the conditions accompanying their work being, it is believed, subject to the Factories Act. In this connection it may

be remarked that women would be precluded from undertaking any clerical work about a mine.

Section 10, subsection 2, says that a mine owner may make return of the amounts and value of the mineral raised or sold every year. As under the census and other laws power is given to compel such returns it seems a pity that the rule adopted in some countries of making such returns compulsory could not have been adopted. Experience has shown that producers of raw or manufactured articles are ready to give details of their work if they find that they are legally required, and have an assurance that their returns will not appear, and will only form an unseen item in a total. The importance of exhaustive and correct mineral returns is nowhere better recognised than in the United States, whose Geological Survey has for the past eight years issued most valuable and interesting mineral statistical reports. If there were in Canada a law compelling such returns the Canadian Geological Survey statistical report would show an increase of twenty per cent. in a year—in amounts and values. The Ontario Government would find a greater profit in such returns than in compelling mine agents to keep registers of names, ages, residences, etc., of boys, when the crucial point, their ages, cannot be in many cases tested or proved.

Section 11 requires that a personal injury from "powder" should be reported. It would have been better in framing an Act for Ontario, where presumably high grade explosives would be largely used, to have adopted the wording of the latest English Act, and to have used the words "any explosive," as the 2nd sub-section would seem to point to the accidents not arising from explosions.

Section 12, subsection 1, would similarly have been improved by adding the words "or for a new deposit at such mine," and under the wording of the Act any mine not worked by a shaft is not required to give notices under subsections 1, 2, 3. The use of a sign board to warn people against abandoned shafts is a good one, but the alternative of "fencing" is better for cattle, and in the dark.

Under section 15 the inspector is given power when he considers any matter, thing, or practice about a mine dangerous or defective to require it to be remedied. In England the law on this point recognizes the fact that within the bounds of permissible mining there are wide divergencies of practice, and that custom, impelled by necessity or competition, had adopted systems of mining and of treating ores, which, if open to condemnation on broad principles, are safely carried on by the exercise of skill and attention. In order, therefore, to secure the skill of the individual operator, the English law allows him an arbitration whenever he is called upon by an inspector to make a change that appears unreasonable to him. It will probably not be long before the Ontario inspectors meet mining engineers, who will kick vigorously

against the exercise of so potent an authority as this, which might often call for changes involving heavy expenditures.

Under section 2 of the general rules experience has shown that the storing of any quantity of explosive in the mine is objectionable, and impartial observers fail to see how the Minister of Agriculture can pronounce iron or steel pricklers safe in one mine and dangerous in another, in view of the fact that even copper has been found to ignite charges. It would be advisable to forbid the unramming of high explosives as well as of powder, and in all cases it is better to leave a lost charge and drill a new hole close to it, as ordered in the English Act of 1888.

Apart from these criticisms which are offered in a friendly spirit, as the earth below is a common heritage as well as the sea, the Act is a good attempt at meeting the dangers which are often forced upon the miner by the greed or ignorance of his employer. The miners themselves should study the Act and bring to the notice of the Department any infringements, and when these charges are made clearly and properly and not maliciously, no doubt prompt attention will be given to them. The responsibility of the miner in regard to his own life and the safety of his comrades should be borne in mind, and it would not be amiss to have in the Act provision for special rules for the workmen and firemen so that they can clearly understand their liability and duties.

The Act is a much more creditable production than the first attempts at mining legislation in the United States, and the Ontario Government having made so good a start will no doubt see that it is carried out to the benefit of both miner and capitalist.

The Springhill Strike.

The collieries owned and operated by the Cumberland Railway and Coal Company at Springhill are at present idle, the men having gone out on strike during the latter end of last month. The men demand that the system of not counting a box with stone in it shall be discontinued, and that a certain scale of dockage should be laid down based on the percentage of stone in the coal. The statement of the men is submitted to the public as follows:

"In the month of January last there were 542 boxes of coal docked, about 450 boxes for February and the same number for March. This was at one slope alone. An equal number nearly was docked at each of the other two slopes, the value of which was \$1,614. For those three months, or in one year at the above figures, the coal cutters of Springhill would be robbed of \$6,556. Pioneer Lodge, representing a large majority of the workmen of Springhill, interviewed the manager and general manager and tried to have the matter adjusted.

After four or five weeks continuous running without any satisfaction, it was decided on the

17th of June to give the general manager until 21st June to make redress of the grievance. The committee waited on him on the latter date, and for his final answer were treated to the remark, 'The men have got all the satisfaction they ever will get.' The committee reported the result of this interview to the Lodge on Saturday evening, 21st June. It was then decided that Mr. Cowans be notified that the men would suffer to be locked out until the grievance was redressed.

It may seem strange that coal should be sent up with stone in it, or boxes sent up not quite full, but when it is made known that, in some cases, men work places where the stone band is from 15 to 31 inches thick, get no consideration for cutting this stone, and only receive 27 cts. per box containing 1,700 to 1,900 pounds of coal, the public will say, surely, 'Little wonder if some small pieces escape detection in the dark mine.' The stone that escapes is composed of small pieces only. It can be proven that boxes have been docked because they contained a piece of stone no bigger than a man's hand. When the public further consider that a number of the worst places are worked with 'close' lights, they will conclude that the men have a substantial grievance and that something should be had for handling so much stone, which is among the coal. This stone, in many cases is not in one part of the seam only, but in four or five different places. For instance, there are 14 inches of stone in the middle of the seam; 3 to 9 inches about a foot above that, on the top about 7 inches, and a foot from the bottom there are from 2 to 6 inches more. All of this stone breaks up into minute pieces which the miner is expected to pick out and stow away for nothing, while digging and filling his coal for the small sum of 27 cts. per box said to hold 1,650 lbs., but actually holding 1,700 to 1,900 lbs. All that the men asked of the manager was that he would not dock boxes unless they contained, at least, 28 lbs. of stone. For that weight the men were willing to be fined 20 cts., and to forfeit the box wholly if 50 lbs. were found, but they were not willing to lose a box because one or two pounds of stone had been detected in it. In reference to docking for short weight, the men did not consider it right that a box should be docked without being weighed. If weighed and found to be short of the standard (1,650) they were willing to allow a deduction for shortage. To this as to the other, the general manager would not listen. He said he would do nothing other than he was doing. He reserved the right to dock at his good pleasure."

The claims of the men are, to a large extent, fair and reasonable, and a good deal of sympathy is expressed for them in their determined stand. The case seems to us to be a fit one for arbitration under the recent legislation of the Mines Department.

In the meantime the shortage in the deliveries of coal is causing some inconvenience to con-

sumers in the Upper Provinces. Many of the miners have left Springhill and are finding employment at the other mines.

Our Iron Interests in Ontario; Another View of the Report.

"The history of the iron industry in Great Britain," says the preface to the Report, "proves conclusively that its growth and prosperity have depended upon a knowledge of methods and processes." So much being known to the Commission, the assistance of practical knowledge of methods and processes should have been sought to aid in the preparation of useful information people will naturally turn to the Report for, and will seek in vain. While the book is evidence of great industry, the arrangement all that could be desired and the introductory geological portion clear and concise, it is to be regretted that straightforward dealing with the Report in the interests of iron mining and manufacture will very plainly expose a few important omissions. Something less of ancient history and of political criticism, and something more of scientific information would have been commendable. It is always well to remember that over past events the immortal gods have no control; and that criticism which ends in pointing to what should have been but has not been done is of little value to mortals in these worrying days when men need to direct all their minds to know what should be done and how best to do it. The geological member of the Commission tells us, in his part of the book, that "the iron mines of Eastern Ontario" are treated in "another part of the report," but search is fruitless for a comprehensive sketch of the geological features and lithological characteristics of Eastern Ontario. The Commission found but one iron mine in operation, but it would have been matter of easy exploration among the mines for samples, and of easy research among the American furnace records where Ontario ores have been used, to have obtained from these sources authoritative analyses of the iron ores of the province. Without this the estimates of working expenses and cost of production given in the report are crude and unsatisfactory. The computations of cost of iron smelting deal with the magnetic ores of the region between Hastings and Haliburton, and curiously differ very widely in the cost of ore:—

	Marmora.	Madoc.	Kinmount.	Snowdon (1).	Snowdon (2).	Howland.	Grhauser's estimate.
Tons of ore	2	2	2.25	1.75	2	2	1.66
Cost	\$ 4	3	6.89	1.80	5	2.33	8.17

The English syndicate or American capitalists whom fancy sees likely to descend upon the country at any moment in quest of knowledge

where they may best invest in iron smelting, will naturally be surprised to find that in the same ore region the cost of ore at the furnace will range from \$1.16 to \$5 a ton. If this should be matter of indifference to men usually so lavish of money and ignorant of business, it is reasonable to suppose they will be utterly unconcerned to know what and where ores may be found suitable for foundry iron, or for a car wheel mixture, or for special lines of steel. The report will not burden them with any information under this head. Lest it should be thought, however, that the criticism of the *Review* is altogether destructive, unstinted praise is accorded to the generous and faithful treatment of the subject of charcoal iron. A careful perusal of the Report should satisfy anybody that this manufacture should no longer await foreign capital for the enterprise. But the *Review* has not found in the Report any comment upon the preposterous misapplication of the bounty and protection offered the iron smelter which will happen if forty per cent. of the bonus be given to the American manufacturer of coke when a better native fuel is obtainable. The record of the Hinckle charcoal furnace at Ashland, built to smelt 80 tons a day and now giving on very moderate fuel consumption 125 tons a day, is proof that in the United States dense magnetite ores can be smelted as cheaply as with coke, while the iron brings a better price. The irregularities of fuel supply so often cited against the charcoal interest have been many times of late far exceeded through the operations of striking coke burners and the combination of coke syndicates. The advance in the price of coal the world over will also go far to reduce the advantage heretofore enjoyed by the foreign iron-maker.

On the preparation of magnetic ores for the furnace, the Commission remark that a quotation from Mr. Birkenbine recommending the "thorough roasting of magnetites" "applies more particularly to the mines on the Quebec side of the river." In Swedish practise all magnetites are roasted without exception. There is nothing in the report to warrant this comment of the Commission, nothing whatever to show that Ontario ores of this class should not be so treated. There was quite enough mention of sulphurous ore to the Commission to have prompted a more extended inquiry into the best treatment. The superior value of iron made from roasted ore and the wide extent of the practice in European metallurgy concur in recommending the roasting kiln. The oxydation attained in the kiln not only facilitates the reduction of the metal but the combinations in which sulphur is liberated. The Magnetic Separator may displace the jig in the concentration of lean ore, but will never serve the purpose attained by roasting, and it remains very doubtful if as a desulphurizer it is as economical. Magnetic separation is as yet a modern experiment: roasting iron ore has been advantageous followed for centuries.

On the subject of "the influence of commercial conditions upon mining industry" it would be strange indeed if the Commission had not a theory to offer. Their views on this subject, it may be premised without offence, are not likely to lead to any practical result. It takes a lot of talk and discussion to change commercial conditions. They are generally too organic in origin to yield to rhetoric. The largest users of iron ore in the United States are opposed to removal of the duty on foreign ore. Their interests in American mines, in making steel rails for mineral railways, in building steel ships for transporting ore, are greater than their interests in Canadian mines. The removal of the duty would not cheapen ore one cent a ton. Ore of uniform quality can be mined, shipped and brought across the Atlantic from Spain or Norway to Philadelphia or Baltimore for less money than it costs to put down Ontario ore in Cleveland. So far from commercial conditions having operated against the iron mining industry, it would seem they have been extraordinarily favourable. Thirty years ago very good ore was mined in Lanark and shipped to the United States. The existence of iron ore in various parts of Frontenac was known. The Lake Superior mines had not been opened. There was no fleet on that lake, but there was a considerable fleet on Lake Ontario. The demand for Canadian ore was met by supplies of waggon loads. The writer has a letter dated 25 years ago from a furnace owner asking for a cargo of ore from a mine from which a sample of 50 tons was taken. The mine was offered for sale in reply, and is for sale by the same owner to-day. A few years passed and Americans made some purchases of Ontario iron mines at prices which, in view of all the conditions, were simply enormous. Railroads were built, in certain instances largely with public money, but the miner paid the top-most charges for freight and shipment. The ores raised were of variable character, now excellent beyond all comparison, again carrying $1\frac{1}{2}$ to 4 per cent. of sulphur, sometimes titaniferous. The miners were neither sparing of capital nor enterprise. In fact, in many cases had they gone slower and worked with more economy the outcome would have been different. But the result must be chronicled, that many American investors have lost large sums in Ontario iron mines from causes which have had no connection whatever with commercial conditions. The lack of native enterprise and lack of liberal dealing in providing facilities for cheap transportation, the extravagant prices at which ore properties have been held, the variable character of Ontario ores, and the inability of mining captains to reach a regular daily output, have all operated to hinder the progress of iron mining in Eastern Ontario. Add to all this that labour has been relatively high-priced for some years past, and it will be seen that the American tariff has had little effect upon the value of

the few thousands of tons of iron ore sent to the United States.

The Commission do not appear to have realized that this low condition of the iron mining industry has been largely due to causes within the power of the business people concerned to remove; but owing to the lack of exertion at the proper time, while the development of mines elsewhere hastened on, the result has come about that from Eastern Ontario at least it is not likely there will be any remarkable demand for iron ore. The investments of American capital in this region have been profitless in the extreme, while the demand for capital for opening new mines in West Virginia and North Carolina is likely to be active for a long period. The large iron formation on the Canadian side of the boundary line in the Lake Superior region will no doubt bring in the usual speculative immigrant who will buy up valuable property at an insignificant price and then put forth every effort to get a railway built at the cost of the Province for the transportation of the ore. At this stage the property will be likely to find buyers among the class who have supplied the first comer with means, and the future course of the enterprise will depend on the quality and supply of the ore, cost of mining and transportation. It is difficult to see what benefit will accrue to the Province from this course of dealing, and in this connection the views of the Commission on mineral and laws come up for consideration. Every mineral calls for legislation suited to the exigencies of its natural conditions. A uniform land law for gold and iron mines is as absurd a production as uniform leases of such property. A prospector with a ten dollar dipping needle and a polled pick travels a few days through a wild region and discovers a large iron deposit. His adventures have not been perilous or otherwise remarkable, save the encounter with black flies and mosquitos, to which the Commission do not fail to refer. He buys 80 acres at \$1 an acre, and before getting his patent has expended for surveys, law fees and other expense as much more. He himself would not be able to earn at another business more than \$100 to \$200 during the time occupied in his discovery. The total cost of his discovery is about \$400. It is talked of in bar rooms and whispered about in the offices of mineral land agents, and other lots on the same "lead" are speedily taken up by speculators. There is no demand in the Province or out of it for this iron ore. The supply offered by the great American mines is ample and apparently inexhaustible. The price is not considered excessive, although some of the companies have declared dividends ranging from 30 to 100 per cent. a year. Before a ton of the mineral, in the instance presented, can be sold the people of this Province must put their hands in their pockets and build railroad docks and chutes perhaps, or largely help to do so by a

liberal bonus. If the ore is not smelted here who will get the benefit of all this liberality? If, with all the facilities we offer, ore is put down in an American port cheaper than American ores, the advantage is either to the American furnace owner or the American people at large. If we want a chance to work the dollars of our surplus into profit producing factors the common school arithmetic of the country is at fault if a better method cannot be found than that outlined, and for the maintenance of which the Commission are apologists. The case supposed as an illustration of the present law is an 80-acre location in which is a large iron mine. It may contain a million of tons of good magnetic ore. Let us suppose that to facilitate developments we offer iron bearing territory at 15 cents a ton royalty for any quantity up to half a million of tons, and 25 cents a ton beyond that. The property will yield the province \$200,000, in return for which the Province may be properly called upon to aid in the development of this and similar sources of revenue. But that is not the American system, say the Commission. Well, if the American system is one of public spoliation, what then? The Michigan, Minnesota and Wisconsin mines are giving an output of ten millions tons a year. The history of their development proves that they should be yielding to these States a royalty of 25 cents a ton, or \$2,500,000 a year. Here are some prices of North-Western Iron Company stocks in a dull market:—

	Par.	Buyer.
Ashland Iron Company...	\$25	\$55
Champion ".....	25	90
Chandler ".....	25	37
Jackson ".....	25	110
Lake Superior ".....	25	67
Norrie ".....	25	70
Pittsburg Lake Angeline Co...	25	170
Republic ".....	25	43

The Commission have faithfully given the opinions of eminent experts in favour of an impartial system of education applied to popular needs, and have as faithfully reported in favour of a partial system of education adapted to a non-industrial class, and applied so as to further a theory of educational centralization, rather than the development of the mining and industrial interests of the country. The Commission quote the opinion of Sir J. Lowthian Bell, the greatest authority of the day on the metallurgy of iron and steel, and an "iron king" also, that "as in France and Belgium a much better purpose would be served by establishing technical schools throughout the country, and that every industrial district has a preferential claim to London." But, say the Commission, "the circumstances of England and Ontario are widely different." Certainly they are not different in the fact that there are industrial districts distant from the metropolitan centre, and the industry under consideration is mining and metallurgical industry, which should always work together under favouring natural conditions. The education necessary to further industry, says Sir Lowthian Bell, and all others

whose knowledge enables them to speak with authority, must be given where it is required. To this the Commission can only reply, in illogical phrase, "One school well equipped would serve our present need, and nowhere else could it be so economically established as in connection with the practical "science department of the State University." This conclusion immediately follows the statement that "we have few trained men to fill any place requiring superior skill, either in mining or smelting or metallurgical works." Here is precisely the defect in the industrial condition of this country. No man in his senses, no company having any regard for dividends, will commit an industrial enterprise in which special technical knowledge of methods and processes is requisite, to the management of the graduate of any technical or practical school. Further training is necessary, and the mere student of practical or applied science must seek this in another country, where, if he displays any special aptitude, he is very likely to remain, especially if his own interest lies in so doing. This is the state of things now going on, and which it is sought to perpetuate in a worse form than ever. The most expensive production in this country is its young men whose education at enormous expense to the community is brought up to a point where it is of no use to the public or the possessors unless supplemented by employment we cannot offer or further training we cannot give. The expatriation of such is constantly going on, and it is no figure of speech that it is a drain upon the resources of this country greater than the whole burthen of taxation. Now, what remedy do the Commission propose for this state of things? None whatever. In a lecture delivered at University College, London, in December last by Dr. Wright on the subject of scientific investigation as applied to the manufacture of iron and steel, he declares that "applied science must be learned in the factory," where the student must acquire "the faculty of reducing to manufacturing processes the small scale operations of the scientific laboratory; to devise means for utilizing waste products in other directions, and in short to solve the varied problems that are continually cropping up in every industrial factory (and especially so at a blast furnace) upon the successful solution of which depends the possibility of the commercial success of one works as compared with another, or of one country as compared with another." Lack of space forbids further extract from this important lecture. It remains only that reference be made to the foundation of the modern Belgian iron and steel industry, which was in a languishing condition until that the King in 1823 invited Mr. Cockerill, an English iron master, to settle near Liege, and assisted him in the erection of iron works on condition that the iron masters of the country should be permitted to learn from him the true principles and latest improvements in the art. The result was the foundation of the

works of the great Cockerill company at Seraing, one of the most perfect establishments in all Europe. The evidence taken by the Commission together with this striking illustration of "the direct process" should have prompted them to recommend the construction by the government of a ten ton furnace in a locality where hydraulic power, charcoal fuel, and variety of iron ores would afford natural conditions favourable to success. A small Bessemer converter, open hearth furnace roasting kilns, magnetic separator and other plant for treating ores and manufacturing iron and steel by every approved process should accompany the blast furnace. The whole plant could be erected with a laboratory and necessary buildings for managers, lectures and workmen for \$100,000. It could be run for five years at a cost within \$100,000, with the result that we should have before the end of that period a trained body of furnace managers and a number of skilled workmen capable of applying in the language of the Commission, the "knowledge of methods and processes" to the reduction of the iron ores of Ontario and the manufacture of iron and steel. The works could then be sold, leased or maintained for the further education of young men as the experience gained would dictate. That any private concern entering into the untried field of iron and steel manufactures in this country will meet with problems it would be desirable to solve but which prudence will avoid, is evident; that the solution of others will be attempted to which experience worthless or profitable can only give the answer is also evident, but the result in any event will in all probability be concealed. What the country requires is knowledge and skill competent to guide its energies and develop its resources. The end can be attained only in the mode here suggested so far as the iron industry is concerned, but those interested in other lines of mineral development advance their particular views. It will be found that the industry whose interests are here advocated will lead, and if well directed largely assist the development of all others.

The Phosphate Corporation, Limited

The Phosphate Trust, to which some reference has been made in these columns, has at last materialized, and that, too, if we may judge from reports, in an eminently successful degree. From the prospectus we find on the Board of Directors the Rt. Hon. Lord Stalbridge, Sir James Whitehead, Bart., Sir Jacob Wilson, Sir George S. Baden-Powell, Hon. Cecil T. Parker, Sampson S. Lloyd, H. Mallaby-Deely, all men of high social status, of good commercial standing, and of excellent business capacity. The list of Founders is also a notable one. It is headed by the Duke of Westminster, who is followed by the Duke of Richmond and Gordon, the Duke of Portland, the Duke of Sutherland, and the Duke of Fife. These five

dukes are succeeded by a marquis, two earls, six barons, and the Prince Camille de Polignac. Then come a number of other familiar names such as that of Sir James Whitehead, Mr. Mundella, M.P., Mr. Sampson S. Lloyd, etc., etc. Among other prominent Canadians whose names appear on the list we observe that of the Hon. C. C. Colby, Hon. J. J. C. Abbott, and Mr. Sandford Fleming. The capital is £1,000,000 sterling in £10 shares, whereof 500 are founders' shares, the respective holders of which, in respect of each share, shall, in addition to paying up the nominal amount of such share, apply for and take at least fifty ordinary shares, and pay the sum of £20 in respect of each Founder's share taken by him towards expenses antecedent to allotment. The idea upon which the General Phosphate Corporation is based is an excellent one. It proposes to buy well-selected phosphate properties in Canada and elsewhere, and to work and develop them. There are in the Dominion immense areas of rich phosphate lands, which only await the well-directed infusion of capital, and capable experienced management to amply repay investment. There are, on the other hand, many worthless properties, and many fairly good ones which are offered to the public, and will probably be offered to the Corporation, at prices enormously in excess of their actual worth, and which at once preclude any chance of a profitable return. In the original draft prospectus of this Corporation were included a number of such properties, puffed up with inflated estimates by a few so-called experts. At the time we strongly condemned any such basis for the foundation of any important syndicate seeking a solid return for their money. If the Corporation is to be a success it must carefully discriminate and closely investigate the properties which will be submitted to it for purchase; and when good properties have been secured, it must see to it that they are capably worked by men experienced in the best and most economical methods of working the mineral. If this is done the success of the Corporation is assured, and its efforts will prove an immense boon to the country in promoting and stimulating the development of similar enterprises.

Algoma Iron Region.—A Winnipeg despatch says:—A number of St. Paul gentlemen who have been prospecting in Western Algoma are here, *en route* home. They state that the iron prospects along the Minnesota boundary on the Canada side were remarkably good. The district was recently visited by the Assistant State Geologist of Minnesota and a Philadelphia expert. They were immensely pleased with the whole iron district tributary to the Port Arthur, Duluth & Western Railway. An iron expert has examined some of the locations which the Kingston & Pembroke Mining Co. are said to contemplate buying, and was much impressed with the outcroppings on the Minnesota side. All the American mining companies contemplate active mining work as soon as the railway reaches the boundary. As their output has to be shipped in bond *via* Port Arthur, several strong companies have been organized. On the Atikokan range claims have recently been located, and exploratory work done. One bed of ore has been uncovered, and shows a width of 46 feet of ore, which is magnetic, free from sulphur, phosphorus or titanium, and will average 68 per cent. of metallic iron.

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

No. IV.

Mr. Archibald Dick, of Nanaimo, B.C., Inspector of Mines of British Columbia.

Mr. Archibald Dick, the Inspector of Mines for British Columbia, resides in the City of Nanaimo, Vancouver Island, B.C.; he was born near Kilmarnock, Ayrshire, on the 25th December, 1841; his father was Mr. James Dick, of that place, his mother Sarah Muir, daughter of Mr. John Muir, of Quarter, near Hamilton, Lanarkshire, Scotland. Mr. Archibald Dick accompanied his parents and their family, who left in 1865, to Vancouver Island, where his mother's brother, Mr. John Muir, and his family had long been settled. As the Muir branch of the family is largely represented in Nova Scotia, as well as in British Columbia and other parts, it will be interesting to make a few characteristic quotations from the History of British Columbia, where the venerable historian, Bancroft, relates that in Vancouver Island "Fort building was still in progress when the "Scotchman Muir, with wife, daughters and sons, arrived at Fort Rupert. "Among them was Michael, born at Kilmarnock in 1840. A shaft to the depth "of ninety feet (subsequently deepened "to 120 feet) was sunk by the Muirs, who "after further examination pronounced "the seam too small to be workable. "Troubles arose with the natives, who demanded pay for the land or its product; "and when the white men refused, the "savages surrounded the pit, threatening "to kill all present should they persist in "their robbery. Prospects were better at "Nanaimo, and thither, in the spring of "1851, Muir proceeded with all his men "and mining machinery, leaving Fort Rupert in possession of the traders only. "Muir arrived at Nanaimo with the men and "machinery. The steamer 'Otter' brought "them thither, and Governor Douglas (after "wards Sir James Douglas) met them there. "The machinery was landed and set up, and "measures adopted for defence. Muir's force "was small, and should the natives grow jealous "or mercenary, as at Fort Rupert, they could "do but little that year; nevertheless they prospected and dug heartily, wasting no time." Thus first opening and starting the coal mines at Vancouver Island which have been so successful and famous since.

Mr. Archibald Dick, on his arrival at Nanaimo, was an experienced and capable miner, in the true sense of the term; and at once found scope for his energies in the mines of the Vancouver Coal Mining and Land Co. (Ltd.), then under the management of Mr. John Bryden (formerly of Ayrshire, now general manager of

the Wellington Colliery, V.I.), where he was engaged for four years. In 1869 Mr. Dick thought he would try his luck at the gold fields of Cariboo, in British Columbia, whither he and many others resorted: meeting with but moderate success, he returned to Nanaimo in 1872, having however graduated in the higher branches of mining, to his complete satisfaction.

During the succeeding five years Mr. Dick was chiefly occupied in prospecting and exploring for coal on Vancouver Island, on his own account as well as for certain of the collieries.

The managership of the Baynes Sound Coal Company was in 1877 offered to Mr. Dick, who accepted the position and carried on the mine until the company were satisfied that operations

could not be profitably continued without a large outlay of capital. By virtue of his position with this company he was entitled to and obtained, we believe, under the Coal Mines Regulation Act (when first passed in the Province), a certificate of service. Those persons who held situations as mine managers for a stated period previous to the passage of this Act were granted certificates without undergoing an examination.

In 1880 Mr. Archibald Dick was appointed the Inspector of Mines for the Province of British Columbia (succeeding Lieut.-Col. Edward Gawler Prior, M.P. for Victoria City, B.C.), and has since that time worthily fulfilled the arduous and onerous duties of that office, to the general satisfaction of the public.

Mr. Dick is Chairman of the Board of Examiners for granting certificates of competency to

colliery managers under the Coal Mines Regulation Act of British Columbia.

In his official capacity Mr. Dick maintains a strict adherence to duty, and he has proved faithful always in the performance of it. On the occasion of a most disastrous explosion a few years ago at one of the Nanaimo collieries he exhibited that quiet bravery which, in a man in his position, is exactly calculated to inspire confidence. As a citizen he shows positiveness, zeal and purpose. Steady and reliable in all his undertakings, Mr. Dick possesses in an eminent degree those traits which, in the common parlance of Englishmen, come under the name of honor. He is one of those men who, if he gave his word, would feel as much bound as if he had given his bond. In a word, he is a man of high integrity and sterling worth.

Mr. Dick has made Nanaimo his home, and was married on 1st January, 1879, to Elizabeth Clara, third daughter of the late William Joseph Westwood and eldest daughter of Fanny Westwood, of East Wellington, near Nanaimo, and has six children, three boys and three girls.

The Cost of Charcoal Pig-Iron.

From the recent report of the United States' Commissioner of Labor it appears that the cost of making charcoal pig in the United States traverses a wide range of figures, not only for raw material but for labor. The latter evidently bears relation to the size of the furnace, being \$1.46 at a 40-ton furnace in the south, \$1.20 at a 75-ton Lake Superior furnace, and \$3.59 at a 20-ton Maryland furnace, where ore at \$10.29 and fuel at \$7.30 for the ton of pig, with other large charges in proportion to output, bring the cost of the metal produced up to \$23.16½ a ton, and this without counting insurance, interest and depreciation of plant. The cost of Charcoal per ton of pig varies from \$5.54 at the south on very low grade hematite ores to \$9.05 at a Lake Superior furnace on the richest of magnetic ore. The cost of ore per ton of pig runs from \$1.98 in Tennessee to \$6.93 at Lake Superior. The total charges given for southern iron are \$10.28; for Lake Superior from \$14.45 at a 60-ton furnace to \$18.78 at a 12-ton furnace. The low cost of southern coke and charcoal iron has resulted in an immense industrial development, not without serious disturbing influences upon northern and eastern enterprises; but the south is evidently not an ironmaster's Paradise yet, seeing that the last market reports state that "many furnaces are shut down owing to trouble with workmen in some instances, and lack of ore and coke in others.

LETTERS TO THE EDITOR.

Ontario Iron Ores.

The Editor:

SIR,—“The Mineral Resources of Ontario,” lately published under the auspices of Mr. Archibald Blue, well deserves the favourable notices which it has been receiving from the press of the United States and Canada.

Mr. Blue has, with pains-taking care and judicious arrangement, put together facts most important both to prospectors and to miners in a practical manner that can be readily understood and used by all.

A good deal of space is devoted to our iron ores and the facilities for smelting them in Ontario.

No doubt one or two charcoal furnaces might find profitable employment in Ontario, but there is not much encouragement for capitalists to invest extensively in that line until we have a larger market.

Although the Dominion Government has imposed higher duties on imported iron and offers a bonus for domestic production, our iron manufactures, which are the most important of all industries, are growing very slowly.

It is time for our Government to recognize the fact that neither high import duties nor bonuses will give us customers for our iron or create a market, and it is the customers and the market we want.

We have abundance of excellent iron ores, and all that we can do with the greater part of them is to seek a market in the United States.

Unfortunately there is at present a prejudice in some parts of the States against Canadian ores. There is some reason for this, caused doubtless partly by the dishonesty or ignorance of those who have engaged in the business. But it is very unfair to condemn all Canadian ores because those from parts of one or two counties in Ontario have not proved satisfactory.

Many of our iron ores occur in the same geological formation in which the best Michigan and Minnesota iron mines are found, and there is no reason why some of our deposits should not be equally valuable when properly developed.

There are a dozen counties in Ontario in which iron ores are found, including the districts of Algoma and Thunder Bay, extending over several hundred miles, besides excellent ores in considerable variety in Nova Scotia, near the Atlantic coast, and in British Columbia near the Pacific.

Mr. W. J. Rattle, M.E. and metallurgist, of Cleveland, Ohio, an expert of high standing, gave valuable evidence before the Mining Commission. Mr. Rattle said: “I am very well satisfied with the outlook in this ‘country’ (Eastern Ontario). I judge the iron ores to be ‘of good quality, and think the prospects are sufficient’ to justify reasonable development, both of magnetites ‘and hematites.

“I believe you have a magnificent outlook for iron. I think these Ontario ores would be easy to smelt, as much so as our ores from Lake Superior. The ores ‘here carry lime largely, and you would require very ‘little flux. You have ample supplies of ores here to ‘make the best quality of steel rails, and in sufficient ‘quantities to start a blast furnace.”

This opinion, given from his own observations by an expert of such wide experience as Mr. Rattle, should be a complete answer to those critics who question either the quantity or quality of our ores.

The following analyses of some ores from the Kingston and Pembroke District show them to be of excellent Bessemer quality, namely:—

Metallic Iron.	Phosphorus.	Sulphur.	Silica.
66.	Trace.	Trace.	2'14
65'33	0'017		
64.	0'025	Trace.	5'27
62.	0'006	Trace.	4'12
60.	0'009		6'31

With no titanium in any of them.

Yours, &c.,

T. D. LEDYARD.

Toronto, July 21st, 1890.

Messrs. Quigley & Hammond, of Fort William, located some iron lands last week 35 miles west of Port Arthur and 5 miles south of Finmark station on the Canadian Pacific Railway. The outcropping is 1½ miles in length, and has an average width of 50 feet; assays by F. Hille, M.E. & Ch., Port Arthur, gave 61% metallic iron. No titanium or appreciable quantities of phosphorus or sulphur.

The Miner in Relation to Mineralogy.

J. T. Donald, M.A., Montreal.

The rare elements are not nearly so rare as they are commonly supposed to be; if they were more frequently sought for they would be more frequently found. So read the writer in a treatise on chemistry some time ago, and since that time the statement has frequently been called to mind in connection with visits to some of our Canadian mining areas.

If the mining captains of our various mines be asked if they have any specimens of the minerals found associated with their ores, very probably the reply will be, “No; we have nothing here except ore and rock”; “ore” meaning whatever mineral is being mined, and “rock” including everything else. Not infrequently in such cases a few minutes’ search over the dump leads one to say interesting mineral specimens are not nearly so rare as they are supposed to be; if sought for they would be found.

It is matter for regret that so many of the men in responsible positions in connection with our mines are so indifferent to the occurrence of minerals associated with their ores. Should one give utterance to this sentiment, very probably the reply of the miner will be, “What is the good? We have no time for anything else but getting out our ore. No money in that,” etc., etc.

Now, the question is: Is the miner right in thinking it is vain and unprofitable for him to be on the look-out for minerals that may occur in association with the ore he is mining? Certainly I think he is very far wrong. We are told the discovery of the Florida phosphate deposits was made by a man who had his eyes open to see what could be seen, and was inquisitive concerning what he saw. The *Engineering and Mining Journal*, speaking of the discovery, says: “In the last fall some progressive orange grower, with a little more curiosity than his neighbors, sent to a chemist a sample of white sub-soil that occurred in his grove; the chemist reported that it was eighty per cent. phosphate of lime; the secret got out, and then the excitement began.” The basis of this discovery, then, was in the fact that this orange grower observed that his sub-soil was peculiar and then imagined the cause of the peculiarity. Take another case: In the Sudbury district the valuable metal platinum has been discovered, as the result of examining the mineral associates of the ores of that district; and in the case of the Villeneuve mica mine interesting compounds of uranium have been found. Did the same intelligent inquiring spirit exist to a greater extent, it is altogether likely we would know of the occurrence of many more interesting mineral localities in Canada. There is yet room, abundant room, for the exercise of this intelligent enquiry in connection with our mines. Take, for instance, our asbestos mining region. It has long ago been pointed out, both by the Geological Survey and by Dr. T. Sterry Hunt, that nickel is seldom or never absent from the serpentines and associated rocks of this region; indeed, Dr. Hunt has predicted that the nickel so generally diffused through these rocks would in places be found in workable quantities, a prediction which as yet has found only a partial fulfilment in the operations of the Orford Company some years ago.

Still farther, the celebrated nickel ore of New Caledonia is a hydro-silicate of nickel and magnesia, and we are told the nickel ore is found associated with iron oxide and chromic iron ore, in beds of serpentine. Surely to those who know how frequently magnetic oxide and chrome iron cut the asbestos veins, no more need be said to show that it is worth while for the asbestos miner to keep an eye on any unusual looking mineral he may meet with in his mining operations.

Even if mining is being carried on in an area where there is no likelihood of finding any mineral or ore of commercial value, there is still no slight advantage to be derived from an intelligent inquiry into the nature of the various minerals there occurring. The finding of minerals or fossils in certain associations may be the key to the solution of the problem as to the origin of the deposits of economic value, and the solution of the problem may, in various ways, confer great benefits upon the industry in question as a whole.

But even in cases where no commercial advantage, either direct or indirect, can accrue from the lookout for associated minerals, we may not say that the quest has been in vain. The habits of observation and comparison induced by being on the lookout for minerals are of inestimable value to the miner himself, and cannot fail to render him more proficient in his calling, and, at the same time, add more or less to the sum total of knowledge. It may be urged by the miners that even though they could be on the watch for the occurrence of interesting minerals associated with their ores, they have not a sufficient knowledge of mineralogy to enable them to determine what are the minerals they may find, and therefore they would not know if they were finding anything of value or of interest. This objection need be no excuse, for the officers of the Geological Survey will gladly examine any mineral sent in to them, and in addition there

are numerous chemists and mineralogists located here and there throughout the Dominion, and I am sure there is no one of these who has not sufficient love for science to be pleased to aid the inquiring miner by identifying any unusual looking specimen he may have met with.

Mine Maps.*

Among the primary necessities of every well-managed colliery is an accurate and complete map of the inside workings, showing not only the outside improvements, but the physical characteristics of the tract to be worked, as well. When we say an “accurate and complete map,” we do not mean such apologies for maps as are in use at many collieries, and which are nothing more than approximate outline plans of the main workings. Such maps are regarded by some mine owners and superintendents as “good enough,” and they cannot see the wisdom of going to the expense of employing competent engineers to make them maps that will in the course of a very short time, prove not only a source of great satisfaction to them, but will prove their economy as well. Such maps cannot be constructed by boys. Neither can they be constructed by the class of incompetent surveyors that call themselves “engineers,” and are willing to work at their “profession” for \$50 or \$60 per month merely because this is more money than they can earn with the pick and shovel, or by tapping molasses and measuring tape.

The mining engineer is a professional man. His profession must have been acquired by years of work and study coupled with a good supply of that very necessary requisite in every profession—“brains.” It takes more study and harder work for a young man to become a competent engineer than it does for him to pass the legal requirements which enable him to practice law or medicine. His profession is one of great responsibility. Thousands of dollars may be either lost or gained in a single decision or act of his. The lives of the workmen in the underground workings often depend on his skill and accuracy. Notwithstanding these facts there are hundreds of collieries at which the book-keeper is paid more salary than the mining engineer under whose direction the colliery should be worked, but often is not.

A mine map may be accurate, and still not be complete. Such maps can be constructed by good surveyors. They can make an accurate survey, and keep their instruments in adjustment, but as they only have a limited knowledge of the difficulties to be contended with in coal-mining, their maps are only outline maps, and are only of use in so far as they show the relation of the inside workings to land lines.

The complete mine map should be a complete history of the colliery, showing also, indirectly, what its future may reasonably be expected to be. It should be constructed by men who do not work to get done in the shortest time, but by men whose main idea is to see how much information they can put on a map.

We do not mean to decry the accurate outline map. It is very good as far as it goes, and is infinitely better than none. But we want to impress on our readers the advantages of maps so constructed that the superintendent can see at once all conditions existing in a mine at all times.

To make a complete map, the engineer should first make a survey around the tract to be worked, locating all the prominent physical features and improvements. If he can do so, he should make a topographical map of the tract at once; but, if time is limited, by running the vertical as well as the horizontal angle, he can carry the tidal elevation, or the elevation above some assumed datum, to every station, and mark it on the map at that point. Then as he makes subsequent surveys, he can gradually get data enough to make a fairly complete topographical map in course of time. Every ledge of rock in place, should be located, and the amount and direction of its dip, as well as the character of the rock, should be marked neatly on the map. The streams of water on the tract should be regarded as of primary importance, and should be located with exactness.

After the surface survey has been made and plotted, a survey should be carefully carried into the workings and the same care taken in reading the vertical angles. Mark the elevation carefully at every station. Take the dip of the vein at every station, and oftener if it changes between stations. If the vein worked is a thick one, note how far the station is above the bottom slate, if above it at all. Note the thickness of the vein, and take frequent sections of it. Locate the ribs of all pillars with accuracy. Don't attempt to make a pretty map by drawing the sides of openings parallel to each other; draw them as they are. Note all pillars that have been robbed out, and those that have been skipped. Designate such pillars by some standard mark to distinguish them from pillars that still remain intact. In running the survey through a tunnel, take a section of it, noting carefully the dips and character of each bench of rock. Do the same in shafts. Take advantage of every opportunity to “tie up” the survey by connecting with some other branch of it by running through crosscuts or any other openings. Take advan-

age of the second outlet to carry the survey to the surface by a route different from that by which the mine was entered, and tie up with the outside survey. "Don't shove," is a short and appropriate expression.

If the surveys don't tie, don't shove them so that they apparently will; re-run them until you find the error that has thrown you out. If you have tied up at every opportunity, the chances are you will not have far to look for the error. Use what good sense you have been blessed with. This will direct you in regard to noting other features not already mentioned. Always bear in mind that your notes cannot be too complete. Don't be afraid of filling your note-book. Note-books are cheap, and they were made to be filled. Keep your notes as neatly and in as condensed a form as is consistent with clearness.

Base all your work on one meridian. If you have a number of collieries in the same neighbourhood, don't have as many different meridians, or you will never know how they lie in their relation to each other, and the difference in meridians will be an endless source of annoyance.

Test your instruments frequently and see that they are in perfect adjustment. Don't trust the magnetic needle if you want to make an accurate survey and map. Test your chain or steel tape as frequently as you do your transit. An inaccurate chain and a poor chainman are as great sources of error as a transit that is out of adjustment and a careless transitman.

Let your mine map be the ventilating chart of the mine. Mark the upcast and downcast plainly on it, and show the course of the air-currents by arrows.

With mine maps constructed on these lines, collieries can be worked more economically and with greater safety. More coal can be taken out at less expense, and advantage can be taken of innumerable natural and other features that, without such a map, would be lost sight of.

If a cross section is desired on any line through the tract, the data to construct it can be taken directly from the map. If a change is desired in the method of ventilating it can readily be planned on the map. If mechanical haulage is desired the necessary data for the mechanics can be taken from the map. If it is desired to rob pillars in any portion of the colliery the superintendent can see at a glance whether it can be done with safety to the outside improvements and the inside workings or not. If there are any streams on the tract they can be readily kept from finding their way to the inside workings, and thus the duty of the pumping engines can be kept down to a minimum.

Millions of tons of the finest coal in the anthracite regions have been lost simply because there were no accurate maps to guide the officials to their work. The writer has frequently seen pillars many times larger than there was any necessity for, and he has just as frequently seen them so small as to be entirely worthless, and the only means that the inside foreman had of determining the thickness of these pillars was by putting a hole through them. The importance of knowing the exact size of all pillars and the exact thickness and character of the strata between the surface, and mine workings cannot be over-estimated. The colliery official or owner who cannot appreciate this is an incapable man, and is unfit to manage a colliery.

If accurate, complete maps meant greater safety only, they would possess advantages that should force them into use at every colliery. But in addition to greater safety they mean greater profits as well, and there is no excuse but obstinate ignorance that tolerates such apologies for maps as are to-day used at the majority of American collieries.

In the anthracite regions of Pennsylvania mine maps are made that will perhaps excel those made in any other portion of the world in point of completeness and accuracy. In the same regions there are maps in use that are simply botches, and are, in many respects, worse than useless. Their inaccuracy is frequently the indirect cause of many accidents and great unnecessary expense, and the users are men who either are handicapped by superior officers who expect to have good maps made by incompetent surveyors because they are cheap, or they themselves follow this narrow line of thought.

If good maps were not in use, and if accurate work was really unreasonably expensive, there would be some excuse other than obstinacy and ignorance to offer for the use of inaccurate and incomplete maps. But obstinate ignorance must be the verdict when such companies and firms as Cox & Brothers and Company, the Philadelphia and Reading Coal and Iron Company, the Lehigh Valley Coal Company and a few others have their mine maps as complete and accurate as it is possible for well-trained and competent engineers to make them. There are other firms and companies that are gradually getting to a higher standard, but the majority of operators—both anthracite and bituminous—still work on with maps that, instead of being consulted at any time, should be promptly consigned to the waste basket, and the engineer corps promptly told to either make their maps with some degree of accuracy and completeness or to get out.

In this connection a word for the competent mining engineer will not be amiss. Mineowners have no right to expect him to spend his time and talents for less com-

pensation than they pay some members of their clerical force. If they want legal advice they pay a good lawyer a reasonable fee for it. If they happen to suffer from dyspepsia or any other ailment they pay a physician a reasonable fee, and the druggist a fat profit on his drugs, and never think of kicking. But if an engineer asks for a compensation considerably less than either the lawyer or doctor get, time and labour considered, they raise their hands in holy horror, and inform him that they can get men who will work for \$50 or \$60 a month. These latter are the parties that make the inaccurate and incomplete maps, and in the end always prove most expensive help.

* From the Colliery Engineer.

Phosphate Shipments.

The following have been the ocean shipments of Canadian phosphate from the port of Montreal to date:—

Date.	Name of Ship.	Destination.	Shippers.	Quantity.
June 17	SS. Fernside	Liverpool	Wilson & Green...	210

To Holyoke, Mass. (previously reported)	647½ tons
To Chicago (to date)	125
Total tons	772½

Notes on Quarrying.

(Wm. L. Saunders, in Stone).

An old quarryman when asked how much it would cost to start a marble quarry, replied: "You will have to run your hands down into your pockets clear up to the elbow before you get any return, but when the money begins to come back, it will come back faster than it went out." There is no doubt about the truth of this when applied to marble deposits, and it might also apply to frequent quarry openings in stone of less value. There seems to be a peculiar charm about the possession of a marble quarry which has induced many a successful business man to give up that occupation in which he had been trained, and which had proved profitable, in order that he might revel in the fascinations of a marble quarry. It is almost invariably true that when a man has once become fascinated with the marble business he is irretrievably lost and can do nothing else. He indulges his fond anticipations of dwelling in marble halls, and figures up the enormous profit which must follow a business which produces a stone at \$1 per cubic foot and sells it at \$5 or even \$9. That there are millions in it seem to be perfectly evident. He gets his little specimens polished and carved in paper weights, horse-shoes, card receivers, &c., distributing them among his friends, and every one congratulates him on the possession of a property which contains such beautiful marble.

After organizing his company, or in many cases before such progress has been made, it is usual to write everybody who advertises himself as a manufacturer of drills to find out how much it will cost to do some prospecting on the property and produce a core. The value of this core drilling in a marble deposit is much over-estimated; though I do not share the opinion of many that it is entirely useless. It is certainly true that several instances may be cited where sound and beautiful cores have been taken out with a diamond drill, yet the quarry has produced little, if any, sound marble. A notable instance of this, and one frequently cited, is that on the Baker property in Central Rutland, Vt. Mr. Baker, sr., was in possession of a handsome piece of property at Central Rutland, and might have still been enjoying the mountain breezes of that beautiful locality had it not been his unfortunate lot to discover marble upon his property. Those who knew this genial old gentleman will remember his enthusiasm when talking to you about his marble, and how delighted he was to receive you at his house and show you his specimens. "We have marble all around us," he would say. "My property is full of marble, and the most beautiful marble in the world," yet in spite of the specimens, and in spite of a very strong financial backing, no profitable quarries have ever been worked on Mr. Baker's property, and Mr. Baker is now dead.

In starting a marble quarry do not depend too much upon the condition of the deposit as shown by the core. Get the judgment of an experienced quarryman, not one whose experience has been confined to one or two localities, but a man possessing general information on the subject, and whose experience has taken him to different deposits in different sections of the country. The judgment of such a man is of more value than a diamond drill, but it is very well to have both.

Do not spend money in the erection of a mill until you have demonstrated the fact that you have a quarry that will produce sound and profitable stone. In the Baker case hereinbefore cited, a handsome mill was erected in anticipation of the large business from the quarries, and though the mill has been operated almost since its erection, yet it has been supplied with marble from other localities, and is entirely out of place in its present situation. The prudent quarryman will send his product to the nearest mill, and pay for its sawing until he has proved that his quarry will produce sound material, and that he has located in the best place. When he decides to put up a mill he takes into consideration the most favourable point for power, for sand and water, endeavouring at the same time to keep the mill as near his quarry as possible.

Less than ten years ago it was the usual thing for men to spend from \$50,000 to \$75,000 on a quarry deposit before receiving returns. Recent improvements in quarrying machinery have largely reduced the cost of opening a quarry. It is a matter of record that a quarry opened within recent years at Gouverneur, N. Y., by Messrs. Davidson & Sons, of Chicago, paid for itself in about two months' time. The case was somewhat exceptional, though by no means extraordinary. Messrs. Davidson & Sons exercised prudence and discretion, not only in the selection of the site, but in the equipment. Instead of "plunging" into the quarry business with a sounding of trumpets and beating of drums, and buying an expensive plant of machinery, they took the sensible course to feel their way gradually. They purchased only such machinery as would be best suited for making an opening, having since gradually enlarged the plant.

A complete and thoroughly first-class plant of machinery for starting a dimension stone quarry, comprising derricks, hoisting machinery, channelling machines, rock drills, boilers, pumps, pipe, blacksmith's tools and fit-

tings, will cost about eight thousand dollars; but it is not necessary to spend even this sum of money unless the quarry has been operated before, or the proprietors are perfectly sure of the stone. If it is only a deposit which promises well, a first-class equipment can be procured for about thirty-five hundred dollars, one sufficient to do considerable work and serve every purpose for several months. Such a plant as this would comprise a channelling machine, drill mounted in a proper way to suit the work, boiler, pump, derrick and hoisting apparatus. The derrick should be erected with a view of using it for heavy lifting with a single line. In other words, it would be a derrick for power hoisting, though it is seldom necessary to do any power hoisting when starting a quarry. A great deal of work must be done in connection with stripping and general levelling off, then the channels must be cut, and in all this there is not much hoisting to be done in proportion to the other work. I have known quarries so situated on the side of a hill that practically no hoisting was done for at least a year, and in all that time the work was progressing favorably and profitably. A steam hoist is an expensive apparatus in the first cost, but a very valuable one, provided there is plenty of stone in the quarry to be lifted. In other words, it is an appliance which will only pay when there is enough work to keep it busy, otherwise it is cheaper to hoist by water power, or even hand power. A horse-power hoist is a useful apparatus in connection with quarry opening, and will usually serve the purpose of doing all the hoisting which is required until the quarry has progressed so far that the nature of the stone is well understood. A horse-power hoist is cheap in the first cost, and cheap in maintenance and operating expenses, and if properly constructed it will do a great deal of work. When the quarry begins to produce profitable stone a steam hoist may be put in and operated with the same derrick, while the horse-power hoist will always be useful, either at the loading station or at some other point about the quarry.

It is not good judgment to erect bricked-in or stationary boilers in starting a quarry, but those of the portable pattern mounted on skids are preferable. They may be placed near the work and can be moved about in case it is necessary. In other words, do not put in a bricked-in boiler until the steam hoist is put in, then it is best to put the boiler and hoist under one roof, and in this case a return flue tubular boiler is preferable. The boiler will serve to run the hoist and do other work about the quarry, while the portable boiler will remain in the quarry to run the channelling machines, drills, etc.

Florida Phosphates.

Messrs. Couper, Millar & Company, London, in a recent circular to the trade, give the following expression of their views on the question of Florida as a new phosphate producer:—

"There have been so many wild rumors scattered broadcast as to the newly discovered phosphate fields in Florida, that we feel it a pleasure to be able to give some definite information on this subject. We may mention that one of the members of our firm was in Florida last autumn, and since then we have been in constant communication with several reliable local correspondents. In addition to this we sent out a well-known phosphate expert, who spent two months in examining various tracts of land and, after his return, we had a further examination made of all the lands at present being worked. We may say at once that this is certainly the largest known deposit of phosphate, but there is nothing in this fact to substantiate the exaggerated reports as to analysis, etc. There are still many millions of tons of phosphate left in South Carolina, while the northern departments of France contain also quantities which can only be counted by millions. It is not the fact of the existence of so many millions of tons, but it is the rate of production and quality which really concerns the market. It may, therefore, be interesting to mention the following fact, viz., that shipments of Florida phosphate in January, February, March, April, 1889, amounted to 4,574 tons, and in the same four months of this year 5,745 tons were shipped, which does not show an extremely rapid rate of progress. It will take time, and more time than many people seem to think, to get these deposits into working order, as many of them have difficulties to contend with in the way of selection and separation of qualities and transport. Added to this, the rainy season has just commenced and will not give any assistance in the matter. Lands have been bought by the tens of thousands of acres, and in several instances as many as 10,000 acres have been bought in one section in order to secure 100 acres of good phosphate land. Many of the tracts acquired are 20 miles or more distant from the railway, and as the companies will not build branches unless guaranteed certain annual quantities the proprietors have been offering large quantities on the European market, so that if they manage to get a house here take such a contract they can then go to the railroad

companies and get a branch built, and borrow money from bankers to commence operations upon.

"Speaking generally it appears that the whole of the West Coast of Florida, from Punta Gorda to Tallahassee, is more or less underlaid with phosphate, but the test of the great bulk of this rocky stratum is below 50 per cent. This fact was ascertained several years ago. Recent exploration, however, in Citrus, Marion and Polk Counties has proved the existence of beds of much higher test. There are two kinds of phosphate, *i.e.*, the Rock and the Nodule formation; and as far as we can judge it is the deposits that contain the Nodules that are likely to prove the most important, for the test varies between 65 and 78 per cent., whereas the Rock phosphate runs down from 80 per cent. to 20 per cent., is more difficult to extract, and when extracted is difficult to classify. When the first shipments were being made whole car-loads on which heavy railroad freight had been paid were thrown aside on arrival at the port as being valueless, and it is only picked cargoes that have been shipped so far. This points to the conclusion that cargoes of really high test will be few and far between, the bulk testing about 65 to 70 per cent. We know one large tract of land which has an inexhaustible supply of this test. Difficulties have also arisen as to the titles under which some of the American companies have been working.

"Our conclusion, therefore, is that though Florida will be the largest producer of phosphate in the future, the quantities likely to be shipped for some time to come will not be large enough to affect the market, and manufacturers who rely upon these supplies for this year or early next year, are likely to be disappointed, everything pointing to present prices being maintained for some time to come."

A New Method of Preparing Manganese.

A new method of preparing manganese, by which the metal can be obtained in a few minutes in tolerably large quantities, and almost perfectly pure, is described by Dr. Glatzel, of Breslau, in the current number of the *Berichte*. A quantity of manganous chloride is dehydrated by ignition in a porcelain dish, and the pulverized anhydrous salt afterwards, intimately mixed with twice its weight of well dried potassium chloride. The mixture is then closely packed into a hessian crucible, and fused in a furnace at the lowest possible temperature, not sufficient to volatilize either of the chlorides. A quantity of metallic magnesium is then introduced in small portions at a time, the total quantity necessary being about a sixth of the weight of the manganous chloride employed. Provided that the crucible has not been heated too much above the melting point of the mixture of chlorides, the action is regular, the magnesium dissolving with merely a slight hissing. If, however, the mixture has been heated till vapors have begun to make their appearance, the reaction is extremely violent. It is, therefore, best to allow the contents of the crucible, after fusion, to cool down to a low, red heat, when the introduction of the magnesium is perfectly safe. When all the action has ceased, the contents of the crucible are again heated strongly, and afterwards allowed to cool until the furnace has become quite cold. On breaking the crucible, all the potassium chloride is found to have been volatilized, leaving a regulus of metallic manganese, fused together in a solid block, about three parts of weight being obtained for every two parts of magnesium added. The metal, as thus obtained, is readily broken up by hammering into fragments of a whitish-gray color, possessing a bright metallic lustre. The lustre may be preserved for months in stoppered glass vessels; but when exposed to air the fresh surface becomes rapidly brown. The metal is so hard that the best files are incapable of making any impression upon it. It is so freely magnetic that a powerful horse-shoe magnet, capable of readily lifting a kilogramme of iron, has no appreciable effect upon the smallest fragment. It was noticed that the introduction of a small quantity of silica rendered the manganese still more brittle, and caused it to present a conchoidal fracture, that of pure manganese being uneven. The specific gravity of the metal, former determinations of which have been very varied, was found to be 7.3921 at 22° C. This number, which was obtained with a very pure preparation, is about the mean of the previous determinations. Dilute mineral acids readily dissolve the pulverized metal, leaving a mere trace of insoluble impurity. It is also satisfactory that practically no magnesium is retained alloyed with the manganese, and the introduction of carbon is altogether avoided by the use of this convenient method.—*Kuhlrow*.

The property of the Ontario Mining Company, near Rat Portage, now being worked under an agreement with the Canadian Pacific Mining and Prospecting Company, is being developed under the superintendence of an English expert. Shaft-houses and other buildings are being erected, machinery introduced, and mining operations will be pushed to the fullest extent.

MINING NOTES.

Nova Scotia.

(From Our Own Correspondent.)

Pictou County.

At the Vale colliery the McBean seam is still shut down from the effects of the fire last December. The six-foot seam re-opened in January has been working fairly steady. The management has, we understand, secured a contract to supply 40,000 tons of coal to the I.C.R.

Mr. John Muir, who has leased what is known as the Kirby area, situated at a point between New Glasgow and the Vale colliery, is working on a four-foot seam of very fine coal. The situation of his property, however, places him at some disadvantage, as he has to haul his coal by road into New Glasgow at a cost of something like 50 cents per ton.

Under the able direction of Mr. Poole and Mr. J. G. Rutherford the old Foord pit, which has been idle since the disastrous explosion in 1873, is slowly being re-opened, and it is expected that early next year will be producing coal in quantity again. The seam here is the largest in the province, and of excellent quality for coking purposes. The Douglas slope, which is in the third seam, has been re-timbered and cleaned up, and drifts are being driven across the measures to catch the second seam which overlies them. The management will then be able to take the Cage pit seam out through the Douglas seam.

The MacGregor pit is working steadily. Some difficult pillar work along the creep has been successfully accomplished. The slants have been sunk to a depth of some 600 feet, and levels are being extended east and west. This seam gives a very good coking coal. There has been a great deal of repairing and fixing up done at this mine for the last couple of years, but it is now evident that all difficulties will soon be overcome, and that a large quantity of coal will be raised.

The Drummond colliery, under the direction of Mr. C. Fergie, is making steady and satisfactory progress. I am informed that they are raising 1,225 boxes per day (of 9h. 25 min.). These boxes hold from 14 to 15 cwt. of coal. Work has been resumed on the Scott pit seam. Altogether it may be safely stated that the output from this mine will be largely in excess of former years.

The main slope at the Acadia colliery is now down to a depth of 3,600 feet. These extensive workings entail constant care and watchfulness on the part of the management, and a large amount of time and labor is expended in looking after the roof and sides. Mr. Maxwell is introducing a new system of winning coal in the deep workings.

The Black Diamond, under the management of Mr. J. W. Sutherland is now raising about 175 tons per day. The coal is mainly used for local consumption. With a view to proving the underlying measures, a portion of this property is being prospected with the diamond drill, under direction of Mr. John Douglas, formerly underground manager of the Albion mines. The drill is now down to a depth of 240 feet, having passed through the Scott pit seam at 100 feet, and it is expected to cut the third seam at 360 feet, and the fourth, or McGregor seam, at a depth of 640 feet.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,

Halifax, N.S.

Cumberland County.

Steady work is being done at the Joggins mines, about 200 tons being the average daily output at present.

The Minudie mine is idle.

Mr. Hall, formerly underground manager at Springhill, is reported to have discovered a promising four-foot seam at Salt Springs, Cumberland County, on which, with a small force, he is at present working.

The Lawson mine continues to turn out a small output for local trade.

(From Press Committee Gold Miner's Association.)

Central Rawdon District.

The June yield of the Central Rawdon Company, Mr. Gould Northup, Manager, was 543 ozs. The tons crushed were 100 of alluvial and 80 of quartz.

The yield of the Northup Mining Company, Mr. C. E. Willis, was 132 ounces from 155 tons.

Rawdon District.

Mr. Robert McNaughton has repurchased the property formerly sold by him to the English Company, and has commenced to pump out the water in the eastern end of the property. It is his intention to re-open the mine as soon as practicable and put it on a producing basis.

Waverley District.

Mr. MacDuff, Manager of the Nova Scotia Syndicate, Ltd., has about completed the work of straightening the shaft on the Union Lode and of getting the underground workings into proper shape for overhand stoping. A new gallows frame has been erected at the pithead, and systematic work has fairly been inaugurated.

The Lake View Mining Company are pushing the work on their stamp mill, and hope to have it stamping quartz before the 1st September. The company have from 1,000 to 2,000 tons of quartz stacked on the surface, and it is not intended to resume mining work until this accumulated quartz shall have been crushed and tested.

Oldham District.

Mr. T. P. Putman, on the 18th June, transferred the property of the Oldham Gold Company, bid in by him at public sale on the 10th June, to Messrs. Hardman & Taylor. Work was begun at once upon the Baker Vein, and No. 3 shaft is now sinking. It is calculated that intersections will be reached about 300 feet in depth, the shaft is now 268 feet. The June yield of the Standard Gold Company was 875½ ounces from 30½ tons.

Renfrew District.

The owners of the "Free Claim" property are rebuilding their stamp mill and water wheel gear. The old mill had been in use a long time, and was badly out of repair.

The Empress Company are working a few men only. The prospects are reported brighter than for some time past, but Manager Turnbull is wise in making haste slowly.

Killag District.

Mr. George W. Stuart started his mill on the 17th inst. on quartz coming from the new lode found last fall. Reports from this find are most encouraging, the width of the lode running from 8 to 16 inches in rolls, and is judged worth 2 ounces per ton.

Stormont District.

Mr. H. K. Fisher has about completed the organization of the North Star Company, operating the North Star group of mines on the west side of Isaac's Harbour. Mining is being vigorously carried on and the lode looks well. Early in July a prospecting drift from the main incline cut the rich streak worked years ago by former owners, and the quartz is variously estimated as worth from \$60 to \$100 per ton. The erection of a mill on the west side of the harbour is now under consideration.

In General.

The next regular meeting of the Gold Miners' Association will be held in the Halifax Hotel, Halifax, on Saturday afternoon the 2nd inst. at 2:30 P.M. A large attendance of members is particularly requested, important business being before this meeting.

Quebec.

We regret to learn of the death of Mr. S. B. Jenckes, President of the Jenckes Machine Company, of Sherbrooke. Mr. Jenckes was one of the early pioneers of our manufacturing interests in this province, having emigrated to Sherbrooke from Rhode Island in 1845.

Eastern Townships District.

From the pits of the United Asbestos Company, under the direction of Mr. John J. Penhale, a very nice quality of asbestos, of which a goodly portion was No. 1 quality, was turned out last month.

The Anglo Canadian has the crusher at work, and find it giving good satisfaction. By means of this machine they are now enabled to work up and utilize at a small cost, rock containing small veins, which formerly it did not pay to cobb by hand. The system adopted is similar to that formerly carried on by the Scottish-Canadian Company; 143 tons were dressed by the machine last month. Mr. Hopper is well pleased with the turn-out from all his pits.

The output from the asbestos mines in the Black Lake district for the month of June exceeded previous records for any one month's work since operations were begun here. All the mines did very well, and the production from some was exceptionally good.

The American Asbestos Company, under the able management of Mr. Klein, continues to push work with customary vigor. The new hoisting plant is in position on the top of the hill, and is run by compressed air from the compressor at bottom, the air being conveyed in pipes, a distance of some 1,800 feet or more; there is not an elbow in the entire line, thus lessening friction, there being only a difference of about 2 lbs. in the pressure on the hill and in the engine-room. The productiveness of the property is evidenced by the excellence of their last month's output.

Dr. James Reed is working on his Lot adjoining the Bell, or Hayden property. Several pits yielding good quality have been opened, and give excellent promise for the future.

The Laurier Mining Company has suspended work on the Lot adjoining the Anglo-Canadian property. Operations are entirely confined to some prospecting on the old Johnston & Loomis property.

The St. Julie Company has also been compelled to suspend operations; the quantity and quality of asbestos found was insufficient to meet prospecting expenses or to warrant a continuance of work.

The D'Israeli Company has shared a similar fate.

Good reports occasionally reach your correspondent from the Central Company, operating a property across the Lake.

Since writing the above, this district has been pretty well shaken up with an explosion of dualin. During a very severe thunderstorm the powderhouse of the Anglo-Canadian Company was struck by lightning, exploding with terrific force, some 30 cases of dualin and a number of kegs of black powder. Fortunately only one person was seriously injured, but the buildings in and about the place were all more or less damaged—but not to the extent of \$40,000 as reported by some Montreal papers.

Mr. A. M. Evans, M.E., of the firm of Blakemore & Evans, Cardiff, Wales, has been spending a few days in this district.

Messrs. King Bros. have at present about 180 men, under charge of Mr. Wm. King, operating some 6 pits south of the railway. Mr. King estimates that the production from his property will show a satisfactory increase over the excellent outputs of former years. Several openings on their property near Black Lake station have proved sufficiently encouraging to cause the erection of sheds and the construction of a road into the works.

The output from the Bell's Asbestos Company's properties continues up to the average, indeed Mr. Sheridan is confident that his output of 1,600 tons for last year, will be exceeded this season by close upon a thousand tons. About 200 men are employed.

Work is also going on briskly at the properties of the Johnson's Company, the Thetford Mining Company, and other Thetford mines.

The White's Asbestos Company has a force of men under Mr. L. Boyd working at Coleraine under agreement with the Megantic Mining Company.

Ottawa Valley.

The output of phosphate from the pits of the Phosphate of Lime Company at High Rock shows a slight lead over the production for the same period last year.

Mr. O. M. Harris reports that all the pits of the Canadian Phosphate Company are turning out satisfactorily. Through a typographical error Messrs. Millar & Company's ocean shipments were credited to Messrs. Wilson & Green and *vice versa*.

The North Star, Central Lake, Emerald, Aetna Hill and other phosphate mines on the Lievres River are steadily working and producing in good quantity.

Recent developments made in Lots 27 and 28 in the 4th Range of Portland West have proved extremely gratifying to the owners, extensive bodies of red and green apatite of high grade having been uncovered. Mr. John Haycock and a small force are at present engaged in the work. The property was recently visited by Mr. O. Ladureau, Directeur du Laboratoire, Central Agricole, Paris, in company with Mr. J. Obalski, M.E. Inspector of Mines for the Province. These gentlemen are unstinted in their praise of the extent and richness of the deposits revealed in these recent workings.

Mr. Robert Dollar, Fort Cologne, has a number of men prospecting over his property in the 4th and 5th Ranges of the Township of Wakefield.

All the Templeton mines are also doing well.

Messrs. Lomer, Rohr & Co., Montreal, made on 23rd inst. an additional shipment of 100 tons of felspar from the mines of the B. & C. Mica and Mining Company at Villeneuve.

From returns kindly furnished by Col. Lay, United States Consul General at Ottawa, we find that the exports of iron ore from 1st January to date, from the Bristol Iron Mines, have been 6,537 tons. The points to which the ore has been shipped are:—

To Catasqua, Penn. (previously reported).....	4,197 tons
“ “ “ (reported to date).....	2,202
“ Philadelphia, Pa.....	138

Iron ore, tons.....6,537

Ontario.

The Silver Center Mining Company of Ontario is the name of a new mining company incorporated by S. C. Duncan-Clark, John Flett, Henry Lowndes, Robert McClain, Richard Chaddick, Thomas Claxton, George Dunstan, O. A. Shaw, O. A. Howland, S. J. Dawson, M.P., and Ed. Gordon, to acquire, hold, lease, exchange and sell mining lands, consisting of mining location "R64," in the Township of Lybster, District of Thunder Bay, and other locations in the district, and to develop the said lands by working mines, smelters, stamping mills and other necessary works. The capital stock is \$300,000.

The Frontenac Phosphate Company (Limited) has been registered with a capital of £10,000, in £1 shares, to acquire phosphate and other lands and mines in Canada or elsewhere, and for such purpose to adopt an unregistered agreement with the Stirling Phosphate and Mining Company of Kingston (Limited), and with C. J. R. Stirling.

An important meeting of the Provincial Natural Gas and Fuel Company of Ontario took place in Toronto a few days ago, at which all the stock of the company was represented. The general manager reported that a new well of a capacity of 3,000,000 cubic feet per day had been added very recently to the already long list of successful wells of the company, the total production of these wells being now about 12,000,000 cubic feet per day more than what will be required to supply St. Catharines, Thorold, Merriton, Welland and adjacent places. It was decided to at once proceed to pipe these towns, as well as to run a pipe line to Buffalo to dispose of the surplus of gas. Offers from the best and largest pipe firms in the United States were submitted in person by their representatives to the directors, who have these various tenders under consideration. No doubt now that the first natural gas pipe line in this country will be an accomplished fact within the next few months.

The Imperial Oil Company and the American Company are steadily getting ready for the fall trade, which, by the way, will soon be upon us. The former company (the Imperial) are making some very extensive additions to their paraffin plant in the shape of three large brick buildings intended for the manufacture of paraffine candles, etc. The American Company have the brickwork about ready for their new stills, and are having a general all-round clean-up about their premises, especially noticeable is the new system of drainage they are putting through their yard.

The Kingston Board of Trade are making efforts to obtain a display of the minerals of Frontenac, Leeds, Renfrew and adjacent counties at the Midland Fair, 1st to 6th September next.

The proposed cement industry at Kingston under Mr. Linderoth has not materialized. He claims, by means of his patented invention of the mixture of sawdust with the raw material before calcination, that he secures more perfect formation of silicates, less free lime, and consequently strong cement. A new project is promoted in the limestone city by Mr. Strathy for the manufacture of builders' plaster, the plant for which, with little additional cost will, it is said, turn out Portland cement. A large cement plant at Marlbank on the Muban and Tamworth railroad is talked of. The extent of the marl deposits of Ontario is beyond estimate, and it is not unlikely they may yet be exploited to a considerable extent in the manufacture of lime as well as cement. Meanwhile the inventors, who are turning blast-furnace slag to every conceivable use, are likely to seek a market in this country for their cheap slag cement. It is a problem whether the leading brands of the best English Portland cement will be displaced by the weaker and cheaper cements now pressing on the market. The room for new competitors seems to be "at the top."

Port Arthur District.

(From Our Own Correspondent.)

THE BADGER SILVER MINING CO.—An exceedingly rich vein was discovered on the 2nd June running parallel with the old vein and situated about 350 feet south-west. It was exposed by running a cross-cut on bed rock across a break in the hill under about 20 feet of clay and boulders. It was about one foot wide at the surface of the trap, carrying galena, pyrites and zinc blende; the gangue was composed of calc spar quartz and fluor spar. At a depth of about 1 foot, leaf silver in considerable quantities came in; at 10 feet it carried about 100 ounces of silver, and has steadily increased in width and richness as depth is attained. The shaft is now down 76 feet, 56 of which is on the vein. Seven and a half barrels of high grade shipping ore, averaging 3,500 ounces of silver to the ton, has been taken out, besides 40 tons of mill rock that averages 100 ounces to the ton. Two-thirds of the vein has been left standing in the shaft. The width of the vein for the last 35 feet is five feet; the silver is in the form of native and argentite, with some zinc blende carrying very high in silver. The silver is quite regularly disseminated throughout the vein, but the richest portion is on the foot wall. Drifts have been started both ways from the bottom of the shaft, besides an adit level has been started in to strike the shaft at that depth. This same vein has also been found on the south-west side of the hill, a distance of 1,650 feet from the discovery shaft carrying the same gangue and an equal amount of silver with the surface of the vein at the discovery shaft. This is believed to be the richest and best discovery ever made in the Port Arthur silver region, and when it is opened up it is expected that it will exceed in richness, size and grade of ore anything in the history of silver mining on this shore, as it is now known to extend for such a great length through the hill and is apparently quite uniform, and in all probability extends into the low lands, down over the slope towards Silver Creek. It will be thoroughly prospected throughout its entire length by Capt. Shear. The force of miners has been increased to 135. The mill is running full blast, and the output of the Badger may be expected to surpass anything in its already remarkable history as a producer. This company has bought the adjoining property (Porcupine) for \$50,000 cash, on which there are three strong veins, one of which is partially developed; about \$10,000 was spent on it and 20,000 ounces taken out. Three shafts are now at work on the bottom level of No. 3 vein, and its development will be vigorously pushed.

THE BEAVER MINING AND MILLING CO.—The owners of this property must be congratulated on the present condition of the mine. For the past two years they have devoted their entire energy to development work, and have not sought to take out any silver excepting what was encountered in the drifts and levels, everything else being left standing, and it may be safely said that thousands of tons of high grade ore is now in sight in the mine. Your correspondent had the pleasure of going through all the workings a short time ago. Ten slopes are now working, and fifteen more are ready for commencement as soon as the mills demand. They have 2,000 tons of mill rock on the dump that will average 100 ounces to the ton. The mill is running night and day and giving entire satisfaction. It started up on June 16th, and has been running on an old refuser dump, left since 1887, that has averaged 30 ounces to the ton. Capt. Hooper invented an improved slow motion vanner, over which he is running this low grade ore. The silver is in the form of light thin leaves of argentite. The Frue vanner motion was too fast to save the thin leaves of silver, but the new vanner is doing the work remarkably well, and will prove a great boon to producers of this class of ore. There is sufficient ore in sight in the mine and on the dump to keep the mill running constantly for 3 years. The July shipment will amount to \$30,000, and will be made in a few days.

THE SILVER ISLET CONSOLIDATED MINING AND LAND COMPANY.—Capt. Thos. H. Trethewey and Mr. H. S. Sibley have just returned from an expedition extending over thirty days examining the company's property. A force of miners were placed at work on the Edward's Island location, situated nine miles east of Silver Islet. They have struck a strong well-defined vein, carrying arsenical silver ore assaying 700 ounces of silver to the ton. The vein is about 20 inches wide, and heavily mineralized. They also brought in some magnificent specimens of black oxide of manganese from a vein they discovered on the company's property at Cape Gargantua. The vein is from 7 to 10 feet wide. The manganese is on both walls and distributed through the middle. It assays about 45%. The importance of this discovery is very great when taken in connection with the vast amount of high grade ores waiting to be developed in this district.

SHUNIAH WEACHU MINES CO.—A new vein running parallel with the old one has been discovered on this property. It is situated about 200 feet to the south; it is about 2 feet wide, and has a rich pay streak 12 inches in width. A force of men are at work on the new find; all the ore taken out of it is being barrelled for shipment. It is very high grade, composed of argentite and native silver. They have also opened up a large body of high grade ore in No. 2 level west and east from No. 4 shaft.

McKELLAR'S ISLAND.—The United States Barytes Company are operating a large deposit of baryta on this island. They shipped 1,000 tons to Buffalo, N.Y., on June 28th. This shipment will be followed by regular monthly shipments of from 1,000 to 2,000 tons. This deposit is said to be the largest and best quality known to exist on this continent.

Explorers are swarming over both the silver and iron districts, and reports of wonderful discoveries of both metals are being made daily, many of which have to be discounted when the actual facts become known. Well authenticated reports by experts competent to judge of the finds of iron on the Aticokan River go to show that the metal is there in almost unlimited quantities, and of the finest Bessemer quality, giving average assays of 67% and free from all impurities.

(Later Correspondence to the REVIEW.)

THE BADGER SILVER MINING COMPANY.—Another rich strike of bonanza ore has been made on this property at a point 2,000 feet west of No. 1 shaft. An adit level was run in on the course of No. 1 vein for 134 feet; a cross-cut was then started north and driven for 50 feet, when a well defined vein was encountered, striking a little north of east and west on the course of No. 1 vein and dipping to the south. The vein is two feet wide with a pay streak of about 14 inches. Only one shot had been put into it when your correspondent visited it, and about 200 pounds of ore were blown out that would average 600 to 700 ounces of silver to the ton of 2,000 pounds. It is the intention of Supt. Shear to drift on this vein at once from the point of discovery, and also drive the lower level in No. 1 shaft on through the mountain. The vein is four feet wide at the breast of this level, carrying good milling ore averaging 40 ounces to the ton; when the length of this vein is taken into consideration the amount of ground to be opened on it is enormous.

The east and west levels at No. 2 vein are each in respectively 60 and 70 feet. The vein is carrying its width steadily, and the quality of ore is the same as that taken out of the shaft. In the adit started in to intersect the shaft at a depth of 76 feet the vein was encountered at the contact of the clay and rock. It is 3 feet wide, and stood up in a comb-like form in the clay. It is carrying 100 ounces of silver to the ton, and getting richer as they approach the shaft. It is only six weeks since this vein was discovered; 12½ barrels of high grade shipping ore has been taken out of it that will average 3,500 ounces to the ton, besides 250 tons of milling ore that will run all the way from 35 to 100 ounces of silver to the ton. I do not think that there is a better showing anywhere in America than there is on this vein for the amount of time and money expended on it. From where it outcrops on the west side of the hill to the point of discovery in the adit it is about 2,200 feet, and at every point where it has been opened it carries high grade ore. It is safe to say that they have 3,000 feet of this vein on their property.

No. 3 (Porcupine) vein sinking in No. 3 shaft and drifting in No. adit level is being proceeded with. The shaft will be sunk deep enough to intersect the adit, which will be 810 feet in length; it is now in 210. The ore being taken out of the shaft assays 125 ounces to the ton and out of the adit 100 ounces. The mill is running on No. 3 ore, and is treating 35 tons daily, the Krause Atmospheric Stamp doing 20 tons, and the five-head battery of stamps 15 tons daily. Supt. Shear has just had a Krause separating table placed in position in the

mill. This a new invention, and the first one of the kind set up in Canada. There are three in operation in the United States. It is triangular in shape, about 8 feet across the head, and tapering to an apex. The length is 16 feet. It is very simple in construction, and is designed to have the same motion as a shovel in the hands of a miner washing ore. The writer had the pleasure of inspecting it at work for several hours, and it is apparently giving entire satisfaction. It separates the concentrates into different grades, the heavies coming over at the head and the lighter grades lower down the table. The water is supplied by a perforated tube running down the front of the table. Its capacity is 9½ tons of pulp direct from the head daily.

THE BEAVER MINING AND MILLING COMPANY.—

The mill is running night and day, treating 25 tons daily. They have not finished the old 1887 dump as yet, nor do they seem likely to for some time. They expected that only a portion of it was worth milling, but as they get into the pile its quality keeps up giving a steady run of 30 ounces to the ton. None of the high grade milling ore has been put through as yet, but I believe that some of the higher grade will shortly be run through with the old dump. The Beaver is in first-class condition in every respect. They have an immense amount of ground opened up; ten slopes are at work, and fifteen more can be started at any time. They have 23 barrels of concentrates on hand, assaying from \$500 to \$1,500 per ton, besides 300 barrels of high grade shipping ore.

A. Lougheed, P.L.S., has just returned after surveying 1,740 acres of iron lands on the Black Sturgeon River for Detroit capitalists. The deposits are 35 miles up the river from the Canadian Pacific Railway at Black Bay. Mr. Lougheed describes the ore as a hard red hematite assaying 64% metallic iron and free from impurities. The most northerly deposit is 1¼ miles in length, and has an average width of 200 feet. The next one south is about 1½ miles long, and an average width of 35 feet. The most southerly location is half a mile in length. No ore was found in place on this location, but large quantities of float ore of a high quality covered the ground. The locations contain respectively 1,000, 500 and 240 acres. The lands are well timbered with white pine, spruce and tamarac, and plentifully supplied with water by the Black Sturgeon River. Mr. Lougheed estimates that there is a sufficient quantity of ore in sight to warrant the building of a 50-mile railway. There is no capping of Jasper granite or otherwise excepting a slight covering of red gravel in places.

The country rock is a reddish slate. This property ought to prove very valuable owing to the short haul necessary to bring it to deep water, and taken in connection with the immense deposits of magnetic iron west of Port Arthur, and the carbonate of iron in the immediate vicinity of the town ought to bring about the erection of blast furnaces at Port Arthur at an early date.

Lake of the Woods.

Work on the reduction works at Rat Portage is at a standstill owing to the delay to the machinery, which is being held by the customs at Port Arthur. The Government passed an order-in-council exempting mining machinery not made in Canada free from duty, and the collector at Port Arthur claims that duty should be paid and then remitted if it came under the order. The company has been obliged to stop work awaiting the settlement of the question, and all the men were discharged last Wednesday. The collector referred the matter to the Department of Customs, and the minister has been considering (?) it for some months. The cessation of work has brought forth many strong terms against the dilatoriness of the Minister of Customs and the action of the Collector. The Board of Trade met Saturday evening to take some action, and the general desire is that the Winnipeg Board of Trade should assist in this matter, as it is as much to the interest of Winnipeg that this should be settled as to Rat Portage.

[On enquiry at the Department of Customs, the Hon. M. Bowell replied to the above dispatch as follows:— "The parties have been told that all mining machinery not made in Canada is free. This they have not established, and in addition claim free admission of machinery imported before the law was passed, though not in Bond.—Edit.]

The buildings of the Lake of the Woods Gold and Silver Reduction works at Rat Portage are fast assuming shape. In fact, the main building is about completed, and the foundation for the engine house, the furnace house and the laboratory is being laid, and they will be rushed along as fast as possible. As the works will, when completed, be one of the institutions of the country, a short description may not be uninteresting. The works are located just across the bay from the town, on a rocky promontory jutting out into the lake, on the south side of the C. P. R. track, and about 100

yards distant therefrom. The company owns $2\frac{1}{2}$ acres of land, which was purchased from the Hudson's Bay company. The building which is erected on this land is in main 115 feet long by 106 feet wide and 75 feet high, in all five stories. It stands on a ledge of solid native quartzite granite, and is built of heavy timber and well put together. The sum of \$2,000 so far has been expended on rock-work alone. This embraces the foundations of the main building, the boiler room, the furnace room and the laboratory. The company intend constructing 150 feet of wharfage to facilitate the handling of home ore, which dockage can be extended to 1,000 feet if necessary as the site is surrounded by water on three sides. These docks will afford ample storage for the ore to be brought in from the Lake of the Woods district. A switch is to be put in by the C.P.R. and ore beds to accommodate foreignores will be built. The ore bins will be situated 11 feet above the level of the top of the rock-breaker, and will be run in cars by gravity. The ore bins in the building will occupy the top stories, and will have a capacity of 210 tons. The ore from the dock will be brought in by a steel cable over a tramway and dumped directly into a rock-breaker, the cable being worked from the engine. The ore when dumped into the rock-breaker, will be reduced by it to the fineness of chestnuts and wheat grains, and will drop through the breaker into large steel buckets attached to an endless chain belt. The ore will be carried in these buckets to the bins, 40 feet above, having a capacity of 210 tons.

Manitoba and N.-W. Territories.

The Alberta Railway and Coal Company has let out contracts for the construction of a large number of miners' houses. The houses and lots are to be obtained by the employees from the company on the following terms: Cost of house and lot from five to six hundred dollars, on a rental purchase of \$12 a month at 6 per cent. per annum interest, the house and lot becoming the property of the employee when principal and interest are paid. The sinkers have got down to the coal in No. 2 shaft. The engine and boiler have arrived for the same. A large staff of carpenters are at work forming trestle work to connect with the shaft and for convenience in loading the railway cars and teams. A large quantity of stone has been quarried and hauled for the foundation of engine and boiler beds and houses of the shaft.

Local papers announce that an expert of extensive experience in coal mining—no name is mentioned—has offered to defray 10% of the cost of boring for coal at Medicine Hat. He is confident that excellent coal will be found in the immediate neighbourhood of the town.

British Columbia.

Development work on the claim of the Lillooet Hydraulic Mining Co. at Lillooet is being actively pushed. At the last "clean up," representing ten days' work for four men, \$175 was taken out, the running expenses being \$90.

At Fish Creek, which is reached from the C.P.R. a few miles east of Illecillewaet, development work has been carried on during the most of the past winter, and two tunnels have been driven at different levels, showing excellent veins of argentiferous galena.

At the Vancouver Enterprise mine on Cayuse Creek, a tunnel is being driven under contract to reach a supposed buried channel of the creek some 600 feet distant, where rich pay gravel is looked for. Rock has been, however, struck in the tunnel, and the work may prove more troublesome than was expected.

The Raney brothers are actively engaged in opening out a mine of magnetic iron ore on the west side of the North Arm of Burrard Inlet. There is, unfortunately, a large proportion of pyrite in the ore taken out so far, but it is hoped that by sinking ore will be found in quantity free from this deleterious admixture. There is said to be a fine deposit of clay on the same property.

Certificates of Incorporation have been granted to the Middle Creek Gold Mining (capital, \$5,000,000) and the North-Western Gold and Silver Mining Company (capital, \$1,000,000).

The Nanaimo Free Press says the last of the importation of coloured miners left the mines on Friday, and the colliery work is now done entirely by whites and Chinese. The recent find of an eight-foot seam of coal at the Union colliery is more than confirmed, for a second bore at 700 yards distant from the first bore also struck the seam, and a third bore at about equal further distance also struck the coal within 16 feet of the surface. This is looked upon as a nice strike, and secures the permanency of the Union mines.

Notice of application for Incorporation is given by the Crow's Bar Mining Company (Limited), capital \$25,000 in 5,000 shares of \$5. The trustees who shall have the management of the affairs of the company for the first three months are D. L. Beekingsale, S. Herbert, J. W. Hoone, J. Van Volkenburger, all of Vancouver. The company is formed to acquire and work for gold and other minerals.

A company of which Major Vaughan is the moving spirit is engaged in an active search for coal in the valley of the lower Fraser. By co-operating with the C.P.R. Co. they have secured the use of the Diamond Drill belonging to that company, and are now boring at Kanaka Creek, that site having been chosen on the advice of Dr. Lawson, as the most likely one to test the general question of the presence of coal in the valley of the lower Fraser.

There is some talk among the more enterprising inhabitants of Lillooet of placing a steam tug on the Fraser between Lytton and Lillooet, that portion of the river being navigable. With a Government subsidy and a mail contract such a venture could doubtless be made to pay, and could afford much easier access to that portion of the interior than is now possible, and would lead to more active mining developments in a really promising district.

Prospecting is active on Illecillewaet Mountain this year. A large number of claims have been taken up both in the vicinity of the C.P.R. and on the North Fork, and assessment and development work is being done on most of them. The Selkirk Mining Co. have let a contract for the completion of their lower adit, which it is calculated will strike their lead at a point about 200 feet farther than it has already been driven. No active mining has been done on the adjoining Maple Leaf claim, but the property has recently been carefully examined and reported upon for eastern capitalists by Dr. A. C. Lawson, and it is probable that further development work will be commenced at an early date to test the value of the claim more thoroughly.

The erection of the smelting furnace at Golden is progressing favorably. The dimensions of the buildings and style and make of plant are as follows: One building for offices and analytical laboratory, 20 x 30; one for roaster furnace, 70 x 80; one for 2 calcining furnaces and ore crusher, 53 x 53, with an additional shed for coke, 53 x 13; one ore house, 40 x 40; also a receiving platform, 90 x 76, close to a spur of the C.P.R., capable of accommodating 12 box cars. There will also be a shed for coal fuel, 20 x 40. These buildings will be composed of square timbers with shingled roofing, and the usual precautionary measures in case of fire. The most of the plant was manufactured by Fraser & Chalmers, of Chicago, Ill., and consists of one water jacket furnace, 7 x 10, with No. 4 blower, 33 x 72; and one Blake crusher, 14 x 24. The belt rolls and sample grinder, 5 feet 6 inches, power elevator and all casting for the calcining furnaces were also furnished by the American firm. The motive power will consist of one 30-horse power slide valve engine and tubular boiler, 12 feet long by 42 inches in diameter; these were manufactured in Toronto. The supply of water will be taken from the Kicking Horse, by means of a No. 6½ Knowles pump, capable of a volume of 150 gallons per minute. This plant is intended or adapted to treat ores of the sulphurous or argentiferous galena class, but will also reduce ores carrying a limited percentage of copper. These works are intended to treat about 40 tons of ore in 24 hours, and will employ a minimum of about 30 actual workmen, exclusive of supernumeraries, if kept running in full blast.

In order to further aid the development of the mineral wealth of the province, the following reduction of fees for assaying, to come into effect on the 1st prox., has been ordered by the Hon. John Robson, Minister of Mines: Tests of single samples for gold, silver, lead and copper to be made for \$1.50 each; when two or more samples are tested, the charge will be \$1 each, and for all other tests a proportionate reduction will be made.

The General Phosphate Corporation.—The *Times* correspondent at Ottawa, writing under date of 25th July, says: "I learn on the best authority that the majority of the phosphate lands of the Dominion have been bonded by the Canadian representatives of the Phosphate Trust for a period of two months, with the option of purchase at the end of that time." We need hardly inform our readers that the statement is as absurd as it is untrue.

We learn that Mr. J. Lanson Wills, who has been absent in Europe and South America for several months, has returned to Buckingham.

Coke Bricks for Furnace Linings.—At a recent meeting, in Dusseldorf, of the Society of German Iron Manufacturers, F. Burgess, of Gelsenkirchen, referring to the subject of furnace linings, said it was well known to those who had to do with blast furnaces that the hearth and bottom of a furnace are the parts which, so far, have been the least successful in performing the duty expected of them. Often, after a short time, only a few inches remain of a hearth that was 3 or 4 ft. thick when set in. Then streams of water must be played on to keep the hearth in any condition at all. The great inconveniences of this state of things need no emphasising. The cause of this quick destruction of refractory material lies clearly in the circumstance that the hot slag, which in most processes is now acid and now basic, dissolves the lining in the shortest time and carries it away as slag. An experiment will show that the best refractory stone of the most widely differing composition, when placed in a stream of slag, will be completely melted away in one to two hours. This fact determined me to look for a better material. Carbon suggested itself to me, because it is apparent in the blown-out furnaces that the best inner coating consists of small coke and graphite cemented with lime and slag, and in this case it is the carbon which has proved the refractory armour. In practice, also, it is well known that slag runs best in a bed of coal or coke ash. The first experiment, which in 1882, was to make a combination of coal, coke dust, graphite, &c., with clay, and to use it in the form of bricks. The firm of Dr. Otto & Co. furnished him with several samples of this brick, which were somewhat defective, as in the process of making the bricks the carbon had been partially burned out; but even these gave good results. It was not possible to patent this process in the metallurgy of Brundkerl. It is mentioned that the lead furnaces in the Harz region were lined with such a mixture of coke dust and clay. In 1885 there appeared a paper by A. Purcel, on ferro-manganese, in which it was stated that already for several years in La Voulte and Talmain, France, hearths and bottoms of graphite bricks had been used. The raw material was retort graphite of 1 to 2 per cent. ash, which, ground and burnt with tar, was then made into bricks and calcined. Part of the tar was caked, and burned the graphite into a hard and durable brick. Experiments were made with ground coke poor in ash, instead of graphite, and these experiments always gave good results. In 1885 furnace No. 2 was lined with this material. And the use of it, even with large production, has given satisfaction ever since. The cost of the bricks is about 100 marks per ton.

Improvements in the Manufacture of Copper.—The improvements in Copper smelting, by P. C. Gilchrist, relate to the separation of copper from impurities, more especially arsenic, antimony and tin. In roasting of white or pimple metal for the production of blister copper, in the treatment of metallic bottoms for the removal of arsenic and conversion into blister or into refined copper, and also in the toughening and refining of blister copper, reverberatory furnaces are used, lined with shrunk dolomite, magnesite, chrome iron ore or other basic or neutral lining by which means it is possible to maintain during the operation of refining a basic slag instead of the acid slag as hitherto. A purer product is thus obtained, together with a larger yield and increase output. It has been found that a suitable amount of lime to add when charging white metal containing 75 per cent. of copper, is from 2 to 3 cents per seven tons of white metal charged. The metal should be melted down slowly under air. Much less slag will be formed than is usual in sand-lined furnaces. A good heat should be kept on the furnace throughout the charge. It is often advantageous to add a few shovelfuls of lime to the slag shortly before tapping the charge. Care must be taken not to form too thick a slag or the operation will be retarded. It is often convenient to charge in also some copper oxides or slags, and to subject the surface of the latter to the action of an air blast, the oxidising action of which materially assists the diminution of the arsenic. The object of the smelter should be to obtain as little slag as possible, and with a low percentage of copper in it, skimmings of slag should be made three or four times, as desirable. When the sample begins to show a blister fracture a few shovelfuls of lime are to be added once or twice until the bath is ready for tapping. The slags obtained when working as described will not average more than 30 per cent. of copper, whereas when working with the ordinary sand bottom the slag usually averages 55 per cent. of copper, besides weighing considerably more per ton of blister produced. It was found when treating 400 tons of metallic bottoms in a basic lined furnace that there was obtained 323 tons of blister and 107 tons of slag, averaging 25 per cent. of copper, and that when treating an equal weight of metallic bottoms in a sand-lined furnace there was obtained 191 tons of blister only and 221 tons of slag, averaging 55 per cent. of copper. A slag in which there is no more silica than 20 per cent. should be worked with, as with more siliceous slags the elimination of the impurities takes place more slowly. —*Journ. Soc. Chem. Ind.*

The Davis-Colby Ore-Roaster *

By Sterling G. Valentine, Ph.D., Lebanon, Pa.

The annual use of large quantities of sulphurous iron-ores (over 1,500,000 tons in the United States) has led to a search for the best methods of desulphurization, in order to make this material more available for the manufacture of a good quality of pig-iron. Although such ores can be used raw in small amounts, they must be previously roasted if they are to constitute the entire ore-charge of a furnace.

In a former paper some of the chief conditions necessary to satisfactory roasting of ore were examined on the basis of experimental data. They indicated, too, the most prominent characteristics of a good kiln. It is proposed to give in this paper some description of the latest application of a gas fired roaster to the preparation

of sulphurous ores, as exhibited in the Davis-Colby kiln, including a statement of some results already obtained in actual practice. The principles involved in the construction and work of this roaster cover the most prominent points heretofore shown to be necessary for good results.

The Davis-Colby ore-roaster is the outcome of some years of trial and practical experience. In the years 1878-9 the Katahdin Iron Works built at their furnace a Westman kiln, which was fired with wood, for the purpose of making the ore used there available for the manufacture of charcoal car-wheel iron. The ore at that locality is a hematite, resulting from the oxidation of a ledge or vein of pyrites, and carries a good deal of sulphur. The Westman kiln being in many points unsatisfactory, changes made from time to time to secure increased efficiency resulted in what is now known as the Davis-Colby gas-fired roaster. This has been and is yet

in constant use at the Katahdin Iron Works, and kilns of the same type have been since introduced at other points.

The illustrations, reduced from drawings kindly furnished by Mr. A. G. Davis, will give a clear idea of the construction of the kiln. In general it consists of two concentric shafts of brick-work, enclosing between them an annular space, *E*, 18 to 24 inches in section, to contain the ore under treatment. The inner shaft, *F*, is continued to a proper height above the top of the roaster to form the draft-stack, as shown in Plate II.; or it may be covered, as in Plate I., the products of combustion being carried downward and out through the flue, *F'*, to a separate chimney. This would allow of any utilization of the fumes deemed expedient. A cone-covered top, as shown, permits of more convenient charging, as ore can be dropped from car-hoppers upon the cap, *L*, giving an even distribution of the ore. In the outer wall are

FIG. 1.—Down Draft Davis-Colby Ore-Roaster.
(Scale: $\frac{3}{16}$ inch to 1 foot.)

Fig. 2.—Davis-Colby Ore-Roaster, Cornwall Anthracite Furnaces, Cornwall, Pa.
Scale: $\frac{3}{16}$ inch to 1 foot.

placed the chutes, *C*; the fire-arches, *B*; the gas-flues, *X*, and the poking-holes and air-holes, *Z*. Openings in the inner wall, *D*, admit the fumes and products of combustion to the draft-stack, *F*. These openings are placed higher or lower, according to necessities arising from the character of the ore under treatment. The external shape, as shown in Plates II. and III., is that of the Giers kilns, which were remodelled to the new type. These illustrations are given to show how readily the ordinary style of roaster may be adapted to this new design. In some cases, particularly where dense hard magnetites are to be roasted, the height of the kiln is increased above that shown, for the purpose of giving the ore a longer exposure to heat; and the fire-arches are put at a greater vertical distance apart, so that the ore may partially cool after its first heating, and be cracked or fissured, thereby exposing the remaining sulphur more thoroughly to the action at the second fire-arches. A

gallery around the outside, at the proper height, gives workmen convenient access to fire-arches and gas-flues.

Gas from the mains, *A*, enters the flues, *X*, in the outer wall, and is distributed to each of the fire-arches, *B*, flowing downward through the outlets, as indicated by the arrows. Two or more sets of fire-arches are used. In these the gas is burnt, the flame and heat impinging on the ore as it descends in the annular space, *E*, raising it to any temperature required. This heating is done in the presence of abundant air, entering at the chutes, *C*, the fire-doors, *B*, and the poking-holes, *Z*. After passing through the ore the air enters the draft-stack through the openings, *D*, carrying with it the gaseous products of combustion and sulphur oxides from the ore.

The ore is filled in at the top, *T*, passes down the space, *E*, which gradually widens downward, and is drawn below from the chutes. Its cross-section being so

narrow, the whole body of ore is thoroughly exposed to the fire.

At most places where these roasters have been introduced, the gas used for firing has been surplus gas from the blast-furnace. Where this supply is abundant and clean, or where the gas can be cleaned for introduction to the flues of the roaster, it answers very well, and is economical. Small blast furnaces can the better allow this method, as their surplus supply of gas is generally sufficient, and likely to contain a larger amount of combustible constituents than that from larger furnaces, the latter, as a rule, having little surplus gas above that required for hot ovens and boilers. But there are serious objections to depending on the use of furnace gas under the circumstances generally prevailing. The gas-flues and small openings into the fire-arches require to be kept open and free from dirt; and while this can, of course, be readily done, it increases the attention required in

working the kiln, and is so far an annoyance and disadvantage. The difficulty of getting a clean furnace-gas is an important objection to its use. Then, too, the variations in the quantity and quality of furnace gas are against it. When a furnace man is especially desirous of securing well-roasted ore, he may find such fuel unequal to the task of preparing it. There are, after all, few furnaces that afford gas enough to heat their blast, furnish their steam, and roast their ore at the same time. It is questionable economy to make any endeavour to turn a blast-furnace into a gas-producer. It may be desirable at times however, to use waste furnace-gas for whatever part of the work of roasting it may be equal to, and augment the supply from another source.

Producer-gas, therefore, is a preferable fuel for the roaster, and can be obtained cheaply from some such apparatus as the Taylor producer. With such an arrangement the gas supply can be kept uniform in quantity and

quality, or can be varied, as the case may demand, thus giving increased control of working.

The principles involved in the construction and working of the Davis-Colby roaster are well calculated to produce good results. The heat is under almost absolute control. Any set of fire-arches, or any single fire-arch, can have its supply of gas increased or diminished at will. The double set of fire-arches serves to keep the ore at the desired temperature until drawn into the chutes, so that from the first point of heat it is held, during its entire descent, at such a temperature as to make the action of atmospheric oxygen upon it most effective.

The air required for a proper oxidation of sulphides in roasting is furnished abundantly through the poking-holes, fire-doors and chutes, passing through the hot ore into the chimney. Thus, the hot ore is always exposed to an oxidizing atmosphere, and a prime requisite for good results is well attained. The narrowness of the ore-section has

well adapted to roasting. The following table shows its composition when raw :—

Raw Katahdin Ore.

	I.	II.	III.	IV.	V.
Iron	47.75	57.34	44.80	39.50	53.50
Phosphorus....	.017	.025	.04	.035	.034
Sulphur	3.90	1.29	.98	2.50	2.48

The roasted ore contains the following percentages of sulphur :—

	1	2	3	4	5	6
Per cent. Sulphur, -	0.07	0.15	0.10	0.18	0.12	0.10

The roasted ore runs, as a rule, from 0.05 to 0.20 per cent. of sulphur, averaging not over 0.10 to 0.12 per cent.

Cornwall, Pa., ore, containing on an average from 2½ to 3½ per cent. of sulphur, gives the following results when treated in Giers Kilns :—

Cornwall Ore Roasted in Giers Kilns.

Per cent. Total Sulphur.	Per cent. Sulphur as Sulphate.	Per cent. Sulphur as Sulphide.	Per cent. Total Sulphur as Sulphate.
1.133	0.283	0.850	24.977

*Samples of clinkered ore.

As being of interest in this connection, the following results are given as obtained by another type of gas-fired roaster, the Taylor kiln, on magnetite ores from the Jones mine, Berks Co., Pa. This one is similar to Cornwall ore, and carries about the same amount of sulphur. The analyses are by Mr. R. H. Voudy, of the Phoenix Iron Company, and the roasting was done in their kiln :

"Jones" Ore Roasted in Taylor Kiln.

Per cent. Total Sulphur.	Per cent. Sulphur as Sulphide.	Per cent. Sulphur as Sulphate.	Per cent. Total Sulphur as Sulphate.
1.087	0.656	0.431	48.85
1.059	0.552	0.507	47.87
1.045	0.618	0.427	40.86
.912	0.548	0.364	39.91
.909	0.444	0.465	51.15

As to the ability of the Davis-Colby roaster to dispose of fine ore, it may be well to state that, when properly charged, as much as 30 to 40 per cent. of fine ore can be used. But fine and coarse should be thoroughly mixed in filling, as a solid mass of fine ore before a fire-arch chokes off the gas and prevents the heat and air from penetrating the ore. Kilns of the size shown in the illustrations, roast from 75 to 100 tons of a reasonably porous

Fig. 3.—Davis-Colby Gre-Roaster, Colebrook Furnaces, Lebanon, Pa.
(Scale: $\frac{3}{16}$ inch to 1 inch.)

the advantage of making it very difficult for any ore to pass the two or more fire arches without being well exposed to oxidation. Since the openings into the draught chimney are just opposite, and a little above the fire-arches, the heat and air are drawn through the whole of the annular space, all gaseous products of consumption passing promptly into the stack and being removed.

Sulphur of iron can be decomposed by atmospheric oxygen alone at ordinary temperature, a very slow reaction indeed, but, like most chemical reactions, the process of oxidation is accelerated by heat. On the other hand, a high temperature, without oxygen, affects a partial decomposition of FeS_2 , leaving a compound very nearly FeS , volatilizing about half the sulphur, but cannot carry the process further alone.

Oxygen being present, however, the chemical affinity between it and sulphur is increased by heat, and a complete oxidation of all the sulphur is theoretically attainable. Oxygen is absolutely necessary for the removal of the second half of the sulphur. Heat is required in such a degree in each case as will most effectively enhance oxidation, and as long as it is desirable to continue the oxidizing action, the heat should be kept at the most favorable point, with ample opportunity for admission, at the same time, of atmospheric oxygen. It is this fact that brings out the peculiar effectiveness of the Davis-Colby roaster.

Some analyses are appended to show results obtained in actual practice with the Davis-Colby roaster.

Excellent results have been obtained in working on Katahdin, Me., ore, which is very open and porous, and

ore in twenty-four hours. Of course a hard, dense ore requires a longer exposure, and the output of such ore is somewhat less. The roaster at the Katahdin furnace, 20 feet high, and 15 feet in diameter, roasts about 40 tons per day, the entire supply for the furnace. The kilns at the Colebrook furnaces and Cornwall anthracite furnaces, as shown in the illustrations, roast from 75 to 90 tons of Cornwall ore per day.

The occurrence of clinkers in this roaster causes little difficulty in working. They are local, seldom extending beyond the bounds of one or two fire-arches, and as the annular space is so narrow, and widens downward, they are readily reached and broken up while hot. Indeed, with proper attention, there is no reason why clinkers should be allowed to form at all, owing to the easy and full control of the heat. But carelessness of men in charge will sometimes bring about that result. The upper fire-arches should generally be kept at a somewhat lower temperature than the second set, gradually raising the ore to the desired heat as it descends, so that if clinkering does take place it is only after long heating at a lower temperature, and after atmospheric oxygen has had full play on the reasonably hot ore. It is seldom necessary to sinter an ore in roasting, but if it is done, it should be the final act of the process, as it renders further effective roasting impossible.

The cost per ton of roasting ore in this kiln varies with the circumstances, and it is scarcely possible to give figures. The cost is greatly affected by the method of breaking and filling the ore, and by the use of furnace, or produce-gas.

New kilns, with a capacity of 75 to 100 tons per day, are built by contract for \$3,000, including royalty. But the system can be adapted to any ordinary Giers kiln, the expense varying with the size and shape of the original roaster.

It is possible that this roaster may find a new field of work in the preparation of gold and silver-bearing lead ores, and other metallurgical processes of which roasting forms a part.

(Ottawa Meeting, October, 1889.)

Burk v. Tunstall.

This was an application for a writ of prohibition against George Tunstall to restrain him as Gold Commissioner for West Kootenay from further proceeding in an action brought in his court by Robert Burk to recover \$70 for labor performed in the Cariboo mining claim in Illecillewaet in the district of West Kootenay. The following is the verdict of the Supreme Court:—

"The grounds taken by Mr. Wilson in applying for rule nisi were that Mr. Tunstall is a gold commissioner appointed by the Provincial Government, and that the powers given to a gold commissioner sitting as a judge in a mining court under section 11. of the Mineral Act are *ultra vires*, to the Provincial Legislature, the power of the appointing judges being solely vested in the Governor-General.

"It is to be regretted that no argument was addressed to me in support of the powers claimed by the gold commissioner under the Act, as no one appeared in opposition to the rule.

"The sections of the Mineral Act, so far as they are of importance with reference to this application, are as follows:

"Sections 4 authorizes the Lieut.-Governor in council to appoint gold commissioners either for the whole province or for a particular district. Sec. 5 establishes in every district a court called the mining court over which the gold commissioners shall preside.

"Such mining court by sec. 6 is to have original jurisdiction as a court of law and enquiry to hear and determine all mining disputes, and is to be a court of record, and the gold commissioner is to have the same powers for enforcing the judgments or orders of his court as are exercised by the Supreme Court or a judge thereof.

"Sec. 10 gives a jurisdiction as to disputes relating to real estate held under the Act. Sec. 11 gives jurisdiction as to personal claims arising between persons engaged in mining, and in respect to supplies furnished to persons engaged in mining, and sec. 12 authorizes the gold commissioner to issue writs of *ca. re. ne exeat* and *ca. sa.* in all cases in which by law he has jurisdiction, which apparently means in all cases in which the Act clothes him with jurisdiction.

"We here find a very large and extended jurisdiction vested in the gold commissioner, unlimited as to amount, and limited only by the fact that the questions to be decided by him must be between persons engaged in mining or in respect of supplies furnished to persons engaged in

mining. This jurisdiction is in reality in excess of the powers vested in the County Courts, uncontrolled by any rules and unfettered by any restrictions. The issues that can be raised under these sections may involve property of a very great magnitude and questions of the greatest importance. In addition to these judicial powers the gold commissioner is vested with certain judicial functions respecting the recording of claims, defining of boundaries of claims, laying over claims, and other matters of considerable importance to a mining community, but which are not involved in the question now before me.

"Prior to Confederation the Provincial Government had all the necessary authority for establishing courts of this character and of appointing the presiding officers, and secs. 4, 5 and 6 were enacted prior to Confederation.

Since Confederation the Provincial Legislature has power to constitute, maintain and organize provincial courts, including procedure in civil matters, under section 92, sub-section 14 of the B. N. A. Act. So far then as that act establishes a mining court and creates its jurisdiction it was within the powers of the Colonial Legislature, but when the Provincial Legislature attempts to appoint judges of the courts thus constituted with other than ministerial powers, it trenches on the powers expressly given to the Governor-General by section 96 of the B. N. A. Act. It is true that the language used in that section is limited to the judges of the Superior, District and County Courts in each province, and it might be contended that these courts having been expressly named, all other courts are excluded. If this were so, the Provincial Legislature would only have to constitute a court by a special name to enable them to avoid this clause, but in the section itself after the special courts thus named, the courts of probate in Nova Scotia and New Brunswick are excepted from the operation of the clause. If these courts had not been so excepted the conclusion would naturally be that they would have been included within the terms under which the other courts are described.

"But there is a further view which I think is conclusive on this point. It is a prerogative of the Crown to appoint all judges, and such prerogative cannot be taken away except by express words, and this prerogative has been delegated to the Governor-General, and I see nothing in the Act taking this right away and vesting it in the Lieutenant-Governor. In the *Magdalene college* case, 11 reg. it was held that when the King had any prerogative, estate or interest, he shall not be barred of them by the general words of an Act of Parliament, and Lord Cairns in *Theberge v. Landey*, 2 app., cases 102, says their Lordships wish to state distinctly that they do not desire to imply any doubt whatever as to the general principle that the prerogative of the Crown could be taken away except by express word.

"I, therefore, hold that the power of appointing judges of the mining courts is vested in the Governor-General, and that although the appointment of a gold commissioner for certain purposes of a ministerial nature, which are defined in the Mineral Act, is entirely within the powers of the Provincial Legislature, yet to clothe that officer with the important and extensive judicial jurisdiction which section 11 of this Act purports to do, is entirely beyond the power of the Provincial Legislature.

"I may point out that under the 7th section of the Mineral Act, the County Court, if there is one whose jurisdiction extends over the district for which a gold commissioner is appointed, has exclusive jurisdiction in all mining questions under the Act, and it will be for the Government to make provision to meet the difficulty that has now arisen.

"I, therefore, direct that the rule for a prohibition be made absolute."

Prosecution Under the B. C. Coal Mines Regulations Act.—Mr. Francis D. Little, manager of the Union Colliery, Comox, was charged before the Magistrate's Court, Comox, on 20th inst., with a contravention of the Coal Mines Regulation Act, inasmuch as he did unlawfully employ a Chinaman named Cow, number 99, underground in said mine contrary to the provisions of the Act.

Mr. Archibald Dick, Inspector of Mines, prosecuted. Several witnesses were examined, whose evidence went to show that the man was a Chinaman and that he had been employed as charged. A second case was also proceeded with, the party being Toong, another Chinaman. Considerable discussion ensued as to whether or not the parties were Chinamen or could be considered as such, both of them being British subjects, Toong having been born in British Hong Kong, and, as he said, belonging to the British Queen, and not to the Chinese Emperor.

Mr. Luxton, after considerable argument, contended for the defence that the Act of the British Columbia Legislature was unconstitutional because it legislated on trade and commerce, interfered with the treaties between Great Britain and China, and legislated aliens as well as questions on criminal law, which were *ultra vires* beyond the power of the Legislature of British Columbia. He submitted that these cases showed conclusively that a statute which enacts words under which it is sought to

create an offence cannot be altered in its language for the purpose of including an offence in it, he claimed, therefore, that section 12 cannot be altered by the magistrate or any other court to include the words "or Chinaman" within its provisions, and without the insertion of these words the offence is not constituted by the Acts as committed by the defendants.

Section 95 of the Act which imposes the penalty says that "any person who is guilty of any offence under this Act, shall be liable, etc.," but neither section 12 nor any other section of the Act makes the employment of a Chinaman an offence under the Act, therefore no penalty could be imposed for so doing. The above is one of the objections I have against the Magistrate assuming jurisdiction in this case.

But even assuming for the purpose of argument, that the Magistrate has jurisdiction, expressly given by the Act, then I submit that no offence has been committed by defendant because the person named Cow in the information is not a "Chinaman" as he certainly has proved on his own testimony that he was born in Hong Kong, and if he was born there I submit he is a British subject.

The Magistrate asked—Is it not the question, of Chinamen or no Chinamen, and would not any Chinese person, even if he is a British subject, come within the prohibitory section of the Act.

Mr. Luxton replied—The question arises, "What is a Chinaman?" The prosecution here says that because Cow was born in Hong Kong, which is geographically in China, he is a Chinaman. I claim if a person is born of Chinese parents in British Columbia he is a British subject, the same as he would be if he was born in the British colony of Hong Kong.

The Magistrate—Is it not a question of Chinamen by race and not by nationality?

Mr. Luxton continued—The race of the Chinamen is the Mongolian race, and had the Legislature intended to restrict the employment of persons of the Mongolian race generally in coal mines, the words of the Act would have been instead of "and no Chinaman," the expression, "and no person of the Mongolian race." There is authority for the distinction in Legislative enactments in the usage of the Legislature of California where they legislate against the "Mongolian race," and not against Chinamen.

The Magistrate reviewed the arguments of Counsel, the conclusiveness of which he was bound to concede, so far as the want of jurisdiction of justices to entertain, hear or determine charges for the unlawful (because prohibited) employment of Chinamen in coal mines was concerned, but the Magistrate otherwise considered the facts alleged in the informations to be sufficiently proved, and it was only his want of jurisdiction that compelled him to refrain from convicting the defendant of the offences charged. The constitutional objections raised against the validity of the Act purporting to prohibit the employment of Chinese in coal mines, the Magistrate said he regarded as (practically) beyond his province to decide upon, therefore he should in any event have left it to be dealt with by a higher court.

He dismissed the charge in both cases, but without costs.

An English Syndicate Secures the Blake and Knowles Steam Pump Works.—An English syndicate has secured control of the Blake Steam Pump Manufacturing Company at East Cambridge, Mass., and the Knowles Steam Pump Works at Warren, in the same State.

This purchase differs in one respect at least from others which have been made recently by English capitalists. All the common stock of the corporation is retained by the old owners of the plants, only the debenture bonds and preference stock being offered for sale. The debenture bonds provide that out of the earnings of the company three per cent. of the amount of the bond issue shall be set aside each year to constitute a sinking fund. Each year three per cent. of the bonds will be drawn and paid off at a premium of ten per cent. The reason given for the deal is the fact that two of the largest stockholders in the old concerns, Messrs. Blake and Taylor, are anxious to be relieved of the care of business, the former on account of advanced age and the latter because of poor health.

A Big Natural Gas Pipe Line.—The *Pittsburgh Commercial Gazette* says that a natural gas line, 20 miles long, and costing in the neighborhood of half a million dollars, is to be built at once from the wells of the Carnegie Co., in Washington county, Pa., to the steel works of Carnegie, Phipps & Co., at Homestead. Mention was made in the columns of the *Gazette* a few days ago of the purchase by the Carnegie firm of 10,000 acres of gas lands in the county named. Some of the best gas land in that section were included in the sale, and it is to this field that the line mentioned above will be built. The placing of this contract, as well as the other large one made by the Philadelphia Co. for its new line to the Bellevue field a few days ago, indicates a big revival of the pipe-laying industry this year.

The Desulphurization of Pyritiferous Iron-Ores.*

By Sterling G. Valentine, PH.D., Lebanon, Pa.

Until within late years, the preparation of sulphurous ores for the blast-furnace has received comparatively little attention. After the first improvement made on the old style of heap-roasting and roasting between walls, there has followed an almost general adoption of the Giers kiln or some modification thereof, and the majority of iron-masters have seemed perfectly satisfied with so much progress. However, the Westman kiln was developed in Sweden, and other gas-roasters for sulphurous ores have been since constructed. They are in use on the continent of Europe and in America to a limited extent.

The following experiments were made in order to furnish additional information as to the proper conditions for the elimination of sulphur from ores where it is present as sulphide of iron, FeS_2 . I desire here to acknowledge the kindness of Dr. Franklin Menges, of the laboratory of Pennsylvania College, at Gettysburg, Pennsylvania, for lending his valuable aid in carrying out a part of these experiments and analyses.

In the first series of these experiments, pure, roughly-pulverized pyrites crystals were used, containing 53.42 per cent. of sulphur. They were made with a view to determine the effect on pyrites, of heat alone, in various degrees of intensity and duration, air being altogether excluded. The heats at a low temperature were made in glass combustion-tubes, sealed at the end, where the pyrites to be tested was placed, and with only a small opening at the opposite end. Although not allowing circulation, this arrangement still permitted a part of the evolved sulphur to escape. The heats at high temperatures were made in Hessian and graphite crucibles, tightly luted, every precaution being taken to exclude air. The temperatures attained are given approximately, and are as nearly correct as it was possible to estimate them, using Pouillet's scale as a guide.

The following table will show the effect of heating pyrites, FeS_2 , air being excluded:—

Approximate Temperature in Deg. Fahr.	Duration of Heat.	Sulphur in Residue, Per cent.	Loss.	Per cent of Total Sulphur Expelled.
Original Pyrites.....		53.425		
1250 " 45 min.		45.500	7.925	14.830
" 5 hrs.		42.591	10.834	20.270
1400 " 1 "		45.140	8.285	17.379
" 1 "		43.570	9.855	18.446
" 6 "		41.850	11.575	21.665
1600 " 30 min.		37.933	15.472	28.990
1800 " 1 hr.		39.389	14.036	26.272
2600 " 30 min.		29.519	23.906	44.720
" 45 "		31.519	21.906	41.003
" 1 1/4 hrs.		29.560	23.864	43.917

The residues from these heats had lost their metallic luster and were generally grayish in color, soft and friable. The samples heated at a white heat were, of course, completely fused. The figures show that, except in the case of a high heat, comparatively a small part of the sulphur was expelled by heat alone without access of air. Contrary to the idea generally prevalent, it is shown by these results that, while a part of the sulphur volatilizes readily, it is by no means easy to get rid of half of it if air is excluded.

The next experiments were undertaken to ascertain the effect of heat on FeS_2 when air is given access freely:

Approximate Temperature in Deg. Fahr.	Duration of Heat.	Sulphur in Residue, Per cent.	Loss.	Per cent of Total Sulphur Expelled.
Original Pyrites.....		53.425		
1250 " 1 hr.		4.271	49.154	92.050
" 2 1/4 hrs.		.700	52.725	98.680
1600 " 20 min.		.78	52.645	98.540
" 45 "		.08	53.345	99.850
1800 " 20 "		.133	53.292	99.751
" 1 hr.		.645	52.780	98.790
2200 " 15 min.		3.231	50.194	93.652
" 20 "		5.916	47.509	88.926
" 35 "		1.558	51.867	97.102
" 2 hrs.		1.181	52.244	97.780

It will be noted that a larger amount of sulphur remains in the residues when higher temperatures have been applied. I account for this by the fact that the high temperature being quickly reached, a sudden fusion of some of the particles of pyrites enclosed a portion of the sulphur in such a way as to prevent the action of air upon it.

A high temperature is, therefore, not needed for the complete decomposition of FeS_2 , when air has abundant access. We say "complete" decomposition, for, although sulphur still is present in small amounts, yet the expulsion of 98 to 99 per cent. of it is, to all intents

and purposes, "complete." Even at a temperature as low as 1250°F. , 98.68 per cent. of the sulphur present was expelled when air had free access. At slightly higher heat, 99.85 per cent. was driven off. These results do not bear out the very prevalent idea that, after having got rid of half the sulphur of pyrites, a much higher temperature is required to expel the remainder.

In this connection Ledebur, in his *Metallurgy*, says:

"Pyrite and marcasite are decomposed even at a low temperature, while about half the sulphur is volatilized (if air is present, burning to SO_2 ; if not, passing off as vaporized sulphur) and a compound remains whose constitution corresponds nearly to pyrrhotite (Fe_7S_8). By simple heating, without air, this lower sulphide of iron cannot be further decomposed. If, however, atmospheric oxygen has access to the glowing compound of sulphur and iron, a further part of the sulphur burns, volatilizing as SO_2 ; the remainder forms next, with the iron, sulphate of iron, which is decomposed, even at a red heat. A part of the oxygen of the SO is used for the higher oxidation of the iron, basic sulphates of iron oxide are formed, and SO_2 vaporized; on still further raising the temperature, the basic iron salt is also decomposed, SO_2 driven off, and oxide of iron remains behind."

In general, the above-described experiments agree with this statement of Ledebur. But it must be remembered that in saying that "half the sulphur is volatilized" at a low heat, he evidently means the one atom of sulphur in FeS_2 . This, however, only reduces the sulphur from 53.33 per cent. in FeS_2 to 39.66 per cent. in Fe_7S_8 . My results have shown that this is the actual result, although with a white heat, without air, I have succeeded in reducing the sulphur to a somewhat lower point.

From the two tables given it appears that, for proper desulphurization of pyrites, air is absolutely necessary, and of greater importance than an excessively high temperature.

Experiments made by Dr. Menges as to the amount of air needed for proper desulphurization of FeS_2 , gave the following results: Working with similar quantities of pyrite in each case, in a current of 900 cubic centimeters of air per minute, the sulphur volatilized without any subsequent condensation in the tube, and on gradually reducing this quantity to 450 c.c., and then to 300 c.c., no condensation occurred. Starting with a current of 400 c.c. per minute, the sulphur volatilized, condensed again further on in the tube, but was subsequently oxidized in the same current without raising the heat. These results show that with ample air-current all sulphur volatilized will readily burn to SO_2 , and that in a deficient air-current any sulphur condensed will be subsequently removed.

In view of the fact that many furnace-men are under the impression that pyritiferous ores can be largely desulphurized in the upper part of the blast-furnace, the following experiments were made: Samples of pyrite were heated in a current of gas taken from the "down-take" flue of a furnace. The gas had the following composition by weight:

	Per Cent.
Carbonic oxide.....	31.17
Carbonic acid.....	10.06
Nitrogen.....	58.72

The results were as follows:

Approximate Temperature in Deg. Fahr.	Duration of Heat.	Per Cent. Sulphur in Residue.	Loss.	Per Cent. of Total Sulphur Expelled.
Original Pyrites.....		53.42		
1250 " 10 min.		41.14	12.22	22.98
" 1 hr.		33.93	19.48	36.68
1800 " 25 min.		33.88	19.54	36.58

These figures show that the desulphurization of pyrites in an atmosphere of furnace-gas is, at best, only partial, the results being comparable to those obtained when it is heated without access of air. In view of the already ascertained necessity for oxidizing atmospheric surroundings, it could but be expected that in an atmosphere devoid of free oxygen only partial desulphurization could be effected. The furnace-man who hopes to use the top part of his furnace as an ore-roaster has little success to look for.

When sulphate of iron occurs or is formed in the processes of roasting, the question arises as to its behaviour on heating; whether or not the presence or absence of air has any influence. It was, of course, known that sulphate of iron decomposes on heating to ferric oxide and sulphur trioxide,* but having seen no statement as to the effect of the presence or absence of air, I made the following experiments:

Two heats, in presence of air for twenty and thirty minutes respectively, at about 1600°F. , gave residues

showing 0.031 and 0.030 per cent. of sulphur; 99.87 per cent. of the original sulphur having been expelled.

Three heats, with the air excluded, at somewhat higher temperatures than the above, for thirty, thirty-five and sixty minutes, gave residues showing, respectively, 0.04, 0.04, 0.002 per cent. of sulphur; 99.81 to 99.9 per cent. having been expelled.

Sulphate of iron is decomposed by heat alone, the presence of air or its absence having no influence. From this it may be inferred that sulphate of iron is harmless in the blast-furnace, its sulphur being expelled by heat in the form of SO_3 and passing out with the furnace gases. The harmlessness of sulphate of iron is, indeed, known to most furnace-men, although all are not familiar with the reasons for it.

In view of this behaviour of sulphate of iron, we inquire next, how far the manner of heating pyrites affects its presence in the residue. Does the presence or absence of air affect the percentage of sulphur in the residue present in the form of sulphate, which we have found to be harmless? To throw light on this point, residues from some of the heats were analyzed to find how far the sulphur contents was in the form of sulphate of iron.

1.—PYRITES HEATED WITHOUT ACCESS OF AIR.

Temp. F. Approx.	Duration of Heat.	Total Sulphur in Residue.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. of Total Remaining Sulphur as Sulphate.
1250	5 hrs.	42.591	42.399	0.192	0.45
1800	1 hr.	39.389	39.247	0.142	0.39
2600	30 min.	29.519	29.485	0.034	0.10

2.—PYRITES HEATED IN PRESENCE OF AIR.

Temp. F. Approx.	Duration of Heat.	Per Cent. Total Sulphur in Residue.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. of Total Remaining Sulphur as Sulphate.
1250	2 1/4 hrs.	0.70	0.231	.469	67.00
1800	1 hr.	0.645	0.158	.487	75.50
2200	2 hrs.	1.181	0.687	.494	41.83

There is a very marked difference in the results. It might be expected that free access of atmospheric oxygen must be a condition for the conversion of sulphide into sulphate. The results show clearly the correctness of that view. Without access of air, practically all the sulphur remaining is in the form of sulphide, but when air has access, a large part, sometimes the larger part, is in the form of sulphate, a fact which, in view of the harmlessness of the latter in the blast-furnaces, emphasize the necessity for abundant air in the roasting of pyritiferous ores. Not only is the sulphur removed in this case, but even of what remains, the greater part is harmless.

In this connection, it was of interest to note the effect of heating in an atmosphere of furnace-gas on the amount of sulphur left in the residue in the form of sulphate. Analyses of the residues from those heats made in a current of furnace-gas, given above, showed as follows:

Temp. F.	Duration.	Per Cent. Totals in Residue.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. Total Sulphur as Sulphate.
1250	10 min.	41.148	41.089	0.059	0.143
1250	1 hour.	33.882	33.800	0.082	0.212
1800	25 min.	33.936	33.806	0.130	0.382

These results show that this manner of decomposing pyrites is not conducive to the formation of sulphate in the residue, and that the results here, also, are comparable to those got by heating without access of air.

It must be borne in mind that all the above experiments were made on sulphide of iron alone. The question arises whether the conclusions reached on pure pyrites will hold good for a pyritic ore. Of course, sulphide of iron can be expected to act in the same way under the same circumstances under the action of heat. Whether or not an ore containing it will permit desulphurization on the basis of the above-ascertained behaviour of FeS_2 depends entirely on the character of the ore itself. If its structure is sufficiently porous to allow air to gain a ready access to the interior of the ore-pieces, it can be expected to sulphurize at a low heat. If it is a close, dense ore, this characteristic is equivalent to exclusion of air from the greater part of its sulphur contents. Dense

* Colorado Meeting American Institute of Mining Engineers.

* "Roscoe & Schorlemmer," vol. ii., Pt. 2, p. 101.

ores are not difficult to sulphurize because they cannot be heated properly, but because air cannot penetrate them. Therefore, because pyrites can be decomposed at a low heat in presence of abundant air, it does not follow that all ores can be desulphurized under corresponding conditions. While it may be said that atmospheric oxygen is a *sine qua non* for proper roasting, no general rule can be laid down concerning the proper temperature to be used.

In order to test the correctness of these views, the following experiments were made:—Small pieces of Cornwall ore, about the size of a walnut, containing, as nearly as could be judged, the same amounts of sulphur, were heated at low temperature under free access of air. The original raw ore showed 2.644 per cent. of sulphur. The following results were obtained:

Temp. F.	Duration.	Per cent. Sulphur in Residue.	Loss.	Per cent. Total Sulphur Expelled.
1200	2 hrs.	.346	2.318	87.01
1200	4 "	.178	2.486	93.31
1500	1 hr.	.099	2.565	96.28

From these results it would seem that a comparatively open-grained and porous ore can be readily desulphurized at a comparatively low temperature when air has access freely.

The necessity of an oxidizing roasting so that the sulphur remaining shall, as far as possible, consist of sulphate, is proved by an analysis of the same ore:

Temp. F.	Duration.	Per Cent. Total Sulphur in Residue.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. Total Sulphur as Sulphate.
1200	2 hrs.	.346	.235	.111	32.18
1200	4 hrs.	.178	.088	.090	51.12
1500	1 hr.	.099	.027	.072	72.72

The importance of having the remaining sulphur as far as possible in the form of the harmless sulphate, and of an oxidizing roasting to secure this end, can be readily seen.

Experiments were also attempted with a very dense Jersey magnetite, but it was found impossible, with the stock of it on hand, to select small pieces comparable as

to their sulphur contents, and the results were worthless.

One thing, however, was clearly shown, namely, that the density of this ore so completely excluded air from the interior of the ore-pieces, as to make futile any attempt to desulphurize it at a low temperature. It required the use of a high heat.

The action of the heat itself on the ore probably varies. It may either cause a cracking of the ore-piece and allow the entrance of air in that way, or it may act, as pointed out by Akerman, in enabling the sulphur to take up oxygen from the ore itself, for its oxidation. It is certain that the degree of heat required for desulphurization varies with different ores; but an abundant supply of air should always be present.

It is certainly possible, however, to use too high a heat. It may be questioned whether a pyritiferous ore should ever be heated fully to its sintering point. A fused ore is harder to reduce in the furnace, and heating it to that point appears to be often exceedingly prejudicial to proper roasting.

To test this point—how far fusion or clinkering of ore affects the amount of sulphur that can be expelled, and how far its influence goes to affect the amount of the sulphur remaining in the clinker present in the form of sulphate, the following experiments were made.

(To be Continued.)

MICHIGAN, Houghton,

Michigan Mining School.

A State School of Surveying, Mining, Electrical and Mechanical Engineering, Physics, Chemistry, Assaying, Ore Dressing, Mineralogy, Petrography, Geology, Drafting, Machine Design, etc. Tuition free. For catalogues and information address M. E. WADSWORTH, A.M., Ph.D., Director.

LEDOUX & COMPANY,

10 CEDAR ST., NEW YORK.

Engineers, Metallurgists & Assayers.

Public Ore Sampling & Storage Works

All the principal buyers of furnace materials in the world purchase and pay cash against our certificates of assay, through New York banks.

By special permission of the Secretary of the Treasury of the United States, cars of ore or copper matte passing through in bond can be opened and sampled at our works.

Consignments received and sold to highest bidder. Send for circular giving full particulars.

Mines examined and sampled. Assays and Analyses of all kinds.

The Canadian Mining Review

CONDUCTED BY OFFICES: B. T. A. BEL
UNION CHAMBERS, 14 METCALFE ST.,
OTTAWA.

Vol. IX. AUGUST, 1890. No. 8.

An Absurdity of the Tariff.

During the last session of Parliament there was an effort made by several members representing mining constituencies to have the oppressive and prohibitory duties on mining machinery removed. As the result of this effort the following section appeared in the new Tariff List, bearing date of March 28, 1890: "Free mining machinery imported within three years after the passing of this Act, which is, at the time of its importation, of a class or kind not manufactured in Canada."

The appearance of this section gave great satisfaction to the majority of the mining interests, and to the gold miners in particular, who have had to pay the heavy burden of 30 per cent. upon almost all the machinery used by them in mining and milling, and to whose product, from its nature, the N. P. did not and could not afford protection.

Several importations under this Act have come under our personal knowledge, some have been allowed free entry, others had to pay duty, and of this latter class we propose to speak briefly. The language of the section being so clear, and also so comprehensive, it was not supposed that any difficulty could be encountered in its administration.

But in the following case it would seem that the department, or its officers, chose to put their own interpretation upon the words, "mining machinery." Several importations, at divers times since the 28th of March, were made of silvered copper plates which are a part and parcel of the amalgamating machinery of every modern gold mill. These plates are used to catch the fine gold coming from the stamps, and are made of soft rolled copper, subsequently annealed and coated or plated with a thin layer of metallic silver upon one side. They are not used in any other business, or for any other purpose. Entry was sought to be made under this Act, and by the Local Collector was referred to Ottawa, where the ruling was made by the then Acting Assistant Commissioner of Customs that such plates "are not mining machinery, such as was contemplated by this Act."

The absurdity of this reply and its illogical character is briefly shown.

First, as to the fact of its being of a "class or kind not manufactured in Canada." There are no copper works in the Dominion to-day which do or can make the plain copper plates and anneal them. Further there is not an electroplating establishment in the Dominion which has a bath large enough to take in and properly plate these coppers with silver; hence even were the coppers available, the manufactured amalga-

minating plates could not be produced, at present, by any concern in Canada. It is, therefore, evident that these plates are of a "class or kind" which not only *is* not, but which *can* not at the present time be made here.

Now as to the point that these amalgamating plates are not "mining machinery." A gold mine is of little or no value without a mill, and no gold mine that we know of ever *was* a mine until it had a mill. No gold mill is equipped to save the fine gold unless it has these amalgamated plates, which are a necessary and integral part of the machinery and plant. They are just as essential to the proper and economical working of a gold mine as the engine which hoists, or the air drill which bores the rock, or the pump which keeps the mine clear of water, or the stamps which crush the rock. Being, therefore, of such importance that they are "mining machinery" would appear to us to be axiomatic.

In the discussion in the Commons on the 26th of March, on the matter of admitting machinery free of duty, the interpretation of the words "mining machinery" was not directly alluded to, but incidentally was fully expounded from the context. As examples we may quote Mr. Mara, who, when speaking of Kootenay, said: "Here we have hundreds of tons of ore on the dumps that, in treating, would give employment to a great number of men," obviously this treatment referred to is metallurgical. He says further when speaking of British Columbia: "We say that such machinery as concentrating machinery, quartz mills, reduction mills, etc., are not manufactured here. * * * We ask that the Government will take the duty off that class of machinery for a short time." Mr. Dawson said: "There are certain things such as diamond drills and amalgamators which are not produced in this country."

Mr. Charlton, who was a member of the Ontario Mining Commission, in speaking of his experience on that Commission, said: "It was found that various kinds of machinery were not produced in Canada, such as for amalgamating work, stamps, diamond drills, etc."

We would, therefore, like to ask Mr. Assistant Commissioner of Customs what mining machinery *was* "contemplated by this Act."

The gold miner usually has a hard enough time to make his mine pay, and if he, in the future, shall have to spend time to find out what "was contemplated" by the Tariff when it says one thing and means another, he will pray for the deace of the Tariff or the "contemplator" or both.

Florida Phosphates.

Dr. Francis Wyatt, of New York, who has recently returned from a professional visit to Florida fully bears out our forecast of Florida as a competitor in the phosphate market. Here are his concluding remarks:—"To take up such short options as are now offered on lots

of land in various counties at great distances from each other, under any conditions of price or surface indications, is simply suicidal, since they allow no time for efficient inspection. The country is wild and practically unsettled. Traveling in the interior is attended by the greatest difficulties and inconveniences. There are no wagon roads suitable for transportation purposes, for the horses sink everywhere knee-deep in sand. The railroad facilities, broadly speaking, are nearly nil, and the postal and telegraphic services are utterly inadequate. Under these circumstances (and I am rather understating than overstating facts), the control of a widely disseminated lot of workings carried on simultaneously would be impossible.

As to the question of quality and usefulness of these phosphates, I consider that the large number of my analyses of samples taken in all directions and under all kinds of conditions gives a satisfactory answer. It has been said that these phosphates are, to a great extent, combinations of phosphoric acid with alumina and iron, but I have shown that in the great majority of cases this is really a misapprehension. On the whole, their average richness is less than we were led to expect, and the proportion of really high grades is extremely small. While I can see no present outlet of importance for the second-class matter, the rich boulder material compares favorably with many others much appreciated by manufacturers of superphosphate. If they are properly selected before shipment, I can, therefore, foresee no possible objection to the high grades, and I believe they will find a ready market at European ports directly their composition is fully understood."

Dr. Wyatt thinks the field may prove profitable to those who purchase and work mines with judgment: but intending purchasers are warned of the disastrous results that will follow to those who are led away by the prevailing "boom" and pay exaggerated prices for surface indications or anything but high grade test.

Arbitration.

The losses sustained through the deplorable strikes at the Springhill and Wellington collieries, not only to the employers and employes, but also to the consuming public, is fitting illustration of the necessity of arbitration as a simple and suitable method by which these and all other demoralizing disputes may be smoothed over and adjudicated. For many years boards of arbitration have coped with the great conflicts between capital and labor in Europe, Great Britain and the United States, and having proved successful in these countries it cannot be doubted that in instances like the present they would be of immense service to both parties in effecting a satisfactory solution of the questions at issue. The benefits that these boards have conferred upon the coal and other trades are incalculable. A most friendly feeling has taken the place of hostility, and confidence and mutual respect

now exists where formerly all was suspicion and hatred. The changed relations of employer and employed have been recognized; they have met at the same table as equals; and out of this has grown a condition of affairs that will make it impossible for the old conditions to return. Mr. A. J. Mundella, M.P., who has been so largely instrumental in the initiation of this wise institution in England, gives many striking instances of the successful operation of permanent arbitration boards in that country. He says: "If the workman of any branch conceive that they have grievances to complain of, in addition to the ordinary representatives of that branch a delegate may attend and lay the case before it. The first business at our meetings is to receive delegations. They retire after having made their statements, and the board proceeds to deliberate. We have never met without settling at least half a dozen questions, some important and some trivial, which, if allowed to remain open, would produce irritation. * * * A large part of the credit of the success of this board, and this change in the relations of classes, is due to the provision for regular meetings of the board. The great curse of industry, and the fruitful cause of difficulty, is a foolish obstinacy and a false pride. This arises in many cases from a want of knowledge and a lack of common courtesy in matters concerning both capital and labor, and in which both have an equal interest. This quarterly coming face to face, this meeting as equals,—and in all questions that come before this board they are equals, and it is foolish to ignore this fact,—and this discussing of subjects of common interest as sensible men seeking for the facts and inclined to moderation and concession if need be, have had a marvellous effect in removing this pride and obstinacy, and bringing about that respect and courtesy that must be the basis of all friendly negotiations between capital and labor." In France there is the "Conseils des Prud'hommes," probably the oldest system of arbitration in existence, and which provides a simple and effective method of adjudicating all labor troubles and disputes. They are composed of an equal number of masters and workmen, each trade electing its own representatives, with a president and vice president named by the government. Arbitration is compulsory upon the application of either, and the decisions of the court can be enforced the same as any other court of law. Fully 95 per cent. of the cases brought before these boards have been amicably settled. In the States of Massachusetts and New York, and elsewhere in the United States, arbitration has speedily and unostentatiously decided many cases, which, if allowed to proceed, would have developed into serious strikes and lock-outs. Trade disputes, such as those at Springhill and at Wellington, are, happily, of rare occurrence; but as our country develops, and our mineral and other important industries expand, the possibilities of more frequent friction are apparent. So im-

pressed was the Royal Commission appointed by our own Government to enquire into the relation of capital and labor, that in their Report, published last year, the necessity of a permanent, as well as local boards in industrial centres, was strongly emphasized. During the last session of the Legislature of Nova Scotia provision was also made, under the Mining Act, whereby labor disputes should be submitted to a board to consist of two arbitrators appointed by the workmen, two representing the company, the four thus chosen to select a fifth, or umpire. This was an excellent and wise provision. But at Springhill it appears that the company refused to submit to arbitration, apparently determined to starve the men into their unreasonable demands. The result has been eight weeks of a most distressful strike, which has not only crippled the operations of the company and been keenly felt by the men, but has also seriously affected trade, both in the vicinity of the mines and in the upper provinces. Strikes are neither rational nor civilized, and, as in these cases, invariably involve loss and hardship. The vital interests of master and miner must necessarily depend on unity, and only by the harmonious action of both can great material progress be attained. Let both meet each other fairly in a spirit of full acknowledgment of each other's rights and duties; when differences occur let them be submitted to a competent board of arbitrators; and when one or other fail to agree on this course, as at Springhill, and at Wellington, let the government step in and make immediate arbitration compulsory.

Suicidal Strikes.

Mr. Powderly, the prominent leader in the labor disputes across the border, is reported to have said, at a Pennsylvania meeting on the 14th June last, "But we are not in favor of strikes. We think they are suicidal. I will say that I have never known of a strike which has been won by the men where the evil consequences have not overbalanced the benefits." The miners at Springhill and at Wellington will bear witness to the truth of his statement.

Cement in Ontario.

The value of the export of cement from Britain to the United States and Canada, for the first half-years of 1888, '89 and '90, stands as follows:—

	1888.	1889.	1890.
To United States...	\$1,094,126	\$941,075	\$1,190,375
To Canada.....	64,000	78,107	108,538

Our neighbors claim they are making cement equal to the English article, but their importations show no decline. The maximum duty is 40 cents, which should not be prohibitory of the Canadian article if we had a first-class one to offer. And why not? We should be well able to make first-class hydraulic cement in Ontario.

Steam Pumps.

Hints on their Selection and Practical Management.

(From the Safety Valve.)

In the first place, regarding the selection of a steam pump, with so many excellent pumping machines in the market, this is a difficult subject to discuss and one that we cannot go into without doing somebody an injustice. It must therefore suffice if we direct attention to a few cardinal points that every steam pump to be entitled to choice should possess. Simplicity of construction is materially an advantage, but like everything else, it may be overdone. In itself it can hardly be regarded as forming a reliable basis for selection, although the simplest pump that conforms to all other requirements, such as efficiency, durability, reliability, &c., is undoubtedly the best. At the same time, the very nature of the work a steam pump is ordinarily called upon to perform, demands that its parts shall be readily accessible for inspection, and neither so costly nor so intricate as to be difficult of replacement in case of wear or breakage. A pump that is made on the interchangeable plan as to its parts, has many advantages in this respect. This applies particularly to the water valves, which are liable to become obstructed by foreign bodies in the water or where the pump is employed for moving thick or gritty fluids.

Select a pump if possible in which the valve motion is reliable at any speed—in other words, a steam pump that can be run at the extreme limit of slowness or at its highest capacity without fear of the steam valves failing or becoming deranged. Pumps have been placed on the market that are liable to slacken off and stop if run "dead-slow," or to run away if left to operate at high speed, and such unreliability, especially where boiler feeding or circulating service is demanded, is likely to prove dangerous. A pump that has "dead centers," is for like reasons undesirable and it is moreover a frequent source of trouble where it is necessary to "start up" in a hurry. A reliable steam pump, such as the best makers supply, will run steadily and constantly at a speed proportionate to the steam supplied and will start promptly from any part of the stroke as nearly as possible at full pressure. The pump valves should have an area of about one-fourth the area of the pump.

Never buy or install a pump that you suspect to be too small for its duty; one or two sizes too large will do no harm, but half a size too small will make an immense amount of trouble. It is easy to determine the capacity of a pump by multiplying the area of the piston in inches by its stroke in inches which will furnish its full capacity per stroke in cubic inches, and divided by 231, in gallons. An allowance of at least twenty per cent., and in some instances more, must be made in these calculations for the leakage caused during the rise and fall of valves, inaccuracies in fitting, &c., as well as the "clearance" between the valves and the piston or plunger. If it is a question of forcing water to a certain height, multiply the amount of water in gallons to be raised per minute, by the weight of one gallon (835 pounds) and the product by the height in feet of the discharge from the point of suction. The result, divided by 33,000, will give the theoretical horse power required to accomplish the work, but a liberal allowance, never less than ten per cent. and in some cases as high as thirty per cent., must be made for friction in pipes and bends, for leakage in pipes, leakage and friction in pump, &c. The speed at which a pump should be run must also be taken into consideration—a boiler feed pump, for instance, should not be run at a higher speed than about forty double strokes per minute. Where water has to be pumped through a long and particularly a vertical line of pipe, a slow movement is more economical and will furnish the best results. A small pump, working rapidly, is subject to greatly increased wear and tear under such conditions, especially where no check valve is provided to relieve the pressure on its valves. The velocity of water in pump passages should not exceed 500 feet per minute.

For condensing engines, the feed pump should have a pump plunger equal in diameter to one eleventh the diameter of the steam cylinder when the pump stroke is one-half the engine stroke and one-eighth the diameter of the steam cylinder when the pump stroke is one-quarter the stroke of the engine. The capacity of a pump for boiler feeding should never be less than one cubic foot of water per hour to each horse power. It must be considered also that water expands when heated, and where hot water is used in feeding, the capacity of the pump should be increased so that it equals the equivalent in cold water.

In setting up a steam pump run all lines of pipes as direct as possible, every bend increases the friction to be overcome. Short bends and short angles should be avoided wherever possible; they retard the flow of water and increase the work of the pump. Where turns or bends must be made, have them as easy as possible. Pipes should be as large as the pump connections at least, and where very long or very crooked, larger sizes must be used. The discharge pipe should never be re-

duced in capacity between the pump and the discharge, especially in feeding boilers. Where pipes are branched to divide the discharge it must be remembered that the area of a pipe primarily governs its capacity; two 1-inch pipes discharge about the same amount of water as one pipe 1½ inches in diameter. The length of a pipe must also be taken into consideration. A pipe two inches in diameter and 100 feet long will only deliver one-fourth as much water as a pipe of the same diameter and only two inches in length.

The suction pipe especially should be made as direct as possible and, above all things, should be perfectly tight. A very small leak in it will greatly impair the efficiency of the best pump. A large one will positively neutralize its action. In locating a pump with regard to suction, it must be remembered that the ordinary suction pump will hardly lift water at sea level more than thirty feet with the most perfect vacuum ordinarily obtainable. It is unwise to depend on a pump doing as much as this, differences in elevation, etc., being considered, and from twenty to twenty-five feet should be the limit to which a pump should ordinarily be taxed. Where water is to be raised to a greater height than this, a force pump, or combined force and suction pump, should be employed. Very hot water cannot be handled by a suction pump, the reduction of atmospheric pressure prior to the lift causing its transformation into steam and vapor. The placing of an air chamber in the suction pipe, by keeping a large body of water near the plunger, makes the supply steadier. It should be made long in the neck, so that when the water is passing through the pump barrel it may not be forced up into the chamber. This would result in an absorption of the air in the chamber and a consequent reduction of the supply of water. Every pump drawing its supply from tanks, wells, rivers, ponds, etc., should have the end of the suction pump covered by a strainer.

The exhaust pipe of a steam pump should be made to run downward when convenient. This will enable the water of condensation to flow out in place of requiring to be driven out by the exhaust.

Finally, the pipes of all pumps located in exposed situations should be provided with unions, so that on extremely cold nights the pump may be detached to prevent freezing. For the same reason the drip cocks of both steam and water cylinder should be left open whenever the temperature is likely to fall below freezing while the pump is standing idle.

Steam pumps, like all other machines, require careful attention to insure their efficiency and durability. It is necessary to see that they are well lubricated and well wiped at regular times and at frequent intervals, especially in the case of boiler feeding or circulating pumps, they should be looked at to make sure that they are not only running, but doing their work. The check valve furnishes one indication of their satisfactory operation. If it rises and falls regularly with each stroke of the pump and its vibrations are communicated to the feed pipe below the valve, the pump is working. It is as well to shut off the stop cock between the check valve and the boiler in a feed pump now and again, and, taking out the check, allow the pump to make a few strokes, which will remove any sediment or foreign substance from the seat. If, although the pump may be running, the water in the tank or boiler does not show its effects, some defect may be looked for. A leak in the suction pipe, worn or loose packing, water or check valves obstructed by some foreign particles, water supply shut off, or, in the case of a well fed by springs, fallen below the point of suction, or pipes choked with such mineral sediments as lime, salt, and other water deposits are among the commonest causes, and can be remedied by any engineer. In the case of a boiler feed pump located near the boiler it is likely to become heated and may, in such a case, fail to lift. The pet cock in the pump barrel may be opened and the accumulated hot water run out, after which it will usually be found that the pump will resume work.

The above points include such as may be regarded as of general importance. There are others that will occur to our readers from time to time, especially where pumps are employed as in breweries, oil refineries, distilleries, chemical works, etc., for moving thick or volatile fluids, or such as are likely to exercise a destructively corrosive effect on metals or packing substances.

A Strikers' Paradise.—Strikers seem to have a paradise in New South Wales. At Sydney the dock laborers threatened to suspend operations unless they were allowed a certain period of the day to smoke their pipes or cigars. Rather than precipitate a conflict with their men on so trivial a matter, the masters have allowed them three-quarters of an hour per day for indulgence in tobacco, and have agreed to pay them for it, too. The next step in concession will be to supply these hard-worked operatives with a particularly fine brand of tobacco and highly ornamented Dutch pipes. But it must be said in favour of this agreement that men work with freshened energy when they have occasional intervals of rest or idling.

A New Canadian Enterprise.

The Dominion Iron and Steel Company has been incorporated at St. John, New Brunswick, with a capital stock of \$500,000. The company is formed for the purpose of erecting and operating mills for the manufacture of rolled and hammered iron, bar iron, cut nails and spikes, horseshoes, railroad and other spikes, fish plates, polished shafting and other articles. The plant is to be built in the vicinity of the city of St. John, on the Bay of Fundy, accessible by vessels and adjacent to lines of railway that connect with all the points east and west. The building will contain four train rolls, ten furnaces, nail and spike factory with 50 machines, a horseshoe machine, with a general machine shop and shafting department. The mills will be built, equipped and operated in the most modern and approved manner, and will strive to equal the output of similar concerns in the United States. The capacity of this plant per month is to be 240 tons cut nails and spikes, 760 tons scrap iron bar and 40 tons horse-shoes, besides shafting and other articles of manufacture. The men who are at the head of this enterprise point to the fact that 40,000 tons of rolled and hammered iron were imported into the Dominion of Canada from Great Britain in 1887. They further recite the fact that while scrap iron enters the Dominion at a tariff duty of \$2 per ton, the duty on nails is 1 cent per pound, and that on scrap bar iron, etc., is \$13 per ton.

This plant will be fed with Nova Scotia and New Brunswick coals, and by being located on the Bay of Fundy it hopes to escape the high freights now paid by the Western Iron Works, which plant is compelled to carry also a stock of coal sufficient for the winter months. The water location selected will admit of weekly supplies being received the year through. They say they will be able to put the finished product of their plant in Montreal, Toronto, and other western towns of the Dominion at the same rate per ton as it costs the iron plants there to freight their coal. The erection and equipment of this plant will cost \$200,000. The company will use scrap iron imported from foreign countries until Canadian pig can be produced cheaply enough to compete with the cost of scrap.

This company makes the following comparison with the prices in the United States markets to show the prospects for good profits:—Cut nails in the Canadian market are worth, at wholesale, \$2.60 per keg of 100 pounds for two-penny and upwards; other sizes in proportion, while in the Boston market they are selling at \$2.05, a difference of 55 cents per keg of 100 pounds, equal to \$11 per ton.

Colliery Ventilation.

In a recent paper read before the summer meeting of the Institute of Mechanical Engineers Mr. E. Bainbridge said:—

"The elements of danger, waste and inconvenience in furnace ventilation for mines have caused an almost general adoption of mechanical ventilators; and many endeavours have been made to improve the ventilating fans which were in existence twenty years ago.

Fans.—The considerations to be aimed at in selecting a mechanical ventilator are as follows:—First cost of fan, engine and foundation; future cost of maintenance; economy of fuel and stores; useful effect of fan. Several committees of mining engineers have been formed to report upon the relative merits of various machines; and as at the present time a series of exhaustive experiments is being made by a committee of the Northern Institute of Engineers, it may be sufficient if in this paper the writer simply refers to some of the chief types of ventilating fans in operation in this country, at the same time giving particulars of a case in which each separate fan is now adopted. These fans are the Guibal fan, Walker's improved Guibal fan, Cockson's, Schiele's, Capell's, Waddell's and Lupton's fans.

The Guibal fan is that most largely adopted, and is so well known that it needs no description. In Walker's improved Guibal fan the chief variation in the style is the same results with a small diameter of fans and the air, instead of being admitted, as in the Guibal fan, on one side only, is admitted on both sides. The Guibal movable shutter is replaced by an anti-vibrating shutter, which is very effective in its action. The tendency recently has been to adopt fast-running fans, which, however, are most suitable where limited quantities of air are required. Four years ago the writer adopted this principle at the Woodthorpe Colliery, near Sheffield, by applying an 8 foot Cockson fan, driven direct without gear by one of Willans and Robinson's direct acting engines, which runs very quietly at a speed of 280 revolutions per minute. At this speed the fan gives about 58,000 cubic feet of air per minute, with 3 inches of water-gauge. The engine since it was started has run about 500 million revolutions, and has cost a very small amount for repairs. The actual economy in the useful effect of a fan depends upon the cost of fuel; but bearing in mind that the useful effect is found to vary from about

15 per cent. to 70 per cent., the matter is of importance; and in the ordinary carrying on of a colliery the quantity of fuel used in driving a fan engine, which practically never stops working, may be said to be one-fourth of the entire fuel used. A simple contrivance in connection with ventilating machines, which the writer is adopting at the Nuntery Colliery, may here be mentioned. A new engine-house which is now being completed will be ventilated by taking a pipe from the roof and passing it into the fan chamber; the air leaving the house will pass up through two ventilators placed in the roof, and thence to the fan.

Steel Production in Great Britain in 1888 and 1889.

In 1888 Great Britain made 979,083 tons of Bessemer steel, a decrease of 42,764 tons from the product of 1887. In 1889 the production was 943,048 tons, a decrease of 36,035 tons from that of 1888, and the total decreased manufacture in both 1888 and 1889, amounted to 78,799 tons. Bessemer steel rails, in both years, nearly made up 50 per cent. of the total output. In 1888 the aggregate production of Bessemer steel rails was 979,083 tons, in 1889, 943,048 tons. As far back as 1882 the maximum output of these rails exceeded that of 1889 by 292,737 tons. Other descriptions of Bessemer steel production in the five principal districts of Great Britain in 1889 amounted to 1,665,122 tons. The average production of steel per converter in 1888 was 23,003 tons, in 1889 it was 25,156 tons. In 1889 the number of converters in operation was 60¾ acid and 22½ basic; total number in the kingdom at that time, 91 acid and 26 basic.

The total British production of basic steel in 1889 was 493,919 tons, or about 14 per cent. of the total output of Bessemer and open hearth steel of all kinds, which amounted together to 3,569,960 tons.

The aggregate output of basic steel in England, Germany, Luxemburg, Austria, France, Belgium and other countries in 1888 was 1,953,234 tons, of which 1,493,032 tons was under 17 per cent. of carbon; in 1889, 2,274,552 tons, on which 1,764,639 was under 17 per cent. of carbon.

Great Britain's production of open hearth steel in 1889 was 1,429,169 tons, an increase of 136,427 tons over that of the previous year, and 448,062 tons over that of 1887. The gain was principally made in the Cleveland district. The net increase (there was decrease in two districts) in 1889 was 136,427 tons. Of the total production of open hearth ingots throughout the kingdom in 1889, 1,357,461 tons were acid and 71,708 tons basic.

At the end of 1889 there were 274 acid and 17 basic open hearth furnaces existing in the kingdom, a total of 291, or three more than at the end of 1888.

Nickel and its Uses*.

Dr. E. D. Peters, Jr.

Common observation would suggest that the consumption of nickel for plating has increased markedly in late years, and as a fact it has more than doubled in the last decade, and even in the past two years has shown a further though moderate increase, which is true also of the German silver manufacture. But the effort is being made in Europe to extend the consumption of nickel in all possible directions. For example, by the introduction of rolled nickel plate as an advance over tin plate. Among the proposed uses none attract so much interest as the use of nickel in alloy with steel to increase the latter's strength. A French invention has effected means for preparing such alloys with regularity and even composition. Lately Mr. James Riley, of Glasgow, Scotland, has published a valuable contribution to the knowledge of the physical characteristics of various sorts of steel when alloyed with nickel which is here abstracted from "Engineering." In the first place, a visit to the place of manufacture in France demonstrated to his entire satisfaction the degree of certainty with which the desired products could be obtained from the crucible. A number of casts were made, the composition being varied at will and the quality and properties of the metal being indicated beforehand. Subsequently it was shown at English works that the composition of the metal can be as effectually controlled in the open-hearth furnace as in the crucible. Mr. Riley states that the alloys can be made in any good open-hearth furnace working at a fairly high temperature. The charge can be made in as short time as an ordinary "scrap" charge of steel—about seven hours. Working the steel requires no extraordinary care; in fact, not so much as is required in working many other kinds of charges, the composition of the resulting steel being easily and definitely controlled.

No special arrangements are required for casting, ordinary ladles and molds being sufficient. If the charge is being properly worked, nearly all the nickel will be found in the steel; almost none is lost in the slag—very different in this respect from charges of chrome steel.

The steel is steady in mold, it is less viscous than ordinary steel, it sets more rapidly and appears to be

thoroughly homogeneous. The ingots are clean and smooth in appearance on the outside, but those richest in nickel are a little more "piped" than ingots of ordinary mild steel. Any scrap produced in the subsequent operations of hammering, rolling, shearing, etc., can be remelted without loss of nickel in making another charge. No extraordinary care is required when reheating the ingots for hammering or rolling. They will stand quite as much heat as ingots having equal contents of carbon but no nickel, except perhaps in the case of steel containing over 25 per cent. nickel, when the heat should be kept a little lower and more care taken in forging. If the steel has been properly made and is of correct composition, it will hammer and roll well whether it contains little or much nickel; but it is possible to make it of such poor quality in other respects that it will crack badly in working, as is the case with ordinary steel. In obtaining a correct idea of the value or usefulness of alloys of nickel with iron or steel, it should be remembered that the composition is complicated by manganese, carbon, silicon, sulphur and phosphorus, whose influence must be carefully watched, requiring long series of experiments. In the absence of these extended series the following will still give valuable results:

In table I, test No. 6, the carbon present (0.22) is low enough to enable us to make comparison with ordinary mild steel, which would give, when annealed, results about as follows: elastic limit, 16 tons; breaking strain, 30 tons; extension, 23 per cent. on 8 inches, and contraction of area 48 per cent. Therefore, in this case the addition of 4.7 per cent. of nickel has raised the elastic limit from

16 up to 28 tons, and the breaking strain from 30 up to 40 tons without impairing the elongation or contraction of area to any noticeable extent. In test No. 3 somewhat similar results were found with an addition of only 3 per cent. of nickel, combined with an increase of the carbon to 0.35 per cent. In tests No. 2 and 5 there is extreme hardness, due in part to the large quantity of carbon present, but also to the presence of nickel in addition. In test No. 9, with the carbon very much reduced, this characteristic hardness is intensified by the increase of nickel to 10 per cent. This quality of hardness obtains as the nickel is increased, until about 20 per cent. is reached, when a change takes place and successive additions of nickel tend to make the steel softer and more ductile, and even to neutralize the influence of carbon as is shown in the test No. 2, in which there is 25 per cent. nickel and 0.82 carbon. In this matter of hardness, due to increased additions of nickel, there is some resemblance to Hadfield's manganese steel, but valuable qualities of nickel steel are reached before machining becomes extremely difficult. There are experiments showing that by hardening and tempering it may be possible to increase largely the breaking strain and elastic limit of these alloys. The alloys polish well, the color being lighter as the proportion of nickel increases.

They do not corrode as easily as other steel, the 1 per cent. nickel steel welds fairly well, but this quality deteriorates with each addition of nickel. Considerable ultimate advantage may be expected from these alloys, particularly where the percentage of nickel is less than five.

The Edward Coal Washer.

A coal washing apparatus known under the above name and which has attracted some attention abroad is described as below in the *Bulletin* of the Industrial Society of France:

"It consists of a rectangular sieve plate about 10 feet long and 3 1/2 feet wide fixed on a pyramidal hutch, having a plunger box attached to one of the long sides, and a continuous opening variable by adjustable slides for the discharge of the heavier waste on the other. The apertures in the sieve plate vary in size, the largest being nearest to the feed end. The piston, which is circular in form, and of very much smaller area than the sieve plate, is a wooden disc moved by an eccentric, and communicates motion to the water in the hutch by a cushion of air confined above the water in the piston box. The eccentric is adjustable upon its shaft so as to allow a certain variation in the length of stroke of the plunger. A clack in the disc allows air to enter if a vacuum is formed below it on the return stroke by reason of the whole of the water not being returned, as in the case of washing very fine slack containing clay, which always absorbs a notable quantity of water. The scraper frame, which is the essential novelty of the machine, is a narrow-like frame suspended by a system of jointed rods above the sieve plate, and receiving motion from a cam acting upon the counterpoised arm of an angle lever, which gives a slow forward and quick return motion. The frame, which is somewhat larger than the sieve plate, is connected at one end with the slide closing the feeding hopper, and receives a fresh portion of the material at the commencement of the stroke, which is dropped upon the plate at the coarse end, and subjected to the most energetic action of the water, while the finer portions of previous charges brought to the surface are drawn forward by the teeth projecting from the frame towards the discharging end. The length of stroke of the frame is 20 inches, so that the surface of the washed material is broken up six times in its passage through the 10-foot length of the machine. Usually the frame is suspended at such a height as to pass clear of the charge on the return stroke; but when the slack treated is very dusty, it is so adjusted that by acting on the muddy surface on the backward passage, the return of the water to the hutch may be facilitated. In the latter case care is taken to keep a depth of from 2 to 4 inches of water above the top of the charge to prevent the suspended mud from settling.

"The finely divided material accumulating as mud in the hutch is discharged at intervals through a pipe at the bottom into settling basins, and the clear water is pumped back to supply the machines. If the interior of the hutch is divided into two parts, each with a separate discharge pipe, the mud from the first is usually waste, while that from the second, being derived mainly from mixed coal and shale, is generally clean enough to be used for firing colliery boilers. When treating unclassified slack, containing all sizes up to about 2 inches, the washed material other than the fine surface coal is subjected to a final screening, giving clean coal in lumps from 2 inches to 6-10 inch; while all below the latter size is ordinary boiler slack with about 10 per cent. of ash. The fine coal raked off the top of the charge at each stroke, by the last teeth in the frame, which are deeper than the others, is received on an enclosed apron at the back of the sieve, where the bulk of the adherent water drains away, and is ultimately pushed over a shoot into a wagon placed to receive it. The stroke of the piston may be varied within considerable limits by adjusting the eccentric so as to be available for washing lumps of all sizes from 4-10 inch up to 2 inches in diameter. The number of strokes varies from forty-three per minute for stuff below 1 inch to fifty-five for larger sizes. The weight of these machines is about 6 tons each. They are arranged to work in pairs, each pair requiring a motive power of 4 to 6 horse-power, and one man to attend to them. The produce is from 12 to 18 tons per hour according to the amount of dust in the slack treated, or an average of 15 tons for two machines. They have been adopted, or are in course of erection, at six collieries in the north of France, and the basin of the Loire, four in Belgium, and three in Spain."

Lamp Cleaning by Machinery.—As a substitute for the slow and expensive process of lamp cleaning by hand, our attention has been directed to the safety lamp cleaning machine patented by Messrs. Ackroyd and Best, of Morley, near Leeds. It is claimed for this machine that it not only does many times the amount of work, in a given time, which can be done by hand, but also that it does the work better. The apparatus both draws and replaces the screws which fasten in the glass, and thoroughly cleanses the gauzes while the man or boy is cleaning the brasswork. With this machine, which is being used at some of the large collieries in the Durham, Yorks, South Wales and Wigan districts, it is stated that one man can clean over a thousand lamps a day, effecting a saving of from 35 to 40 per cent. over the old method of cleaning by hand.

MINING NOTES.

Nova Scotia.

Pictou County.

(From Our Own Correspondent.)

A good deal of lively prospecting is being done on the East River iron areas, and results, so far, have been encouraging, work on the Cameron and McColl & Son's areas opening some very promising deposits of ore.

At all the collieries in this county mining operations are going ahead briskly. The Black Diamond Colliery is the only one that is a little slack.

The opening up of the Foord pit continues smoothly. The management has put in place a very nice little blow-down, which is giving every satisfaction. The fan-shaft is being sunk through the big coal, and when this is completed places will be driven down hill for air-ways. At present they are compelled to use the pump shaft for down-cast, and hoisting shaft for up-cast.

The shipments from the Drummond Colliery for the month of July amounted to 18,000 tons, which is the largest export ever made from this colliery. For the month of August the shipments should be fully 20,000 tons, as they have double-shifted their pillar work.

Mr. John Douglas, who is prospecting for the Black Diamond Company at a point north of the present workings, has nothing new to report this month. So far his work goes to show that what he has been unearthing is nothing other than the west crop of the overlying seams of the Albion Mines.

The large hoisting-engine at the Vale Colliery, Thornburn, is to be taken down and erected at the Aeadia.

Another correspondent writes:—"You will see that the Springhill strike is ended and a victory claimed for the men, but I understand it is not altogether on one side; the practice of docking is allowed and now recognized and several matters of practice put beyond dispute. Trade here continues brisk. Our hot weather is over and the country has been made green again by frequent showers.

The location for the proposed blast furnace is still undecided, though it is generally considered that the New Glasgow Coal, Iron and Railway Company favors the site between the Foord pit and New Glasgow, offered by the Aeadia Coal Company in exchange for stock in the Com. ary.

The strike diverted but little of the Springhill trade to this county.

The New Glasgow Coal, Iron and Railway Company has a large force working on its various iron areas. At the Cameron area, at Bridgeville, two shafts have been sunk to depths of 70' and 80' respectively. The shafts are about 200 feet apart, and are connected by levels following the vein. The vein varies in width from 5' to 27', and in the most northerly of the shafts continues to give an excellent quality of ore at depth. On the McDonald property a slope has been sunk for 300' following the vein. At a depth of 75' below the crop of the ore a level has been driven 200' south and 75' north, all in ore. At 150' below the crop of this ore the second level is driven 225' south and 100' north,

in ore. Below this lower level the slope is continued for a distance of about 130', and the quality of the ore is found to improve towards the dip. The ore, however, is of an excellent quality throughout, the difference between the upper and lower parts being that there is a larger proportion of coarse ore to the dip. At Upper Stewiacke, the company has also opened a deposit of red hematite, and mined about 200 tons therefrom to date. At Brookfield, in Colchester County, operations have been continued upon the brown hematite veins occurring there, and a shaft to depth of 83' has been sunk. The crop of this vein is met at a depth of 15'. At 32', a level has been driven 150' west and 100' east, the average width of vein being about 22'. At a depth of 82' levels are now being driven, and the work so far done in them gives every indication of the vein holding out equal to that in the upper level to the west. At Black Rock, on the East River, Pictou County, some preliminary work has been done on a most promising deposit of brown hematite. Since operations were begun in July last year about 6,000 tons have been mined to date. The work is under the superintendence of Mr. R. E. Chambers.

The pay-roll of the Drummond Colliery for July amounted to \$17,000, the largest paid out in one month.

The bore-hole at the Black Diamond has been put down to a depth of 600 feet, but the results are not made public, which looks discouraging.

Cumberland County.

After nearly ten weeks strike the Cumberland Railway and Coal Company has, we understand, acceded to the demands of the men, and mining has accordingly been resumed at the Colliery. This most desirable end has been accomplished, we understand, very largely owing to the intercessions of the Hon. W. S. Fielding, the popular Premier of this Province. Commenting upon the strike and its consequences the *Journal of Commerce* has the following:—"Hardly a week has passed by that we have not had to chronicle the business difficulties of one of the local storekeepers, brought about simply from the impossibility of making sales for cash, or collecting payment for those made on credit. As a consequence the wholesale trade began in their turn to feel the turn of the screw, and thus from the pinched miner to the distant wholesaler, every link in the chain of commerce suffered from the unusual strain. If the version of the strike and its causes put forward by the miners be correct, and the fact that the company have never contradicted it would seem to indicate that it is, there were certainly grievances which the shareholders of the company should have put pressure on the management to abolish.

Press dispatches announce the sale of the Joggins Colliery to an English syndicate. We have not yet been put in possession of the particulars.

The Londonderry Iron Company is making preparations to work the extensive deposits of spathic ore at Londonderry. Gas kilns for roasting 250 tons ore daily are being erected. The old blast furnaces will be raised 15 feet, and capacity at each increased to 500 tons pig iron weekly.

A good deal of prospecting for coal is also going on in this county. The result of the work so far done at Salt Springs has not been so satisfactory as was anticipated, but Mr. Hall is still confident that he will yet strike something valuable. Mr. James Baird, manager at the Chegnecto Colliery, is also doing similar work near Maccan Station, on property owned by the Londonderry Iron Co.

Cape Breton.

Reports received here from the Nova Scotia coal mines indicate a season of unprecedented prosperity. So far the output of each mine, with the unfortunate exception of the Springhill colliery, is much larger to date than for the corresponding period last year. The shipments at the Caledonia mine, of which David McKeen, M.P., Cape Breton, is manager and director, amounted to 27,500 tons for the month of July, an average of more than a thousand tons for each working day.

Burchell Brothers, of Sydney, N. S., have purchased the Gardner coal mine. The new proprietors intend to equip and operate their mine at once. The Gardner is good coal, plenty of it, the mine well situated, and, doubtless, its present owners will take advantage of the growing demand in the Dominion and help to swell the yearly output at the Cape Breton mines by many thousands of tons.

Darr's Hill.

The Dufferin Mining Co. are pushing work in their new 20-stamp mill and hope to have it completed in September. It is intended to stamp 60 tons per day and to be more efficient than the old 40-stamp mill. The mill is modelled upon the Black Hills pattern.

Killag District.

Advices from this district state that the lode now working is looking better than ever. The quartz is from 9 to 15 inches in thickness, and will yield at the rate of 5 ounces per ton. Some of the rolls are reputed as valued at 10 ounces per ton. A level is being driven at a depth of about 30 feet to connect the two shafts. When this is completed the rich streak will be opened for over 75 feet in length. A recent break in one of the mortars in the mill prevents active crushing from being carried on immediately.

Renfrew District.

On the evening of the 11th inst. the large frame building at Renfrew, which contained the hoisting and pumping engines and air compressor of the Empress Gold Mining Co., was destroyed by fire. About six pounds of dynamite were in the building, and men were afraid to fight the fire until the same had exploded. The loss will not be heavy, as the machinery is reported as not seriously damaged. The Empress Co. is chiefly owned by Mr. C. H. North, of Boston, Mass.

South Uniacke.

The owners of the Witherow mine are doing but very little work. The main shaft has been sinking for a new pay-streak, which, at time of writing, had not been reached. The Thompson Co. continues to mine very small lots of very rich quartz. It is reported that the pay-streak has run out on one end of this property though still good on the other and.

Some Halifax men have been prospecting the property east of the Thompson line, but have, as yet, no results to make public.

Montague District.

The cessation of work upon the Rose Lode here, which took place some months ago, was not unexpected by parties familiar with the lode when it was working some years ago. The pocket from which the rich quartz was milled last winter is said to have been only a fragment of the rich streak formerly worked, and the continuation of the streak beyond the break is yet to be found. With skilful management and a little capital expended in dead work this continuation should be found without difficulty.

Central Rawdon District.

Several falls of rock in the workings of the Northrup Mining Co., limited, are reported. So far, they have occurred chiefly in the older part of the mine, and the old shaft is reported as closed up. The wall rock slacks and swells very rapidly upon exposure, entailing constant watchfulness upon the management.

Colchester County.

The Colchester Coal Mining Company have done some preliminary work on their area at North River, above Onslow. The indications are so encouraging that arrangements are now being made for new machinery plant for more extended working. About 100 feet of a slope is now completed, with a gin for hoisting, double track, trolleys, etc. Up to the 1st of the present year about \$1,500 have been spent in development.

In General.

The next regular monthly meeting of the Gold Miners' Association of Nova Scotia will be held at the Halifax Hotel, on Friday afternoon, the 5th September, at two o'clock. A large attendance of members is particularly requested.

The property and machinery plant of the Brunswick Gold Mining Company will be sold at public auction by the sheriff, at the County Court House, Halifax, on Saturday, 13th September next.

The Stanley Gold Mining Company are applying for incorporation. Capital, \$40,000; head office, Westville. Directors: John McDougald, M.P.; John Bryson, M.P., and Duncan McGregor. The company's property is at Fifteen-Mile Stream.

The Lawson Antimony Mining Company are also seeking incorporation. Capital, \$50,000; chief place of business, Halifax. The directors include Robert McNaughton, Truro; B. F. Pearson, and Charles Annand, Halifax. The properties to be acquired and worked are in the Rawdon District.

Quebec.

The output from the mines of the Johnson's Asbestos Company, Limited, at Thetford, for the present year promises to be between 1,200 and 1,500 tons, No. 1 and No. 2 quality. At date a little over 2,000 tons of No. 3 are on hand.

A correspondent from the Beauce district sends the following: "Gold mining in this district has been very quiet, due, I expect, to the failures of the Colonial Gold Mining Company, and the Gold Mining Association of Canada, and this, not because the gold is not here, not

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

because there is great difficulties in the way of its extraction, but simply because of excessive extravagances on unnecessary works and methods of mining. In prospecting the property of the former Company, which I have since purchased, I discovered an old river-bed in the hill called 'Jersey Point', at the juncture of the DuLoup and Chaudiere rivers, and from one pan of dirt I found a pennyweight of gold. I have also found a quartz vein carrying free gold. There is no quartz-mill or crusher in this district, and as I think they are greatly needed, I am prepared to make any arrangements with any company that will come and put one up. Any company favorably disposed to do this would receive encouragement from our municipality in the way of a remission of taxes for a number of years."

Eastern Townships District.

The Memphremagog Mining Company purpose erecting shortly a smelting plant to treat the ores from their mine in the Township of Potton. A small force is employed opening out the property, and a large quantity of ore will not be raised until the smelter is in place. It will be remembered that this company mined an output of some 2,000 tons last year.

BELL'S ASBESTOS COMPANY, LIMITED.—The directors have declared an interim dividend of 10s. per share (free of income tax) for the half-year ending June 30 last, being at the rate of 20 % per annum, payable by warrant on the 31st inst. to the shareholders on the register on the 26th inst.

The shipments of copper ore from Capelton Station, from 1st January to date, amount in the aggregate of 27,571,400 lbs., or a little over 13,785 tons.

Ottawa Valley.

The shipment of phosphate from the mines of the Canadian Phosphate Company from opening of navigation to date have been :—

No. I.—(80 to 85%.....)	1,338 tons.
" II.—(70 to 75%.....)	1,864 "
" III.—(60 to 65%.....)	506 "
	3,708 tons.

At the Aetna Hill and Lansdowne mines, operated by the Anglo-Continental Guano Company, under direction of Mr. J. B. Smith, considerable activity is manifest, and the shipments for the year are expected to be figure close upon 3,000 tons.

The completion, or rather the non-completion of the works at Little Rapids, is again causing great trouble and inconvenience to the miners on the Lievres. Two scows, belonging to the Canadian Phosphate Company, had the misfortune to get on the rocks at the rapids this week, and suffered considerable damage thereby. The Department of Public Works promised that the work should be finished this year, but judging from appearances it will probably be a couple of years yet before this bugbear is removed.

The new Ingersoll plant for the High Rock mines will be in running order by the end of this week. Mr. Pickford, sr., from London, Eng., is expected at the mines next month.

Mr. C. C. Hoyer Millar, of the firm of Couper, Millar & Co., London, Eng., will also visit the mines of the Can. Phos. Co. in September.

The boom in "prospects" and other properties held for speculative purposes, consequent upon the exaggerated ideas formed of the operations of the Phosphate Corporation, is dying out. Properties held a few weeks ago at chimerical figures have now lapsed into their old groove.

The Templeton mine-managers complain of the scarcity of labor, miners being difficult to get.

Prices continue good, and the prospects of a busy season are bright.

Ontario.

Port Arthur District.

(From Our Own Correspondent.)

THE CROWN POINT MINE.—A one-half interest in this property has been sold by Messrs. Cummings and Montgomery to H. R. & E. Tinkham, Hon. O. P. Stearns, Hon. J. D. Ensign, Geo. Elder, James Billings and C. E. Shannon, all of Duluth, Minn., the consideration being \$100,000.

The property is situated in the township of Lybster, about forty miles from Port Arthur. It is composed of location R95 and comprises 160 acres; it adjoins the Shuniah Weacheu Mines Company's property and the West

End Mining Company's land on the north. The location is traversed by three strong well-mineralized veins. No. 1, or the main vein, which is a true fissure, causing a fault of 9 feet, outcrops for three-quarters of a mile; it has a general east and west strike, and dips southerly about fifteen degrees; its average width is four and one-half feet; the vein gangue is composed of calc spar, fluor spar, zinc blende, and a small quantity of galena. It carries silver in the form of argentite and native, giving good results wherever opened, the lowest results from milling, ore giving 25 and the highest assays of smelting ore giving 2,980 ounces of silver to the ton of 2,000 pounds.

Nos. 2 and 3 veins outcrop on the top of the mountain and extend down over the east and west slopes respectively. They have the same general strike and dip as No. 1, and give every promise of turning out as well as it did on development, surface specimens taken anywhere on the vein, giving good assays in silver. The gangue has the same characteristics as No. 1.

The work done up to date consists of the following :—No. 1 adit level on No. 1 vein was started in 90 feet from the top of the mountain, some distance below the trap, and has been driven in on the vein for a distance of 150 feet; good milling and smelting ore was taken out of this level for its entire length.

No. 2 adit on No. 1 vein was started in at a point 65 feet below No. 1 adit and has been driven in a total distance of five hundred and seventy-eight feet on the vein. At a point four hundred feet from the mouth of No. 2 adit a winze has been sunk to a depth of forty-four feet; one hundred and forty feet in on No. 1 adit a winze has been sunk to connect with No. 2 adit. Another winze has been started near the breast of No. 1 adit and is now at a depth of 20 feet. There are five cross-cuts from 16 to 20 feet in length driven at different points on the levels. On the westerly end of the outcrop, about three-quarters of a mile from the workings described above, an adit has been run in on the vein for a distance of sixty feet; these workings are all below the overlying trap and in the Animikie slates. The vein has been left standing in the last one hundred feet of No. 2 adit, and a conservative estimate of the amount of ore in sight at this point places it at seventy-five tons of smelting ore that will average 400 ounces to the ton of 2,000 pounds.

There are 1,400 tons of good milling ore on the stock pile that gives average assays of 50 ounces to the ton.

During 1889 they made several shipments to Duluth smelters, some of which gave an average value of 852 ounces to the ton in silver. I have been unable to ascertain the quantity shipped, but one lot shipped on Sept. 19th, 1889, consisted of 17 tons.

The new company proposes to push development work with all possible despatch, and have decided to build a branch railway, one mile in length, to connect with the Port Arthur, Duluth and Western Railway. I understand it is the intention of the Shuniah Weacheu Mines Company to join them in the construction of this branch. This will give them first-class facilities for the transportation of supplies, machinery and ore. They also propose to erect a concentrating plant of fifteen head of stamps with power sufficient to run twenty-five head power drills, and a compressed air plant will be placed in position as early as possible.

It is also their intention to start another adit seventy-five feet below No. 2, which is designed to be the main working level of the mine. It will give them about 230 feet of back ground. Very little hoisting or pumping will be required for some time, as the workings are all above the common level of the country.

The force of miners will be increased as fast as men can be secured, and an early development of this promising property may be looked for, and from the developments already made it is reasonable to expect that future operating will give satisfactory results, and that the Crown Point will add one more to the famous silver producers of the Port Arthur district.

Messrs. Cummings and Montgomery are to be congratulated in securing the co-operation of such influential and wealthy gentlemen.

THE MOCAN VALLEY GOLD LOCATION.—This property is situated in the district east of Port Arthur, 3½ miles north of the Canadian Pacific Railway, at Jackfish Bay, Lake Superior. It is easily accessible from either the lake or railway, through the Mocan Valley, which is quite suitable for either a waggon or tramroad. The north end of the location borders on Mocan Lake, a deep clear body of water, about half a mile in length. The outlet is fourteen feet in width, and passes directly through the location, near the works on the vein. It makes a descent of 40 feet above and near the works referred to, and will give an excellent supply of water for all mining purposes. The creek lies in a valley that occupies the western portion of the location, the mountains rising on either side to a height of about 200 feet. The location and vicinity is well supplied with timber suitable for mining purposes.

The rock formation consists of the Huronian diorites

and chloritic schists, striking east and west, and dipping with a high inclination southward, with an occasional syenitic vein penetrating it from a great granitic syenite belt, which bounds it on the south side within a few hundred feet of the location. Several quartz veins intersect the location, two of which carry free gold. One of them, which may be said to be the main vein of the location, is in about the centre of the property, striking eastward across the mountain from the above-mentioned valley. It has been exposed in several places, over a distance of about a thousand feet from the foot of the hill, up the face and back on the summit. It is a strong fissure vein, from 2 to 6½ feet wide, of quartz, with an inch of clay on the foot-wall in the tunnel.

The tunnel was driven in on the vein for thirty feet at the foot of the mountain, twenty-five feet above the level of the valley. The vein here is four to seven feet in width, and carries considerable auriferous pyrites, assaying \$22 in gold per ton of 2000 pounds. On the surface, about fifty feet further east, the vein carries free gold, and it is expected that if the tunnel was driven in to cut that point it would show free gold also; in fact a few colors were shown in the last blast put into the tunnel. The vein in the tunnel dips 60° to the south. Thirty-five different tests have been made on this vein, in pulverizing, roasting and washing, and with few exceptions turned out a good showing of gold dust in the pan. A test of 1290 pounds, made by the North-Western Reduction and Chemical Works, of Chicago, of the rich part of the vein, gave an average of \$41.34 in gold to the ton of 2000 pounds. Assays from other parts of the vein, by C. Kreissman, M.E., of Port Arthur, gave an average of \$20 in gold to the ton of 2000 pounds. The second vein bears N.N.W., dips westward 30° to the horizon, and lies about fifteen chains to the east of the tunnel, and will interest the main vein. It is three feet wide, and is composed of decomposed quartz. No assays have been made from this vein, but it shows free gold in considerable quantities by panning.

The district east of Port Arthur is attracting the attention of explorers to a greater extent this season than ever before. Some very promising gold, silver and nickel properties have been located in the vicinity of Schreiber.

CLOUD LAKE SILVER LOCATION.—This property is situated on the north-east quarter of Lot 5, Concession 2, in the township of Crooks. The title has been in dispute for about a year, owing to rival claims made by different explorers. In April last the Ontario Government issued a Commission which held sittings in the court-house at Port Arthur. A mass of evidence pro. and con. was submitted during ten days. The commission reported some time since and the Government have finally decided to give each of the two claimants an undivided one-half interest in the property. The location comprises 174 acres and is traversed by two strong, well-defined and heavily mineralized lodes. No. 1, or the main vein, has a general north-east and south-west strike, with an average width of 5 feet and can be traced for one thousand feet. No. 2 vein has an east and west strike with an average width of four feet; it joins No. 1 about the middle of the outcrop; from the point of intersection eastward as far as the vein is exposed it has an average width of 8 feet. A shaft 12 feet in depth has been sunk at the contact of the two veins. The lowest assays from rock taken taken out of the bottom of this shaft, showing no silver, was \$300, and the highest from rock showing argentite, zinc blende and galena was \$2,900 per ton. Development work has been commenced and good results may be looked for.

TERRACE BAY GOLD MINING COMPANY.—This company's property comprises 1,600 acres and is situated on the shore of Terrace Bay, a few miles west of Jackfish Bay, Lake Superior. Mr. Roland, M.E., who has lately made an examination of the property for the owners, found it to contain several well defined and highly metalliferous lodes. The geological formation prevailing throughout this tract generally is Laurentian; occasionally as towards the northern and eastern limits rocks of the Huronian age are encountered. The gauge of the veins, as far as tested, consists of fine quartz, of a granular, and in places vitreous, texture and appearance, carrying chalc pyrites, highly auriferous, argentiferous galena, and molybdenite, while the walls are invariably slicken-sided with pyro-schist, the matrix being occasionally streaked with red orthoclase. An average of twenty-five pounds of this chalc-pyrites yielded by assay \$13.50 per ton of 2,000 pounds. The principal testing work was done on location No. 4 where, on a strong well-defined lode, bearing north nine degrees east, a drift was run in 45 feet. This lode is joined at intervals of about ten feet with heavy mineralized "feeders" from the south and east. The lode improved very fast, as the drift was driven in on it. The concentrates from the ore taken out give excellent result. I believe it is the intention of the company to proceed with the development

of the property. It is splendidly situated; the Canadian Pacific railway runs through the property and the harbour facilities are of the best.

THE BEAVER MINING AND MILLING COMPANY.—This company shipped two carloads of smelting ore and concentrates on the 2nd inst. to Messrs. Balbach & Sons, Newark, N. J., valued at \$40,000. Capt. Hooper expects to be able to ship from \$25,000 to \$40,000 monthly, and taking into consideration the amount of ore on the stock pile and the developments made in the mine, it is quite reasonable to expect that he will be able to do so. New ground will continue to be opened up and the extent and number of the veins on this property gives them great opportunities for work of this kind. They have at present on hand at the mill and ore-house about two carloads more that will be shipped shortly.

THE BADGER SILVER MINING COMPANY.—This company shipped 17 tons of smelting ore and concentrates on the 4th inst. to Geo. W. Robinson, 91 Wall street, New York, valued at \$37,000. This is the product of No. 2 vein since its discovery on the 8th June. Superintendent Shear says he can guarantee shipments of \$55,000 monthly from the Badger property this year. Everything is going on very smoothly. They have 480 feet of ground opened up on No. 2; it has become richer at the west end than at any point yet opened. Several stringers came in from 75 to 100 feet west of the shaft, everyone of which was literally filled with argentite. A Cunningham twin engine, friction drum steam hoist has been placed in position at No. 3 shaft. An adit level is being run in to cut the vein 60 feet below the bottom of No. 4 shaft in the slates. Good milling ore, assaying from 100 to 150 ounces of silver to the ton, is being taken out of No. 3 adit and shaft. Drifting is being pushed on the west end of No. 1 vein. The vein is widening out and becoming stronger as the drift is driven in. Some of the ore is very high grade, going up to 700 and 800 ounces to the ton, the average of the vein is about 125 ounces, and from all appearances it will improve very shortly. The mill is running full blast night and day, treating 35 tons daily.

THE WEST END MINING COMPANY.—This company's property has been sold to Elias F. Drake, of St. Paul, Minn., representing a syndicate of wealthy capitalists, for \$150,000 cash.

It is situated in the township of Lybster, and adjoins the Shuniah Weachu Mine Company's property. It comprises 240 acres. There is a steam hoisting and pumping plant, and about twenty buildings, including superintendents' residence, store, blacksmith shop, boarding house, miners' dwellings and ore house on the property.

The location is traversed by four good veins, and with the exception of some surface work, only one of them has been developed. It is a true fissure vein, averaging six feet in width. It outcrops on the Shuniah Weachu Company's land, and is exposed clear across the West End Mining Company's property, carrying a uniform width throughout; the entire length of this vein on the property is slightly over half a mile. It is very rich in silver, carrying it in the form of native and argentite and highly argentiferous zinc blende, the vein matter giving assays from 40 to 5,000 ounces to the ton of 2,000 pounds. In October, 1889, the writer saw 26 bags of ore taken out of the cross-cut, mentioned below, that would average not less than 7,000 ounces to the ton, principally native silver.

So far the work on the property has been confined to development, no stoping having been done. The object of Mr. H. N. Nichols, a thoroughly practical mining man from Denver, Colorado, who has been superintendent, has been to open up, and place the property on a good paying basis, before attempting to take out any ore, other than what was encountered in the course of development work.

The work done consists of the following: No. 1 shaft has been sunk to a depth of 225 feet, 75 feet down levels were run east and west 175 and 100 feet respectively. 140 feet from the surface the second set of levels were driven east and west 75 and 50 feet on the vein. No. 2 shaft is 65 feet in depth, and drifts have been driven each way on the vein for a distance of 125 feet. No. 3 shaft has been sunk to a depth of 50 feet, and No. 4, which was commenced a short time since, is 15 feet in depth; in addition to the shafts winzes have been sunk between the levels in No. 1 shaft, and a cross cut has been run into the face of the bluff to intersect the vein east of No. 2 shaft, and a drift, 125 feet in the vein from breast. The cross cut workings are all No. 1 vein, and the shafts are 650 feet apart.

In the course of this development work 15 tons of smelting ore has been taken out and shipped to Denver smelters, and the stock pile contains about 2,000 tons of good milling ore, 1,000 tons of which will average about 100 ounces to the ton, and the balance 40 ounces to the ton. I understand that it is the intention of the new owners to put a large force of men at work and develop

the property on a large scale as soon as the railway reaches that point, which will be about December next, a large concentrating plant will be erected.

(Later Correspondence to the Review.)

THE BADGER SILVER MINING COMPANY.—In No. 2 shaft sinking has been resumed below No. 1 level, and a winze is being sunk 175 east from the shaft. Drifting still continues west on No. 1 level. All these workings are being done on the vein, which continues just as rich as when I reported it last. The new steam friction drum hoist is now in place at No. 3 shaft and is giving excellent satisfaction. No. 1, or the lower adit level at this shaft, is now in a total distance of 300 feet, 90 feet of which has been driven since the Badger Company acquired it. This property (Porcupine), the whole of this distance has been in good pay ore and has steadily increased in richness, the last 30 feet being all bonanza ground. The vein is strong and regular with an average width of 3 feet. The gauge of the vein is principally calcite, carrying both native and black silver. On the hanging wall there is a band of witherite varying in thickness from 2 to 8 inches, and very rich in argentite. This band appears to continue through the hill, as they have the same streak in the shaft 500 feet east from the breast of the level. Sinking was commenced last week in the shafts. They have 14 feet more to sink to reach the depth of No. 1 level, at which point drifting will be commenced to connect through to the level. There is every reason to believe that the rich body of ore they now have in No. 1 level continues through to the shaft, as the bottom of the shaft is now in bonanza ground of identical character.

Drifting is being proceeded with at the west end of No. 1 vein. The vein is becoming stronger and better defined, carrying good pay ore all the way. The mill is kept going night and day. Another large shipment of high grade smelting ore and concentrates will be made in a few days. Geo. W. Robinson, of New York, general manager, and one of the principal owners of the property, visited the mine this week in company with his family. The Badger stock, which has a par value of \$5, sold one month ago for \$6, cannot be purchased now for less than \$22, and most of the holders refuse to part with it for less than \$50 per share.

Numerous sales of mining locations have been made within the past few days in the silver district, the early event of the railway, no doubt, is the principal cause of the movement. Intending investors would do well to secure lands now, as when the railway is completed to Whitefish Lake it is bound to increase the value of mining lands, and consequently the price at which they can be purchased.

A. P. Bliss, of Saginaw, Mich., who purchased the Palisades location for \$10,000 and has since refused \$20,000 for it, purchased on the 13th inst. R. 58 and R. 59, containing 80 acres each, entirely undeveloped, lying immediately west and east of West End mine and Shuniah Weachu mine respectively, for \$40,000 cash. Two days after the purchase he refused an advance of \$3,000 on the price he paid. It is his intention to place all these properties under development early in 1891. R. R. Paulson, the iron king of this district, purchased R. 255 for \$1,000 cash, an 80-acre location lying west of Sand Lake, on which there is a good silver vein and a very promising outcrop of iron, both of which are developed. Two silver locations, lying north of Whitefish Lake, in the Township of Strange, were sold last week for \$300 and \$500 each, and changed hands in a few days at an advance of about 500 per cent. each. Numerous other transactions in mining lands are on the tapis, some of them involving large amounts of money are reported, and while it cannot be said to be a boom, it is safe to say that it is the legitimate outcome of the rich and satisfactory developments already made in the district, and which will soon be increased by the facilities afforded by the railway.

Capt. Wilson has had a gang of men out testing R. 366 lying a short distance north-west of Sand Lake, and reports having found leaf silver in the gneiss, which at that point is 11 feet in thickness. He has great faith in finding good silver in this formation, and his results so far certainly appear to bear him out. No work of any consequence has been done in ground of this kind in this district, and therefore his theory cannot as yet be disproved. His work will be watched with great interest, as this formation joins the "Animikie" slates on the north-west.

THE SILVER ISLET CONSOLIDATED MINING AND LAND COMPANY.—Capt. T. H. Tretheway began operations on the 13th inst. at the new parallel vein on Edward's Island. A shaft will be sunk on the vein to the point of intersection of the old or No. 1 vein. It is expected that a rich body of ore will be struck at this point, as both veins carry silver in good quantity on the surface. The dip of each will bring them together 75 to

100 feet from the surface. No. 1 carries arsenical ore, giving assays from 150 to 700 ounces of silver to the ton of 2,000 pounds. Their property at Cap en Gargantua has been re-surveyed. This is the property that has the manganese vein, averaging 10 feet in width and standing up like a dyke over the surface of the ground. At the time of discovery, about two months ago, average samples from the surface of the vein were assayed by Chas. Brent, M. E. Port Arthur. They gave an average of 39.80 % manganese. Check assays made for the company in New York gave a somewhat higher percentage in manganese. This property will be thoroughly explored by means of a diamond drill and sinking a number of shafts at different points on the vein. The Cape Maimase lands will also be thoroughly explored and tested. It is expected that this company's operations will assume large proportions very shortly. Mr. H. S. Sibley is expected here about the 25th inst. He will be accompanied by an expert, who will examine and report on some of the company's lands.

THE ELGIN GOLD MINING COMPANY.—The property of this company is situated at Jackfish Bay, Lake Superior. Some development work was done there in 1884-5, which gave very satisfactory results. The vein carries free gold and highly auriferous pyrites. Capt. J. H. Dickie commenced operations on the 4th inst. with a gang of ten miners to open up the old works and drive a new drift in on the vein. The Canadian Copper Co. of Sudbury are largely interested in this property, and if Capt. Dickie's report is favorable, smelting and concentrating works will be erected and the property worked on an extensive scale.

Lake of the Woods District.

Owing to the delay in the completion of the new Reduction Works a petition is being circulated for signature in Rat Portage for the forfeiture of the bonus promised by the town. The postponement of the completion of the works is due, in large measure, to the difficulties experienced with the customs officials in passing in the machinery plant, to which reference was made in our last issue.

Sudbury District.

The production of copper and nickel ore from the mines of the Canadian Copper Company for last year is officially stated to have been 60,000 tons. No. 1 furnace was blown in for the first time on December 24th, 1888, and ran from that time to December 31st 1889, 259 days of 24 hours, using 31,268 tons of ore and producing therefrom 3,849 tons of matte, averaging probably about 18 per cent. copper and 13 per cent. nickel. In this operation there were consumed 3,950 tons of Connellsville coke, costing about \$6.50 per ton at Sudbury. Smelter No. 2 started September 4th, 1889, and ran 73 days from that period to December 31st, using 9,740 tons of ore and producing 1,210 tons of matte, averaging probably about the same per cent. copper and nickel as No. 1. This furnace consumed 1,169 tons of coke. Shipments have been made to Philadelphia, New York, Swansea, Liverpool and Hamburg. Coke is shipped by boat from Cleveland to Algoma mills, and thence over the Canadian Pacific Railway to Sudbury. The shaft at Copper Cliff Mine is sunk at an angle of 45°. On the 31st December, 1889, it had reached a depth of 502 feet, and the width of the ore deposit at that depth was 65 feet; the present depth (on slope) is about 458°; about 300 men are employed.

The Dominion Mineral Company's smelter has had to be shut down, their supply of roaster ore having given out.

The smelting works recently erected by the Vivians, of Swansea, will soon be ready to treat ore from their mines.

Kingston District.

(From our own Correspondent.)

At the pits of the Foxton Mining Company, after having done almost nothing but "dead work" since the beginning of the year, a large body of high test phosphates has again been struck, and the output has consequently very materially increased. The force will be increased to 45 men.

At the "Orser" phosphate mine, 11, 11, Loughboro', five men are employed. The output is as yet slow, a good deal of time being taken up in opening, as it is a new mine. It is intended to largely increase the force after harvest. The prospects are very good here.

The Sydenham M. & M. Company opened in spring a new phosphate property on 12 in 8th con., Loughboro'. It was not successful at first. About two months ago they struck a very large vein, and since then have taken out about 250 tons. 17 men are now employed. When some "dead work" now being done is finished, it is expected that a good output will be made.

Fred. Foxton is opening on W. $\frac{1}{2}$ 5, in the 8th, Loughboro. Not much done yet.

Rock Lake Mine, (Bell & Claxton.) Some time ago water got into the large pit—beyond control of the machinery at hand—and work had to be abandoned there for the present. It is intended to remedy that immediately by putting up a powerful plant, &c. Eight or ten men are working in small pits. 422 tons of phosphate have already been shipped this season, and about 100 tons are lying at the mine ready for shipment.

Messrs. James Richardson & Sons, Kingston, expect to ship at least 4,000 tons of phosphate this year.

The Sydenham Mica and Mining Company have now employed at their mica mine near Sydenham (lot w. $\frac{1}{2}$ 11 in 7th con., Loughboro) 15 men. The shaft is now 160 feet deep. At their shop in Sydenham, where the mica is cut, 12 men are employed. At their white mica mine in Effingham they employ 10 men.

Webster & Co. have discovered and opened a dark mica mine on 16 in the 9th, Loughboro, the lot on which is situated the old Frontenac Lead Mining Company's works. Five men are now employed. The mica is said to be of very good quality and abundant.

Fred. Foxton is opening a mica mine on W. $\frac{1}{2}$ 5 in the 8th Loughboro. The mica is good, but the productiveness has not yet been ascertained.

Chas. Orser is opening on 11, 11, Loughboro, where the mica is also good, and indications point to its being in quantity.

In General.

The Haliburton Mining Company, owning some 1,200 acres in the 11th, 12th and 13th Concessions of Lower Monmouth, has a small force prospecting under superintendence of Mr. F. S. Miller. Some promising deposits of phosphates have, we understand, been opened up.

The Premier Oil Company, which recently purchased the plant of the Producers' Refining Works at Petrolia, give notice of application for incorporation. Capital stock, \$150,000. The directors of the new company are Wm. Brough, Toledo, Ohio, S. Cunningham, Washington, Robert Reid, Montreal, R. K. Thomas, Montreal, and R. Menzie, Petrolia. New underground tanks have been constructed, pipe lines laid, new condensers and stills erected, and many other improvements in the way of buildings, water works, increased facilities in every department, etc., are under course of construction. Another month will probably see the completion of the firm's proposed works, when the whole will be immediately put into operation. Among those interested are capitalists from Pennsylvania, Ohio and New York.

The Frontenac Phosphate Company, recently organized, is equipping its mine with a new machinery plant. The shipments of the company will be made per Messrs. Millar & Company, Montreal.

The Citizens' Natural Oil and Gas Company, of Kingsville, Ont., struck a fine flow of natural gas in their well near that town a few days ago. This well is about 300 feet from the great gusher No. 1 of the Ontario Natural Gas and Oil Company, and about the same depth—1,020 feet. It is estimated that the flow of gas will be about 15,000,000 cubic feet a day.

Manitoba and N. W. T.

Mr. Geo. H. Campbell, President of the Manitoba Railway and Coal Company was in Ottawa during the month, negotiating with the Department of the Interior respecting the land grant to his company. This company is the owner of some 2,000 acres of coal lands near the town of Deloraine, upon which some satisfactory prospecting has recently been done. A number of test pits, and a shaft to a depth of 60 feet, have been put down, giving abundant evidence of a profitable output when mining operations proper are begun. Mr. Campbell estimates that the company, when in working order, will be able to place about 50,000 tons of coal on the Manitoba market. Arrangements are being made for the immediate construction of the company's railway from the mines to Deloraine, and from thence to the city of Brandon, a distance of some 70 miles. The coal seam averages 7 feet, and, judged by recent analyses, is of good quality.

A meeting of the Canadian Anthracite Coal Company was held at Ottawa during the month, when it was decided to increase the present capital stock of the company from \$500,000 to \$1,000,000. Operations at the mines are to be resumed at once.

At the mines of the North-West Coal and Lumber Company at Canmore a good deal of activity has been manifested lately.

Mr. Brinkenhoff, the discoverer, and one of the original owners of the coal mines at Canmore, passed through the city on Saturday on the way to St. Paul to visit his family, after spending seven months in the mountains. An English company, known as the North-West Coal and Lumber Syndicate, has purchased the property above referred to, but Mr. Brinkenhoff still retains an interest in it. He says that two cars are now being loaded with coal, which is to be sent to Winnipeg to be tested, and it is expected that shipments will be made regularly afterwards. The mine will be operated as vigorously as possible. Mr. Brinkenhoff says that coal companies in the west labor under a disadvantage owing to the distance of mines from the chief markets and high railway rates, but he hopes to see the latter difficulty removed ere long. As the people in the smaller towns along the lines of railway are beginning to use coal as fuel, the consumption in this country is gradually growing, and must soon reach great proportions.

British Columbia.

The miners at the Wellington collieries are still out on strike, the men refusing to work because the Dunsmuirs, who are the owners, would not give consent to the following demands:

"First—To work eight hours from bank to bank.

"Second—Recognition of their men as a union.

"Third—And their committees be empowered to investigate in all differences between employer and employees."

Commenting on the matter the *Colonist* has the following pertinent remarks:—"The eight hour shift has obtained in Wellington for years, but the time is counted from the hour in which they actually begin work until the hour they leave off. What the miners wanted was to have the day's work to begin when they were on the bank ready to go down into the mine, and to end when they were on the bank again in the evening.

"These conditions may be of importance to the miners, but the question is whether those whom the miners looked up to for guidance and advice were warranted in urging them to strike if they were not conceded. They knew, if the miners generally did not realize it, what a lengthened strike involves, and granting that the men would be benefited if they obtained what they wanted, was the good to be gained of sufficient importance to justify so extreme a measure as a strike in order to obtain it?"

The Revelstoke Mining Company, organized in London, Eng., early in the present year, is reported to have recently acquired the No. 1 and "United" mining claims, as well as a two-third interest in the "Great Eastern" and one-half interest in the E. W. R. The No. 1 was bought from Velnoweth and Duncan for \$15,000, and the E. W. R. and Great Eastern from the same parties for \$1,000. The United was got from Hugh and Tom McGovern and James E. Dolan for \$7,500—the total purchases amounting to \$23,500. These investments were made with the object of supplying the Revelstoke smelter with ores from the Hot Springs district of Kootenay Lake. The No. 1 has already made a record as an ore-producer, it having been under bond to G. B. Wright, who is said to have shipped \$25,000 worth of ore from it in 1888, and fully as much has been expended on it in development.

From all reports it would seem that West Kootenai will be represented by a first-class mineral exhibit at the Toronto Exhibition next month.

The Island Mountain Mining Company, located near Barkerville, B.C., has its mill nearly completed, and will commence crushing in a few days.

Mr. Lyman Banks, representing eastern capitalists, has bonded 7,000 acres of coal lands at Fort Rupert, Vancouver Island. He has also purchased in the States a diamond drill with a complete outfit of mining machinery. Mr. Banks left on Friday by steamer *Boscovitz* for Fort Rupert. He was accompanied by a party of experts, and boring will be prosecuted at once with every prospect of success.

At a recent meeting of the Crow's Bar Mining Company it was estimated that the preliminary expenditure on the company's claims would not exceed \$6,000. The water will be brought from a height of about 3,000 feet above sea level and traverse about 18 miles of country through ditches and lakes, with a final fall of about 2,000 feet through a ditch about 12 miles long, of which nearly four has been already constructed.

The establishment of mining associations in different parts of the Dominion is a feature in the development of our industry which cannot be too highly commended. When properly conducted these excellent institutions have proved of great mutual benefit, and have exercised a most wholesome influence on many public questions affecting the welfare of the miner. Were there more of them in our mining districts there would be fewer objectionable features in mining laws; the prohibitory effect of our tariff on imports of mining machinery would be diminished, if not abolished; there would be less booming and misrepresentation, and more vigorous development at our mines, and the industry all round would be in a much more prosperous condition. The latest acquisition, which we heartily welcome to the ranks of those already organized, is the Miner's Association of Revelstoke, B.C. As the Executive Committee state in an address appended to the constitution of this new association, experience has shown that action on the part of the miners of British Columbia is absolutely necessary in order to prevent legislative measures which, if passed, are calculated to inflict serious injury to the mining interests of that Province. We wish the association every possible success.

Our Portrait Gallery.

Owing to business changes our engravers are unable this month to furnish our readers with the portrait for our fifth sketch. The series will, however, be resumed in our next issue and continued regularly thereafter. The subject of our next sketch will be that of Mr. John Bowron, Gold Commissioner for the Cariboo District, British Columbia.

Lake of the Woods Gold District.—W. Roland, C. and M.E., has just returned from making an examination of the Stewart locations, Nos. 250 P and 288 P, situated on the line of the Canadian Pacific Railway at Rossland Station. The property comprises 220 acres, and is traversed by three veins, two of which are exceptionally well defined. The veins have a general north-east and south-west strike. The country rock is of the Huronian series. Several test pits were sunk under his supervision, at intervals, on each of two of the veins. Average samples were taken from these pits, and gave the following results on assay by Chas. Brent, M.E., Port Arthur:—

Sample No. 1,	4.89 ozs. gold
" " 2, from hanging wall	5.32 " "
" " B, from most southerly point	3.48 " "
" " 4, from most northerly point	6.92 " "

Check assays made by Prof. Heys, Toronto, gave:—

Sample No. 1,	4.65 ozs. gold
" " 2, from hanging wall	5.48 " "
" " B, from most southerly point	3.42 " "
" " 4, from most northerly point	7.00 " "

Concerning Belgian Miners.—A correspondent of the *Leeds Mercury* writes as follows: "Mr. T. Lindsay Galloway, M.A., F.G.S., some time since paid a rather lengthened visit to several of the principal European coal mining districts, including a number in the north of France, Germany, Austria and Belgium, and he embodied what he had seen in an interesting paper read before the North of England Mining Institute. The mines of Belgium, he states, are a prolongation of those in the north of France, and, owing to the strata upon the southern side of the basin being literally crumpled into folds, there is great scope for the resources of the art of mining. At the Product mines, in the vicinity of Mons, females are employed, as is the case at the mines generally in Belgium. The men work in companies of five or seven, and are attended by two females, known as the *bouteur* and the *chargeur*. The *bouteur* is generally a young girl, who collects the coal into a heap at the rail ends, which the *chargeur* fills into tubs. The females are dressed in jackets and trousers, the younger ones working from 4 a.m. to 3 p.m. which is the same shift as the hewers, being eleven hours.

A Seller's Regrets.—The *Coal Trade Journal* states that about two months ago William Moore, of Scranton, Pa., sold 100 acres of land situated in Dickson borough, just across the city line, to Messrs. Benner, Watkins and Williams, coal operators. The price was \$25,000. Soon after the land had been deeded over the owners erected a McEthen mine drill upon the place and in a few days the huge auger was penetrating the bowels of the earth. This set Moore to thinking, and two weeks ago he sought the coal operators and offered them \$30,000 to sell back, but the offer was refused. Recently the drill broke through a vein of coal 10 feet thick at the depth of 150 feet. The coal is of the finest quality, and there are "millions in it" for the new owners. The value of this land now is estimated at over \$1,000,000. This opens up a new coal sub-field, and in a locality where the presence of coal was not even suspected.

Improved Bee-Hive Coke Oven.

John Fulton, M. E., Johnstown, Pa.

The general plan of the bee-hive coke oven has held its place in the manufacture of coke with great firmness. It is venerable with age, and indeed has been sneered at because of its antiquity. Notwithstanding all this, it has kept quietly on its way, producing the very best possible coke from the coal used in its manufacture.

Multiplied attempts have been made to displace this most ancient of ovens, but these have so far accomplished very little. The 15,144 bee-hive coke ovens now in operation in the Connellsville coke region bear testimony to the appreciated value of this oven. The Connellsville coke is a standard coke so far as known on the continent of North America.

The physical and chemical properties of this bee-hive oven coke are fully shown in the table in the foot note below.

Its use in blast furnaces fully maintains the character given in the table. At a large furnace 1897 pounds of this coke produces one gross ton of Bessemer pig iron, and the output of the furnace is correspondingly large

(8,478 gross tons per month), exhibiting the energy and economy of this fuel.

In Virginia and West Virginia excellent coke is also being produced in the bee-hive oven, some of which approximates very closely to the Connellsville standard.

The Cumberland Valley Colliery Company, of Pineville, Ky., make a most excellent coke in their bee-hive ovens, one of which has been a surprise in the degree of its purity and physical properties, being somewhat superior to the standard Connellsville. Hence so far as the quality of the coke produced in this oven for metallurgical purposes, it is the peer of any other class of oven. It may seem strange that through its long years of faithful service very little improvements have been made in its general form or its details. Quite recently, however, the size of the oven has been enlarged so that the standard oven of the Connellsville region at present is 12 feet in diameter across its floor, and the height from the center of the floor to the top of the dome under charging port is 7 feet. This enlargement has been made with a primary view of increased output, and also reducing the percentage of waste at the door of the oven where air has to be admitted to mix with gases and support combustion in the dome above the charge of coal in the oven. The

door of this oven has been enlarged and its height increased so as to permit the air to be introduced at a level above the charge of coal in the oven, so as to have as little contact with the coal in introducing the air into the oven as possible, thereby lessening the ashes or waste that is made in this way.

The accompanying cuts (made from actual working drawings) illustrates the dimensions and manner of construction. In Fig. 1 is shown a transverse section of a bank of these ovens, the one at the left being shown completed, the right hand drawing illustrating the manner of construction. Fig. 2 shows the ovens in plan and Fig. 3 in elevation.

It will be noted also that in the general method of building these ovens a thinner variety of building stones are used. In fact, stones from three to four inches thick, make the best bond, and have greater endurance than the larger stones hitherto used in such structures.

The iron frame to the oven door has been modified by removing the arch piece, which was found in its expansion and contraction to shatter the masonry above the door. The frame, with its three sides, is sufficient to protect the jambs and posts of the doorway from the friction of the rabbling irons.

Fig. 1.

Fig. 3

The Desulphurization of Pyritiferous Iron-Ores.*

By Sterling G. Valentine, PH.D., Lebanon, Pa.,

(Continued from Page 108.)

Some pieces of Cornwall ore, similar to those used before, were heated beyond their sintering point, and as quickly as possible, to intensify the effect. For comparison the former results, obtained on heating at a low temperature, are added:

No. of Heat.	Temp. ° F.	Duration.	Per Cent. Total Sulphur in Residue.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. Total Sulphur as Sulphate.
1	1200	2 hrs.	0.346	0.235	0.111	32.18
2	1200	4 hrs.	0.178	0.088	0.090	51.12
3	1500	1 hr.	0.099	0.027	0.072	72.72
4	2400	45 min.	2.125
5	2400	45 min.	2.422	2.337	0.085	3.50

Recalling the fact that the raw ore contained 2.664 per cent. of sulphur, the effect of the sudden fusion can be readily noted in the differences between the results of the first three heats of the last two.

The following are analyses of some clinkers taken from roasters working on Cornwall ore, showing the same effect:

Per Cent. Total Sulphur.	Sulphur as Sulphide.	Sulphur as Sulphate.	Per Cent. Total Sulphur as Sulphate.
1.397	1.224	.173	12.380
1.380	1.245	.135	9.782
1.873	1.777	.096	5.125

These results indicate plainly that the fusion of ores in roasting may prove prejudicial to good results. When it once takes place it is scarcely possible for desulphurization to proceed further. The vicid coating of fused iron oxide, silica and lime, or whatever may, in various cases, go to make up the impervious exterior, is a barrier both to ingress of air and egress of sulphur in any form. If the heat in any roasting process must be carried to so high a point, it should be gradually raised, and sintering should take place only after continued heating at a lower temperature in abundant air. I have frequently found pure sulphur condensed in the cavities of cold clinkers, where it had been vaporized from pyrites, but was unable to escape. Clinkering ore quickly is equivalent to roasting without air, and even more, for the sulphur that heat alone would vaporize is imprisoned in the mass. Furthermore, it prevents any great amount of the sulphur left from being in the form of sulphate.

Ledebur states that desulphurization will be the more complete the smaller the pieces of ore, the more freely air has access, and the higher the temperature or roasting.* It is easy to understand that small pieces means greater surface exposure and less requirement for penetration for heat and air. We have seen that air is absolutely needed for everything like a complete desulphurization. As to temperature, our results do not bear out the asserted necessity of a high heat for thorough roasting in all cases.

The practical application of all these conditions in the roasting of ores is a matter of no little difficulty. A proper roaster must be one in which the heat is under control, the ingress of air ample, and the egress of the products of combustion prompt. A gas-roaster seems to approach most nearly to these conditions. The Giers kiln in any of its forms seems to be a very deficient apparatus for desulphurization, because it has none of these qualifications. Its effectiveness is about on a par with roasting without air, for little or no air can get at the ore while it is being heated in this style of kiln. Being fired with solid fuel, it is, as a rule, under little control as to temperature, and the greater number of them are chronically "clinkered."

The working of such a kiln can be seen from a few analyses at hand. At the Musconetcong Iron Works, in a modified form of this kiln, the results as given by Mr. J. P. Pardee (*Trans.* xv., 680), were as follows:—

	Per cent. Sulphur.
Raw ore.....	0.883
".....	0.68
Roasted ore.....	0.39
".....	0.29

Cornwall ore roasted in Giers kilns gives the following results:—

	I	II	III	IV
Per cent. sulphur.....	80	1.41	1.05	1.12

As this ore runs from 2½ to 3 per cent. of sulphur, the analyses show only imperfect desulphurization, and are comparable to roasting out of contact with air. As a rule, not more than half the sulphur is removed.

The following conclusions may be drawn from this investigation, in regard to pyrite ores:—

1. Heat alone, without access of air, can remove, at best, only one-half of the sulphur present.

2. Atmospheric oxygen is absolutely necessary for a proper desulphurization.

3. Even at a low heat, ore is properly desulphurized if air can gain access freely to the FeS₂ in it.

4. Sulphate of iron can be decomposed by heat equally well with or without air.

5. In order that the residuum of sulphur in roasted ores may consist, so far as possible, of sulphates, the roasting must be done under free access of air.

6. Fusion or sintering of ore is likely to prevent any further desulphurization.

7. Sintering does not allow much of the remaining sulphur to be in the form of sulphate.

8. Fusion, hence, should never occur in roasting except after continued heating in air at a lower temperature.

9. Ores cannot be properly desulphurized in the upper part of the blast-furnace.

10. An efficient roaster must allow easy control of heat, abundant air access to the hot ore, and rapid removal of the products of combustion.

*Handbuch der Eisenhüttenkunde, p. 188.

The Future of the Port Arthur Silver Region.

"I believe," says Mr. Herbert R. Wood, in a paper read before the Canadian Institute, "this region must ultimately take a foremost place among the silver mining districts of America." My reasons are these:—1st. The universal excellence of the ore, while much is extremely rich, running as high as ten or twelve thousand dollars a ton; it is all good average mill-work. 2nd. The close proximity of the ten locations in the second group, all within a radius of three or four miles, leads one to believe the belt has plenty of out-crops awaiting the prospectors' pick. 3rd. As the depth of mining increases the value of the ore does not necessarily decrease, as the richest ore is in zones or pockets, liable at any moment to come into view. 4th. It is as yet a new mining region and but awaits the thorough and satisfactory trial of one or two mines to ensure the development of all. 5th. From a geological point of view the veins should all be rich, satisfactory mines. They trend with hardly an exception north-west and south-east, and are true fissures in all probability formed by the one convulsion of nature and similarly filled. The difficulties that have hitherto attended the development of this mineral region seem to have been in several cases the Temerity of the capitalists unacquainted with mining and the expenditure involved in sinking into rich zones of ore. In other cases properties have become mortgaged, mismanaged, till finally abandoned. What is needed is thorough mining men to take hold with lots of capital and push the mines and sink till the mine becomes a settled organization, working, yielding and paying.

Notes on Some Coals in Western Canada.*

By Wm. Hamilton Merritt, F.G.S., Toronto.

With the exception of the Vancouver Island coal, all the western coal fields owe their present development to the completion, in the autumn of 1886, of the Canadian Pacific Railroad. While it could not be expected that a very great deal could have been accomplished in three years, enough has been done to pretty thoroughly establish the coal-bearing areas and their correspondence with those which have been developed to the south of the boundary, along the lines of the transatlantic railroads in the United States.

This summer I visited some of the important developments in the coal areas of Washington Territory, largely with the object of being better able to appreciate the corresponding coal-bearing areas in British Columbia to the north.

In Western Canada coal-bearing rocks have been found in three zones:

1. In the plains to the east of the Rocky Mountains, and in the eastern flanking ranges, the coal occurs in the Cretaceous formation (including the Laramie).

2. In the interior plateau of British Columbia the coal is found in the Tertiary formation.

3. On the coast of British Columbia Cretaceous and Tertiary rocks are found carrying coal, and on the Island of Vancouver the well known Nanaimo coal has been worked for years in the first-named formation.

In all of these zones the coals vary from lignites up to higher grades, the factor determining quality being the amount of pressure to which they have been subjected. The intensity of this pressure is generally shown by the

disturbance which the coals exhibit, and, in many cases, is almost directly in proportion to the distance of the deposits from mountain ranges. This seems to be also the opinion expressed by Mr. Bailey Willis in connection with his Census Report on the coals of Washington. It has been elsewhere stated that super-imposed strata has been thought to have been an important factor in these changes; but my observations for several years in all these areas lead me to the conclusion that it is pressure alone from distortion and upheaval that has altered these western coals into the many varying grades in which they are found to exist.

In the first zone an enormous amount of coal occurs in the territory between the western borders of Manitoba and the Rocky Mountains. I shall merely note some of the seams, which are reached by rail, as examples of the character of the coals in the area mentioned. In the plains they are all lignites, changing to a high-grade lignite at the Galt mines (which are reached from the Canadian Pacific Railroad by a branch railroad 110 miles long), into a bituminous coking coal at the Bow River mines (where a 7-foot seam cuts across the main line of the Canadian Pacific Railroad), and finally, the maximum result of the metamorphic influence is reached in the Cascade Valley, where the pressure of the mountains on both sides of the Cretaceous trough, has altered the coal which it contains into an anthracite.

The following analyses, passing from east to west, convey some idea of the types of these coals:—

TABLE A.—EASTERN ZONE.

	a.	b.	c.	d.	e.
Water.....	20.54	10.30	6.50	4.41	0.71
Volatile combustible matter.....	33.26	34.40	38.04	40.32	10.79
Fixed Carbon.....	41.15	39.61	47.97	48.27	80.93
Ash.....	5.05	15.64	7.55	7.00	7.57
Total.....	100.00	100.00	100.00	100.00	100.00
Coke.....	None.	None.	None.	Good.	None.
Approximate distance from mountains, miles.....	234	128	36	28	0

a.—Medicine Hat, lignite (Geological Survey) fair coking.

b.—Crowfoot " " " " " "

c.—Galt " " " " " "

d.—Bow River mines, bituminous, " " " "

e.—Cascade Valley, anthracite, " " " "

In the interior plateau of British Columbia lignite and coal have as yet been found in only a few places. The following are the only occurrences yet discovered worthy of notice:

At Princeton, or Allison's, some 20 feet of alternating lignite and shale seams occur, lying at a gentle dip. The lignite can be obtained of a workable thickness, but the greater part of the bed is too much mixed with shale. The character of the lignite, as indicated by the analysis, is that of an inferior coal.

The lignite found at Marble Canyon, Hat Creek, is of a better description, as shown by the analysis. It is said to be of very considerable thickness. I did not think the quality sufficiently good to justify a visit to the place, which has been described in the Reports of the Geological Survey.

At Kamloops, close to the Canadian Pacific Railroad, coal of a very fair bituminous character has been found; but as yet seams of only about a foot in thickness have been opened up. The vicinity is being tested by a shaft.

In the Nicola Valley, some 49 miles from the railroad, a seam of bituminous coal, about 5 feet in thickness, has been exposed. This coal has been subjected to a greater amount of metamorphic influence than any yet discovered in this zone. It lies adjacent to a mountain, which is probably a result of the disturbance that has altered it into a good coking bituminous coal.

TABLE B.—INTERIOR ZONE.

	a.	b.	c.	d.
Water.....	15.75	8.60	6.26	36.065
Volatile Combustible matter.....	35.40	35.51	39.97	
Fixed carbon.....	41.45	46.84	48.22	
Ash.....	7.40	9.05	5.55	
Total.....	100.00	100.00	100.00	100.000
Coke.....	None.	None.	Fair.	Very good.

a.—Allison's, lignite.

b.—Hat Creek, lignite (Geological Survey).

c.—Kamloops, bituminous.

d.—Nicola, bituminous, (Geological Survey).

On the Pacific Coast zone, on the main shore, there has as yet been located a very small amount of coal and lignite, in the districts which correspond to the large areas

developed along the Puget Sound to the south of the international boundary. And, as has been ascertained to the south of the line, the coal which has been found near the coast is merely a lignite, but that which occurs inland, near the Cascade Range, has been altered into a bituminous coal. A sample of the latter type is found in a 2-foot, somewhat dirty, bed of coal, which has been opened on the slope of Sumas Mountain. Still further inland, the Cretaceous conglomerates occur near Chillawack, but all the coal which they have so far been found to contain consists of a few small masses forming part of the conglomerate, and some very thin strings of a coaly matter. The analysis from the above-mentioned Sumas Mountain seam is as follows:—

Analysis of Sumas Mountain Coal.

	Per cent.
Water	4.62
Volatile combustible matter	35.68
Fixed carbon	42.00
Ash	17.70
Total	100.00
Coke	Fair.

*Transactions of the American Institute of Mining Engineers.

Haase's System of Sinking Through Quicksand.—The management of the Guenin colliery, Cottbus mining district, Germany, while sinking a pump shaft to a depth of 87 feet through quicksand, recently employed the Haase system, the chief feature of which consists in driving down a series of wrought iron tubes, side by side, so as to form a cribbing for the intended shaft. The tubes are 13.1 ft. long, with an internal diameter of 4.1 in. and 0.2 in. thick. Wooden guides with cast iron crossbars at the top and bottom are attached to the timbering of the shaft so as to secure that the tubes take the required direction in their downward course. Six sets of the tubes were used to reach the coal seam. The shaft was 10.8 ft. by 8.5 ft. within the ordinary timbering, and 9.5 by 7.2 ft. within the tubular lining, and required 64 tubes altogether.

Increase of Wealth in the United States.—The rapid increase of the wealth, business and prosperity of the United States, during the past ten years, is simply marvelous. According to the published figures the total wealth of the country is now \$71,459,000,000, equal to nearly \$1,000 per capita. This is an increase in ten years of \$18,000,000,000, or 42 per cent. Great Britain's wealth in 1885 is given at \$50,000,000,000. The average of wealth per head in England is \$1,545, in Scotland \$1,215, in Ireland but \$565. The total wealth of France is estimated at \$36,000,000,000. England exacts in taxes \$20 per head of population, while each individual in the United States pays \$12 50. America will produce 7,000,000,000 tons of iron this year, while England's greatest production is 8,600,000 tons.—*Engineer.*

SITUATION WANTED.

A Blast Furnace Manager, who has had many years' experience at Anthracite and Coke furnaces, desires a position as Manager. Can give the best of references.

—FOR—
MINING

—AND—
RAILROAD WORK.

ADDRESS—
W. H. HARRISON,
MANAGER,
BROCKVILLE, ONT.

Intercolonial Railway OF CANADA.

The direct route between the West and all points on the Lower St. Lawrence and Baie des Chaleurs, Province of Quebec; also for New Brunswick, Nova Scotia, Prince Edward and Cape Breton Islands, Newfoundland and St. Pierre.

EXPRESS TRAINS leave Montreal and Halifax daily (Sunday excepted) and run through without change between these points in 30 hours.

The Through Express Train cars of the Intercolonial Railway are brilliantly lighted by electricity and heated by steam from the locomotive, thus greatly increasing the comfort and safety of travellers.

New and Elegant Buffet Sleeping and Day Cars run on all through Express Trains

CANADIAN EUROPEAN MAIL
AND PASSENGER ROUTE.

Passengers for Great Britain or the Continent by leaving Montreal on Friday morning will join Outward Mail Steamer at Halifax the same evening.

The attention of shippers is directed to the superior facilities offered by this route for the transport of flour and general merchandise intended for the Eastern Provinces and Newfoundland; also for shipments of grain and produce intended for the European market.

Tickets may be obtained and all information about the route, also Freight and Passenger rates, on application to

G. W. ROBINSON,
Eastern Freight and Passenger Agent,
136½ St. James St., MONTREAL.

E. KING,
Ticket Agent,
27 Sparks Street,
OTTAWA.

D. PORTINGER,
Chief Superintendent,

Railway Offices, Moncton, N.B.
14th November, 1889.

The Canadian Mining Review

CONDUCTED BY OFFICES: E. T. A. BELL

UNION CHAMBERS, 14 METCALFE ST.,
OTTAWA.

Vol. IX. SEPTEMBER, 1890. No. 9.

To Our Readers.

The present issue of the *Review* has been delayed in publication through an unforeseen mishap to our printing house.

The Iron and Steel Institute.

The members of the Iron and Steel Institute who are holding a Meeting conjointly with the American Institute, of Mining Engineers in New York, will pay a flying visit to the Sudbury mines and works during the month.

At the request of the Government we wired Dr. Raymond with the object of ascertaining if the Dominion could not be favored with a more extended visit, and in reply we were informed that the arrangements made precluded any definite answer until a later date. Dr. Selwyn will be in attendance at the Meeting, authorised by the Government to extend an invitation to the Institute to visit the Dominion. The visit by these eminent metallurgists and ironmasters would unquestionably result in much benefit to the country, and we trust that it is not yet too late to have them partake of Canadian hospitality.

Systems of Phosphate Mining.

In the earlier days of the Canadian Phosphate industry, mining was largely carried on by contract. The miners provided their own dwellings, tools and supplies, and the owner of the property incurred no outlay or expense, except to pay for phosphate won. This was usually paid for at the rate of six dollars a ton, the standard quality being seventy-five per cent. and any phosphate below that grade was liable to rejection. It was customary to pay monthly, at the rate of five dollars a ton, on a measurement of twenty cubic feet to the ton, one dollar's margin being reserved for a final settlement on the weight. An advantage of this system is that it avoids the investment of capital by the mine owner and saves him from all risk of loss in prospecting for shows or in working unproductive seams. It also secures an output that would not otherwise be made, as neighbouring farmers will occasionally put in a few week's work and produce ore at a rate that ordinary laborers would not accept as day wages. But the disadvantages of this method of working phosphate mines are many and have caused a general abandonment of the system, except for an occasional venture in a small way. The chief difficulty is to secure good quality. The miners build up walls with handsome blocks of apatite, within which they pile as much dirt as opportunity and conscience

will permit, and the latter deterrant is not often operative. As payment has to be made monthly and every analysis by a chemist costs five dollars, expense debars the owner from securing accurate tests, and, as in the winter time the piles freeze into a solid mass, the difficulty of inspection is great. Many a cargo of contract mined phosphate, upon which great hopes of profit were based, has gone below guarantee in Europe and been rejected by the purchaser. Another objection to this system of mining is the bad condition in which the property is left. The contractor, intent only upon present gain, works his pits in a cheap and shiftless fashion, having as much debris as possible unhoisted and working in the smallest space in which he can move. He "gouges out" the seam and moves to a new surface show to repeat the operation, the consequence being that the property is soon covered with holes in the ground that require an outlay before they are workable. There is a strong moral objection to this system. It places men in a position where all their interest lies on the side of dishonesty and where there is every facility for its commission. Contract work in sinking shafts and running drifts is popular and safe and is largely resorted to at the Sudbury Copper Mines at present. The men in such case are paid by the fathom of excavation and their work is readily checked. But the conditions of phosphate mining are very different, and both materially and morally the contract system of mining as applied to it must be pronounced bad.

The usual system of phosphate mining is by day labor. The chief difficulty about it is the lack of incentive to the workman to render faithful and efficient service. If he can get through the day without rebuke from the "boss" the less he does for his wages the better it suits him. In large mines under good superintendence and strict oversight and where machinery is used a fair amount of effort is secured from the men; but when the work is scattered over a wide area or is under careless management the loss from neglect on the part of the laborers is very great. Many a small enterprise that properly managed might have grown to success has been ruined by loafers. The city owner makes a rare visit to the property and sees things going on briskly. On other days the manager takes his horse and buggy and drives to the neighbouring town for a bar of soap or a hammer and the men "take it easy." Over-estimated reports of output are given and it is not long since a company, that was supposed to have 500 tons of ore raised, discovered a weight of only 150 tons.

A remedy for the ills of these two systems of mining seems to exist in the form of co-operation or profit sharing. Experience shows that it is impossible to devise means to avoid loss by dishonesty and laziness under the contract or wages system. Some miners are dishonest and lazy and all have a good deal of "human

nature" in them and it is natural for men to give as little work for the money as policy will permit. The only effective way to overcome this tendency is by stimulating self-interest. If the miner's pay was contingent on the quantity and quality of the ore raised, an inducement would exist for him to use his best exertions. With a shifting force such as is commonly employed in mines this method is not easily practicable, but where steady labor is employed and the men are residents of the region some system embodying this principle of co-operation seems to be feasible and it is to be hoped that it may be tried in the phosphate industry. It was attempted in one case a few years since, but as the mineral was scarce no amount of effort could secure a profit. In nearly every department of industry, associative work for common profit appears to be proving its fitness by favorable results; but the difficulty of its application to mining has so far afforded but little opportunity for the introduction of this humanizing system. If it could be tried under suitable conditions and the success of the enterprise was alike the concern and interest of employer and employee or a mutual association of workers probably the results would be satisfactory to the pocket as well as elevating to the moral nature.

The Springhill and Wellington Strikes.

Reference has already been made in these columns to the strikes at Springhill and Wellington, the two extremes of the Dominion. So important, however, are the relations between labor and capital, and so widespread are the effects of any disturbance or quarrel leading to suspension of work that the subject may bear another reference. It is claimed and with a fair show of reason that Canadians are quite as well educated as their cousins south of the line, and rather more so than Europeans. This rule applies to our miners as well as to any other class, they being intelligent, quite capable of understanding their business, and usually newspaper readers.

Strikes among miners appear in many cases to arise from an accumulation of feeling that they are unjustly treated in some respect, a belief which is nurtured by their forming isolated communities, and by the ascendancy which is readily acquired by any of their number possessing the art persuasive, and by the gift of organisation. In many cases it has been found that masters have failed to meet their employees in a friendly spirit, and that changes however necessary have been carried out in an arbitrary manner. As the two elements of capital and labor are completely dependent on each other, common sense would dictate to both sides, a policy of forbearance, conciliation, and fair play. There are of course certain conditions which do not always admit of compromise or argument. A demand is made for an increase of pay or a lessened wage rate. If these cannot be conceded in any instance under consid-

eration, there is in the fair way of looking at business matters, nothing left but for the two parties to separate.

The general public suggest arbitration as an universal panacea. In Nova Scotia an arbitration Act was passed some years ago, and action taken under it by the Springhill miners; owing to technical defaults made by them the case never came to arbitration, enough however was done to suggest a new Act which was passed. As yet no case has been submitted to arbitration under it, and it can be understood that the Springhill miners smarting under their defeat when trying the first Act, hesitated to commit themselves to the later legislation. The Springhill strike was not directly one for higher pay, but for a readjustment of dockage for excessive amounts of stone in the coal sent out by the miners, as already mentioned in these columns, and some similar matters. The complaint against a long established system of dockage had gone on for some time, until a strike was resolved on as the best means of settling the question.

It is to be regretted that the matter was not submitted to arbitration, as it was a proper one for that method of treatment, and no doubt an award would have been given fairly meeting the requirements of the case. The matter being in fact the necessity of the Company having clean coal to furnish to its customers. This being common to the welfare of both the company and the miners, an admission to this effect on the part of the latter, and a promise to send up clean coal, would doubtless have paved the way to a ready compromise as to fines, dockages etc. Arbitration is perhaps better suited to meet disputes such as this, than to deal with abstract principles of wages. If a body of men believe that they should have an advance of pay conceded to them, no arbitration can convince them that they are wrong in their opinion. Where differences arise in details of work, employees more readily accept a solution differing from the one they had designed, for all are aware of the wide differences in mining conditions and practice in various localities, but no one has yet succeeded in convincing a man that, his wages are a full equivalent for his days labor.

In the case of the Wellington strike the demand for an eight hour shift to count from the time of leaving the surface to returning to it is really one of wages, and the Company alone can say if they are in a position to grant it. If the profits of the operations permit of its being granted, there is a fair ground for a bargain, so that in return for the concession of a shortened period of labor the Company may have the support of the men in more regular work, and the discharge of men who are too fond of lay days. As to the second demand, the recognition of the men as a Union, there is a wide spread desire on the part of all employers to deal with their hands as individuals, and naturally so, for a lazy or stupid employee is often a

direct source of loss. It has been noted that men of this class are not unfrequently allowed by their fellow workmen too much sympathy against their employers, which in the long run operates against the interests of the employed. There are, however, many colliery managers who not only recognize their employees "Union," but find it a help in prosecuting their business, and there can be no doubt that a mine manager, if he deals with the representatives of his men in a fair and friendly spirit, often enlists in them, their trusted representatives, efficient assistance in curbing the discontent of these men who always have a real or fancied grievance.

It is not quite clear what is meant by the third demand that a committee of the employed, or Union should investigate in all cases of dispute between masters and men. A committee could not be expected to act impartially when they are delegates of the parties interested. In any scheme of voluntary arbitration it is always open for either side to say whether the matter is not one for arbitration, and it has seldom been found that a steady adherence has been given to this method of solving disputes. The idea of compulsory arbitration has often been mooted, but the practical difficulty of compelling a body of workmen to abide by its decisions is at once apparent. No Government in the Dominion is ready to undertake the task of putting a thousand or so of workmen into jail, and as the Companies have available assets that can be attacked by fines, etc., such a method appears unfair whenever a Company demurred at obeying an unfavourable decision. It must be admitted that if a Company offers arbitration or is ready to act up to a compulsory arbitration, some assurance is due that the defaulting side should be coerced into accepting the results of a fair judgement.

The most feasible road toward the solution of these difficulties in reconciling the unceasing disputes between capital and labor appears to be the cultivation of a spirit of friendliness, and the untiring efforts of all concerned in or associated with industrial communities directed toward educating both parties into a sense of the unreasonableness and folly of cessation of work, and to inculcate in them the knowledge that outsiders, practically qualified, are almost invariably the best judges of what is fair between man and man. Business men continually find that their differences are most readily settled by arbitration, and in many cases law suits are resorted to as a form of arbitration rather than as a means of indulging in obstinacy or personal feeling.

Employees should endeavor to identify themselves as far as they can with the interests of the corporation they are engaged with as every good day's work done in an ungrudging spirit benefits the employer who is enabled to produce a better article, and to give his hands steadier work. On the other side it is unquestionable that a frank recognition of the daily toil of the workmen in any concern, and a

desire for their advancement, coupled with some share in any profits over and above a fair return on the capital invested would lead to a better understanding and remove the idea too often prevailing among the employed that they are only tools to be flung aside when their usefulness is passed.

American Institute of Mining Engineers.

According to circular from Dr. Raymond, the fifty-seventh meeting of the American Institute of Mining Engineers will begin in New York on Monday afternoon, September 29th, at 2 o'clock. All sessions will be held at Chickering Hall, 130 Fifth avenue; hotel headquarters will be at the Park Avenue Hotel. The sessions of the Institute for the reading and discussion of papers will be Monday afternoon and evening, and on Thursday morning, afternoon and evening.

On Wednesday, Thursday and Friday mornings the sessions of the British Iron and Steel Institute will take place.

On Wednesday afternoon there will be an excursion of the two societies, and invited guests, up the Hudson River.

On Thursday afternoon, the Holley Memorial will be unveiled in Washington Square. The commemorative address will be delivered in Chickering Hall, previous to the open-air ceremony, by Mr. James Dredge, editor of *London Engineering*.

Other than members at the discretion of the general committee, may accompany the excursionists and partake of the entertainment *en route*, at the following rates, which cover railway fares and Pullman berths only:

New York to Pittsburg and return, \$20.

New York to Pittsburg and Chicago and return, \$30.

New York to Pittsburg, Chicago, and over the Northern or the Southern excursion route and return to New York, \$60.

Philadelphia or Pittsburg over either route and return to starting point, \$60.

Applications for joining the excursionists, accompanied with check for the amount of fare, should be made to Charles Kirchoff, 66 Duane street, New York city.

The Cariboo Mining District

We publish in this number of the REVIEW an engraving and sketch of Mr. John Bowron, the gold commissioner of Cariboo District, kindly furnished us by a subscriber—a resident of Cariboo and an intimate acquaintance of Mr. Bowron's. The Cariboo District ever since the discovery of gold within its limits in 1860, has maintained its superiority as the chief gold producing district of the Pacific province. The richness of some of her placer mines has been really phenomenal. The Diller Company on Williams' Creek (3 men) produced in April, 1863, within 12 hours, 104 lbs. weight of the precious metal, which is perhaps the highest

earning for the time occupied on record. But there were numerous instances of men jumping, within 24 hours, from poverty to affluence. Hitherto operations have been principally confined to placer or alluvial mining, from which source, it is estimated, some fifty to sixty millions of dollars have been produced. But the still greater wealth of this district in its quartz ledges is only now becoming apparent. The success which attended the working of a quantity of rock last season at the test works erected near Barkerville by the Provincial Government, puts the question of the value of the numerous quartz veins which intersect the country beyond a peradventure. Such, at all events, seems to be the opinion of the Government and Legislature, since, although the works were completely destroyed by fire last winter, they are already being rebuilt, and that upon a larger scale. English capital, too, is now seeking investment in the district, the result of an examination of the mines by an expert sent out from London last season. It is now also a matter of certainty that the district will soon have the advantages or railway communication, as two companies have been chartered and liberally subsidized by the Provincial Government, making the Cariboo mining region their objective point, or passing through it. This is at present the great want of the district, as, handicapped by fully two hundred miles of waggon road, over which all machinery and material for quartz mining must be hauled by freight teams, the advantages of carrying on extensive operations are serious. With the commencement of railway construction therefore we shall no doubt see the era of Cariboo's early prosperity renewed and perpetuated.

The Phosphate Corporation.

Throughout the Phosphate districts owners of Lots are cleaning out pits and fixing up shows in order to exhibit their wares to the experts of the General Phosphate Corporation who are now on a tour of examination with the purpose of buying up "all the Phosphate land in Canada." There will probably be a good deal of disappointment on the part of many who have been waiting for several months upon the promise of sale, for it is hardly to be supposed that any Company would buy more land than it can properly develop and work. It is to be regretted that some wealthy owners of lands who are abundantly able to work their properties do nothing but "fix them up" for sale at extravagant prices.

Statements, more or less incorrect, have recently been prominent in several of our local papers respecting the value of the stock taken up by the public in the Corporation. In some cases it is broadly stated to have collapsed; in others to have been partially successful. As a matter of fact the Company was *underwritten* before being offered to the public to an extent which assured it a fair start; and while only a comparatively small amount of stock was taken up by the public we have the assurance of the

chairman, Lord Stalbridge, that 20,000 shares have been allotted, equal to a capital of £20,000. As matters now stand the Corporation is on a distinctly better working basis and if judiciously operated should prove a success. A notice of the first meeting of the Corporation is given in another column.

The Phosphate Season.

Notwithstanding high prices and the accession this year of seven or eight new companies to the ranks of our Phosphate producers, it is apparent that the exports for this season will compare very unfavorably with those made in 1889 and in former years. A careful estimate points to 18,000 tons as a probable limit to the quantity that will go forward to Europe, while shipments to American and Canadian points, will in all likelihood not show any advance—if they equal last year's returns. Altogether we estimate that the aggregate shipments will not exceed 20,000 tons. This regrettable state of affairs must not, however, be in any way accounted to scarcity of ore, but rather to the temporary suspension of production on the part of the Emerald and North Star mines. The North Star will be remembered to have contributed by far the largest proportion of the entire output of last season, but pending certain negotiations for its transfer to new hands, but little work has been done this season. The new Companies did not start in until this season was well advanced and therefore could not be expected to compensate for the falling off in the other two. With a continuation of good prices, improved working plants, and the acquisition of the outputs from the new producers we think there is very good prospect of ample amends being made in the coming year for the unavoidable shortage in the yield for the present season.

A New Phosphate District.

Considerable interest has been excited by the report of phosphate discoveries in the district of country fifty miles northwest of Peterborough, Ontario. Mr. William Watt of Perth, one of the most experienced phosphate miners in Canada, has lately visited the region and spent a fortnight in making a thorough examination of it. He visited over one hundred phosphate lots and found the mineral on all of them. He states that it occurs in the form of crystals in a mixture of lime with small crystals of mica and he did not see a seam, vein or bunch of phosphate rock in any locality. A company has been working one property all summer and have secured a few tons of crystals. The country is described as consisting of long and high mountains covered with hardwood, offering a supply of fuel that seems inexhaustible. There is a great deal of pyroxene such as accompanies phosphate in the mines of Quebec and Eastern Ontario, and the region is what a miner would pronounce "likely ground," although as yet no discoveries of economic value have been made.

Sublime Gatherings of the Pundits.

If, as Carlyle used to maintain "the most reverend phenomenon" in the universe is man, then what could exceed in sublimity a gathering of the very flower of men, the two thousand odd pundits who compose the British Association for the Advancement of Science. Surely the most irrepressible cynic will be awed into reverend silence when he reads in *Nature* Professor Tilden's account of the organization and productive performances of some of the sections of this great institution.

"As a sectional secretary I have read papers (other people's) at three o'clock in the afternoon to an audience consisting of a vice-president impatient to follow the president to lunch, two reporters who were not listening, and my wife making signals of distress from a back bench. As a sectional president I have sat at the same hour, luncheonless and weary, while a paper which seemed as long as discursive as the story of the Ancient Mariner, was droned forth by the author to an audience of about three persons fidgeting like the belated wedding guest. I wonder whether this sort of thing is supposed to be of any use to anybody. I think, further, that something should be done to reduce the cost of a meeting to the town visited by the Association. The gorgeousness of the entertainments given, and the demands made upon provincial pockets, have become so extravagant that none but wealthy or ambitious towns can face the luxury of a visit of the British Association."

It would seem to be true that nothing is perfect in the world, not even the British Association.

LETTERS TO THE EDITOR.

The Tariff Question.

Truro, N.S., Sept. 19th, 1890.

The Editor:

SIR,—I am glad to see that you are championing the cause of the gold miner. If any industry in our Dominion required assistance in order to develop our great resources gold mining is the one. I thought the Act passed last session would assist to some extent this hazardous business, but such an interpretation has been put on the Act that it is practically a dead letter. Now, Mr. Editor, I do not believe for one moment it was ever intended to be the delusion it has so far proved to be. Why should copper plates, either plain or silvered, not be admitted free for gold mining? Why should the Gates ore-crusher not be admitted? The Gates ore-crusher is wanted by our gold miners, but the duty shuts them out. As you are on the ground I hope you will keep at the Government until they either interpret the Act to be of service, or abolish it. We are either entitled to have gold mining machinery, which is not manufactured in the Dominion, admitted free, or we are not; therefore I say let us have the answer, free or dutiable, then we will make no mistake in our calculations in that line.

My principal business is that of manufacturing gold mining machinery and I personally would have preferred leaving the duty as it was, but the Government having decided to change it, let us have some benefit from it as gold miners. I am largely interested in the business, and at the present time need for one mine in which I have invested, a Gates ore crusher. Hoping you will succeed in showing the matter in its true light and continue to assist in furthering the development of our rich mineral areas,

Yours, etc.,

GOLD MINER.

[We have submitted the whole matter to the Hon. C. H. Tupper and Sir John Thompson, who have promised to lay it before the Government. Both these gentlemen take a lively interest in the welfare of the miners of their province, and we may therefore rely upon their best endeavors to have this matter adjusted.—EDIT.]

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

No. 5

Mr. John Bowron, Gold Commissioner for the Cariboo District, B.C.

Mr. John Bowron, Gold Commissioner for the famous Cariboo District, British Columbia, is the youngest son of a gentleman prominent in the history of Lower Canada during the first half of the century, and a brother-in-law of Lieut.-Col. McEachren, C.M.G., of Ormstown, Quebec. His father, Wm. Bowron, Esq., a Yorkshireman by birth, emigrated when quite young to New York State, where he engaged extensively in lumbering and mercantile business; but on the breaking out of the war of 1812 removed to Quebec Province and became an active participant in the stirring events of the time. In the year 1818 he married Sarah Odell, only daughter of Col. Odell, of Odellstown, Quebec, and was for a time engaged in wholesale business in Montreal, but subsequently accepted a lucrative appointment from the then Governor General as Crown Lands Agent for that part of the Province now comprising the Counties of Huntingdon and Chateaugay. Having removed from Montreal he founded and settled in the Town of Huntingdon, which for a long time was known as Bowronville. Here, at the pretty homestead of Island Villa, on the banks of the Chateaugay, the subject of our sketch was born on 10th March, 1837, and here in 1852, full of years and honours, the old "Squire" died of apoplexy, which had first attacked him some two years previously at the very time he was about to lay the corner stone of the well known Huntingdon Academy, many of whose graduates are now prominent in the public life of the Dominion. It was at this academy that the subject of our sketch received the best part of his early training. Having removed to the Western States he there took up the study of law, but upon the discovery of gold in the Cariboo District he, with his nephew W. R. Schuyler, of Huntingdon, joined the first large overland party bound for the then far-off gold fields. This party, which numbered 136 men and one woman (a Mrs. Schuber, now of Ashcroft, B.C.), assembled at Fort Garry, now Winnipeg, on the 3rd June, 1862, and with an outfit of 96 ox carts, travelled slowly and wearily over the "Great Lone Land" to Edmonton. Here, of course, they had to abandon their carts, and packing their animals they crossed the Rocky Mountains to Tête Jaune Cache, on the Fraser River. At this point the party separated, some going south to the head waters of the Thompson, while the others continued down the Fraser in canoes or rafts. The small party known by the expedition as the Hunting-

don party, with which the subject of our sketch was more immediately connected, built a large raft in which, with nine of their animals, they made an eventful trip down the Fraser to Quesnell mouth, which they reached on the 11th September. Were it not foreign to our present purpose it would be interesting to relate the adventures of this first overland party, which comprised a number of the now prominent residents of the Province, as for instance, Mr. Mara, M.P., Mr. Tunstall, Gold Commissioner for Kootenay, Mr. Fortune, of Enderby, Mr. McMicking, and others.

Mr. Bowron being advised against going up to Williams' Creek so late in the fall, continued his journey to Victoria, where he spent the

hospital Board. Mr. Bowron has in the early days done his share of practical work in the mines, and has always taken a deep interest in the development of the mineral wealth of the district, in prospecting, which he has spent his resources freely. His confidence in a prosperous future for the mines has been constant and unbounded, which confidence recent developments in quartz seem amply to justify. On the bench as Gold Commissioner, Mr. Bowron finds his early training in law and his practical experience as a miner of decided value, and this qualification, with his well known impartiality, renders his decisions in mining disputes generally acceptable to litigants. Mr. Bowron was married in 1869 to Miss Edwards, of Michigan, and has two sons and two daughters.

Mining in the Cariboo District, B.C.

Dr. G. M. Dawson, Asst.-Dir. Geological Survey of Canada.

The Cariboo district, entered by the miners in 1860, has ever since produced the greater part of the gold of the Province of British Columbia. It has proved to be one of the best placer-mining camps ever discovered, and though most of the heavy runs of gold on bed-rock, so far found, may now be considered as worked out, its capability as a field for placer-mining of one kind or other is by no means exhausted, and the very limited area within which some of the richest finds have occurred encourages the belief that no great difficulty will eventually be found in tracing these alluvial deposits to their sources.

The fifty-third parallel of north latitude passes through the centre of the Cariboo mining district, which may be described as a mountainous region, but is, perhaps, rather to be regarded as the remnant of a great high-level plateau, with an average elevation of from 5,000 to 5,500 feet, dissected by innumerable streams which flow from it in every direction, but all eventually reach branches of the Fraser River. These streams, falling rapidly about their sources over rocky beds, descend into great V-shaped valleys, and, with the lessening slope, the rock becomes concealed by gravel deposits, which increase in thickness and extent till the valleys become U-shaped or flat-bottomed, and little swampy glades are formed, through which the stream flows tortuously and with gentle current. The steep-sloping banks of the valleys are densely covered with coniferous forest, of which comparatively little has been destroyed by fire, owing to the dampness of the climate at this great altitude. The surface of the broken plateau above is often diversified by open tracts, affording good pasture in summer; and the whole country is more or less thickly covered by drift or detrital matter, concealing the greater part of the surface of the rocky substratum. As in all new gold-mining districts, the shallower placer deposits, and gravels in the present stream-courses first attracted attention, but with the experience of California and Australia it was not long before the "deep diggings" were found to be far the most profitable. Williams and Lightning creeks have, so far, yielded the greater part of the gold of Cariboo. They were known from the first to be rich, but have been found specially suited for deep work, in having a hard deposit of boulder-clay beneath the beds of the present water-course, which prevents the access of much of the superficial water to the workings below. By regular mining operations the rocky bottom of the valley is followed beneath 50 to 150 feet of overlying clays and gravels, the course of the ancient stream being traceable by the polished rocks of its bed, and the coarse gravel and boulders which have filled its channel. In the hollow of the rocky channel the richest "lead" of gold is usually found, but in following the rock-surface laterally, side-ground, rich enough to pay well, is generally discovered for a greater or less width. The old stream-courses of the Cariboo district are found to have pursued very much the same directions that their present representatives follow, crossing often from side to side of the valley with different flexures, and occasionally running through below a point of drift material projecting

winter, returning to Cariboo in the early spring of 1863, where he has ever since resided, and been prominently identified with the progress and development of the mines, as well as every other enterprise calculated to promote the material or social well-being of the community. Mr. Bowron was appointed Postmaster in 1866, holding the position for 10 years; he became Mining Recorder in 1872; Government Agent in 1875 and Gold Commissioner in 1883, all of which offices he has filled with acceptance to the Government which he represents, and to the general satisfaction of the community in which he resides. He was one of the founders of the Cariboo Library in 1864, as also of the local Amateur Dramatic Club, and he represents the Government as Chairman of the Royal Cariboo Hos-

into the modern channel, but never, I believe, actually leaving the old valley or running across the modern drainage system, as is so often the case in the deep places of California and Australia.

The most important deep work was carried out in the old pre-glacial and buried channels of Williams and Lightning creeks, where it has now practically almost ceased. As the methods employed are, however, of interest in illustration of the mode of occurrence of the richer gold deposits, and may yet be applied to other valleys even in this district, the following description is included. It will serve as a general description of this class of mining, and is substantially the same with that given in the previous publication on the mines of British Columbia, and refers particularly to the work in progress at the time of my visit to Cariboo in 1876.

To reach the buried channel, on which it is generally impossible to sink directly through the superposed loose and watery materials, a shaft is usually sunk at the lower or down-stream end of the claim, on the sloping side of the valley, where, after having gone through a moderate depth of clay or gravel, the slaty rock of the district is reached. The shaft is then continued through this till a depth supposed to be sufficient is attained, when a drift is started at right angles to the course of the valley, and if the right depth has been chosen—either by rough estimation, or calculation based on that required in other neighbouring workings—the old channel is struck in such a way as to enable the subterranean water collecting in it from the whole upper part of the claim, to be pumped to the surface by the shaft. On driving out of the slate rock, however, into the gravel, so much water is frequently met with that the pumps are mastered, rendering necessary a cessation of work till the latter part of the season, or the application of more powerful machinery. When the drift is not found to be at a sufficient depth to cut the bottom of the old channel it is generally necessary to close it, and, after continuing the shaft to a greater depth, to drive out again.

The old channel once reached, and cleared of water, is followed up its slope by the workings, to the upper part of the claim, and where paying side-ground occurs this is also opened.

The richest pay is generally obtained in the actual channel of the old stream, but where this is much contracted the force of the water is often found to have swept the gold away to those places where its width is greater. The harder rocks still preserve their polished and water-worn forms, but most of the slates are rotten and crumbling to a considerable depth, and in cleaning up in the bottom, a thickness of one to two feet is frequently taken out with the pick and shovel, and sent up to the surface with the overlying gravel, for treatment. In the side-work, as in the central channel, the greater part of the gold is found lying directly on the bed-rock, though, in some cases, particularly on Williams Creek, paying layers occur in the gravel several feet above it. The side-ground is worked up from the channel in successive breasts parallel to it. The lowest layers of gravel generally contain many large boulders of quartz and slaty fragments not much water-worn, which must have come down from the hill-sides; the appearance being that of deposit by torrential waters to a depth of four to six feet in the channel, above which the gravel is generally better rounded, and more evenly spread, though still mixed with clayey matter.

In consequence of the unconsolidated nature of the gravel, the pressure on the supports of the workings is often excessive. The sets of timber are, in some places, only a few inches apart, and the whole of the workings have, in some cases, to be lined with complete lagging. The timber used is usually massive, being from one to two feet in average thickness, and consisting of the spruce of the country, simply barked and sawn into lengths. Its cost delivered at the mine at the date mentioned was eight cents per running foot, all suitable sizes being taken at the same rate. The lagging, which is merely split out, four feet long, five inches wide, and two thick, cost \$7.00 a 100 pieces. With every precaution, the timbers are frequently crushed by the pressure, or the uprights even forced downward into the slate. Where large boulders are removed from the sides, or 'slum' is found, spruce brush requires to be extensively used behind the lagging, and in many places the water streams from the roof like a heavy shower of rain. The whole of such deep workings were, as a rule, annually filled with water at the time of the spring floods, and it was sometimes not till late in the summer or autumn that the pumps again acquired the mastery.

The following are particulars referring to the Van Winkle mine on Lightning Creek, which was the most successful in operation at the time of my visit in 1876:—

The claim covered about 2,050 feet in length of the valley, the deepest part of the old channel of which had been cleared out to a length of between 1,600 to 1,700 feet in October of 1876. Much side-ground, however, yet remained, and the workings sometimes attained a width of from 200 to 300 feet in following this up as far as it could be made to pay. The claim yielded the first dividend in December, 1873, \$40,000 having been

expended before gold was reached in the channel. It afterwards paid handsomely, having produced in one week gold worth \$15,700, and on other occasions at the weekly 'clean-up,' sums of \$14,000, \$12,000, etc. At the date above mentioned the total product of gold had amounted to the large sum of \$500,965.

In the Van Winkle mine the average depth of the workings was about seventy feet only, the lowest shaft being placed 300 feet from the stream, on the opposite side of which the rock rises to the surface, forming steep cliffs. The water was raised to within forty feet of the surface, when it was discharged into an adit 3,000 feet long, which was also used by other claims. There were two pumps, ten inches in diameter, the power being supplied by an eighteen-foot breast-wheel. This did not, however, represent the total volume of water pumped, as the ground of this claim was partly drained by others lower in the series, in which work could not be carried on till late in the season. In October of 1876 the following companies on Lightning Creek were driving their pumps day and night, the Van Winkle being the only mine clear of water:—

Costello Claim.—Pump, twelve inches diameter, nine-foot stroke, making ten strokes a minute.

Vulcan Claim.—Pump, twelve inches diameter, six-foot stroke, making eighteen strokes a minute.

Vancouver Claim.—Pump, twelve inches diameter, nine-foot stroke, making ten strokes a minute (double acting).

Van Winkle Claim.—Pumps, ten inches diameter, fourteen-foot stroke, making ten strokes a minute (two pumps).

The quantity of water being raised at this time would, therefore, amount to about 13,870 gallons a minute, or 19,874,000 per diem.

In many cases the machinery and appointments used in mining on the deep channel were very creditable, and almost the whole of this work was paid for by the miners of the district itself. Money gained in one enterprise was usually invested in another, and the shareholders in a mine were frequently to be found themselves at work in it. On Lightning Creek the old deep channel has been followed and worked out to a length of about 16,000 feet in all, and in addition a number of rich bench claims and tributary creeks have yielded good returns. In endeavoring to "bottom" the old channel further down the valley very great difficulty is encountered in consequence of the quantity of water and the increased depth of the sinking required. The Eleven of England is the lowest claim in which the old channel has been reached, and though evidence was here found in the finer character of the gold, of increasing distance from the main sources of supply it is probable that still lower portions of the valley may be proved to pay with improved facilities.

It is impossible to present complete returns of the amount of gold obtained from the old bed of Lightning Creek, but the following approximate statement to November 1st, 1875, published in the report of the Minister of Mines of British Columbia for 1875, is still of interest in showing how large this amount, in the aggregate, must have been. The claims are here arranged in their order following down the creek:—

Campbell and Whitehall.....	\$ 200,000
Dutch and Siegel (now Perseverance)	130,000
Dunbar.....	30,000
Lightning.....	153,962
Discovery and Butcher.....	120,000
South Wells.....	141,531
Spruce.....	99,908
Point.....	136,625
Van Winkle.....	363,983
Victoria.....	451,642
Vancouver.....	274,190
Vulcan.....	56,955
Costello.....	20,476

It would probably not be an exaggeration to state that the deep channel, for the portion of its length above referred to, with the adjacent side ground worked at the same time, has yielded throughout gold to the value of over \$200 to the running foot.

On Williams Creek, on which the towns of Baskerville and Richfield are situated, the chief workings have been in a space of about two miles and three-quarters in length. In this the deep channel has been worked through, and also as much of the side-ground as would pay at the time at which the mining took place. Many of the lateral creeks and gullies here have paid remarkably well; and the hill-sides, in some places to a height of a hundred feet or more, have proved to be sufficiently rich for the hydraulic method of working, which is now profitably carried on.

Though Williams Creek has produced in the aggregate the greatest amount of gold, Lightning Creek showed for a time a larger annual yield.

The Canon between Barkerville and Richfield divides Williams Creek into two parts. For about half a mile above it the ground was shallow, and has been worked open to the bed rock. Further up deep drifting was

practised in former years, and hydraulic work is now carried on. Below "The Canon" all the work has been deep; in the old channel, although "pay-streaks" were sometimes found after getting down about twenty feet, these were usually disregarded in early days. In the Cameron claim, however, half a mile below Barkerville, the dirt paid nearly to the surface, and was worked in stages from below after the old channel had been cleared out. The workings were about sixty feet deep at Barkerville, only thirty-five feet at the former site of Cameron, and at the Ballarat claim—three-fourths of a mile below Barkerville—eighty feet. This is one of the lowest claims in which the old channel has been bottomed, and most of the gold obtained was light and scaly. The valley is here wide, the present stream turning abruptly to the west, while a wide, low hollow, known as Pleasant Valley, runs off in the opposite direction to Antler Creek. It is supposed by many that the main channel of the ancient water-course turns off in this direction, but, owing to the great quantity of water and loose character of the ground, neither this nor the present valley of Williams Creek below the Ballarat has yet been proved, though much money has been expended in the attempt. The Lane & Kurtz Company went to great expense in importing machinery, and erected very complete works some years ago, but did not succeed in proving their ground, and have since abandoned the attempt. The place at which this work was carried on is known as "The Meadows," the valley here opening out and becoming wide and flat-bottomed. The company held a Concession covering about four miles in length of the valley, but succeeded in reaching a depth of 125 feet only, and in drifting out found that they were still too high for the deep channel, while the volume of water was greater than their pumps could master.

As showing the great local accumulation of gold in the deep channel of Williams Creek, and indicating its local origin, the following approximate statement of the value of gold obtained in various claims, covering certain lengths of the channel, is important. All these claims were below the Canon, but they do not form a consecutive series, no such details being available for many other claims:—

Adams.....	100 feet	\$ 50,000
Steele.....	80 "	120,000
Diller.....	50 "	240,000
Cunningham.....	500 "	270,000
Burns.....	80 "	140,000
Canadian.....	120 "	180,000
Neversweat.....	120 "	100,000
Moffat.....	50 "	90,000
Tinker.....	140 "	120,000
Watty.....	100 "	130,000
	1,340 "	\$1,440,000

In Cariboo district, even to the present time, the prices of labour and supplies have never been lowered to a point at which it would be profitable to work any but the richer deposits, which in the nature of things bear a small proportion to those capable of yielding a moderate or small amount of gold; and in working over the deep ground in early days much was left that would even now pay handsomely, but cannot be found or reached on account of the treacherous nature of the moved ground, filled with old timbering and water. On both Williams and Lightning Creeks, but particularly in the former, there must be a great quantity of gold in ground of medium richness even yet. To render this gold available, however, and to prove successfully the lower and more difficult parts of the valleys, greater and more exact engineering knowledge, better and larger machinery, and, above all, cheaper labour and supplies, dependent on greater facilities of transport, such as would result from railway connection are required. The most important works of a general kind, which have so far been carried out in Cariboo District, are the Bed-rock Drain and Bed-rock Flume, on Williams Creek. The first of these is a tunnel which runs through all the old deep workings, beginning at the lower end of the part of the creek called "The Canon" (about 1,000 feet above Barkerville) and running out in "The Meadows." The total length of this tunnel is about one and one-eighth miles, and the cost of its construction is estimated at about \$100,000. The flume, constructed in 1865, begins about 1,000 feet above the head of the drain, at the upper end of "The Canon." It is a cutting averaging about twenty feet in depth and a mile in length, and is estimated to have cost about \$250,000. Into it the small flumes of the various companies working along the creek discharge, and it has also served for the working of the ground belonging to the Flume Company. By means of the free drainage afforded by these works a great part of the later mining has been rendered possible. As an illustration of what might be done in this way, it may be mentioned that it has been suggested that by cutting a flume to Antler Creek—part of which would require to be a tunnel—free drainage of the whole upper part of Williams Creek would be obtained, and, if the grade should prove to be sufficient on survey, it would enable the valley, from its sources to

the flume level, with all its old workings, and the great depth of tailings holding more or less gold which has accumulated, to be completely stripped by extensive hydraulic works.

In the above general notes on Cariboo district, Williams and Lightning Creeks have been particularly referred to as exemplifying the conditions there found, and the methods employed in working the old deep channels.

These two creeks have, besides, yielded by far the greater quantity of the gold, and on them the pre-glacial channels have been found to be continuous, and, though deep, specially well adapted for working. Underground drifting on old channels has, however, been practised, as well as several other creeks, of which Keithly, Harvery, Grouse and Mosquito creeks may be specially mentioned. There are besides a number of creeks which have yielded much gold by surface work or in open sinking of moderate depth, portions of which still remain, which it is confidently believed by miners would prove rich in deep ground if properly explored. Antler, Cunningham and Jack-of-Clubs creeks, with Willow River, are supposed to be specially promising from this point of view, and, though attempts have been made from time to time to test the deep ground on several of these, it has not yet been successfully accomplished. On Antler Creek in particular the Mason Company has been at work with this object for a number of years, and has not yet abandoned the efforts.

Approximate statement of value of gold produced by Cariboo District from 1874 to 1888:—

1874 (partial).....	\$ 700,000
1875.....	1,075,237
1876.....	646,000
1877.....	411,402
1878.....	380,535
1879.....	500,000
1880.....	564,000
1881.....	610,737
1882.....	471,525
1883.....	457,787
1884.....	423,855
1885.....	347,700
1886.....	288,300
1887.....	247,673
1888.....	250,377

The amounts above assigned to the various years are merely approximate, particularly for the earlier years of the series, the returns for which are extremely imperfect. The table as a whole, however, illustrates the large amount continuously afforded by the Cariboo district from a period beginning more than ten years subsequent to its discovery, and after the most productive years had passed. It also evidences the gradual falling off in yield, which has been nearly continuous since the richer portions of the deep channel of Lightning Creek have been worked over.

The Capelton Chemical and Fertilizer Works.

Leaving Sherbrooke by the 9 a.m. B. & L. train (which, by the way, is not remarkable for rapid transit but, as the genial conductor says, it teaches patience) we proceed towards our destination. Nearing Capelton we see in the distance the extensive chemical works of Messrs. G. H. Nichols & Co. comprising Sulphuric acid, Fertilizer and Smelting works, occupying the site of the old G. W. Brooks' farm-house. We are struck by the practically entire absence of sulphurous gas which is usually seen emanating from establishments of this character. Getting off the train at Capelton station we walk to the spacious offices of the company, only 100 feet away. We notice with pleasure the convenient arrangement and neat finish of these offices. Here we find everything that conduces to health and comfort, combined with excellent facilities for conducting the business of the various departments—characteristic of the regard which the Messrs. Nichols have for the comfort and convenience of their employees in charge of their extensive establishments. Away in the distance up the hill we can just see the towers, smoke-stacks and roofs of the substantial mine-buildings of the company, of which we intend to give our readers a description at some future day.

Accompanied by the Superintendent we gain admittance to the sulphuric acid works. The first building we enter is the burner-shed, where is the handsomest and largest battery of burners of the Melétra-Herreshoff style, in America. Here the green-ore (the product of the Albert mine) is burned; the fumes, which pass off in the form of sulphurous acid gas going directly into an improved style of Glover tower, the invention of Mr. J. B. F. Herreshoff, A.M., Superintendent of the Laurel Hill chemical works,—the property of the company.

From the Glover, or concentrating tower, the burner gas passes into the great leaden chambers, where all the sulphuric acid is made. In this weak condition it is known as chamber-acid, which, for commercial use, must be further concentrated and purified.

Dr. Lungé says: "The introduction of lead chambers is, by general consent, ascribed to Dr. Roebuck, of Birmingham, who, in 1746, built such a chamber six feet square, and a few years afterwards constructed a factory in order to supply acid for bleaching linen."

At the present day these lead chambers are erected of immense size, some of them having a capacity of one hundred and forty thousand cubic feet. Here, at Capelton, we find a dozen or more of these huge lead chambers, looking like great boxes, formed, top, bottom and sides, of heavy sheet lead, rolled specially for the Messrs. Nichols, and supported by heavy wooden frames.

Sulphuric acid, which, at the close of the eighteenth century, cost for commercial use, in large quantities, upwards of fifteen cents per pound, is now turned out and sold in car-load lots here at Capelton, in quality unexcelled, for about one-ninth of that price.

This is partly due to the fact that up to the last fifty years only brimstone was used (principally from Sicily), while at the present time pyrites forms one of the principal sources of the sulphur used in sulphuric acid manufacture, and partly to the great strides that have been made in the art.

It is conceded by noted European authorities that the appliances used and the methods pursued by the Messrs. Nichols at their factories, represent the most advanced state of the art of sulphuric acid manufacture in the world.

Many of our readers will doubtless ask what is sulphuric acid, and what it is used for in such large quantities?

To the first question we would answer briefly, and avoiding technical terms, that it is a combination of oxygen, sulphur and hydrogen.

To the second, we would reply that a few of the most important applications of sulphuric acid, are, for making muriatic acid, soda-ash, bleaching powder, soap, glass, for making superphosphate and other fertilizers, for preparing nitric, phosphoric, hydrofluoric, carbonic, chromic, oxalic, citric, acetic, and other acids. For cleaning sheet iron to be galvanized, for working galvanic cells, for making many organic coloring matters, for purifying many mineral oils, for effervescent drinks, for destroying vegetable fibres in mixed fabrics, for drying air (principally in the laboratory), for making shoe blacking, for dissolving indigo and for numerous other productions. Indeed so largely does this acid enter into the arts and manufactures, that one of England's greatest statesmen, Lord Beaconsfield, better known as Benjamin Disraeli, has said that the state of a country may be very well judged by the amount of sulphuric acid it consumes.

From the chambers the remaining gases pass into large circular tanks called Gay-Lussac towers after the famous chemist of that name.

In the burner-shed are situated the platinum stills, in which the concentrating of the acid is done. These stills, unique in style, are also the invention of Mr. Herreshoff.

From the stills comes a limpid stream of chemically pure acid, running rapidly, yet one is inclined to think that it is glass, so clear and steady it is, reminding us of its commercial name, "oil of vitriol." From the stills the acid is conveyed in pipes to enormous tanks, where it is stored ready for market.

Immediately west of the burner-shed is the stock room, where acid of different grades is kept, and where the old fashioned carboys and drums are filled ready for shipment.

The favorite method of putting up the acid for transportation is to run it into large tanks on platform cars, thus obviating the expensive handling of a hundred carboys, which are so fragile that, notwithstanding the most improved methods in use and care in packing, breakages occasionally occur.

Adjoining the burner-shed on the east, stand the smelting works, to which the ore from the burners—now deprived of its sulphur—but still containing the copper, is carried by a series of conveyors and elevators of improved design.

The cupola is a Herreshoff water jacketed furnace. By this smelting process the resulting matte carries about fifty per cent. of copper; the other principal constituents being iron and sulphur. This matte or regulus, is at present shipped to Great Britain, where it is made into ingot copper. The furnace above referred to, is compact, symmetrical, and very efficient. At night the smelting works possess peculiar attractions. As the steady stream of molten slag pours over into the iron pots placed to receive it, it casts a ruddy glow on the faces and brawny arms of the workmen and the whole building is aglow with the same enchanting light. Presently we hear the furnace men cry out "copper!" This is the signal for a few minutes of exciting work. It means that the copper matte has collected in the well or fore hearth to that height at which it is drawn off. One of the workmen dons a heavy leather coat to protect him from the sparks and tiny pieces of melted matte that dance and fly in all directions on coming in contact with the least moisture. Two other men seize heavy sledges, while a third snatches up the tapping-steel, which he holds against the clay that

keeps back the metal, while the men with hammers drive in the steel; a fifth man runs back to a large iron pot to receive the matte, as it belches forth in an incandescent stream, sending sparks in all directions.

The "slag," or dross (the principal constituents of which are, iron, silica and alumina), runs from another outlet into large iron pots called buggies, and is wheeled away out of the building, where it is dumped in the molten state, solidifying as it cools, into one compact concrete light mass.

A few hundred feet south from the Chemical Works, close to the main line of B. & L. Railway, stand the Fertilizer Works, where are compounded the several grades of complete plant food, so well and favourably known to our farmers. One of the principal ingredients, the phosphate of lime, or apatite, is brought here from the North Star mine in the Buckingham district, Que. Here it is first dried, and ground in a large Griffin mill, an ingenious machine in which centrifugal force and rotary motion combined, are utilized. The apatite, after it has been ground to an almost impalpable powder, is conveyed by machinery to another part of the buildings, where it is treated with sulphuric acid. This process renders available a very high percentage of phosphoric acid. To this acid-phosphate are added the other chemicals that conduce to the growth of plants as may be required to adapt the complete manure to different soils. After passing through various mills and mixing machines, it is put up in sacks of 200 lbs. each, neatly branded.

The machinery, which is of the most improved design in this building, is admirably adapted to the work.

So thoroughly satisfied are agriculturists who have used the manures made here, that it is quite unnecessary for us to extol the merits of any of them.

Having now "done" the establishment, we stop for a moment to get an adequate idea of the proportion of the business of these chemical works.

Few of our readers know how important that little post village, Capelton, is; and to give a rough idea of the huge scale on which operations are carried on there we will put down some figures.

In the construction of the buildings, which are well designed and thoroughly substantial, upwards of three-quarters of a million feet of lumber were used.

The floor space in the various departments amounts to upwards of two acres.

All the buildings are clapboarded and painted.

The surface painted amounts to over one and one-half. The lead-work which we have described comprises about 500 tons of this metal.

The company are now doubling their capacity, but already their acid works are three times as large as anything of the kind in the Dominion, and their capacity is sufficient to supply the demands of this now rapidly developing country.

Only three years ago the site on which these works are erected was almost a mudhole, and to-day it is the scene of one of the greatest and most important industries in Canada.

Messrs. G. H. Nichols & Co. are, and have for some years, been the leading manufacturers of sulphuric acid in America, and their works at Laurel Hill, Long Island, N.J., are the largest and most complete of the kind on the continent.

Masonry Supports in the Tilly-Foster Iron Mine.

Mr. L.G. Engel has published a very elaborate paper on this subject. The method of working the deposit, he states, was formerly by stalls driven along it, with pillars left to support the roof; but a cave occurred, compelling the adoption of a new system of mining. At intervals of 100 feet levels are driven from the shaft completely round the ore body, with the foot or hanging wall forming one side of the level. Stalls are driven through between the level at the foot wall and the level at the hanging wall, and they are then raised until they are within 25 feet of the level above. The hanging wall is 80 to 160 feet from the foot wall, and is supported by pillars representing 75 per cent. of the deposit. The plan adopted to support the hanging wall, while the pillars are being removed, is that of building with concrete raised on arches thrown from the wall, to an extent sufficient for the support of the hanging wall. The severity of the frost in winter will not permit concrete to be made at the surface. The concrete consequently is mixed underground and raised to its position when the arches are built. The first arch built had a span of 90 feet, with a rise of 15 feet. It was built of brick and made 3 feet in depth. A shaft is left in the arch and concrete above, through which materials are raised by steam power from the mechanical mixer placed under the arch. In order to avoid the interference with the workings of ore in the lower levels, the first pillars were built above the 300 foot or highest level off the shaft; but a continuous pillar will afterwards be raised from the 500 foot level up under one already built, thus forming a solid mass of concrete 300 feet in depth, and 1,700 feet in horizontal sectional area over an arch at the 500 foot level. The estimated cost amounts to 46 cents per ton of ore recovered.

The new Dressing-Works of the St. Joseph Lead Company, at Bonne Terre, Missouri.*

By H. S. Munroe, School of Mines, New York City.

The dressing-works of the St. Joseph Lead Company were destroyed by fire, February 26th, 1883. Within about four months, or on July 5th, 1883, the new mill, with a capacity of 500 tons per day, was built and in active operation. The capacity of the new mill has since been increased to 800 tons per day.

The old mill was built in 1867, by Mr. C. B. Parsons, the present superintendent. It was a curious rambling old structure, which had grown with the demands of the business; a few jigs having been added in one place, a table or two in another and wings and sheds added to the main buildings, from time to time as it was found necessary to increase the efficiency or the capacity of the mill. The old mill was, moreover, a most interesting place to the student, a perfect "museum of ore-dressing." Nearly every form of dressing apparatus known to the art had, at one time or another, found a place under its roof, jigs of many kinds, concave, convex, side-bump and stationary tables, tyes, buddles, dolly-tubs, etc., etc. The method of dressing followed in the main the lines of English practice, but with many modifications, both in the machinery and the methods of working, due to the

inventive genius of Mr. Parsons. At one time, however, the mill was surrendered to a German expert, of acknowledged ability, and the Continental system of dressing was given a fair trial, with its numerous sizing-drums and jigs with varying speed and stroke adapted to each ore-class. Different forms of crushing apparatus were tried and the best method of handling the ore and the different products of the mill, was carefully worked out.

The new mill represents, then, the results of fifteen years' study and experiment in the old structure, and is a shining example of the "survival of the fittest" both in apparatus and in methods of treatment.

The salient features of the new mill are: first, the method of treatment, which follows English rather than German precedents; second, the dressing apparatus, which has many novel features; and third the construction and arrangement, and the methods of handling the ore and mill-products, which are quite unique.

The work of dressing is carried on at Bonne Terre under special difficulties. For many years the only water-supply has been the rainfall of a basin about a square mile in area, the water being collected and stored in a reservoir formed by a dam across the little valley. The water is used over and over again, the portion heavily charged with slime being allowed to escape into a small settling pond, from which it is again pumped into the mill. The only water lost is that carried off in

the wet sand and that lost by evaporation. This loss is made good by drawing small quantities from time to time from the reservoir.

The disposal of the waste sands or "chats" is also a matter of some difficulty. Until recently the company had no dumping ground available near the mill, which fact, with the lack of water, made it impossible to run off the sand by launders in the usual way. Resort therefore was had to the plan of carrying off the sands in railroad cars designed for the purpose. In the old mill these cars were loaded by bucket-elevators, but in the new mill special "chat" tanks have been introduced for the purpose. The water which drains from the cars runs into the settling-pond and is saved. The "chats" are used for grading, for railroad embankments and ballast, and recently in the construction of a new dam made necessary by the undermining of the old reservoir. The bulk of the sands are dumped in the valley above the dam, so that the water which they still retain drains out and eventually finds its way into the reservoir. By a recent consolidation, these disadvantages have been removed in part. The company now owns a large pumping-plant on Big river, about three miles away, and only the additional water-supply so gained has made it possible to continue work through the severe drought of the past season. A more convenient dumping-ground for the waste sands, also has been secured.

PLATE II.

The ore is galena, associated with some iron pyrites carrying traces of nickel and cobalt. The mineral is disseminated in a magnesian limestone in irregular segregated deposits of large size. Formerly it was supposed that these deposits occurred in definite "ranges" and at certain horizons only, but further exploration with the diamond drill has proved the existence of ore-bodies over the whole area prospected, nearly a square mile, and through a thickness of over three hundred feet of limestone. The deposit is worked by enormous chamber-workings, supported at intervals by heavy pillars. Underhand stoping is employed and the ground is broken with machine drills and high explosives. Formerly small diamond drills were used for boring the blast-holes, and very deep holes, thirty feet and more, and heavy charges of explosive were employed. The recent advance in the price of diamonds has made necessary the introduction of percussion-drills; and the excessive amount of block-holing, incident to the large blasts, has caused the employment of blast-holes of more moderate depth. Owing to the large size of the workings, the cost of breaking ground is quite low. The rock is loaded in small iron cars, hauled by mules, and brought to the surface through vertical shafts.

The main shaft is close to the mill, and the cars are run by the launders into the dumping-cradles above the crushers. The minecars from the more distant shaft are

brought to the mill on special platform cars by switching-engines. These platform cars hold twenty mine-cars each and there is a sufficient number of them to avoid delay.

Outline of Method of Treatment.

The method of treatment may be outlined as follows: The ore is crushed by jaw-crushers and rolls, and screened dry through a 6 mm. screen. The sands passing through the screen are thoroughly mixed with water and elevated by centrifugal pumps to distributors and divided among the Parsons jigs, without any previous sizing or classification. The tails ("chats") after passing over the two sieves of these jigs receive no further treatment, and are conveyed by launders to the "chat-tanks." Coarse galena and raggings are skimmed by hand from the jigs at intervals, leaving always a sufficient bed to ensure good hutchwork. The hutchwork which comes through the sieves of the Parsons jigs pass through a series of spitzkasten. The heavy galena, mixed with some sand and slime, settles in the first box of the series from which it is fed to a trunking-machine. The pure galena from this machine falls into railroad cars and goes to the smelting-works. The tails from the trunking-machine, together with the sands settling in the second box of the spitzkasten, are elevated by centrifugal pumps and divided between the Hartz three-sieved jig. The tails of the Hartz jigs receive no further treatment,

going directly to the chat tanks. Galena and pyrites are skimmed from the sieves of these jigs. A bed of galena is, however, maintained on all three sieves so as to ensure a rich hutchwork. The hutchwork of these finishing-jigs is nearly pure galena, and goes to galena-boxes on the lower floor, which are emptied from time to time, and the galena loaded on cars to go to the smelting-works.

The fine slimes settling in the third and fourth boxes of the spitzkasten are united and raised by centrifugal pumps to the distributors feeding the first row of Parsons Rittinger tables. The middlings from these tables are treated on the second row of tables. The tails from all the tables flow into the chat tanks, and the heads run into galena-boxes on the lower floor from which they are loaded into cars.

The raggings, containing from 12 to 20 per cent. of lead, which are skimmed from the Parsons jigs, are re-crushed by fine rolls and elevated without screening to a line of Hartz three-sieved jigs. These raggings contain considerable pyrites.

Arrangement of the Mill

Plate I. gives a general plan of the mill and Plate II. a transverse section. The mill is a two-story structure. On the main floor are the ore-bins, the roughing-jigs, the finishing-jigs, and the tables. All the work requiring abundance of light and careful supervision is concentrated

on this floor. The entire absence of overhead machinery, screens, shafting and belting, classifying-tanks and launders is very noticeable. There is nothing to intercept the light falling on the jigs and tables, and the whole floor is so open that supervision is rendered much more effective. The roof is a mere umbrella of corrugated iron, with light iron trusses and supported on slender columns. All the heavy weights and jarring machinery are as near the ground as possible. The roll screens, centrifugals, pumps, spitkasten, chat-tanks and galena-boxes are on the lower floor near the ground. The shafting, gearing, pulleys and belting are all below the main floor.

This arrangement has many advantages. It is cheap; the heavy framing being confined to one story. It is strong and durable; the jar of the moving machinery, crushers, jigs, and tables having but little effect on such a low, flat and strongly-braced structure. All the classifying-and settling-tanks, with the enormous weight of water which they contain, rest directly on the ground. Finally, the absence of overhead machinery and apparatus, besides increasing the light and facilitating superintendence, lessens materially the risk from fire, there being absolutely nothing to burn above the main floor of the mill.

The main disadvantage attending the arrangement of the mill in two floors, as described, is the necessity for elevating the material to be treated several times. This

is accomplished, at Bonne Terre, by the use of centrifugal pumps by which the sands are elevated *with the feed-water* required for the proper working of the various jigs and tables. It should not be overlooked, however, that the bulk of the material is elevated but once. After passing over the roughing-jigs, 600 tons of waste sand go at once to the chat tanks. Of the remaining 200 tons, 74 tons are mineral and ragings, and 20 tons escape with the overflow of the spitkasten, leaving only 106 tons to be elevated again. The average lift of the 800 tons raised by the centrifugal pumps, including that which has to be elevated a second time, is less than thirty feet. If a mill of several stories like an anthracite breaker, or one arranged in steps or terraces like the Lake Superior mills, had been built at Bonne Terre, it would have been necessary to deliver the ore at a level at least forty feet higher than at present, involving a much more expensive building, and increased cost of hoisting, forty feet instead of thirty, for the whole 800 tons, merely to save the elevating of 100 tons a second time.

Again, if the mill had been built in several stories both the wash-water and feed-water for the different machines would have to be raised about twenty feet higher than at present, and as twenty-nine tons of water are required to treat one ton of ore, this additional lift would be a serious matter.

In round numbers the saving by the present arrange-

ment amounts to about 520,000 foot-pounds per day, or over 20 horse-power.

Lighting of the Mill.

The mill is lighted by numerous large windows in the side walls, and by nearly one hundred large sky-lights of heavy glass inserted in the roof. At night the necessary light is furnished by numerous incandescent electric-lamps, those near the feeding platforms, which are liable to be struck by flying bits of ore, being protected by heavy wire-cloth.

Crushing of Ore.

There are ten sets of crushing and screening apparatus in the mill, each crushing about 80 tons in twenty-four hours, consisting of a 7' x 15' Blake crusher, lever pattern, with corrugated jaws; a pair of Cornish rolls, 14" x 30", with chilled tires; a revolving screen, 3 feet diameter by 8 feet long, with 6 mm. perforated steel-plates, a bucket-elevator for the material coarser than 6mm., and a centrifugal pump.

The jaw crushers are set to crush to about 38 mm., or 1½ inches, and the rolls to crush to about 16 mm., or ¾ inch. Of the material passing through the rolls at any time, about one-third is too coarse to pass through the screen, consequently the ore passes through the rolls one and a half times. While the perforations of the screens

PLATE III.

are 6 mm. in diameter, not more than 2 per cent. of the screened product is coarser than 4 mm.

The crushers are fed by hand, one man to each machine. Care is taken to have the feeding regular, as on this depends the amount of material going over the jigs, tables, etc., which must be kept uniform.

Some interesting data were obtained as to the fineness of the ore at different stages of crushing, samples having been sifted through sieves of different mesh and the percentage of each size computed.

Size.	Average of Ore from Mine.	Product of Blake Crusher, crushing		Product of Rolls.	Screen'd Ore Average
		Rich Lumps.	Lean Nut Ore		
Above 38 mm.....	61.3				
16 mm. to 38 mm....	23.2	67.7	75.2		
4 mm. to 16 mm....	7.5	20.7	18.9	35.2	2.0
1 mm. to 4 mm.....	4.9	8.6	4.4		41.0
¼ mm. to 1 mm.....	1.6	.8	.4		27.0
Below ¼ mm.....	1.5	2.2	1.1		30.0
	100.0	100.0	100.0	100.0	100.0

It will be seen that of the ore coming from the mine, nearly 40 per cent. is as fine as if it had passed through the jaw-crushers, 15.5 per cent. is as fine though it had passed through the rolls, and 8 per cent. is fine enough for the jigs. This latter portion is very rich, containing over 20 per cent. of lead, while the average richness of the ore is about 8 per cent.

Two experiments were made with the Blake crusher; the first with large lumps of rich ore, the crushing of which should give a maximum of fine stuff; and the second with small pieces of lean ore, which should yield a minimum of fine stuff. The jaws were set to crush to 38 mm. or 1½ inches. About one-third the product in first

case, and one-quarter in the other was as fine as though it had passed through the rolls. But little fine stuff, less than 1 mm., was made in either case.

The figures in the last column show the average composition of the crushed ore after it has passed through the 6 mm. screen, and as it goes to the jigs. It will be seen that the rolls produce a large proportion of fine stuff. The losses in the treatment of this fine stuff are very great. Its production could, perhaps, be lessened somewhat by some changes in the arrangement of the crushing machinery, but it is evident that some better form of crushing-apparatus than rolls, is urgently needed for such fine comminution as is required at these works.

Of the 30 per cent. of stuff, less than ¼ mm., there is produced:

In the mine..... 1.6 per cent.
By the crushers..... .8 per cent.
By the rolls..... 27.6 per cent.

Total (as above)..... 30.0 per cent.

The experiment of using coarser screens than 6 mm. has been tried without success, the losses from included mineral being much larger. It is proposed to make a trial of other forms of crushing-apparatus, the results of which will be of great interest. Since a machine for fine crushing, that will produce a minimum of slime, of large capacity and economical, is much needed, a promising field is open to inventors.

In crushing 224,203 tons of rock in 1886-1887, an average of 8 sets of crushing apparatus being in operation, the following new parts were required:

For the crushers:
12 levers at \$25.00.....\$300.00
9 jaw-plates at \$15.00..... 139.50
12 jaw-plates at \$12.00..... 144.00
Toggles, check-plates and sundries.... 247.80

Total.....\$831.30

or an average of about \$100 for each crusher. This does not include the cost of babbitting the bearings nor labor in making repairs.

For the rolls:

7 pairs tires at \$120.00.....\$ 840.00
Gear-wheels and pinions..... 335.00

Total.....\$1,175.00

or about \$147 for each pair of rolls. The tires of the rolls used for coarse crushing are not turned when worn, but are replaced by new ones. The tires of the fine rolls are kept in good condition.

For the screens, 21 sets of perforated plates at \$60.75, equal to \$1,275.75, were required, or an average of 2.6 sets per year for each screen.

The average life of the wearing parts of a jaw-crusher is therefore about 8 months; each set of chilled tires on the rolls lasts about a year; and a set of screen plates about 4 months.

Centrifugal Pumps.

The centrifugal pumps, used for elevating water and sand together, are made under the Heald & Cisco patents, by the Morris Machine Works, Baldwinsville, New York. They are made somewhat heavier than for ordinary work, the metal in the pan, for example, being ¾ inch thick. No attempt is made to repair the pumps. Usually the pan and shell are worn out in about the same time. The work of replacing an old pump by a new one takes an hour to an hour and a half. When the centrifugal pumps were first used for pumping coarse sands, a new pump lasted about three weeks, but by increasing the thickness of the wearing parts the life has been prolonged. It is possible that by lining the pumps with rubber, as is sometimes done in the case of centrifugal machines of the type used for dredging, the pumps might be made still more durable. The average life of one of these pumps is 100 days.

The smaller pumps (3-inch) used for elevating the fine sands and slimes last much longer.

An incidental advantage from the use of centrifugal pumps is the very thorough mixing of water and sand, a matter of some importance, because the ore is crushed and screened dry and only mixed with water just before entering the pump. By this thorough mixing the percentage of float-mineral is undoubtedly diminished.

The sand and water is conveyed to the distributors feeding the jigs by 4-inch extra heavy gas pipe, which lasts about two years. Any change in direction is made by bending the pipe with as long and gentle a curvature as possible. The 3-inch pipes, conveying the fine sands and slimes, have been in use over four years, or since the building of the new mill, and are apparently still in good condition.

The Parsons Feeder.

A simple and effective device, shown on Plates IV. and V., is used to sub-divide the sands or slimes, elevated by a single pump, among a number of machines, jigs or tables. A satisfactory method of doing this, so as to secure an equal and uniform distribution, without any concentration or classification of the sands on one machine at the expense of the others, has been for a long time a great desideratum in dressing works. The ingenuity of Mr. Parsons has furnished a very satisfactory solution of this difficult problem. The feeder or distributor is a casting at the top of the pipe from the centrifugal pump, divided by partitions into a number of radial boxes, which surround the delivery pipe and are connected therewith by vertical slots of uniform size. By increasing the number of radial partitions the streams of sand or slime can be sub-divided to any desired extent. From the bottom of each of these boxes a pipe conveys the sand or slime to the jig or table.

When it is necessary to shut off the supply temporarily from one jig or table, its box in the distributor is filled and the opening closed with a piece of cloth, which for convenience in handling, is fastened to an iron rod with a loop-shaped handle. The distributors are made of cast iron, and are quite durable. Those now in use have required no repairs since the mill was built, 4½ years ago. The pipes leading from the distributors to the jigs must be renewed occasionally.

Roughing-Jigs.

Plate IV. shows the details of the Parsons jig, used for the preliminary jigging. It is a two-sieve under-piston jig, each sieve 24" x 39" (or 22" x 27" in the clear.) The piston is vertical 1½" in diameter, and moves in a short horizontal cylinder, 4½" long in the partition between the two jig-boxes. The piston-rod is horizontal and enters through the stuffing-box. For convenience the jigs are made double, i.e., four sieves or two jigs, are united in one machine. One great advantage of this form of jig is the small floor space occupied by a large number of machines, the whole area of the jig-box being available for jigging. The stroke of the piston is 2 inches, and the number of strokes per minute one hundred and fifty. The quantity of under-water required is about two cubic feet or 16 gallons per minute. The consumption of feed-water is 16 to 18 gallons per minute, containing about 13 pounds of sand (dry weight). There are nine jigs, 4½ machines, for each set of crushing apparatus. Each jig treats, therefore, about 9 tons per 24 hours, or less than one-third the capacity of a jig of equal area according to data given by Rittinger, so that the mill has ample jig capacity.

In the Lake Superior copper mills the tendency, of late years, has been to increase the number of jigs, in the attempt to lessen the losses in the tailings. The St. Joe mill has, however, a larger jig capacity, in proportion to the rock crushed, than any of the Lake Superior mills. For the treatment of 800 tons of material per 24 hours there are 252 jig-sieves. The best equipped mill in the Lake Superior region would have on the same basis, but 224 sieves. The rough sands at the St. Joe mill are divided between 90 sieves, or 9 tons per 24 hours to each. In the Lake Superior mill alluded to there would be but 60 sieves for the same mill capacity. At Lake Superior, however, about 45 per cent. of the ore is separated in the classifiers as slime, and goes directly to the tables. This reduces the average amount of sand treated on each jig to 7½ tons per 24 hours. On the other hand, the sands are very unequally divided, so that some of the jigs treat over 10 tons per 24 hours, and others as little as 5 tons. These latter jigs treat very fine stuff, and at 5 tons per 24 hours are really worked to their full capacity. The loss on these jigs is fully as large as on the coarse jigs, notwithstanding the greater fineness of the material, and the smaller quantity of included copper present.

Experiments made by the writer, about two years ago, at one of the Lake Superior mills, seemed to indicate that the capacity of the mill could be increased fully 50 per cent., and this without increasing the losses, simply by making but two grades of sand in the classifiers instead of four. The practice at the St. Joe mill, when no attempt is made to classify the material before jigging, and when, consequently, sands and slimes are treated together on the same jigs, represents a further and extreme step in the same direction. The results obtained

by this novel procedure are opposed to our preconceived ideas and accepted theories on the subject of jigging, and the St. Joe practice is certain to have important influence in modifying jigging methods in the future. The results obtained, it is true, are not wholly satisfactory, the loss of galena in the very finest slimes being large. In other respects, however, the method has many advantages, and the loss in the fine stuff can be brought within reasonable limits by simple modifications in the methods of treatment, which will be discussed further on.

During the past year the writer has had the opportunity of studying very carefully the working of these jigs. A large number of samples were taken, and several hundred assays made under his direction. In order to determine the action of the jigs on the coarse and fine grades of sand and slime, samples of the material treated, of the tailings, and of the hutchwork were subdivided by sifting, and the different portions assayed separately. From the results of the sifting and from other data, it was possible to estimate the proportion of sand and slime of different grades passing through the jig-sieves into the hutch-work, and the proportion of each size which passed over the sieve and into the tailings under different conditions.

The following table contains typical assays of the material treated and of the products of jigging:—

Size.	Percentage of sand of each size.	Lead in Ore. Per cent.	Lead in Hutchwork Per cent.	Lead in Raggings. Per cent.	Lead in Tails. Per cent.
1 mm. to 6 mm.....	41.1	6.32	16.20	1.06
¼ mm. to 1 mm.....	29.6	9.10	74.0	.96
⅛ mm. to ¼ mm.....	9.3	13.81	19.271
1-12 mm. to ⅛ mm..	1.5	12.93	14.8	1.09
1-20 mm. to 1-12 mm.	2.2	7.84	8.8	1.74
Below 1-20 mm.....	16.3	12.22	16.4	6.07
Average.....	100.0	8.93	22.3	16.54	1.53

From the assays of the different portions of the ore it will be seen that the stuff less than ¼ mm. is richer than the average, while the portions coarser than ¼ mm. are poorer. This is due to the friability of the galena, which is crushed finer than the gangue.

The hutchwork is quite poor, containing but 22.3 per cent. of lead. This is due to the large proportion of partially concentrated fine stuff, less than ⅛ mm., about two-thirds of which passes into the hutchwork. This fine stuff is separated by the trunking-machine and the pointed-boxes, and concentrated on the finishing-jigs and tables.

The assays of the several portions of the jig-tailings show very closely the limits within which the jigs are doing good work. It will be seen that the amount of lead in the tailings decreases with the fineness of the sands down to ⅛ mm. A careful examination of these coarser sands will fail to show any free mineral, the lead being present as included galena. The finer the comminution the smaller the amount of such included mineral, and consequently the poorer the sands. Below ⅛ mm. the tailings increase in richness, which is due to the presence of free galena. The loss from this cause is not serious, save in the portion finer than ¼ mm.

It will be seen that the plan of jigging sands and slimes together, makes it possible to treat very much finer material with success than has heretofore been supposed possible. The limit for successful work on jigs is generally placed at about 1 mm. The successful jigging of stuff ⅛ mm. and less, marks a decided advance in the art of dressing. The coarse grains form the interstitial channels* in which this very fine stuff can be concentrated. It is well known that any attempt to treat stuff finer than 1 mm. by itself results in a very imperfect working of the jigs, the losses being large, and the capacity of the jigs small.

The great advantage of this system of jigging is the large proportion of sands successfully treated and finally disposed of by the roughing-jigs alone. Out of 800 tons per day, only 136 tons require further treatment, viz., 30 tons raggings, crushed and treated on the three-sieve jigs, 66 tons fine sand, also treated on three-sieve jigs, and 40 tons of slimes treated on the side-bump tables.

The sole disadvantage lies in the difficulty of forcing all the very finest slimes to go through the jig-sieves. Under normal conditions about 40 per cent. of the stuff below ¼ mm. passes off with the tailings. Even this very fine stuff is somewhat impoverished by the action of the jigs, and of that which escapes, a very large proportion is too fine to be saved by any form of apparatus, so that the final loss from this cause is not as serious as might at first appear.

The jigs are run with a long stroke, and with as little feed-water and under-water as possible, in order to carry the larger proportion of the fine stuff through the jig-sieve.

It is possible, by lessening the amount of feed-water and under-water, to cause a larger proportion of this fine stuff to pass through the jig-sieve, but at the expense of forcing through, at the same time, much coarser material,

and thus sending to the finishing-jigs material that can be treated successfully on the roughing-jigs. The following table shows the effect of reducing the amount of water used in jigging, the percentage of hutchwork and tailings with the normal and with reduced quantities of feed-water and under-water being placed side by side for the different sizes:—

	Above ¼ mm.		⅛ to ¼ mm.		1-20 to ⅛ mm.		Below 7-20 mm.	
	Normal.	Reduced.	Normal.	Reduced.	Normal.	Reduced.	Normal.	Reduced.
Hutchwork.....	26	39	68	94	67	93	60	83
Tailings.....	74	61	32	6	33	7	40	17
	100	100	100	100	100	100	100	100

It will be seen that in each case the maximum percentages of sand pass through the sieve between ¼ mm. and ⅛ mm., and between ⅛ mm. and ¼ mm. This indicates that the grain of maximum velocity is about ⅛ mm. in size. This agrees closely with the size called for by theory. The theoretical limit* of successful work on these jigs is therefore about ⅛ mm.

It would be possible to classify the sands before jigging and to send all this fine stuff directly to the tables. This would necessitate the use of a large volume of water to effect the classification and would involve a large increase in the number of slime-tables.

Experiments are now being made, with every prospect of success, to reduce the loss in this very fine material, without sacrificing the advantages of present method of treatment.

Spitzkasten.

The hutchwork of the roughing-jigs goes through a series of spitzkasten, respectively 1½ x 7½ feet, 4 x 6½ feet, 8 x 12 feet and 8 x 12 feet in horizontal cross-section and 2 feet, 7 feet and 10 feet deep. These boxes are built between the posts supporting the main floor of the mill. Their position is indicated in Plates I. and II.

Trunking-Machine.

The material settling in the first box goes to the trunking-machine. This machine consists of a semi-cylindrical iron trough in which revolves a screw conveyor. The trough is divided into two sections, respectively 14 feet and 10 feet in length. The screw conveyor in the lower and longer section is made up of fan-shaped blades of castiron, about 4¼ inches wide, with a space of about 2 inches between them, breaking the continuity of the screw. The material to be treated flows through rubber hose from the settling-box into this trough; being introduced about midway. The revolution of the shaft forces

the galena toward the upper end. The water flows out at the lower end of the trough, carrying with it all the light sand. Wash-water is admitted through a line of spigots at the side of the trough. The upper section of the trough simply serves to convey the galena into the car.

Mineral coarser than ¼ mm. or ⅛ mm. is very perfectly concentrated by this machine and delivered to the car as nearly pure galena. Mineral finer than ¼ mm. is carried off in the tails. The tailings from this machine are united with the product of the second box of the spitzkasten and go to the three-sieve finishing-jigs.

Finishing-jigs.

The three sieve Hartz jigs used as finishing-jigs, as well as for the treatment of the crushed raggings, are of the ordinary side-piston type, and are not figured. They do not require special description. They are run at a speed of 270 strokes per minute; strokes ¼ inch in length. The jigs treating crushed raggings are run slower, 210 strokes, ⅝ inch long, per minute. The jig-sieves are of No. 8 wire cloth (No. 17 wire).

The following table gives the results of typical assays on samples subdivided by sifting:

Size.	Per cent of sand of given size.	Lead in sands treated Per cent.	Lead in Hutchwork.			Lead in tailings. Per cent.
			1st sieve. Per cent.	2d sieve. Per cent.	3d sieve. Per cent.	
Above $\frac{1}{4}$ mm	8.9	40.99	} 79.69	} 70.34	} 41.80	3.94
$\frac{1}{8}$ mm. to $\frac{1}{4}$ mm . .	43.6	16.76				1.02
1-20 mm. to $\frac{1}{8}$ mm.	13.3	16.40				.62
Below 1-20 mm. . . .	34.2	32.58				11.97
Average	100.0	24.75	Average three sieves, 74.00			5.24

The material treated on the finishing-jigs is very rich containing about 25 per cent. of lead, and the losses are quite large. The material treated is also very fine, over 90 per cent. being less than $\frac{1}{4}$ mm. The losses are confined to the stuff below $\frac{1}{8}$ mm., above that limit the tailings are poor, with the exception of the stuff above $\frac{1}{4}$ mm., the quantity of which is small (about 3 per cent. of the tails). It will be seen that these jigs treat successfully finer stuff than the roughing-jigs, probably because of the finer jig-cloth and smaller interstitial channels. It is proposed to treat the tailings of these jigs, or at least the finer portions of the tails, on round or side bump tables.

Parsons-Rittinger Tables.

The Rittinger side-bump table, as modified by Mr. Parsons, is shown in detail on Plate V. The tables are built in pairs, and each table is made double as usual. They are small, each half the double table being about 3 feet by $7\frac{1}{2}$ feet. Instead of being hung from rods the table is supported on four cast-iron feet or "guides," which slide on horizontal steel rods. The latter rest in cast-iron "saddles, bolted to the heavy sill-timbers which run under the whole row of tables. Light spiral steel springs around two of these rods give motion to the table. The tables bump against each other, the blow being taken by a joist of hard wood lying loose between them (not shown in the drawing). The tables are forced apart, against the tension of the springs, by a spiral wedge-shaped cam; 150 bumps, $\frac{5}{8}$ inch long, are given per minute.

The surface of the table is covered with the black enameled duck, sometimes used for desks. This covering is cheap and easily renewed, and furnishes a surface well adapted for the exceedingly fine material treated. The tables are inclined $4\frac{1}{2}^\circ$. There are 16 pairs of double tables in the mill, or 64 table in all. Of these, 32 are head tables and 32 are used for treating middlings. They are not worked to their full capacity, the head tables treating but $1\frac{1}{4}$ tons each, or $2\frac{1}{2}$ tons to the double tables per twenty-four hours. The material treated is exceedingly fine, 70 per cent. being less than $\frac{1}{8}$ mm.

The following are typical assays of the stuff treated and the resulting tailings. The samples, as before, were subdivided by sifting.

Size.	Percentage of sand of given size.	Percentage of Lead in stuff treated.	Percentage of Lead in tailings.
$\frac{1}{8}$ mm. to $\frac{1}{4}$ mm.	9.0	2.50	.82
$\frac{1}{4}$ to $\frac{1}{2}$ mm. to $\frac{1}{8}$ mm.	19.4	2.65	.40
Below $\frac{1}{8}$ mm.	71.6	15.52	2.74
Average.	100.0	11.75	2.45

Loss in Dressing.

For the year ending May 1st, 1887, the yield of the ore treated was 5.65 per cent. The loss in the tailings is about 2.13 per cent., or 27.4 per cent. of the total amount of lead in the ore. The losses in the Lake Superior copper mills range from 28.5 per cent. to 31 per cent., treating material much more easily saved than this galena. The losses in each case are due to include mineral in the coarser sands, and to finely divided mineral in the very fine slimes. At Bonne Terre an unusually large part of the mineral exists in the ore in an exceedingly fine state of division, as is shown by the large percentage of included mineral in stuff as fine as $\frac{1}{8}$, $\frac{1}{4}$ and $\frac{1}{2}$ mm. This necessitates very fine crushing, and consequently involves the production of a large amount of very fine stuff, much of which contains galena too fine to be saved.

Cost of Dressing.

The cost of dressing for the fiscal year ending May 1st, 1887, was 36.4 cents per ton, divided as follows:—

Labor	13.4
Repairs	10.0
Supplies	3.5
Coal	9.5
	36.4

This compares favorably with the very best Lake Superior practice, the cost of dressing at the Atlantic mill for the last few years being per ton of rock:

	Cents.
1881	42.54
1882	37.07
1883	35.35
1884	38.95
1885	30.36
1886	26.5
1887	27.5

The cost at the Atlantic mill (for 1885) can be subdivided as follows:—

	Cents.
Labor	10.86
Fuel	14.52
Supplies, etc.	4.98
	30.36

At the Atlantic mill, the water is supplied through a launder above the level of the mill-floor and is not pumped. The ore also is delivered to the mill at a higher level than at St. Joseph and need not be elevated in the mill. This rock has also been previously crushed by jaw-crushers at the rock-house, the cost of which crushing properly belongs to the cost of dressing, but is not included in the published figures. Finally, the sands are carried off with the water in the waste launders and do not have to be loaded into cars. At least 10 cents per ton, therefore, should be added to the Atlantic mill figures in making comparisons of cost at the two places.

The amount of rock treated per ton of coal consumed is as follows:—

St. Joseph mill, 1887	33.59 tons.
Atlantic mill, 1886	28.34 tons.

The advantage in favor of the St. Joseph mills would be even more striking if an allowance were made for the fuel consumed in elevating water and ore.

The limestone crushed at St. Joseph is probably not as hard as the amygdaloid rock treated at the Atlantic mill. Somewhat finer screens are used at the Atlantic mill, but the average fineness of the ore is almost exactly the same.

	(1887). St. Joseph mill. (Rolls).	(1886). Atlantic mill. (Stamps).
Above 1 mm	43.0	41.6
$\frac{1}{4}$ to 1 mm	27.0	27.6
Below $\frac{1}{4}$ mm	30.0	30.8
	100.0	100.0

These figures indicate that it is cheaper to crush by rolls than by steam-stamps; and that the rolls produce quite as large a proportion of slimes as the stamps. The cheapness of the crushing and the large amount of slime, however, are both due in part to the friability of the ore.

It will be difficult to find two mills, either in this country or abroad, treating ore at equally low cost; and the above figures furnish a powerful argument for the English method of concentrating without size classification.

The losses in the treatment of the very fine stuff are large both at Lake Superior and in Missouri. The remedy in each case will doubtless be found in better methods of crushing and in extending and perfecting the slime-treatment.

* Loc cit.

Canadian Peat Fuel.

Peat occurs in great abundance in many places in the Dominion, but has never been much worked, except in a few localities south of the River St. Lawrence, more particularly at St. Hubert, in Chambly County, about ten miles from Montreal, and at St. Brigid, about ten miles from the town of St. John, on the Richelieu river. It is also known to exist in large deposits in New Brunswick, in other parts of Quebec, in Ontario, and in the North-West Territories. The utilization of peat for fuel has occupied the attention of economists and others for many years, but hitherto, none of the many schemes brought forward have been sufficiently practical and economical to bring it into general use. Mr. David Aikman, of Montreal, who has given much time and consideration to the subject has, however, produced a fuel from peat which is in many respect superior to coal. Its heat-producing power is as great as coal, and can be easily understood from the following analysis:—

Moisture	3.84
Fixed carbon and volatile matter	89.26
Ash	6.90
	100.

Analysis of Coal.

Moisture	4.59
Fixed carbon and volatile matter	89.49
Ash	5.92
	100.

It burns with a clear white flame, after all the volatile matter is consumed, leaving a bright red coal which will last for a long time.

Owing to its freedom from sulphur and its specific gravity being equal to coal, makes it invaluable for use on locomotives. Air-dried peat was used on the Grand Trunk railway. Taking one trip as an example on Engine No. 158, five feet driving wheels, sixteen inch cylinders, and twenty-six-inch stroke, drawing twelve loaded cars:—

Distance run per ton of 2,240 lbs.	
of fuel	40.33 miles.
Fuel used per mile	55.44 lbs.
Greatest pressure of steam	140 "
Least "	100 "

During the experiment fuel was put on in small quantities; no smoke issued from the stack; a steady brilliant white fire was kept up and steam generated with great rapidity. The damper was kept closed, and air admitted through a slot in the furnace door. Not an atom of ash or cinder was left in the smoke box, ash pan or upon the wire gauge or spark catcher. The bottom of fire box was scarcely ever covered with the fuel, the steam being generated too rapidly to allow of a large quantity of fuel being put into the furnace. For all kinds of steam boilers it can be used to advantage, also for smelting purposes, as it stands a very strong blast. It is also the cleanest and most economical fuel which can be used in grates and stoves, for heating and cooking.

The fuel is made by machinery carried on a scow which is made to float in the bog, the peat is excavated by a pair of large screw augers which work in front of the bow and deposit it in a well where it is submitted to the action of steam taken from the exhaust of the engine, it is then brought by an elevator to the squeezer, where it is deprived of about 33 per cent. of water, after which it is broken by revolving teeth, passed through a dryer of a special construction invented for the purpose and delivered into the press in the form of dry dust, which by the action of heat and the screw is brought into a pasty condition, the tar or resin naturally contained in the peat being set free, under the pressure it becomes partially carbonized and issues from the press in a continuous stick of peat fuel ready for use, it may be two, three, four or more inches in diameter. The whole process is entirely automatic, and only takes about twenty minutes from the time of excavation from the bog to the time it is delivered from the press. We will suppose the scow as described with excavator, and peat-making machinery, all ready to start, and the line on which she is to work decided upon. It will be necessary to clear away in front of her a space, the width she is intended to cut, (it may be 14, 16, or 20 feet), if the bog is soft this can be done by men on a gangway made on purpose so as to move along without sinking, the fibre moss, etc., lying on the surface must be cleared off, this can be laid on one side to form a pathway, which will become solid as soon as the drainage operation begins. The machine can then move forward in the usual way, and will cut about 3,000 feet in a week, converting the peat excavated into good solid fuel, available for any purpose for which coal is used at the rate of about 550 tons for the 3,000 feet advanced, if the cut is 20 feet wide and leaving behind a canal full of water which must be kept up to its level, in order to allow the machine to continue her operations. When the water ways are all made, discharges can be cut to allow the water to drain away which it will do very quickly, smaller cross drains can then be cut cross-ways as the bog gets more solid. In a short time, it will easily be seen, that by this system bogs or marshes which are now almost inaccessible and waste, can be converted into solid ground available for agricultural purposes. In this country where our peat operations have been carried on, the surrounding lands which were so wet that nothing could be done with them have been all reclaimed and are now cultivated and bearing crops. The entire cost of one machine with complete outfit for drainage and peat making purposes in Canada is about \$9,000. If it was only intended for drainage purposes the cost would be about \$4,000. The material excavated could then be deposited as a road bed alongside of the canal and be made available for transport etc.

The special advantages claimed for this fuel are:—

- (1) That it can be produced at a less cost than coal, and that a great saving can be made in transportation, because it is more uniformly diffused over all the country compared with coal.
- (2) That it is more economical.
- (3) That it is free from sulphur.
- (4) That it does not make clinkers.
- (5) That it lengthens the life of fire-boxes, grate-bars, fire-bricks, grates, stoves, etc.
- (6) Saving a cost of repainting railway coaches through absence of cinder sparks, etc., comfort of passengers.
- (7) That it is superior for making iron and steel.

We understand that a company is now being organized in Canada and that the work of utilizing peat lands for fuel will shortly be an accomplished fact.

MINING NOTES.

Nova Scotia.

(From Press Committee Gold Miners' Association.)

Beaver Dam.

Reports from this district are to the effect that Mr. D. S. Turnbull is pushing the construction of the twenty-stamp mill as fast as possible, in the hope of starting it before cold weather comes.

Chester Basin.

Since the closing down of the Neptune Co.'s mine in the Spring little or nothing has been done in this district. A few prospectors are at work, but no pay lode has as yet been found.

Gay's River District.

The Coldstream Mining Co. are at last beginning to work. The excavations for the proposed fifty-stamp mill have been begun, and a large boarding-house is in course of erection. Work on the mining property proper, however, is yet in its inception, and the company has not yet got down to real development work. It is expected, however, to increase the working force of miners this month.

Renfrew District.

The "Free Claim" property here has resumed active mining work. During the summer the owners have rebuilt the ten-stamp mill, putting in new foundations and mortar, and entirely rebuilding the water-wheel.

The Empress Co. are rebuilding the engine-house and shaft-house recently destroyed by fire, and the new machinery for pumping out the old Ophir lode has been completed and started up. The owner, Mr. C. H. North, of Boston, paid the property a visit last week.

South Uniacke District.

A representative of the Thomson-Houston Electric Co. has recently contracted with Messrs. Thompson & Quirk to supply their mine in this district with one of the company's new electric percussion drills. The agent, Mr. Medbury, proposes to set up the drill in Halifax and operate it for a week or so, in order that mining men may have an opportunity to see the drill at work and judge of its merits.

This will be the first installation of an electric drill in Nova Scotia, and will, in fact, be the first drill put upon the market by the Thomson-Houston people. The results will be carefully watched by our gold mining men, and a detailed account of the drill and its success or non-success will appear in the REVIEW.

Stormont District.

In the matter of the Palgrave Mining Co. *vs.* J. McMillan *et al.*, a hearing was given before the Commissioner of Public Works and Mines on the 11th inst., at Halifax, on the petition of the Palgrave Co. that it be allowed entrance on lands claimed by McMillan and others for the purpose of working its mineral property, under sec. 44 of the Revised Statutes. No decision has yet been given by the Commissioner.

It is greatly to be desired that some new legislation be introduced at the coming session of the House of Assembly which shall have for its object the settlement of one of the evils of the existing laws, viz., the uncertain relation existing between the owner or claimant of the land and the lessee of the mineral rights. To this uncertain relation are traceable the source of much litigation whenever the mineral rights prove to be of value.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

Waverley District.

Up to the 16th instant the fine new mill of the Lake View Co., at this place, which was to have been completed the 1st. of August, and then the 1st. of September had not dropped a stamp. It is now announced that the mill will not be running before October 1st. The mine is yet idle.

Tangier District.

The property of the Brunswick Gold Mining Co., at this place, was sold on September 13th by the Sheriff at public sale and was bid in by Mr. Parker, solicitor, for the sum of \$8,500. It is rumored that Mr. Parker bought for New York parties who intend re-opening the property.

Montague District.

There is little that is new to report from this district; work has been rather slack, and the working mines have apparently come into a temporary lean streak. Rumors of a sale in the district for a large figure cannot be traced to a reliable source.

(From Our Own Correspondent.)

Cumberland County.

The sale of the Joggins coal mine is stated to be definitely closed, the price named being \$230,000. It is reported that the purchasers are interested in the Canadian Pacific Railway.

The Boston Coal Mining Company having neglected to pay the annual rental, its leases have been declared forfeited. The property had not been worked for some time.

Cape Breton.

The Sydney and Louisburg Coal and Railway Company is stated to have found the Carrol seam underlying several square miles of its territory. Further details as to its size, quality, etc., are not yet available.

The Mullins seam of North Sydney is reported as yielding five feet six inches of good coal, and already extensive rights have been secured along its line of outcrop.

Pictou County.

Mr. John Douglas, who has been coal prospecting for the Black Diamond Company, has suspended operations, believing that nothing of any value can be found in that section. Prospecting by other parties at a point four miles north-east of where Mr. Douglas was at work have also proved unsatisfactory.

Messrs. John Muir & Sons have had a siding constructed into their workings, which will connect them with the Vale railway and give them a more profitable outlet for their coal than heretofore.

The re-opening of the Food pit continues satisfactorily.

Twenty new coke ovens have been added to the plant of the Drummond colliery. These are understood to be giving good satisfaction, but no reliable figures of the quantity manufactured have yet been made public.

In General.

The next regular monthly meeting of the Gold Miners' Association will be held at the Halifax hotel on Friday, 3rd October next, at two o'clock in the afternoon. A full attendance is particularly requested.

Mr. Joseph R. Wilson, son-in-law to Mr. Thomas Shaw, M.E., inventor of the Shaw Mine Signalling apparatus, has been giving an exhibition of his machine in Halifax, at Stellarton, and other points in the coal district. The owners of the patent on this new machine are evidently leaving no stone unturned to create a sentiment in favor of its adoption. The *Colliery Engineer* and several of its readers are protesting against its introduction in the collieries of Pennsylvania, claiming that it is impracticable. We should, however, be glad to have the views of some of our colliery engineers on its merits.

According to the official returns there has been a decline in the importation of American coal into Canada during the twelve months ending 30th June last, as compared with the corresponding period ending 30th June, 1889. The figures stand 1,372,225 tons, value \$5,366,643 for 1889, and 1,305,671 tons, value \$4,768,549 for 1890. According to these figures the average price was \$3.91 in 1889, and \$3.65 in 1890.

Reflecting the views of the Dominion Government on the question of reciprocity in coal, the London *Free Press*, the special organ of the Minister of Agriculture, says:—"Every pound of hard coal that we use is admittedly free of duty, but we will wait in vain for the United States to offer the freedom of 'the markets of

sixty millions' to the soft coal yielded from our mines. As they have built a wall against our great Nova Scotia industry, in the interest of Pennsylvania, it is but natural that similar protection should be afforded to our own people, hence the Canada duty of sixty cents per ton against the United States duty of seventy-five cents, and with that arrangement all parties in this country are very well content. Nova Scotia is selling more coal in Quebec than she ever sold before, not even excepting the year when the United States took our coal free of duty, and in return they take from the upper provinces the stores of provisions which formerly came from New England. The coal duties are not so oppressive to Canadians, but the duty levied by the United States is a serious burden on their own people, especially to the shipping of both the Atlantic and Pacific. Every pound of coal used by the steamships of San Francisco is brought from the mines of British Columbia. It would be a great relief, therefore, to abolish the duty there, but if they choose to tax themselves in that quarter, it is but little spite to the British Columbia miners."

The Halifax Mining and Prospecting Company is the name of another new company which was been granted a charter on the 16th inst. Directors—Charles Annand, Halifax, N.S.; Geo. E. Forsythe, Halifax, N.S.; B. F. Pearson, Halifax, N.S. Capital, \$250,000. The chief place of business will be at Halifax.

Application for incorporation is made by "The Napier Mining Company, Limited." Capital, \$120,000, divided into 1,200 shares of a value of \$100 each. Directors—W. J. Fraser, Halifax; Frederick Taylor, Lowell, Mass.; John E. Hardman, Oldham, N.S. The chief place of business of the new company will be at Oldham.

Quebec.

A large force is at work at the Temiscamingue mines. The shaft has been put down to a depth of 75 feet and is still in first-class galena ore.

Templeton District.

The Blackburn, McLaurin, and other phosphate mines in this district are working steadily and a good force is employed at each.

The asbestos property, owned by American capitalists, is also being developed. A force of 19 men was put on last month, and at last reports the veins had widened to four inches and were yielding in good quantity. Asbestos of good quality has been mined.

Ottawa Valley.

Mr. E. Packard, Chairman, and Mr. C. C. Hoyer, Millar, visited the mines of the Canadian Phosphate Company during the month and report themselves much pleased with the result of the operations at the pits. The production for the month has been larger than for any previous period since mining was begun by the company. The Directors have declared an interim dividend of 6d. per share, payable on 1st November.

The representatives of the Phosphate Corporation (Limited) are now on a tour of the phosphate mines in this district. We are informed that the properties so far acquired consist of the Ross Mountain Lot, from the Hon. J. C. Abbott, the Murphy Lot in Templeton, and the Stewart Lots near the High Falls, Lievres River, in all about 2,000 acres. Mr. J. Lainson Wills and Mr. George Attwood, M.E., are acting for the company. Mr. Knud Sando, one of the principal promoters, and Sir George Baden Powell, one of the directors, arrived in Buckingham on 30th inst. on a visit to some of the properties now before the company for purchase. They both condemn the high prices asked by vendors.

Eastern Townships District.

Dr. James Reed has placed an order with the Ingersoll Rock Drill Company for a plant similar to that put in at the American Asbestos Co., the United and King Bros. mines. Lots 27, 28, 29, in Range A Coleraine, are to be worked extensively. These lots give good promise of becoming large producers of asbestos.

All the mines at Thetford and Black Lake continue working steadily, and managers are pleased with their outputs. The production of asbestos for this season will show a decided lead over any previous years' operations.

The American Asbestos Company are putting in a cable derrick to carry off their waste rock from working ground.

The Anglo-Canadian Co.'s output still continues to lead the other Black Lake mines, and at the end of the year will be found to be nearly double the company's production for the same period last year.

The United Asbestos Company's turnout for last month was extremely satisfactory, a goodly portion of the output being No. 1.

Messrs. King Bros. are opening out their Black Lake Lots under direction of Mr. A. M. Evans.

The Excelsior Copper Company are testing undeveloped portions of their Harvey Hill property with the Diamond Drill.

Ontario.

The Provincial Natural Gas and Oil Company are busy laying their pipe line from the wells at Welland to Buffalo, where the line will be assumed by the Standard Oil Company.

A small force of men is employed opening up a promising deposit of iron ore on the Desbarats location, 35 miles east of Sault Ste. Marie on the line of the C. P. R.

The Sebastopol Phosphate Syndicate, Limited has been registered in London, September 1st, 1890, by Leslie, Antill and Arnold, 1, Gresham-buildings, E.C., to acquire any phosphate or other mines, and to work and develop the same. Capital, £5,000, in shares of £1 each. First Subscribers—G. J. Wells, of Chester; G. C. Lomer, 4, Fenchurch avenue, E.C.; and five others, each taking one share. This is a new company to be under control of Messrs. Lomer, Rohr & Company, Montreal, and to operate a phosphate property at Sebastopol.

Perth District.

The Anglo-Canadian Phosphate Co. continue their system of day work at the Otty Lake mines, near Perth, Ont., under charge of Mr. Robert Cordick, and during the summer have opened up over thirty of the old contractor's pits besides discovering several new shows. A force of about twenty-men is employed and 250 tons of high grade phosphate is now ready for shipment, besides a quantity of seventy per cent. ore. The phosphate has been sold for shipment to London.

Work has been resumed at the Bob's Lakes mines, Bedford, Ont., by the Anglo-Canadian Phosphate Co. This property has been worked for the past two years under the contract system, but will now be operated by day labor. Over one hundred seams of phosphate have been opened up by the contractors on a small portion of the property, a good deal of which remains to be explored.

Port Arthur District.

(From Our Own Correspondent.)

THE BADGER SILVER MINING COMPANY.—This company shipped a car load of high grade smelting ore, valued at \$15,000, to Geo. W. Robinson, 91 Wall street, New York, on the 10th inst. This ore has all been taken from No. 4 vein, (Porcupine) since Aug. 4th, together with about 350 tons of milling ore. They have another car load of high grade ore about ready, taken from No. 2 vein, within the same period, which will be shipped about the 15th inst. No. 1 Adit level is still in bonanza ground both ways, which taken with the body of ore at the bottom of the shaft, makes a certainty of No. 4 vein being a great producer. The mill is kept in full blast night and day, breaking 35 tons of ore daily. The Badger is going to exceed the highest expectations formed of it at the beginning of the season. Supt. Shear estimated that he would be able to ship a car load of high grade ore monthly, and he will have two car loads to his credit for September.

THE BEAVER MINING AND MILLING CO.—This company shipped a car load of high grade ore and concentrates, valued at \$17,000, to Messrs. Balbach & Son, Newark, N.J., on the 10th inst. They have another car load ready for shipment, but teams have been scarce lately, that they have been unable to have it transported to Murillo. The Beaver looks remarkably well, all the slopes being in high grade ore. The production is averaging over \$40,000 per month. A new vein carrying good milling ore at the surface has been opened on the North Bluff; Capt. Hooper has a gang of miners employed opening it out. It is improving in richness as development proceeds and gives promise of being a good producer.

THE KING.—This property is composed of the north half of lot No. 12, in third concession of the township of Strange, and comprises 320 acres. There are six parallel veins on the property, only one of which has been partially developed. This vein was two feet wide at the surface; at a depth of eight feet it had widened out to four feet, from which point it has maintained a uniform width to the bottom of the shaft, which is now down 26 feet. The pay streak is 18 inches wide. At a depth of

eight feet the vein gave assays from 40 to 3,000 ounces of silver to the ton of 2,000 pounds. No assays have been made below that point, but the vein has become richer and more heavily mineralized, and on assay will, no doubt, carry much higher in silver than near the surface. The Whitefish river runs along the south boundary of the property and has a fall of 125 feet in passing from the west to the eastern limits of the property, which will furnish ample power for all necessary works in treating the ore. The Port Arthur, Duluth and Western Railway runs within two miles of this property, and when it is completed to that point, which will be about November next, the first shipment of higher grade ore will be made and all necessary machinery taken in to operate the mine. The owner, Mr. Bonfield, of Petrolea, Ont., intends to thoroughly explore and develop all the veins on the property.

THE BLACK RIVER AND TERRACE BAY GOLD MINING CO.—Capt. Andrews and W. Roland, M.E., have just completed tests and examinations of the different mineral lodes on this property and all arrangements for future operations are now about completed. The results of the tests made and the exploratory work done, show that these veins carry from \$9.50 to \$17.50 per ton in gold, and from three to thirteen ounces of silver to the ton of 2,000 pounds. While concentration tests made at the Beaver Mining and Milling Company's mill by C. Romer, Ch., go as high as \$500 per ton. Over twenty new veins were discovered on the property during the course of the exploratory work by Capt. Andrews and Mr. Roland. The property consists of four locations of 400 acres each. It is well timbered and has a magnificent water power at the Bridal Veil Falls on the Black River which runs through the property. It is easily accessible by the Canadian Pacific Railway or by steamer from Lake Superior.

THE STAR MINE.—Drifting is being proceeded with from the bottom of No. 2 shaft, the vein is holding out in width and richness. As soon as machinery can be transported in over the Port Arthur, Duluth and Western Railway, operations will be carried on, on a more extensive scale.

THE OGEMA.—Professor Hillé, M.E., has made an examination of this property which is situated in the township of Dorion, in the Black Bay district. A high range of granite bluffs traverse the property, the vein occurs about half way up the bluff, along the contact of the granite and gneiss, which forms the valley below. The outcropping is about eighteen inches in width, nearly solid galena, twenty feet below an adit has been run in to cut the vein, here it is double the width that it was at the surface, and the galena assays from 62 to 64 per cent. Assays from samples taken at the surface, showed it to carry 24 ounces of silver to the ton of 2,000 pounds.

Manitoba and N. W. T.

The track of the Galt railroad is now laid to a point 30 miles north of the boundary line. It will probably be completed to Lethbridge by the 20th inst., and be formally opened to the public by an excursion from that place to Great Falls on or about October 1st.

A special general meeting of the Alherta Railway and Coal Company will be held at their offices 37 Old Jury, London, Eng., on 15th October. The purposes of the meeting are:

1. To authorize the purchase and to accept the transfer of the property and assets of the North Western Coal and Navigation Company (Limited);
2. To authorize the issue of mortgage bonds and share capital both preferred and ordinary required for the purposes of the company;
3. And generally to consider and adopt all measures incident to or arising out of the agreements with the North Western Coal and Navigation Company, Limited, with the Great Falls and Canada Railway Company and with the Lethbridge Construction Company;
4. To approve the head office of the company in London;
5. To receive the report of the directors and pass the accounts of the company, and to fix the remuneration of the directors.

The average monthly output from the Lethbridge collieries since 1st January, 1890, has been 11,000 tons. 650 men and boys are employed.

The Canada North-West Coal and Lumber Syndicate are raising about 100 tons of coal per day. A force of 75 men and boys employed.

Sir Alexander Galt, who has been upon a tour of inspection of his railways and coal interests in the Northwest has returned East. At Great Falls, Montana, connection is made with the new railway connecting the Great Northern road of Montana with the Galt coal

mines at Lethbridge. This road is 198 miles long, of which 150 miles are completed. Over this distance Sir Alexander and party travelled on an engine, reaching the spot to which the track had been completed ten miles this side of the boundary. This new connection will prove of mutual benefit to the people of Montana and the Galt mines, giving the former their coal at much cheaper rates than is now possible and the latter an enlarged market for its merchandise. The mines are now producing about 11,000 tons per month, but this will be materially increased shortly. Three new shafts have been recently sunk, two of which are now yielding coal, and the third is expected to be worked very shortly. The extension of these mines has built up Lethbridge in a wonderful manner.

A demand of assignment has been made by Mr. James Baylis, merchant, of Montreal, a creditor to the extent of \$3,794 dols., on The Stair Coal Mine and Manufacturing Company, Limited. The petition for a winding-up order was granted by Justice Wurtele, sitting in the Superior Court, and Mr. George H. Paterson, accountant, was appointed provisional liquidator. The exact liabilities of the company have not yet been filed but are supposed to be heavy.

British Columbia.

The captain of the steamer Empire, which recently arrived at San Francisco from Nanaimo, B. C., reports that there is no change in the condition of affairs at the mines. The miners still hold out, and the Dunsmuirs will not give in. The steamer Wellington is tied up at the wharf and the crew has been discharged. On her last trip from this port the Wellington took up thirty men who had been engaged to work in the mine. When they arrived at Nanaimo all the men joined the strikers, save three. There are sixteen men at work in the mine, and these can just turn out enough coal to supply the Vancouver tugboats. When the strike took place, over 400 men walked out. Of this number about 150 were single men. The latter have left the island and obtained work in Vancouver, Seattle and Tacoma. The married men are supported by contributions from the other miners. All the men employed in the mines belong to the Union, and every man who is at work is assessed 10 per cent. of his wages. The troops sent from Victoria and Vancouver, to quell any riot that might arise, are to be sent home. There is no chance of a settlement, and it will be several months before any Wellington coal arrives in San Francisco.

Six striking miners, on trial on a charge of intimidating miners working at the Wellington collieries, have been found guilty. The Chief Justice bound each of them in \$200 to appear for sentence when called, remarking that the full effect of their act was probably not yet developed. In rendering judgment he said: "I suppose you never think, read or write, or if you do you get newspapers edited by men just as ignorant as yourselves, who only write what they know you will buy." The strike is still unsettled.

Cariboo District.

The Black Jack—a one stamp mill—started last year, with satisfactory results, is still pounding away, and the company hopes to increase its capacity in due time.

The Golden Mining and Smelting Co. have almost completed their works and will be shortly ready for ore; in fact, they are now making advances on all ore shipped them.

The Forks of Quesnelle, is enjoying something of a boom in the way of alluvial mining. Various new locations have been recorded within a few weeks, and strong companies organized to work them. The gold taken out is coarse, and the prospects are remarkably good; but it will take a considerable expenditure of capital to realize them.

The Island Mountain Company's quartz mill has now been running steadily for two or three weeks, and the results, so far as the public know them, are encouraging. The starting of this mill has been awaited with eager expectation and hopefulness, for it was felt that if it proved a success the erection of other mills and the development of our numerous quartz ledges would follow as a matter of course. Our hopes seem, therefore, on the point of realization. The mill is a ten stamp one, and has four of the best modern concentrators.

West Kootenai Minerals at Toronto.

West Kootenai sent an excellent display of mineral specimens to the Toronto Exhibition. The utility and value of this exhibit was, however, sadly diminished by the wretched accommodation provided for it by the Exhibition people, the whole being crowded into a dirty little shanty in which British Columbia potatoes, fruits,

mountain goats and other products were piled in a most indiscriminate and unattractive manner. This is a matter which we commend to the attention of the authorities, who should be well able to provide first-class accommodation for exhibits of so much importance to the development of the country.

The following is a detailed description of the 43 samples of ore on exhibition:—

TOAD MOUNTAIN.

1. Grizzly, R. & A. C. Fry, 75 oz. silver, vein 6 feet, Toad Mountain, 60 feet of shaft sunk, 8 miles from Nelson.

2. Cariboo, A. C. Fry, 175 oz. silver, vein 4 feet Toad Mountain, 2 shafts sunk, 10 and 15 feet, 8 miles from Nelson.

3. Dandy, Fox, Kelly & Cook, 50 oz. silver, vein 7½ feet, Toad Mountain, 65 feet of tunnel on ledge, 8 miles from Nelson.

4. Iroquois, C. M. Townson & Co., 40 oz. silver, vein 13 feet, Toad Mountain, 2 tunnels 70 and 50 feet on ledge, 8 miles from Nelson.

5. Tough Nut, Dr. Hendryx, 45 oz. silver, vein 4 feet, Toad Mountain, 37 feet of shaft, 102 feet tunnel, 8 miles from Nelson.

6. Silver King, Hall Bros., \$300 silver, vein 15 feet, Toad Mountain, 160 feet of shaft, 200 feet of tunnel, 8 miles from Nelson.

HOT SPRINGS.

7. United, Revelstoke Mining Co., 24 oz. silver, 50 per cent. lead, vein 5 feet, Hot Springs, ledge stripped 150 feet; 2 miles from Ainsworth.

8. No. 1. Revelstoke Mining Co., 89 to 249 oz. silver, vein 8 feet, Hot Springs, 430 feet of tunnel, 3 incline shafts, ore houses, etc., 2 miles from Ainsworth.

9. Spokane, L. C. Dilman & Co., \$35 silver, vein 4 feet, Hot Springs, 40 feet of incline shaft, ¾ mile from Ainsworth.

10. Sky Line, A. D. Wheeler, \$400 to \$16000 silver, vein 15 feet, Hot Springs, 130 feet of shaft on ledge, 3 miles from Ainsworth.

11. Pearl, B. B. Barker, 40 oz. silver, vein 1½ feet, Hot Springs, 14 feet of tunnel, 3 miles from Ainsworth.

12. Little Phil, Thos. McGovern, \$10 to \$200 silver, 4 ft. Hot Springs, several crosscuts on ledge, ½ mile from Ainsworth.

13. Tariff, George Francis, \$27 to \$34 silver, vein 6 feet, Hot Springs, several crosscuts on ledge, 1-2 mile from Ainsworth.

14. Kismet, H. Auderson, 25 to 40 oz. silver, vein 10 feet, Hot Springs, 30 feet of shafts, 3 miles from Ainsworth.

15. Let Her go Gallagher, A. D. Wheeler, \$460 silver, vein 8 feet, Hot Springs, 90 feet of shaft, ore houses, etc., 3 miles from Ainsworth.

16. Sunlight, Geo Herb, \$40 to \$175 silver, vein 8 feet, Hot Springs, 30 feet of shaft, cross-cuts, etc., 2 miles from Ainsworth.

17. Norman, McLeod & van Hook 40 oz. silver, vein 6 feet, Hot Springs 8 feet of shaft, 2½ miles from Ainsworth.

18. Arkansaw, Roberts & Buckley, 75 oz. silver, vein 8 feet, Hot Springs, 12 feet of shaft showing large body of ore, 2½ miles from Ainsworth.

19. Neosha, R. McLeod, \$500 silver, vein 6 feet, Hot Springs, 10 feet of shaft, 2½ miles from Ainsworth.

20. Union, Chas. Roster, 60 oz. silver, vein 5 feet, Hot Springs, 75 feet of shaft, ore houses etc., 2½ miles from Ainsworth.

21. Little Donald, E. L. Davenport, 75 oz. silver, vein 7 feet, Hot Springs, 130 feet of shaft, several crosscuts, 1 1-2 miles from Ainsworth.

22. Krao, A. D. Wheeler \$90 to \$384 silver, vein 12 feet, Hot Springs, 130 feet shaft, several crosscuts, 1½ miles from Ainsworth.

SUNDRY LOCATIONS.

23. Centre Star, Joseph Bourgeois, \$8 silver, \$48 gold, vein 20 feet, Trail Creek, 12 feet of shaft showing 20 feet of ore, 6 miles from Columbia river.

24. Josie, H. Sharon, \$8 silver, \$48 gold, vein 30, Trail Creek, ledge stripped showing large body of ore, 6 miles from Columbia river.

25. Queen Victoria, James Burr, 13 oz. silver, large deposit, Kootenay river, small test holes on hill, 6 miles from Nelson.

26. Royal Canadian, Simon Ray, \$76 to \$704 gold, vein 2 feet, Eagle creek, 2 tunnels 40 feet and 60 feet, 7 miles from Nelson.

27. Umatilla, F. C. Collins, 40 oz. silver, vein 5 feet, Nelson, shaft showing large body of ore, 7 miles from Nelson.

28. Poorman, E. L. Davenport, \$100 to \$200 gold, vein 2 1-2 feet, Egale Creek, 80 feet of shaft, 400 feet of crosscut, 6 miles from Nelson.

ILLECILLEWAET.

29. Maple, Cariboo Ck Mining Co., 45 oz. silver, 72 per cent. lead, vein 8 feet, Illecillewaet, 120 feet of tunnel 89 feet of shaft, 3 miles from C.P.R.

30. Maple Leaf, A. F. McKinnon, 80 to 90 oz. silver, 72 per cent. lead, vein 29 feet, Illecillewaet. Improvements \$3,000, 3 miles from the C.P.R.

31. Blue Bell, Green & Gallop, 65 oz. silver, 60 per cent. lead, vein 2½ feet. Illecillewaet, 45 feet of shaft, etc., 2 miles from the C.P.R.

32. North Star, Green & Gallop, 62 to 125 oz. silver, 70 per cent. lead, vein 6 feet, Illecillewaet, 20 feet of shaft, etc., 6 miles from C.P.R.

33. Jumbo, Corbin and Kennedy, \$100 to \$800 silver, vein 6 feet, Illecillewaet, considerable improvements done, 4 miles from C.P.R.

34. Goat Cave, A. Chisholm, 30 oz. silver, vein 2½ feet, improvements done to the value of \$400, 2 miles from C.P.R.

35. Dunvegan, Boyd, Bain & Co., 80 to 130 oz. silver, 78 per cent. lead, veins 8 feet, Illecillewaet, 500 feet of tunnel, etc., 11 miles from C.P.R.

36. Sultan, Boyd, Bain & Co., 200 oz. silver, 60 per cent. lead, vein 4 feet, Illecillewaet, improvements done to the value of \$500, 4 miles from C.P.R.

37. Gold Queen, Stark & Taylor, 18 to 200 oz. silver, 45 per cent. lead, \$9 gold, vein 4 feet, Illecillewaet, improvements to value of \$250, 5 miles from C.P.R.

38. Sanguhar, Walter Scott, 110 oz. silver, 22 per cent. lead, vein 24 feet, Illecillewaet, improvements to value of \$200, 14 miles from C.P.R.

39. Round Hill, Capt. McCallum, 18 to 42 oz. silver, 70 per cent. lead, vein 5 feet, Illecillewaet, improvements to value of \$500.

40. Gladstone, Kennedy and McCarthy, 70 to 1,100 oz. silver, 70 per cent. lead, vein 10 feet, Illecillewaet, improvements to value of \$5,000, 3 miles from C.P.R.

41. Crystal, Corbin & Kennedy, 100 oz. silver, 70 per cent. lead, vein 6 feet, Illecillewaet, 20 feet of tunnel has been driven, 3 miles from C.P.R.

42. Bobbie, A. Chisholm, 110 oz. silver, 70 per cent. lead, vein 14 feet, Illecillewaet, improvements done to the value of \$100, 3 miles from C.P.R.

43. Snow Flake, Jowett & Haigh, \$300 to \$1,500 silver, vein 2 feet, Illecillewaet. Improvements done to the value of \$1,000, 3 miles from C.P.R.

Portland Cement for Machinery Bolts.—The Troy, N.Y., *Polytechnic* gives the following results of an experiment with English Portland cement for testing its adhesive strength in pounds per square inch, compared with sulphur and lead, for machinery bolts in rock. In a solid limestone ledge 7 holes were drilled 1½ inches in diameter, and 7 of 1½ inches in diameter, 3½ feet deep. Seven ¾ inch and 7 1-inch bolts were prepared with thread and nut on one end, plain at the other, but ragged 3½ feet from the blank end. The following are the results of the tests: In sulphur, 3 out of 4 bolts developed full strength, 16,000 and 31,000 pounds; 1 1-inch bolt drew out under 12,000 pounds; in lead, 3 out of 4 developed full strength as above; 1 1-inch bolt drew out under 13,000 pounds; in cement, 5 out of 6 broke without pulling out; 1 1-inch bolt began to yield at 26,000 pounds, but sustained the load some seconds before it broke. Further tests showed the strength of the cement to be equal to 400 to 500 pounds per square inch of exposed surface. It seems to be ascertained that cement preserves iron from corrosion.

Profit Sharing by a Coal Company.—Three years ago the Campbell's Creek Coal Company, in the Kana-wha Valley, commenced the sharing of profits with its men, and on the first occasion divided something over \$6,000. Last year the amount was much less, because the profits were smaller. The result this year is shown in the announcement that on September 20th the company will divide \$4,500 among the men. The money is given out in proportion to the amount of wages the men earn, and the next distribution will give each man an average of about \$60. Besides sharing the profits the company does a sort of insurance business among the miners in a novel and commendable manner. In that district the miner is "docked," or forfeits a certain amount of his wages when the coal he turns out has over a fixed percentage of slate. The company mentioned takes the dockage according to the general custom, but that amount, instead of going to the company, is put into a fund for the benefit of the men. From this fund the men are entitled to draw \$4 per week when sick. On several occasions, when through numerous demands this fund has become exhausted, the firm replenished it temporarily. In another way this company and its employes have moved together for the common good. In that locality the public schools are open only about four months in the year. To continue the schools for nine months each year the miners pay each twenty cents per month into a private school fund. The effect of this plan of sharing profits, and the mutual good feeling between the men and their employers, is plainly apparent. The men are contented and steady; they have improved morally and physically.—*American Manufacture.*

Phosphate Shipments.

The following have been the shipments of phosphate from the Port of Montreal, as per Custom House manifests, to date:—

Date.	Name of Ship.	Destination.	Shippers.	Quantity.
Aug. 25	SS Lake Winnipeg.	Liverpool	Millar & Co.	250
" 28	Michigan	Hull	do	200
" 30	City of Lincoln	London	Lomer, Rohr & Co.	90
" 30	do	do	Millar & Co.	300

Colliery Winding Ropes.—In the mining district of Dortmund, in 1887, at 91 collieries there were 201 winding ropes, namely, 32 flat steel ropes, 4 flat aloë ropes, 156 round steel ropes, 9 round iron ropes. Of the 3,005 winding ropes discarded during the sixteen years from 1872 to 1887, the following broke suddenly during working:—Of 309 flat steel ropes, 21, or 6.80 per cent.; of 147 flat iron ropes, 19, or 12.93 per cent.; of 86 flat aloë ropes, 6, or 6.89 per cent.; of 8 flat hemp ropes, none; of 1,598 round steel ropes, 51, or 3.19 per cent.; of 857 round iron ropes, 104, or 12.14 per cent.; altogether of 3,005 winding-ropes 201, or 6.69 per cent.; in 1872 out of 114 winding ropes, 22, or 19.30 per cent. broke suddenly. This proportion gradually decreased, until in 1887, out of 201 winding ropes, 3, or 1.49 per cent. broke suddenly.

Silver Milling in Montana.

In an excellent paper "Concentration before Amalgamation," etc., read before the American Institute of Mining Engineers, the operations of the Combination Mining and Milling Company, of Black Pine, near Lodge County, Montana, are described as follows:—

"The mill, as originally constructed by Messrs. Fraser and Chalmers for the Black Pine Mining Company, was an ordinary 10-stamp, wet-crushing mill, with room left between the battery and settling-tanks for concentrating machinery should it be found necessary to add it. As illustrating the impracticability of working these ores by raw-amalgamation alone a short summary of the operations of the Black Pine Mining Company may be given.

The mill was started on the 16th of July, 1887, and the run lasted until the 14th of September of the same year. During this period there were treated 1,178 dry tons of ore, assaying 17.5 ounces, and containing 20,615 fine ounces silver. Of this amount there was recovered in the form of bullion 9482.90 fine ounces, or 46 per cent. of the battery assay.

We need only note the points of difference between the Combination Company's plant and the form of mill ordinarily employed for treating silver-ores of the class usually termed "free-milling." These, as is well known, are so-called more because their low grade precludes their profitable treatment by the various other more efficient but vastly more expensive methods, than because they are better adapted to that process.

The ore is stamped, passed over four Frue vanners, the light pulp that goes over their "tails" being settled in tanks, shovelled into pans, and there amalgamated, discharged into settlers, and the resultant amalgam strained, retorted and melted in the usual manner. An analysis of these concentrates for the month of October, 20 tons into 1, gave the following result:

	Per cent.
Silica.....	32.50
Lead.....	9.10
Copper.....	8.22
Sulphur.....	1.19
Zinc.....	0.81
Silver.....	0.54

Samples of the pulp going to the pans for the same month show that it contained:

	Per cent.
Copper.....	1.05
Lead.....	0.48
Zinc.....	0.25
Sulphur.....	0.09
Silver.....	0.05

For the year ending May 31, 1889, the details of milling were as follows:

Dry tons crushed.....	9,061.965
Average assay, ounces of silver per ton.....	22.67
Gross contents of ore, ounces of silver.....	205,434.75
Estimated per cent. of reduction.....	80.70
Estimated product.....	165,785.84
Dry tons concentrates produced.....	541.805
Average assay of concentrates, ounces of silver per ton.....	136.17
Silver in concentrates.....	73,777.55
Silver in bullion.....	97,660.60

Total fine ounces.....	171,438.15
Actual per cent. saved.....	83.45
Total cost of milling.....	\$ 39,537.61
Average cost per ton.....	4.36

Batteries in service, 347 days, 5¼ hours. Average ore crushed per stamp in 24 hours, 2,612 tons. An analysis of the cost of treating one ton for the year gives the following figures:

Labor and superintendence.....	\$ 25,821
Salt and other chemicals.....	2,965
Fuel, at \$1 per cord.....	1,944
Castings and iron.....	3,846
Oils and illumination.....	1,066
Quicksilver.....	4,915
Miscellaneous supplies and team in yard.....	3,084

Total.....\$ 43,641

When the mill was started by the present management, an assay of the escaping slime-water was made, showing the value of the slimes carried by it to be 52 ounces in silver to the ton, or more than double the silver contents of the original ore. A series of carefully conducted experiments were at once inaugurated, and from them it was learned that three tons of these slimes, dry, containing 156 ounces of silver were passing through the waste-gate from the settling-tanks every 24 hours. These slimes were too light to permit of their being thoroughly settled by even the most extensive system of tanks, and to check this heavy loss, a China pump was placed in the last of the series of slime-tanks. This pump discharges into a small tank placed above and immediately in front of the mortars. It is only 1 foot deep, being made

shallow in order to prevent the gradual settling of slimes in it, and the consequent necessity of cleaning it out from time to time. From the side of this tank, and near its bottom, is the 2-inch pipe for supplying the water to the stamps. The only purpose of this tank is to furnish water to the stamps at uniform pressure. By prohibiting the use of any clear water in the battery, the escape of these slimes was very materially reduced, but this of itself was not enough to stop all overflow, as it would be in an ordinary wet-crushing mill, for reasons which will be explained later on.

The immediate effect of turning back into the battery, say two tons, every 24 hours, of slimes carrying twice as much silver as did the original ore (and this proportion of values has always existed), was to heavily "salt" our battery sample, and as the most rigid economy was essential to the commercial success of the property, the question of securing any accurate check on the mill became momentous. After careful consideration, it was decided to adopt the following system: Night and day samples are taken from the battery-launders in the usual manner, and are assayed daily with the other mill samples, but the results are corrected by the salting for the previous month. To determine this percentage, it is simply necessary to obtain the actual battery assay, and this is secured from the data furnished by the balance of the mill work, after the monthly averages are made up, in the following manner: The number of tons crushed, minus the number of tons of concentrates produced, must equal the number of tons amalgamated. The number of tons-amalgamated, multiplied by the average assay pan-sample, must be equal to total silver contents of the pulp amalgamated. This, added to the total silver contents of the concentrates produced, secured in the same manner, gives the grand total of five ounces of silver in the ore. This divided by the number of tons crushed gives the actual battery-assay. In this computation all tons are dry tons. The percentage of salting thus determined varies slightly, but the fluctuation is due more to errors in sampling than to any change in the actual amount of the salting. Usually, this is about 5 per cent.

But there was still a heavy loss in the escape from the settling-tanks of water carrying rich slimes, owing to the introduction of water at the heads of the vanners. To stop this, a small jet pump, using steam from the boilers and supplied with 50 feet of steam-hose for a discharge, was placed at the tanks, and slime water used in lieu of clear water for thinning down the pulp in the pans. While this corrected the evil, it also had the effect of increasing the difficulties in the way of concentration, as, in order to stop all overflow from the tanks, only as much water could be used on the heads of the vanners as was pumped into the pans, plus the evaporation.

After much experimenting it has been found, that with the limited quantity of water that can be used on the vanners, a speed of 180 revolutions of the crank-shaft per minute, with a belt travel of 3½ feet per minute, and an inclination of 3½ inches in the length of the machine, gives the most satisfactory results on these ores, although intelligent and constant adjustment is rendered necessary by reason of the changes occurring from time to time in the character of the pulp treated.

By reference to the details of milling for the year ending May 31, 1889, it will be noticed that the mill overran its assays 2.49 per cent., or 5144.63 ounces. As the actual battery-assay is determined by the assays of average pan and concentrate samples, and as the pan-sample is of necessity taken before the rich slime-water is pumped into the pans for the purpose of thinning down the pulp, the mill is bound to overrun, presuming perfect accuracy of sampling and assaying, exactly the amount of that part of the silver contained in the slime-water used in the pans which is amalgamated. As the greatest care is exercised to secure the most accurate sampling possible, and as in the assaying no deduction is made for silver in litherage, except in the tailings sample, the amount that the mill overran may safely be credited to the use of slime-water in the pans.

The pan charges have been changed constantly, according to the character of the pulp treated, and the amalgamation tests have been many and varied. The charge now being used, which seems to be the best tested, is 50 pounds of salt, 2 pounds of sulphuric acid, and ½ pound of cyanide, with 100 pounds of quicksilver strained in after the pan has been running 4 hours. The temperature of the pulp is raised by steam to 180° Fahrenheit, and the charge is run at 65 revolutions per minute for 8 hours. Settlers are run 14 revolutions per minute, and give good agitation with 3-inch shoes.

In the battery, 40-mesh brass-wire screen-cloth has been used during the past year, with the exception of about two weeks, when 30-mesh was tried by way of an experiment. After a thorough test it was found that the loss occasioned by higher tailings exceeded the profit accruing from increased crushing capacity, and the 40-mesh screens were replaced. The falling off in the savings during the time the 30-mesh screens were in use was largely owing to the fact, that the difference between the very finest of the slimes and the coarse particles that would pass through a 30-mesh screen was so great, that

with the increased quantity of pulp to be treated by the vanners, they could not be made to do close and clean work.

The concentrates produced, which thus far have been the final product, have been shipped to a smelter for treatment; but experiments are now in progress looking to their treatment at home, and it is highly probable that the necessary machinery will be added to the plant in the near future.

The Treatment of Fine Gold in the Sands of Snake River, Idaho.*

By T. Eggleston, Ph.D., New York City.

The sands of Snake River, Idaho, have long been known to contain gold. They were worked by some of the first prospectors who came to Idaho, and on the banks still stand the ruins of camps abandoned for years. There are almost always prospectors searching for gold during the season of low water, and it is not an infrequent thing to find a miner of the old type actually panning the sand, or the prospect-hole which he has just left. There is more or less mystery about these miners and their methods of finding the spots where they work. They are always subjects of much speculation to the ordinary traveller. The rich discoveries are, for the best of reasons, concealed until the claims can be taken up. It is difficult to find a place where there are no prospects, but the "colors" are so very fine that they do not offer much inducement to enterprise. The California miner usually values a color at from 5 to 10 cents, often the latter; while on Snake River it would take 100 colors, or even more, to make that amount.

There is not much difficulty in panning out the heavier pieces of this gravel, so that those which remain have not over half the diameter of a pin's head. Below this size the separation is extremely difficult, as the flakes are very thin. The heavier pieces of the hasalt, the black sand and fine gold remain persistently together; and, after the iron has been separated by a magnet, there still remains a material which appears grayish to the eye, has about the same gravity as the light particles of gold, and cannot be removed with an electro-magnet run by a very strong battery. After the heavy black sand has been separated by the magnet, the fine particles of gold float, while the gray sand sinks; so that I had the greatest difficulty in concentrating half a liter of material, taken up from under the head of the burlap sluice, into a bulk of 15 by 14 millimeters. A large part of the concentrated gold floats; and when, after much trouble, the surfaces are wetted and the gold is got under the water on to the top of the sand, the first wave from the other side of the pan over the sand floats the gold again.

The minerals contained in the fine sand are quartz, chalcedony, semi-opal, zircon, topaz and magnetite. I have not been able to distinguish any trace of pyrite, and have only occasionally seen small grains of peridot. These minerals are sometimes ground and broken, and sometimes are small detached crystals, which can, however, be seen only with high powers. The gold itself is in flattened forms. Almost every piece is convex and shows surfaces which are bright and more or less mammilated, having the appearance of having been acted upon by some reagent. They are quite similar to the artificial nuggets which I described some years since.†

It is a question of interest how this gold got into the sands. The most probable answer seems, at first sight, to be that it came from the abrasion of the rocks. This leads to the further question, Why is it, then, so very much finer than gold-sands ordinarily are? I do not pretend to be able to answer these questions decisively now, but hope to do so at some future time. The object of this paper is rather to describe the method in use for catching a part of the gold.

Snake river, during the course of nearly 100 miles, which I have studied, runs through a columnar basalt. The rock covers the plains, where the surface of the flow is covered with great nodules from 15 to 40 feet in diameter, and from 10 to 12 feet high, which have a radiated and at the same time a columnar structure. The erosion and destruction of this rock has formed the sands of the great Idaho desert. The rock is much fissured and is covered only to a slight depth with sand. It is generally compact, but the surface of the ground is covered in some places with small pieces so full of bubble holes that they appear like scoria. All such pieces have a more or less large coating of silica on them. It is in this rock that the Lost river disappears, to come out again, as is generally believed, in one of the numerous large springs which flow from the north side of the bluff below Shoshone Falls.

The Oregon Short Line railroad crosses Snake river at American Falls station, where the river is 1,500 feet wide and descends 50 feet in several falls 10 or 15 feet high between bluffs 30 to 60 feet high. It runs west in this way a little over 100 miles, the bluffs on both sides of the river gradually growing deeper, until at what is known as Twin Falls the river suddenly falls 175 feet, leaving the bluffs 500 feet high. In the course of the next 3 miles it forms

Shoshone Falls, where the river first narrows to 750 feet in width and then takes a jump, first of 75 feet and then, within a few yards, of 210 feet, leaving the bluffs at the foot of the falls 1,200 feet high on both sides of the canon and the river 1,000 feet wide. The top of the bluffs is a very hard compact basalt, with occasional small modules of chalcodony, but only in a single place, just above the Twin Lakes, below Shoshone Falls, did I see in this top rock any large holes, and nowhere any appearance of weathering or decomposition in the rock itself in place. The rock is in many places coated with a white covering of silica, formed by the evaporation of the water percolating through or collected on the surface. These coatings sometimes take fantastic shapes, as in the case of the Devil's Spade, about a mile above Shoshone Falls, where what appears to be a painting in white of a gardner's spade can be seen in a niche just below the top of the bluff. Notwithstanding this deposition of silica, the rock shows to the eye no trace of decomposition. I was told that the iron pyrites is found in modules in the upper part of the bluffs; but I did not see, in the course of more than a week that I spent on the river, a single piece of iron pyrites, however small, though I looked carefully for it. Below the great Shoshone Falls, on the level of the river, the rock is porphyritic, light gray in color, and much more felspathic and friable than the basalt above, and thoroughly rotten from decomposition. About 100 feet from the foot of the falls it is so worn away that I crawled through apertures in the decomposed rock for 25 or 300 feet, at a distance of about 10 feet above the water, the outside of the rock still being intact. This decomposition is much like that which occurs in the sand-rock of the Kentucky River, near Jackson, Ky. It is not an uncommon thing in the various side-canons which lean into the main canon of the river to find that the bottom rock has been so much decomposed, by the absorption of its alkalies, or so much washed out, that pieces of the overhanging hard rock, 50 to 75 ft in length and 8 to 10 feet in width, have dropped down, retaining their vertical position, leaving a chasm 2 or 3 feet wide between them and the main rock. Striking examples of this occur in the side canon near the Twin Falls and below the Great Falls.

This decomposition of the underlying rock has taken place on a very large scale, and is particularly visible just above and for a considerable distance below the main falls, so that the surface for 500 feet from the main fall is broken up into what appears at first sight to be small terraces, which are difficult of access. From the top of the cliffs this sinking of the rocks gives an appearance, on a very small scale, quite similar to the grand canon of the Colorado river, as seen about 75 miles from Flagstaff, Arizona, when the same phenomena takes place on a different rock, on a scale probably larger than anywhere else in the world. The water of the river is cool, and slightly alkaline to the taste. The soil is full of alkali, which is undoubtedly one of the results of the decomposition of the rock. It is also probably one of the sources of the solution of the gold, and its subsequent deposition in the sands of the high banks as well as the deposition of the silica minerals formed by evaporation.

It is a fact well known to those who chlorinate pyrites concentrates, that the gold they contain is in all degrees of fineness; that, in some cases, it is extremely difficult to attack the gold; and that, in other cases, the loss in roasting is enormous, on account of the very large surface, as compared to the weight, of the gold particles. It is known that the gold is much finer in some pyrites than in others, and I supposed at first that this might account perfectly for the condition of the gold in these sands. The microscopic examination, however, does not justify the conclusion that the gold has come exclusively from the decomposition of pyrites; since in no case have I been able to find any gold that was coated, or the surface of which was not just as bright as if it had been for a long time exposed to chemicals. That small quantities of gold are contained in solution in the waters flowing through these rocks seems to be probable. The experiments that I have been able to make in the laboratory tend to confirm this opinion.

Snake river, below Shoshone Falls, runs for 18 miles through basalt, the height of the bluff varying from 1,200 feet at the falls to about 500 feet at the end of that distance. It then commences to widen out gradually, the talus of sand increasing little by little in height until at last the outlines of the rock only, come up at the top of the bluff. These finally disappear; and what was a talus becomes sand-hills on the south side, and, on the north, more or less irregular sand-bottoms, with cliffs of basalt varying in height, but generally not more than 30 to 40 feet high, so that in several places roads have been constructed in the side canons from both sides down on to the bottoms. On the top of the bluff there is no water. The rock is columnar and very much fissured. It dips south, so that there are no springs on the south side of the river, but all along the north side at intervals of three or four miles great springs gush out, which form at once considerable streams, issuing directly from the rock.

The river bottom-lands widen from nothing to about half a mile. They rise above low-water mark as much

as 30 to 40 feet. Where it is possible to get water to them, either from the springs on the north side or by flumes taking water high up the river on either side, the sands, after the alkali is washed out of them, make excellent soil, and in both ways some beautiful ranches have been made.

The sand in the river contains some gold, not in large quantity anywhere. It is so very fine that it is difficult to collect it without special apparatus. The gold value of these sands is estimated at about five cents to the cubic yard, which includes top soil and bottom gravel as well. The pay-streak is richer than this, but in the working it is impossible to make any separation.

The pay-streaks, after prospecting, are worked on both sides of the river. There are a number of these placer-workings about 50 miles below Shoshone Falls, which have been operated for a number of years by a method but little known. One of these, known as Hunt's placer-claim, at Salmon Falls, which is 17 miles across the desert from Bliss Station on the Oregon Short Line Railroad, I had occasion to visit in the summer of 1889.

The method of excavating the sands is simple. It consists in bringing a ditch into the pay-dirt, and making the ditch itself do almost all the work of excavation. The fall of the water breaks the ground down, and sufficient grade is given to carry it to the machines. The best grade for the water-ditch has been found to be 4 inches in 12 feet. Ditches with earthen banks, and flumes, sometimes partly in earth, and at others wholly on tressels, are used. When the ground-sluice is not over 36 inches wide, gravel runs easily on a 4-inch grade. The long flumes have a grade of $3\frac{1}{2}$ inches to 12 feet. The ground-sluice is made so as to gradually work back, cutting itself out by the fall of the water. The top soil is broken back by the pit-man with a steel bar, and the lumps are broken up with a light pick. The pay-gravel varies from 10 to 25 feet in thickness, and has to be washed in benches, taking from 5 to 8 feet for a bench. No ditch is required in the gravelly places. The stream is directed around the bank by the pit-man, who uses "shear boards," 14 inches wide and 2 inches thick, with round sticks 1 foot long and 2 inches in diameter, run through them as handles. These are so placed as to direct the water against the bank, to undermine it slowly, so that the sands cave, but not so rapidly as to impede the course of the water. These planks require the constant attention, in the day time, of one man in the pit, who in ten hours will bar down ground enough to keep the machine working for twenty-four hours. The skill of the pit-man consists in so barring his gravel and arranging his shear-boards that the pit will take care of itself at night. The current must be strong enough to carry all that falls into the sluice leading to the machine. Occasionally, the ground-sluice is dammed by the gravel in the night, and cuts a channel in such a way as to make it impossible to reach certain blocks of ground. This is not, however, a serious inconvenience, since the ground has to be broken in benches, and the spot so left is taken in, in working the bench below.

The stream carrying the broken-up gravel runs through sluices, in general not more than 24 inches wide. But, from about 8 feet before it reaches the first iron plate of the machine, the sluice is enlarged, so that where it meets the plate it is 4 feet wide. The machine consists of a board-sluice, lined with perforated sheet-iron plates, 3 by 4 feet in size, which are called "grizzlies." Below them, on both sides, is an inclined sluice, leading to an undercurrent, which discharges into sluices covered with burlap, called "sack-boxes." The width of the machine is constant, but the length varies with the fineness of the gold to be caught. At Hunt's claim there are three—one 24, one 30, and one 36 feet long. The flume that carries the gravel is 1 foot lower than the top of the "grizzly." The sand accumulates here and makes a pavement, and prevents the wearing of the bottom. In some of the small machines this sluice is paved for some distance with wooden blocks placed on end; but all of them have blank plates for the length of one plate, at least, set almost without grade; and these have been found to wear best, as the water builds its own grade from the sluice to the machine. The blank plate is 4 feet long. It is made, like the other plates, of steel or coke iron, 5-32 of an inch thick. The grizzly-plates are perforated with conical holes, $\frac{1}{2}$ an inch between centres, which are 5-32 on the top and $\frac{3}{8}$ on the bottom, to prevent the holes from clogging. These plates are 3 feet long and 4 feet wide. The sides of the sluice are made of boards, 1 inch thick and 12 inches wide, except just over the undercurrent, where they are 2 feet wide. The grade of the "grizzlies" varies from a $\frac{1}{4}$ to $\frac{3}{4}$ of an inch, according to the size of the gravel. The coarser it is the more grade is required. In setting up the machine a frame is first built, and on this the grizzly is placed loose, so that the grade can be changed if necessary by wedges placed underneath it. Ordinarily, $\frac{1}{2}$ an inch to the foot is found to be the best grade. When the grade is determined, the grizzly is wedged firmly to its place. At the end the grizzly discharges the material too large to go through the holes into the tail sluice, which must have sufficient grade to carry off all the tails. Below the

grizzly the sides incline both ways towards the center at the rate of 2 to 3 inches, or more, to the foot, and end in an undercurrent called a "sand-tank," which is 4 feet wide. This has a grade of $1\frac{1}{2}$ inches to the foot, towards each side. It is generally placed immediately under the center line in the middle of the machine, but its exact position depends on the lay of the ground. In its center is a sump, 4 inches lower than the lead-boxes, so as to distribute the water equally to the burlap-sluices on each side of the machine. These are 4 feet wide, incline $\frac{1}{2}$ to $\frac{3}{8}$ of an inch to the foot, and are arranged according to the length of the grizzly. For the 36-foot grizzly there are twelve of them, six on a side; for the 30-foot, there are ten, five on a side; for the 24-foot, there usually are only six, three on a side. Four would work better. The grade of the lead-boxes is $\frac{1}{2}$ to 1 inch to the foot. The lead-sluices are arranged so that the back one carries the gravel to the sluice furthest away from the machine. They are 10 inches wide. In order to distribute the sand evenly in the width of the sluice, there are four divisions at their head, which vary in length so as to distribute the current equally. At their upper end there is a movable grating made of strips of wood, set inclined, to keep out any floating matter which may accidentally get in, and to further distribute the stream. The sluice-boxes are 3 feet wide, and 24, 30 and 36 feet long; made of thin boards placed end to end. The sides are 6 inches high and are nailed to the sides of the bottom boards. They have a grade of $\frac{1}{4}$ to $\frac{3}{4}$ of an inch to the foot. If the material treated is all sand, which is the usual case, the grade is $\frac{1}{4}$; if gravel and sand together, $\frac{3}{4}$. These burlap-sluices connect with the tail-sluice by a sluice at their end, at right angles to the main sluice, which is 3 feet wide and has a grade of $\frac{1}{2}$ an inch to the foot, over which the burlap-sluices project 6 inches, and which projects 2 feet beyond them. These sluices, like the grizzly, are set on a frame, so that the grade can be changed by wedging, and when once determined on, can be set firmly in place. As the tail-sluices are on both sides of the machine, they discharge in front of the grizzly with sufficient force to move all the tails down the main tail-sluice.

At the head of the burlap-sluice, just beyond the wooden gratings, which regulate the flow of the gravel, is a cross-bleat, under which an iron plate, 1 foot wide and as long as the width of the sluice is fitted. This is made of old grizzly iron. It is held down at the side by a cleat, under which it slips.

The sluice is covered with burlap 40 inches wide. It has been found by experience that 7 ounces to the yard is the best burlap to use. Heavier and lighter have been used, but are not found to answer so well. The lead-sluices have a grade of 1 inch to the foot; when the plate is put on them, there is a slight drop; and here there is always gold to be seen at the clean-up. Each of the lead-sluices is so arranged that it can be cut off separately. This is done by a gate of wood wrapped with burlap to make it quite tight and, in order to further keep out the water, the burlap, which is to go on to the sluice after the clean-up, is thrust into the lead behind the gate, which prevents the passage of water and at the same time wets the burlaps, so as to fit it to be spread out on the sluice. These gate-wrappings, as soon as the clean-up is finished, are hung up on the east side of the grizzly, so as to be ready for use at the next clean-up. The burlaps on the sluices are held down by cleats of wood, kept in place by wooden eccentrics, screwed to the side, so that when they are turned down, they hold the cleat in place. These cleats are $1\frac{1}{2}$ by 1 inch and are cut from a 1-inch board. After six years' use some of them are so worn that they have to be turned up on their angles to meet the eccentrics. In the 24-inch sluice there are six of these on each side.

To make a clean up, the man in the pit comes down to the machine with the superintendent, and the water is turned off from each of the sluices, one at a time, commencing always with the outside sluice. The assistant has a piece of flat rubber set in a handle. He knocks down the eccentrics on both sides of the sluice to be cleaned, with the handle, so as to loosen the cleats. These are then taken out, washed in the next sluice and placed crosswise over it, to be at hand when wanted. The superintendent takes out the iron plate at the top and carefully scrapes off the sands and gold, washing the plate in the next sluice. The assistant takes the burlap from the bottom, brings it up to the center of the sluice, and commences to push with his rubber the material collected underneath the burlap on the bottom from the lower end to the middle of the sluice. The superintendent carries the top of the burlap to the middle, folds it to 18 inches and the width of the sluice, then doubles it over towards the side of the sluice, presses it flat with his feet, and places it in one of the boxes. There are two of these boxes for each sluice. They are 18 inches long, 13 inches wide, and $7\frac{1}{2}$ inches deep, and are lined with tin. The woodwork of the boxes is only knocked together, but with constant use they last four years. When the tin commences to rust through, so that they leak, the boxes are used exclusively for the burlaps. The tight boxes are always used for the sand. While the superintendent is

arranging the blankets, the assistant goes to the top and pushes the sand down to the middle, to be put into the other box. When the sluice is clean, the fresh-wetted burlap is taken out of the lead-sluice, the upper end being held by the superintendent and the lower end by the assistant, and stretched with both hands over the sluice, leaving the upper end of the burlap to project over the upper end of the sluice. The burlap is shoved under the cross-cleat by the iron plate, which is cut off at the corners to prevent cutting the burlap; this goes under the cleat and is held fast, leaving about 2 inches of the burlap projecting over the top of the plate. The side-cleats are now taken from adjoining sluice and put in, commencing at the top. On their hands and knees the two men go from the top to the bottom, pressing the cloth in place, spreading the burlap so that it comes up to the sides of the cleats and sometimes over the top, according as it stretches. They then turn down the eccentrics, put in the grating, and turn on the water. This work, in a single sluice, takes five minutes. The next sluice is treated in the same way, and so on until the clean-up is completed. They are careful to spread the burlap tight and smooth; for, if it is wrinkled or bulges, sand collects under it and less gold is caught. If they are properly put down, only two or three pans of sand will be thus collected which, at the head of the sluice, contains considerable visible gold. Most of the gold, however, is caught in the burlaps.

The burlaps are cut so as to cover the whole length of the sluice and lap over the lower end; but they wear, and after some use grow short, so that they are generally 18 inches to 2 feet shorter than the sluice. The lead-sluices at the head of the burlap-sluice, which distributes the stream, are keyed in and are kept together by diagonal strips. The grating is put in loose, 6 or 8 inches from the slats.

Nothing but burlap has been found to answer for this work. Ducking was used at one time, but it did not catch the gold so well and rotted too fast. The burlaps are used until they go to pieces from rotting. They usually last two months. When worn out, they are used around the gate. When they can no longer be used, they are dried and burned, and the ashes are panned. In order to prevent the closing of the pores by vegetable matter, the burlaps must be spread out in the sun to dry thoroughly after each clean-up, to destroy the plant-life before they can be used again. They last longest in summer. In the winter they are apt to tear from freezing at the sides. The whole work of the three machines is done by five men,—one man in each pit; the helper, who does other work; and the superintendent who, with the pitmen, makes the clean-up and "rocks" the dirt.

Over the 24-foot machine, 200 to 250 inches of water are constantly run in 24 hours: on the 30-foot, 350; and on the 36-foot, 400 inches. The work done on each machine averages about a cubic yard of gravel for each miner's inch of water used. The essential requisite is to secure a good dump; unless this is done, the tail-sluices will soon be filled up. Usually, on Snake river the spring freshets wash the tail-sluices out; but for two or three years, on account of the low water in the river, this has not been the case. It is also necessary to set the bed-rock sluice in such a way that there will be plenty of water the year round. In some places it has been set too high, so that when the river is low there is no water to wash with, while there is plenty of water in the river. Not only plenty of water, but free water is essential to the economical success of this process.

The boxes from two of the machines which are at a distance, are cleaned at a shed near the house, half a mile from the sluices. In one which is difficult of access the rocking is done on the spot. The clean-up house is 14 by 12 feet. On the long side against a window is the washing-tank. An ordinary gold-sand rocker is placed at the end next a window, and the retort-furnace opposite to it. The boxes containing the burlaps are piled next the washing-tank. The sand in the boxes is piled next to the rocker. The washing-tank is 10 feet long, 3 feet wide and 3 feet deep. It has a shelf 6 inches wide behind, and one 4 inches wide at an angle of forty-five degrees in front. The burlap taken from the box is washed several times up and down in the tank, where water is constantly running in and out. It is then allowed to fall into the tank; the end being held by the hand, is washed by shaking it on to the front ledge, and is then folded backward and forward so as to make the folds 1 foot wide. It is then thrown on to the ledge behind. The gold sand from the burlap which remains on the front ledge is then washed into the tank, the end of the burlap is brought over on to the front ledge, while the rest remains on the opposite ledge, and the space between the two parts of the burlap washed up and down and again folded on the front ledge. This is repeated twice; so that each burlap is washed three times. The ledge is washed every time to throw the gold into the water. The washing is done at some distance from the discharge-pipe, to avoid the danger of the fine gold floating off. The sand collected at the bottom of the vat is allowed to settle until the water is almost clear. The water is drawn off from above at three plug-holes, at different levels, and the sand collected is rocked. The

rocker has a plate 60 inches long by 24 inches wide. The end and sides are turned up 1 inch, so that the inside space on the plate is 22 by 59. The hopper, into which the sand is put, is 13 by 15 inches, and 5 inches deep. The bottom of the hopper is made of a grizzly plate and the constant washing has worn grooves laterally towards the holes. The inclination of the plate is $2\frac{3}{4}$ inches in 2 feet, which experience has shown to be the best. The plate is copper and not silvered, silver-plated plates not having been found to answer. The plate is first washed with a swab soaked in potassium cyanide. Then mercury, sprinkled half way down through a fine cloth placed over the end of a bottle, is wiped over the surface with the cyanide swab. The sand is put in at the hopper and the rocker is rocked seventy-eight times a minute. What comes off the plate runs into a tail-sluice, and carries almost no gold, not more than two dollars to the ton. About seven small coal-shovels full are worked in a minute, care being taken never to clog the holes. This is all that is done with the sand from the boxes. The sand from the tank is mixed with cyanide, the proportion being determined by trial, and allowed to stand two hours before rocking. The moment the rocker is stopped, the end of the amalgamated plate is turned up so as to drain to the back, to prevent the loss of mercury and amalgam. Each machine is cleaned twice a week. The 24-foot treats from 78 to 80 tons per day, and the others correspondingly more. The gold collected by this method is very fine,—much finer than any that I have seen, except from some of the Arizona placers.

The machine runs itself, with only one man in the pit. It pays to run sand which has from 50 to 85 colors. These machines collect from thirty-five to forty dollars a day each. The work of the clean-up varies with the size of the machine. With the 30-foot machine, all the work of cleaning up the sluices, washing the burlaps, spreading them out to dry, and rocking, is done in six hours. The 36-foot machine takes an hour longer, and the 24-foot an hour less.

This method is one of the least expensive of all the devices for the treatment of fine gold. It requires but little capital and labor, and the returns well repay the men. It requires, however, free water. By changing the grade of the machine and sluices, and multiplying the number of burlaps, very close work can be done.

Coal-Mining and the Duties of Colliery Managers.

The following address was given by Mr. William Rogers, J.P., F.G.S., at the annual meeting of the National Association of Colliery managers, held at Wigan in the North of England.

Every intelligent workman, before commencing operations in his particular trade, necessarily considers well the material he has to work upon, the object he desires to obtain, and the tools he has to work with; and before he is an efficient manager he must further know what is the necessary knowledge he must acquire in order to place him in this position. Our first point of enquiry, therefore, must be this, viz.:—What is this coal, the material upon which we have to work? Time does not permit me to enter into a scientific description of the origin or formation of coal; we all know that it is supposed to be a vegetable formation, in some cases of large forest trees, and in others of more humble origin in the shape of lower growth, such as ferns, moss, &c., which by peculiar coverings of water and soil has escaped the ordinary and natural decay so general in all vegetable matter; but there are coals and coals, and it is of the greatest importance, before you can arrive at the best mode of working any particular stratum of coal, to see that you clearly understand its special nature. For instance, some seams of coal may be hard, others soft, some seams thick, others thin, some seams are intervened with bands of foreign matter of varying qualities; the strata also above and below the seams to be operated upon want due consideration, such as the nature of the roof and floor, and if the field is disturbed or dislocated by faults they also form an important element in arriving at a right conclusion as to the best mode of opening it out. All these indicate to you not only the vast importance, but the absolute necessity of a certain amount of geological knowledge, which will make your work not only more interesting, but far more efficient and valuable. Formerly the study of geology was confined to, comparatively speaking, a few scientific men who had both leisure and special training to pursue it, but now, happily, we are living in an age when there exists a desire and a real endeavour to combine theory with practice in all branches of industry, and the facilities for your acquirement of the amount of geological knowledge necessary for any of yourselves are greatly multiplied; these are advantages possessed by colliery managers of the present day which were utterly unknown by your predecessors. If it had been a compulsory study for all workmen seek-

ing advancement as a colliery manager, numbers of areas of acres of coal now unworked would have been opened out, and work found for thousands of our artisan classes, and on the other hand thousands of pounds would have been spared the country in foolish attempts to find coal where none could possibly exist. To some geologists the idea years ago prevailed that coal did exist where it has lately been discovered through the borings for the Channel Tunnel, and I think I can safely predict that there are yet existing vast fields of coal which at the present time are not even thought of. It may, however, be said, and with some truth, that the prospecting for coal is more the province of a mining engineer than a colliery manager, but surely an intimate knowledge of the strata, through which a sinker has to pass before reaching the coal, is of the utmost benefit to the colliery manager.

The history of mining is lost in the traditions of the past. Early Scripture history shows us that the Egyptians and other nations were intimately acquainted with metalliferous mining, and before then mining was extensively practised by Asiatic races. When the use of coal came first into existence history is altogether silent or very vague. In this country, I believe, tin and copper mining were first known in Cornwall, but the early stage of coal-getting can hardly be dignified by the name of mining. There is scarcely a mining district where the coal crops out to the surface that has not extensive remains of day-eyes or tunnels driven from the surface. The extent of such tunnels was of necessity limited by measure of the animal power that could bring the coal from the face to the entrance of the eyelet or tunnel, or where water existed, to the limit of drainage power. Of course, in those days the use of coal as a general article of consumption was comparatively very limited. In many places (and I believe this state of things can be remembered by some now living) the coal had to be conveyed on the backs of pack horses to the nearest points of distribution. This limited demand naturally prevented any systematic mode of getting it, although in a few more populated districts shallow shafts were sunk, and windlasses or whimseys were utilised for the purpose of raising it. It is amusing and interesting to anyone, but especially to colliery managers, to contrast the very clumsy and yet simple methods of getting and dealing with coal in the past with the wonderful advantages we now enjoy. Really and truly, mining in the strict sense of the word did not become a practical science until the successful application of steam power to colliery operations, completely revolutionising the whole trade. Rapid indeed was the progress of coal-mining when the steam engine as an effective machine came into popular use, creating at one and the same time the demand for coal as the feeding power of the mechanical steam horse, and the means of winning the same, by bringing it from the face of the mine to the bottom of the shaft, and again from the bottom to the surface, by clearing the mine, by steam pumps, of its old enemy, water, and by ventilating it either by furnace or fan of the deadly foul air and gases so fatal to the thousands dependent upon it for their livelihood, and last, and by no means the least, by distributing it at a cheap cost over the United Kingdom, and even over the mighty seas which lap our shores. The power of steam was known thousands of years ago; its useful application scarcely goes back beyond the last century. From that useful application has sprung up untold wealth to the world. We have it upon indisputable authority that at the commencement of last century the pit shafts in the north of England—afterwards to become the greatest coal district in the world—were only a few yards in depth, none exceeding 50 yards; there was no mechanical haulage underground, the coal was actually carried from the working-places to the pit bottom on the heads of women and children; a slowly-revolving whimsey, propelled by some animal, performed the operation of winding and pumping; and upon reaching the surface, horses and mules conveyed loads not exceeding 3 cwt, of coal over very bad roads, across hill and dale, for shipment. At that not very remote period there was no other mode of conveyance. Ventilation needed no appliances because the workings were so limited in extent, and the persons employed so limited in number, that natural ventilation fulfilled all requirements. Somewhat later, roads for the better transit of coal were made, and consignments of something approaching 17 cwt. were made possible in carts. Then wooden rails were laid as a help to the carts, and afterwards wagons were used, provided with sails.

The rapid development of coal mining causing extensive workings at nearly every pit presented a new and serious risk to the workman in the form of explosive gas—hitherto the chief danger being firedamp and (what is still too much the case) falls of roof. This explosive gas was the cause of many and appalling losses of human life, hundreds of poor fellows at one instant of time being killed and mutilated, and thousands of pounds lost in damage to the workings where they occurred. It is also true that even now the world is not exempt from the recurrence of these explosions, but what would have been the extent of them had not Sir Humphrey Davy

invented the safety lamp, it is appalling to think. The greatly-extended workings of the present day necessitate increased ventilation, and this is a subject that every colliery manager should never lose sight of. The more rapid velocity of air through the workings has to some extent lessened the safety of the lamp, as there can be no doubt that explosions have taken place through the current of air being driven through the wire gauze hitherto so impervious; there again the existence of a new danger leads to the effort to discover a suitably remedy. New lamps to meet this difficulty have been introduced in a great many instances, but, in my opinion, the safest lamp, without at all depreciating the excellence of the electric lamps, is yet to be found in some modified form of the old and tried friend that has served the collier for so many years. I would, however, impress upon all colliery managers the old proverb, "Prevention is better than cure," and he is the best manager who, by carefully distributing a sufficient quantity of air (not only in the working-places, but also through the goaf) prevents the possibility of the formation of huge gasometers.

This slight sketch of the progress of coalmining brings us to our present favoured position. As compared with the old days of manual labour, ill-directed and badly applied (being merely a labourer's calling), we have a trade requiring all the assistance that science (in the form of geology and chemistry), skill and appliances in the forms of engineering, both mechanical and mining, can give us. We require stores and implements unknown and unthought of in its early history, and many trades have sprung up in connection with mining, finding employment for thousands of our labouring classes, wire and steel ropes, steel rails and wheels, iron castings, timber and other utensils too numerous to specify in detail requiring a training for the position you gentlemen now hold, second to none in the industries of this country. We now have pit shafts sunk to a depth of near upon half-a-mile; powerful winding engines hundreds of horsepower, worked by steam, and raising tons of coal at each journey at speeds equal to that of an express train; workings extending for miles from the pit bottom, and mechanical power conveying expeditiously large trains of coal from the working places to the cage; magnificent pumping appliances placed above ground or below, and capable of raising any quantity of water from any depth; enormous ventilating machines passing through the workings of a colliery not merely tons, or even hundreds of tons, but thousands of tons of air per day, and capable of running night and day for years. And much as has been done during our own century, the next will, in the opinion of many who are competent to judge, be equally fruitful of improvements. Shall I, at this point, without trenching on a later portion of my remarks, suggest that the wonderful invention of electricity, still in a state of infancy, will probably advance to giant's growth? Shall we have it applied not merely to signalling, but to pumping and winding and hauling? and in the actual getting of coal? Greatest perhaps of all, will the dim light with which we now grope our way amidst the darkness underground, contending with dangers more difficult because unseen, pass away? and by an effective and safe and comprehensive application of electric light, provide us with an illuminant in every part of our mines, equal to the light of day?

To a certain extent the mining schools of this country have rendered most efficient service in providing for the requisite knowledge in chemistry, mechanical engineering, &c., but I should like to see the day when these schools are not only used by aspirants for certificates, but those who, having acquired them, still desire to extend their knowledge, and apply it to the special works under their control. I am convinced that the better chemical acquaintance with the seam of coal a manager has to win, and an extended acquaintance with the science of mechanical engineering would frequently assist the firm he is connected with in various ways, such as finding the most suitable or particular coal markets, and he would save them hundreds of pounds in more ready mechanical contrivances for drawing and raising it to the surface. I believe that great benefit would arise to the trade generally if the managers would seek out and encourage miners of thought and experience, so that by their aid a more easy and effective method of winning coal would be soon discovered at a cheaper cost, resulting in increased wages to the collier with less trouble to himself, a less percentage of small with a greater percentage of round, and a greater employment for labour.

A colliery manager's first duty is to provide for the safety of the men under his employment. This is a short sentence, but what does it not embrace? No mine can be safe unless all the details essential to mining are carefully thought over and carried out. Parliament has wisely set out certain rules to guide a colliery manager, but these regulations only touch the fringe of what ought and must be done before the maximum amount of safety can be secured. He is, indeed, a poor manager who thinks he has done all that is required of him when he has committed to memory these rules and reduced the same to practice. In order to prevent accidents from

gas, too much attention cannot be given to proper and sufficient ventilation both in the goaf and working places; also, to prevent accidents from falls of roof, a regular and systematic inspection of the main roads and working places must be made; and, further, to prevent the numerous miscellaneous accidents, uniform attention must be given to propping, inspection of the main roads, machinery, and all working places.

The next duty of a colliery manager is to see that he gets his coal at the cheapest possible cost, consistent with the safety of the men under his supervision and the efficient opening-out of the mine. It will be seen that very much depends upon considering in the first instance a well matured plan. This is of the utmost importance, and I would urge upon managers, after having carefully considered their plan, not to deviate from it unless some glaring error is manifest. Many good collieries have been rendered too expensive to work by ill-advised and badly-matured plans, and even in some cases through having been worked haphazard without plans at all. One great point is not to open out the mine too extensively at one time, thus incurring large dead expense in keeping open the requisite roads and airways; another is to have as short drawing roads as possible, for the great aim of every manager should be to keep the collier and his drawer as much occupied at the face of his place as possible. The various systems of mechanical haulage, whether tail-rope or endless rope, and whether driven by steam or compressed air, enable us to overcome all difficulties under this head. Again, too little attention is, I fear, in many cases paid to the saving of timber, pit rails, coal tubs, &c. There are few concerns that at one time or another have not to lament the loss of rails, and more old timber is lost annually than can be imagined, from neglect to draw it when opportunity arises. Another great point is to see that the proportion of small to round is kept at the very lowest point. The annual loss under this head is something enormous, and I should say that a manager who can decrease this percentage is almost as great a benefactor as the celebrated agriculturist who could grow two blades of grass where one grew before. A great deal depends, of course, upon the nature of the strata lying above or below the seam to be worked, but where holing is possible in the warrant it should always be strictly followed out.

Again, in these heavy days of competition, the condition of the coal as far as cleanliness is concerned is a great and important subject for attention. I have seen positively unmerchantable coal take a fair position in the market where this point has been carefully watched and attended to. This opens out the wide subject of coal picking, coal sorting, and coal washing, on which we have not time to dwell.

Lastly, there is the great and important question of output, and here I would point out the necessity of a manager studying the interests of the miner under his charge. The get of any one collier is of as much importance to the concern he serves as it is to the collier himself—what is a loss to the one is also a loss to the other. Short drawings, plenty of empty tubs, good roads, sufficient props, quick despatch of full boxes means filling the pit with good workmen, while others are short-handed. Above all, I would impress upon you the fact that colliery managers are men of position who should respect their office and themselves if they desire to have it respected by others; they should be courteous in manner to those under them while firm in their determination to see that all do their duty—violence, hasty temper, and bad language only degrade, and do not assist the manager in controlling those under him; a kindly word and an interest so far as is practicable in each collier's work under him is a surer method of having his wishes obeyed.

I have purposely avoided dealing with any special subject of a controversial character, pointing out the goal all should strive to reach rather than the means by which it should be arrived at. Time would not permit me going into the numerous questions of detail. Let safety and cheapness of output be your watchwords so far as the management of the mines under your control are concerned, and courtesy, firmness and fairness be your watch words so far as the men are concerned. The human machine, remember, is far more intricate to manage than the natural laws that govern mining. First learn how to govern yourselves, and then the watchwords I have given you will assist you in managing others. I am by no means an enthusiast, and do not expect the day will ever arrive when men, having separate interests, will arrange them without some friction, but of this I am convinced, that where courtesy and firmness are displayed on the one side it will be more or less reciprocated by the other, and that where interests are mutual there will be a mutual desire to make them so.

Messrs. Dobbie & Stewart, Thorold, Ont., have issued a handsomely illustrated catalogue of their specialties in machinery for contractors, miners and quarrymen.

The new works of the Canadian Rand Drill are now in full swing under the management of Mr. F. A. Halsey, formerly of the New York establishment.

The General Phosphate Corporation.

The statutory general meeting of the General Phosphate Corporation, at Cannon-street Hotel on Tuesday, 16th Sept. was a lively affair.

The Right Hon. Lord Stalbridge was in the chair, and in the course of his address he said:—

Ladies and Gentlemen, as you are all aware, this is the first ordinary or statutory meeting of the company, and it has been called perhaps rather earlier than the extreme limit which is allowed by law, in order to make you fully aware of the present arrangements of the company. Of course it is not possible to go into great detail, but still we thought it was only right that you should know exactly what has been done. In Canada, as you have seen, there appears to have been a general scream of delight at the operations of your corporation, and every owner of either what was real good phosphate property, or what was thought was good phosphate property, furnished up his lands, such as they were, and hoped, by some means or other, to foist them at once on this corporation; but I can assure you that your directors intend to be in no hurry in purchasing properties without making themselves thoroughly acquainted with the value of those properties. We are now at this moment entering into provisional contracts for the purchase of two what I trust will prove valuable properties to the company; but before doing so we intend to make ourselves thoroughly acquainted with the value of those properties. With that object one of the directors, Sir George S. Baden Powell, M.P., who is thoroughly acquainted with Canada, and with all the leading gentlemen in that Dominion, has gone off to Canada, and is there now. Our able solicitor (Mr. Davidson) hopes to leave also shortly for Canada in order to perform the legal part of the business, and examine the titles and so on. We hope by means of these two gentlemen, aided by experts, in accordance with the aims laid down in our prospectus, to be, before the end of our first year, the possessors of valuable and good properties. Of course, the difficulty with such a property as ours is to obtain a thoroughly valuable output, and we do not intend to purchase any properties without obtaining guarantees from the vendors that the output will come up to what they assert it is to be, both in quantity and quality. In that way we hope to pecuniarily benefit the corporation, and to become the owners of valuable properties. More than that, we do not intend to run before we can walk. We do not propose to proceed too fast, and we certainly shall not take every property that is offered to us. I can assure you that the list of properties that have been offered to us would reach nearly from here to Charing-cross; but we do not intend to proceed without the utmost caution. I regret to say that two of our directors have resigned, from causes over which they had no control. Mr. Sampson Lloyd finds that the times at which the board meet are not those which enable him to give that attention to the company which he would like to give, and he has therefore resigned, and Sir James Whitehead, I am sorry to say, since he joined the board, has been ordered by his medical adviser to go abroad for some time. Sir James worked very hard on the board while he was in London, but owing to the advice of his medical adviser, and knowing that at this period of the existence of the company it is absolutely necessary for the directors to give their attention to it, he has sent in his resignation, which, I need hardly say, has been accepted with very great regret by the board. We, of course, shall not be in a hurry to elect fresh directors, but we shall take our time to select gentlemen who will be able to give time to the board, and will also be able to give it the benefit of their experience. I do not know that there is anything more that it is in my power to say at the present time, except to assure you that the prospects of the corporation are very good indeed, and I hope and trust that in a year's time we shall be able to appear before you with a satisfactory account of the proceedings of the company.

The shareholders listened with commendable patience to the noble chairman, but immediately he sat down there was a hurried movement amongst certain turbulent spirits present to commence "heckling" him.

A Mr. Grantham had the first innings. He wanted to know the number of shares actually allotted.

"Twenty thousand shares," replied his lordship, "equal to a capital of £200,000."

"Absurdly insufficient," said Mr. Grantham, amid a chorus of "Hear, hears."

Then several indignant folk wanted to know why Sir James Whitehead and Mr. Sampson Lloyd had resigned, and if up to the time of their resignation they had been in accord with the rest of the board.

Lord Stalbridge said they had, but some incredulous shareholders appeared to doubt it.

Then followed a rough-and-tumble conversation, during which Messrs. Grantham, Foreman, Snare, and Unwin kept bobbing up and down like so many jacks-in-a-box. Lord Stalbridge kept his temper admirably; not to some of his tormentors, who indignantly asserted that had they known that the company would have gone to

allotment on so small a subscription they would unhesitatingly have withdrawn their applications for shares.

Some, in fact, went so far as to request the chairman to call a general meeting, in order to see whether, under the circumstances, it was desirable to go on with the company; others stated they would be content with getting back a portion of the money they had paid, for they were convinced that if the company went on not only would they lose all they had put into the concern, but that they would, in all probability, be liable to a further call.

The chairman asserted that, in the opinion of the board, there was no necessity for making a further call; but several shareholders impolitely asserted that this was all fudge.

Pressed to call the meeting asked for, the chairman firmly declined to do anything of the kind. He said there was no necessity for calling such a meeting, as he and those associated with him had every confidence in the future of the undertaking.

Frankly, I think "it goes without saying" writes the editor of the *Mirror* "that many people put their money into the General Phosphate Corporation on the strength of the magnificent list of founders, whose names are paraded big in the papers and in the prospectus. The list of founders is, we are assured, the same as when the company was floated; if they, then, have confidence in the concern, there should be no difficulty whatever in filling the places of the directors who have resigned from out of their number. Until this is done, and men as good as Mr. Simpson Lloyd and Sir James Whitehead have been elected on the board, the shareholders have every right to feel uneasy. It would be interesting to know whether the high opinions formed of the prospects of this company are shared by the founders; in any case, it will be equally interesting to know what induced them to become founders. If things do not turn out as Lord Stalbridge fondly anticipates, a very serious responsibility will rest upon these gentlemen. I shall be glad to insert any communication they may have to make upon the subject."

Asbestos Rivals.

(Trade, Finance and Recreation.)

Those companies which own asbestos mines in Canada swear that Canadian asbestos is the best that can be got, while those having mines in Italy say that all other is rubbish, but we may take it as a fact that Canadian is quite good enough for ordinary purposes. At all events, this is the conclusion we arrive at when we see, of the two companies which we are quite prepared to admit, in the absence of evidence to the contrary, do the greater part of the English business, that one which openly professes to use nothing but Canadian can give its shareholders dividends at the rate of 22½ per cent., while the other has so far been unable to pay interest owing on that half of its capital appropriated to preference shares.

The United Asbestos Company has a capital of £50,000 in ordinary shares, and £9,970 10 per cent. preference shares, yet after providing for the interest on the debentures, the trade profits do not yield enough to be worth dividing even amongst the preference shareholders, while the Bell's Asbestos has £100,000 in ordinary shares, which for last year received 22½ per cent., after interest on £68,400 debentures had been provided for. If these figures mean anything at all, they would prove that Canadian asbestos is not only good enough for ordinary purposes, but is infinitely the more profitable of the two kinds to manufacture. We have seen the different kinds, and would, if we were in the habit of wearing asbestos garments, prefer to have them made of the Italian material; but so far as we can gather, this kind of the stuff is an *article de luxe*, and too expensive for ordinary use. The accounts rendered by the two companies are too meagre to enable us to form any idea of what one or the other is doing, as we have no trading accounts, therefore we cannot get at what the turnover actually is, and this, after all, is what we desire to know. There is, besides, another item to take into consideration, especially as regards the Bell Company, and that is how much of the profit is derived from the sales of asbestos, raw and manufactured, and how much from lubricating oil, engineers' stores, etc., etc., in which this company does a large business. We understand that the United Company has recently given a good deal of its attention to this branch of business, yet we cannot but fancy that there is something wanting, some life and go which is absent in the one case and is conspicuous in the other—for with a very long start in business, and one half of the capital to provide for, the United would seem to have fallen hopeless by the roadside.

We noticed but a short time ago a letter from the general manager and secretary of the last named company, which apart from a certain amount of historical information, stated that the company's business had increased more than 20 per cent. over that of the previous year, that the increase in the first six months of

this year was nearly 25 per cent., and in the months of July and August the increase was over 35 per cent. This, we hope, is not altogether an imaginary or delusive increase, that is to say, an increase in the quantity of goods sold, without any corresponding increase in the profits; because we cannot get rid of the idea that we have heard somewhat similar words before. Still, as regards the benefit of this increased work to the shareholder, the result was practically *nil*. In fact, we turn back to the company's report for the year 1888, issued on February 20th, 1889, and find the following words:—"An encouraging feature of the business is, that while the sales of the first nine months of the year showed an increase of over 20 per cent. compared with those of the previous year, the sales of the last three months showed an increase of 35 per cent." Here we have almost word for word and figure for figure what is again repeated 18 months afterwards, the shareholders, preference and ordinary alike, still being innocent of dividends.

Turning now to Bell's report for 1888, we find the following paragraph:—"The large growth of the business during the past year has been continuous, the trade in each month showing an increase on that of the corresponding month of the preceding year"; and again, the report for 1889 says, "during the past year the home trade has grown in bulk, but the margin of profit has been less than was obtained in the preceding year"; and, in fact, the same dividend of 22½ per cent. was maintained.

Of the relative merits of Canadian or Italian asbestos, we confess that we know little; in our narrow-minded way we are compelled to judge by results, and we see that Canadian gives its shareholders 22½ per cent., and Italian nothing. There are probably other things to take into consideration, for even the United, which boasts so much of its superior Italian article, owns Canadian mines, so that it ought to be able to meet Bell's on its own merits in this quarter; therefore we are compelled to come to the conclusion that it is not to Canada or to Italy that the palm is to be given, but rather that results largely depend upon the way each company is managed.

The Ventilation of the Saarbrücken Collieries.

R. Nasse states that, of the twenty-four collieries in the Saarbrücken mining district, bituminous coal is mined at eight, the remainder working gas and non-coking coals. The total quantity of coal raised in 1884, to which year this report refers, amounted to 6,087,126 tons. The number of men working in the collieries with forced ventilation was 13,168. One-fourth of these worked with open lights, the remainder using safety-lamps. In all the larger collieries there are several independent ventilation sections, each of which has a special ventilating shaft, besides which they have usually several openings at the surface for the intake of fresh air. The mean greatest length of the air-ways is 3.26 miles, the minimum being 1.2, and the maximum 6.1 miles. Guibal's *temperament* (the ratio of the volume of the air-current, in cubic metres per second, to the square-root of the depression in millimetres of water) was determined in 24 cases; 14 times it was between 2 and 4, 7 times greater than 4, and thrice below 2; the minimum 0.9 occurring with an underground engine and boilers. The relative degree of moisture of the air-current reaches nearly everywhere, and usually at a very short distance from the intake shafts, 95 to 100 per cent. The latest analysis of the return air, made on behalf of the Russian Commission on Fire-Damp, showed it to contain from 0.203 to 0.652 per cent. of carbonic anhydride, as compared with 0.04 per cent. in fresh air; the percentage of hydrocarbons was from 0.473 to 1.463. At the time at which the samples were taken the air-current was at the rate of 69.22 cubic feet for every miner underground, one horse counting as four men. The temperature of the return-air in the main air-way proved in the Gerhard Colliery to be 25° C., a temperature exceeding by 6.5° C. the highest normal rock temperature of the strata occurring in the colliery. At the Camphausen Colliery, which is the most difficult one to ventilate, the return-air proved to be of a temperature varying from 27.5° to 29° C., the ventilation having lowered the temperature by 4° C.

At the end of 1884 only two of the collieries had natural draught; in one of these the air in the return-shaft was heated by a steam-pipe. In the collieries with forced draught there were 17 ventilating furnaces and 29 centrifugal ventilators. The furnaces produced air-currents with a mean volume of 352,212 cubic feet per minute, and the centrifugal ventilators a current with a volume of 979,082 cubic feet per minute.

Of the 29 ventilators, 26 are of the Guibal type, 2 of the Pelzer type, and 1 of the Zimmermann type. Up to the year 1877 the Guibal fans were all built from the same model, having a diameter of 23 feet, by a breadth of 6½ feet. At the present time the Guibal fans are constructed with a diameter of from 26 to 33 feet, the breadth varying up to 10 feet.

The volume of air allowed in the different collieries per man per shift is, in the mean, 85.8 cubic feet, the

minimum quantity being 25.42 cubic feet, and the maximum 298.7 cubic feet; this is at the mean rate of 71.69 cubic feet per ton of coal raised during the shift, the minimum rate for this quantity being 15.18 cubic feet, the maximum 265.5 cubic feet. The rate at which the return-air passes up the up-cast shaft reaches 16 to 23 feet per second. The ventilating furnaces are of small size, and burn in the mean 45.5 tons in the twenty-four hours. For 1,000 cubic metres of draught there are burnt by the furnaces 456 tons of coal, and for an equal rate there are used in working the fans 2.12 tons of coal. The annual cost of ventilation, at the rate of 1,000 cubic metres of air per minute, was:—

Furnaces.....	£401
Fans	432

The coal in the case of the furnaces being calculated at cost price, and with the fans at selling price. For the year 1883 the average cost of production of an air-current per ton of coal was a little more than one-half penny. Zinc pipes are used almost without exception for transmitting the air; they have usually a diameter of 10.23 inches. If the diameter is not sufficient two lines of piping are employed. The cost of such piping, together with the wages for placing in position, is, in the mean, four shillings per yard.

For dividing the air-currents sliding doors are employed. Brattices of indiarubber or of sailcloth are temporarily used; the indiarubber wearing best. For permanent use, masonry is employed. Wooden brattices are less frequently in use, as they are difficult to keep airtight. The cost of the brattice, including the wages expended while placing it in position is, per square metre:—

Sailcloth.....	from 1s. 6d. to 2s. 6d.
Indiarubber.....	2s. 6d. to 2s. 6d.
Wood.....	2s. 6d. to 2s. 6d.
Brickwork.....	3s. 6d. to 4s. 6d.

The German Government and the Miners.—It is officially announced that all, or nearly all, the demands which were recently submitted to the German Government by the miners' delegates have been conceded. The principal points are that shifts last eight hours only, that all the miners who were dismissed after the recent strikes shall be reinstated, and that provision shall be made in the Labour Amendment Bill, now before the Reichstag, for the creation of arbitration courts. The mining officials also are to come under the jurisdiction of the court of discipline, and they are to be punished for ill-treating miners. "Farming" certain jobs is also to be abolished.

Comparison of Electricity and Compressed Air.—Mr. H. W. Hughes (South Staffordshire Institute of Mining, Eng., vol. xv., pp. 69-82), has collected details of cost and efficiency of electric transmission of power, and compares them with the cost of pneumatic transmission. At the Chapin Mine in Michigan, air is compressed to 60 lbs. pressure at 60° F. by four turbines, and is conveyed through a 24 inch pipe for three miles. The pipe cost £12,000, and the total cost of the plant is estimated at £100,000. A test showed 1430 indicated horse-power at the compressors, and the sum of the indicated horse-power at the mines was only 390; the loss is therefore nearly 73 per cent., and this amount does not include friction of the compressors. The author gives a second case, in which a 500 horse-power turbine compressed air and delivered it three miles distant. The efficiency was 32 per cent. and the cost of the plant £84,000. An electrical company has agreed to give an efficiency of 60 per cent. from a similar turbine for a cost of £17,520, inclusive of the entire electrical equipment.

Arbitration in Labor Disputes in the United States.—Referring to the decrease in labour disturbances in the United States during the past year, the British Consul-General in New York in his last report says that this favourable change is attributable largely to causes—first, to the general acceptance of arbitration in one form or another, as enforcing the true principle of settlement of disputes, especially in productive industries, where the interests of capital and labour are mutual; and, secondly, to the power of investigation vested in the Board of Mediation, which has had the effect of deterring parties from making undue exactions and imposing unjust conditions. The Board in its report to the Legislature, states that its constant effort has been, through a wide distribution of its reports among those whom they may concern and by other available means, to impress the lesson of arbitration and infuse a spirit of compromise, and to induce settlements by local boards, or by direct negotiations between the parties, free from outside intervention. The tendency and growth in this direction have been encouraging. The destructive policy of a "a word and a blow, but the blow first," is gradually being reversed, and the blow of a strike or lock-out is coming to be regarded in order only as a last resort after the word of reason has proved a failure.

The Canadian Mining Review

CONDUCTED BY . . . B. T. A. BELL

OFFICES:

UNION CHAMBERS, 14 METCALFE ST.,
OTTAWA.

Vol. IX. OCTOBER, 1890. No. 10

Visit of the Iron and Steel Institute to Canada.

A party of the members of the Iron and Steel Institute of Great Britain and German Association of Iron Smelters, numbering nearly one hundred ladies and gentlemen, have accepted the invitation of the Federal and Ontario Governments to visit the Dominion. The party will enter Canada at Niagara Falls, where they will be met by Dr. Selwyn, Director of the Geological Survey of Canada, and Mr. B. T. A. Bell, Editor of THE CANADIAN MINING REVIEW, who are entrusted with the arrangements on behalf of the Dominion Government. After a visit to the Falls the party will enter a special train on the morning of the 29th and leave for Toronto via Hamilton. The following is a brief outline of the programme prepared for the reception and entertainment of the distinguished visitors:—

OCTOBER 29TH—WEDNESDAY.

Reception at Toronto. Drive to Public Buildings. Banquet given by Board of Trade in evening. Leave Toronto *via* Grand Trunk Railway Special Train for Sudbury at 11 p.m.

OCTOBER 30TH—THURSDAY.

Visit Mines and Works of Canadian Copper Company, H. H. Vivian & Co., and Dominion Mineral Company. Leave per Special Train for Ottawa at six p.m.

OCTOBER 31ST—FRIDAY.

Arrive in Ottawa noon. Reception by Cabinet Ministers. Drive to Lumber Mills, Chaudiere Falls, Pulp and Match Factories, Parliament and other Public Buildings, etc. Attend "At Home" given by citizens in Russell House. Hotel Headquarters, Russell House.

NOVEMBER 1ST.

FORENOON—Visit Geological Survey Museum and Offices. Luncheon given by the Federal Government, to be presided over by His Excellency the Governor General. Leave per Canada Atlantic R'y for Montreal at five o'clock p.m. Arrive in Montreal 8.15. Hotel headquarters, Windsor.

NOVEMBER 2ND—SUNDAY.

NOVEMBER 3RD—MONDAY.

Party will leave per Train in morning for Lachine where they will Shoot the Rapids and return in time for Luncheon. Drive in afternoon to Mount Royal, Public Buildings, Redpath Museum, McGill University, etc. Reception in evening.

NOVEMBER 4TH—TUESDAY.

Programme under consideration.

It is greatly to be regretted that owing to the hurried nature of the visit and the necessarily limited time at the disposal of the visitors, but little opportunity will be afforded them of inspecting our mines and quarries. The invitation was very hastily issued, and at a date that precluded any possibility of an extended visit to

our mining centres. It is hoped, however, that sufficient will be seen of the country to impress them with the extent of its resources, its marked prosperity, and the opportunities and advantages it offers as a field for industrial development and the investment of capital. We extend to the Institute and the German Association of Iron Smelters a hearty welcome to the Dominion, and wish them one and all a pleasant and enjoyable excursion.

Evils Inherent to a Pernicious System of Company Promoting.

During the past year our phosphate districts have been excited by rumours of a great "Trust" in England that intended to buy up vast quantities of phosphate land. A few properties were bonded by visitors from London and by influential Canadians who forthwith visited England "purely for pleasure." A preliminary prospectus was issued, having among its directors the names of the "Marquis of Exeter" and "Sir Charles Tupper, by special permission of the Government." By means of this distinguished support a great array of nobilities was displayed on the List of Founders in the final prospectus, though the name of Sir Charles Tupper had disappeared, possibly in consequence of the fiasco of the Three Rivers Meat Company. The General Phosphate Corporation, with a nominal capital of £1,000,000, offered its shares to the public, who responded so poorly that, notwithstanding the assurance from Lord Stalbridge that 20,000 shares, equal to £200,000, had been allotted, but comparatively small amount of cash was secured, and it became necessary to call upon the Founders, or underwriters, to take up the shares to the extent that they had pledged. It is understood that there has been some demur in responding to these calls, and in many quarters doubts as to the strong financial condition of the company are freely expressed.

We are pleased, however, to note that the Corporation has really purchased the Stewart Lots at the High Falls, the Ross mountain property, also on the Lievres River, and the Murphy Lots in Templeton, provisional to certain conditions agreed to by the vendors. Mr. George Stewart, the vendor of the High Falls property, has contracted to take out a stipulated annual output, and mining operations will be begun forthwith. Mr. Stewart is well known to be a shrewd and practical manager, and we sincerely wish him and the Corporation every success. Our allusion to the circumstances attending the organization of the company is not made in any unfriendly spirit, but rather for the purpose of calling attention to some inherent evils that this and similar undertakings inflict upon the phosphate and other sections of our mining industry. It may be fairly charged that the falling off of some 10,000 tons in the output of phosphate this year is due to the formation of the Corporation. A property that produced nearly 10,000

tons last year was bonded to the promoters of the Corporation, and, in confident expectation of a speedy sale, work was reduced, and the output for the year has been merely nominal. In the Perth district alone nearly 50,000 acres of land were bonded by speculators and offered to the Corporation. Assurances were given that the lands were accepted, and for six months past the visit of the inspector has been a matter of weekly expectation. Repeatedly pits were cleaned out and properties "fixed up" for the anticipated visit, and every little while the report has gone around the country that "the papers were to be signed in a few days." This kept the country in a ferment, and great will be the disappointment if after all the purchases are not made. With the exception of the work of Messrs. Wilson & Green at Black Lake, and the Anglo-Canadian Phosphate Co. at Otty Lake and Bob's Lake, there has been no legitimate mining of any moment done in the whole of this district for a year. A large fortune quickly won by a land sale was a more pleasing prospect than the smaller and slower gains of mining. One property, purchased for \$7,000 by a man of large means, was opened up and held in idleness at an asking price of \$100,000, although the owner could have more than doubled his money in a year by taking out the phosphate already exposed and reasonably assured.

This is the first evil to which we would allude,—the promotion of land speculation and the consequent discouragement of genuine mining operations by the formation of these great "syndicates."

The second evil of such corporations is the limited chance of success that they stand, owing to the heavy expenses with which they are burdened. In this case £10,000 was estimated for promotion expenses. The cost of English visitors and "distinguished experts" has to be met and an "eminent London solicitor" is sent across the ocean to examine titles, which, owing to our simple system of registration of deeds, could be accurately determined by any intelligent lawyer's clerk in the country. The fees of directors are an extra expense, and the salaries of managers and assistants are apt to be larger and more numerous than in private undertakings. The enterprise is thus handicapped from the start with a dead outlay of capital, in addition to the large amount invested in the lands; and here we may remark that the Canadian seller receives only a moderate compensation as a rule, but his asking price for the land is doubled or increased many-fold in the prospectus, the difference going into the pockets of the company promoters or in paying the heavy cost of floating the company. The outcry against high prices of land in Canada is made by men who would think nothing of offering it to the British public for three times the sum, and if any such prices are available we would like to see the money paid out principally in Canada to the men who have developed the properties.

It may as well be frankly stated that past

experience shows that phosphate mining affords a good prospect of a fair commercial gain, but offers a small chance of a great speculative profit. The well-selected property, managed and worked with close economy, will, at present market prices for phosphate, give a return that will be satisfactory to the reasonable investor. But a public company, promoted at great cost, saddled with honorary expenses, obtaining lands at inflated values, and carrying on its work in an extravagant or ill-considered fashion, has a small chance of success.

We would, therefore, urge Canadians to work their lands themselves. They can usually obtain additional working capital at home or abroad in return for a share in their enterprises; and they should be content to accept aid on these terms and look to their legitimate earnings for their reward.

For a year and a half there has been a "phosphate boom" in London, but it has been overwhelmed by the discovery that "all the phosphate land in Canada was for sale." Now Florida phosphates have diverted the attention of speculators, and it may as well be understood that the Canadian boom has burst; and we must add that it has done but little good and a great deal of harm. Let Canadians go to work and do an honest mining business instead of trying to unload their lands upon foreign "syndicates." Then they will have buyers coming to them to purchase their productive mines, and they will in the end have more profit, greater self-respect, and a better reputation than have been gained by the late fruitless efforts to dispose of indefinite mining "prospects" for definite cash.

Profit Sharing at English Ironworks.

On Saturday morning the result was made known of the ballot taken the previous evening, of the workmen employed by the Thames Ironworks & Shipbuilding Co., limited, on the question of the adoption of the proposed scheme for profit sharing submitted to the men by Mr. H. F. Hills, the managing director.

The objects of the scheme were set forth—(1) to unite the interests of all concerned in the works, and to provide that the workmen shall participate in the prosperity of the company; (2) to prevent the friction, waste, and consequent loss from antagonistic views as to the relative claims of capital and labor under varying conditions of trade; (3) to emphasize the fact that in the Thames Ironworks it is in the power of workmen by individual exertions so to improve the work and economise the cost of labor as to enable the company to give them a share of the profits. The conditions were that after receiving £23,750 per annum as interest upon the shareholders' existing capital, the remainder of the profits should each year be equally divided between the company and their employees. Arrangements were made for the keeping of accounts to and for the election of a representative council of sixteen—eight by the company and eight by the workmen of the different trades. Men after six months were to be entitled to participate in the division of profit; the proportion earned by those not in the service six months was to be and form the basis of a provident fund to be administered for the men in a manner agreed upon. It was to be understood that the adoption of the scheme (outside the conditions) would leave the company and the men entire freedom in other respects, and the scheme was to be determined at twelve months' notice on either side. It was first published in April last soon after a strike of joiners at the yard, and was, when put to the vote, emphatically rejected. But the minority of the men, dissatisfied at the result, called the whole workmen together, and negotiations were apparently settled satisfactorily—the six months' service was altered to three months, and six months were fixed upon as the determining period—and the men, having taken the counsel of

various trades unionists, co-operative and socialistic leaders, it was hoped that the next poll of the men would decide to adopt the scheme, a great point being that when it was adopted the definite rules would be formulated by the representative committee, and be submitted to the directors. The poll was by ballot this time, and when the figures were announced they surprised even the more sanguine of the opponents of the scheme. For adoption 507 voted, against 1,206; 107 were neutral, and 15 ballot papers were spoilt. The votes were counted in the presence of the representatives of the men and the company.—*London Iron and Steel Trades Journal*.

LETTERS TO THE EDITOR.

The New Phosphate District.

TORONTO, October 13th, 1890.

The Editor:

SIR,—My attention has been called to an article in your issue of last month as to a new phosphate district which has been discovered about fifty miles north-west of Peterborough, and which has been visited by Mr. William Watt of Perth. Doubtless this is the district which our company has lately been operating in as we understand Mr. Watt lately visited it, and as it is important that this new district should not be injured at the start by such unreliable information as you appear to have received about it, I am instructed to send you a short report that was made to us some time ago by a gentleman who visited the district but who is wholly unconnected with this company.

We would be glad if you would help to remove the false impression that your article may have left with the public regarding this district by publishing this report in the next issue of the CANADIAN MINING REVIEW.

The name of the gentleman who made the report can be furnished to you at any time if you so desire it.

Yours, etc.,

J. S. LOCKIE,
Secretary Haliburton Mining Co., Ltd.

REPORT REFERRED TO:

Classification of mines in the Townships of Monmouth and Dudley, in the County of Haliburton, lately opened up by the Haliburton Mining Company, Ltd.

NO. 1 UPPER, LOT 15, CON. 11.

Cutting 10 ft. deep and about 40 ft. long. Large deposits of phosphate, calcine and mica. (Large sample red and green phosphate.) Lots of rock phosphate thrown out which could be cobbled.

NO. 2 UPPER, LOT 16, CON. 11.

Fine, clean red rock phosphate at the top; also red and green in the workings.

NO. 3 UPPER, LOT 17, CON. 12.

Vein crossing north-east and south-west; width about 20 feet. Very large masses of red rock phosphate; also plenty of mica.

NO. 2, SAME LOT, CON. 3.

500 yards from No. 1; also very fine deposit of red and green phosphates. Phosphate abounding on the surface. Natural drainage from the shaft.

NO. 4, LOT 17, CON. 12.

Just uncovered; same appearance or indication as Nos. 1 and 2. Slightly lower down the hill, with very fine deposit of rock phosphate, equal to any of the others.

NO. 1 LOWER, LOT 15, CON. 11.

Very fine deposits of green and red rock phosphate. On the cobbled or waste rock from 10 to 20 per cent. of phosphate adhering to it is absolutely wasted from want of proper machinery for dressing the same, and this applies to all the other deposits mentioned. This pit is about 14 ft. surface. (A very large specimen weighing two or three hundred pounds.) At this time there is ten to twelve tons of clean phosphate ready to ship.

NO. 2, LOWER, LOT 14.

Very large bed of red and green phosphate very near the surface; the pit is about 11 feet deep, phosphate showing at both ends, three feet solid at one of the ends and pretty near the same at the other. About three tons cobbled; enough to make a carload on surface uncobbled.

NO. 3 LOWER, LOT 13.

Eastern boundary. A very great depth of gray and red rock phosphate. Rock coming between the two beds of phosphate. This looks promising.

DUDLEY MINE.

Crystal and rock phosphate on the surface, also in the pit and lots of mica. This phosphate is also of the highest quality, and being only just opened a large vein can be traced to great advantage, but it is anticipated the vein can be approached under more favourable circumstances.

All of the above phosphates are of the very highest grade. An analysis made by Professor Chapman of Toronto University of some of this phosphate shows it to be equivalent to tribasic phosphate of lime 88.89 per cent.

[We cheerfully publish the above and hope that the expectations concerning the new phosphate district will be realized. The best proof of its value would be the production of ore. Our previous informant—a gentleman who, by the way, is fair, unbiassed and thoroughly practical—stated that as the result of three or four months' work on one property he saw one ton of clean phosphate and ten tons of uncobbled rock. The report given above mentions an output of 10 to 12 tons from one pit, and three from another, with a car load to be cobbled. This is the kind of evidence wanted, and not mineralogist's statements of "very large masses," "very fine deposit," "phosphate abounding," "very large bed," "a very great depth of phosphate," etc. A property that answers to this description might soon speak for itself and needs no puffing by experts. We speak in another column concerning the evil tendency to fix up properties for sale instead of working them productively.—ED.]

The Duty on Mining Machinery.

OTTAWA, 24th Sept., 1890.

The Editor:

MY DEAR SIR,—Mr. Tupper desires me to acknowledge your letter of the 19th inst., and to say that he has asked the Commissioner of Customs for a full report on the subject of your communication.

Mr. Tupper will lay this report before the Privy Council if Mr. Bowell has not returned when the report is ready.

Yours very truly,

C. C. CHIPMAN.

OTTAWA, 20th October, 1890.

The Editor:

DEAR SIR,—Replying to your letter of the 17th inst., I beg to say that I have placed your application with reference to the duties on silvered-copper plates for gold mill amalgamators before the Minister of Customs who has, as you are aware, returned to Ottawa since your previous communication upon the same subject.

Yours faithfully,

CHARLES H. TUPPER.

Tests to be Applied to Slate.—Prospectors looking for slate quarrying locations are often at a loss to know when they really have a good slate. The few following simple rules, familiar to those in the trade, will enable them to distinguish a bad slate from a good one, with sufficient certainty to be useful:—

(1.) As a rule, good slate when struck gives a clear, bell-like sound.

(2.) It is generally considered a good sign when it shatters more or less before the edge of an axe.

(3.) Light blue slate is less absorbent, as a rule, than black blue varieties.

(4.) Good slate has a hard, rough feel, while an absorbent slate feels smooth and greasy.

(5.) The absorptive powers of a slate may be tested in two ways. 1. Place the slate on edge half immersed in water. If it draws up the water and becomes wet at the top in six or eight hours, it is spongy and bad. The extent to which the water ascends is roughly the measure of absorption. 2. Weigh a piece of the slate dry and then again after immersion in the water for twelve hours, after wiping off the superficial moisture; if it shows much increase in weight it is too absorptive to be good.

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers etc.]

No. 6.

Capt. Thomas H. Tretheway, Port Arthur, Ont.

The subject of our sketch was born in St. Stevens' Parish, Cornwall, England, on the 22nd day of December, 1841. He is the eldest son of James Tretheway, the miner, of the same place, and is a living exemplification of what integrity, perseverance and intelligence faithfully applied, will do for any man who marks out for himself a course, the beacon star of which is to render the most faithful and honest service in his power to his employers, no matter in what capacity he may serve. He is closely identified with the progress and advancement of the district of Algoma, both by land and water, having served the early settlers on both elements, through many years of its early history, and the name "Capt. Tom" is familiar in every household from Thunder Bay, on Lake Superior, to the Bruce Mines on Lake Huron. He has not always confined his attention to mining, having at different periods in his history been a master of construction on public works, such as breakwaters, docks, etc. He followed a seafaring life during several summers on the Great Lakes, rising steadily, from "before the mast," to be master of several different steam and sailing vessels. At present he holds a master's certificate, entitling him to take command of any passenger or freight-carrying vessel, steam or sail, plying on the great inland waters. He also holds a certificate as a third-class marine engineer. So that it may readily be seen that no matter what the nature of the employment might be his one object was to excel and thereby gain the top rung of the ladder. With regard to his connection with mining it need only be said, that from sorting ore, up to being superintendent, he always gave eminent satisfaction. He has three sons growing up perfect imitations of their father. The eldest is 23 years of age, and is a competent assayer. He had charge of all machinery, including the repairing of drills and pumps underground, and the erection of two hoisting engines, one compressor and four steam pumps at the Shuniah Weachu mines. He improved the pumps so that they condensed their own steam, by turning the exhaust steam into the suction pipe of the pump, thereby increasing the power of the pumps from 10 to 20 per cent. and saving the company a proportionate amount. An incident in the early life of Capt. Tretheway well illustrates the character of the man. He was employed doing some work for his father, and was chided by him, in the old Cornish fashion, "that

he would never be as good a man as his father." He answered "yes I shall, and a better, and some day have charge of all your other sons." Four years after this he was in charge of The Roberts Coal Mine, at Salineville, Ohio, at which time his father and brothers were employed under him.

The subject of our sketch emigrated to Canada in company with his parents. The family landed in Quebec in the summer of 1848, and proceeded westward by river and lake, and settled at Port Hope, Ont. His father was given charge of the Grand Trunk Railway Company's quarries between Cobourg and Toronto. During his residence in Port Hope our subject enjoyed the only schooling it was his privilege to receive during life, and then only for a period of about two years, for as soon as he was able,

like many others of Canada's sons in those early days, he was, from force of circumstances, compelled to labor for his daily bread. He continued to work in and about the quarries until the summer of 1858, when the family again joined the stream of emigration flowing westward through Canada, and settled at Bruce mines, Algoma.

He was then 17 years of age and went to work in the jigging houses of the West Canada Mining Company, of which the late Wm. Plummer, M.E., was then Superintendent, and James Bennets, Manager. The company operated the Wellington and Huron Copper Bay properties, which were adjacent to and a continuation of the veins of the old Bruce Mines, which were operated by the Montreal Mining Company. This group of mines may be said to have been

the cradle of the mining industry in Western Canada, and in it our young friend was nurtured up to the years of early manhood. In 1850, Capt. Richard Wallis, of the North-West Mine, Keewenan County, Mich., engaged him to go to the then northern wilds of Michigan, on the south shore of Lake Superior, where he worked as a miner, timberman and shaft foreman for a period of two years. Later, under the superintendence of S. W. Hill, he was employed by the same company as an explorer, on the property which is now known as the Delaware and Pennsylvania Mine. He was thus employed for two years, when he returned to the Bruce Mines, and worked as a tributer at the Bruce, Wellington and Copper Bay mines. In 1863 he removed to Woodville, near Jackson Mich., and entered the employ of the Woodville Coal Mining Company as a coal miner, and in that capacity advanced very rapidly to a front rank. He was then engaged by Roberts & Co., coal miners of Cleveland, Ohio, to take charge of their works and open up their coal properties at Salineville, Columbiana Co., Ohio. He performed this work in the most satisfactory manner. In addition to opening the mine, it included the building of half a mile of railway and three-quarters of a mile of tram-road. He once more turned his steps towards Bruce Mines and entered the employ of the West Canada Mining Company as manager of the jigging houses. His somewhat restless disposition induced him to adopt a seafaring life on the lakes during the summers, where he evinced the same aptitude that he already had at mining, exploring and works of construction. By his energy and economy he soon became the owner of vessel property. He was master and owner of the schooner *Warner* and other vessels well known to the older residents of Algoma, trading on Lakes Huron, Superior and Georgian Bay. In 1871 he was sent to Thunder Bay, now Port Arthur, by Thomas Marks & Bro. to superintend the construction of

two stores, a dock and warehouse. In 1873 he was given charge of a portion of the work on the Government dock, then under construction. He was then employed as a master dock builder and had charge of the erection of machinery at the famous "3A" mine, and at Jarvis Island Mine, in each of which cases he received a considerable bonus for the satisfactory way in which he performed the work. He again took to sailing, and was master of the steamers *A. Neff*, *Watchman* and *Kate Marks*. In 1880 he entered the employ of the Silver Islet Consolidated Mining and Land Company, first at rebuilding the tugs and scows used in transporting the ore from the islet to the mill on the mainland. He was then given charge of the construction of 200 feet of breakwater at the most exposed part of Silver Islet. This piece of work still

stands, and is apparently as good as when constructed. At this time he was promoted to the position of underground captain, and had charge of all underground work, including the sinking of the new shaft from the surface down to the ninth level. During this period he had charge of the construction at this mine of the first skip road ever built on the North Shore of Lake Superior. In 1882 he was given the superintendency of the company's works at Cape Maimase, Lake Superior. He remained there till the company closed its operations.

He then entered the employ of D. McDonald & Co. at Port Arthur, and was given charge of construction on the Port Arthur breakwater, and sank the first twenty cribs. He was then employed by George H. Macdonnell, of the same firm, to open up a Baryta mine on McKellar's Island. Work was suspended there in the fall of 1886, and on the formation of the Shuniah Weachu Mines Company, of Liverpool, Eng., he was engaged by them as underground captain at their mine at Silver Mountain. In the following year he was promoted to the superintendency of the company's entire works, and remained as such up to the 15th May, 1890. While employed here he did all the assaying for the mine. On his retirement he was presented with a cash bonus and testimonials from the company, couched in the warmest terms of appreciation.

During his superintendence at this mine he was frequently engaged by owners of mining properties to examine and report upon them as to the advisability of development, etc., and although he received such a limited education in his youth, his reports are second to none, and will compare favourably with those of men with half the alphabet after their names.

On the first day of June of this year he again entered the employ of the Silver Islet Consolidated Mining and Land Company as superintendent of the company's works, including Silver Islet, Edward's Islet, Cape Gargantua and Cape Maimase, all of which properties are again being opened by the company.

The Opening Meeting of the Iron and Steel Institute.

The first day's session of the British Iron and Steel Institute opened at New York on October 1st, in Chickering hall. The attendance was very large. The foreign delegates predominated in numbers, but quite a number of the American Institute of Mining Engineers were present. Sir James Kittson, President of the B. I. and S. Institute, was in the chair, and called the meeting to order.

Mr. ANDREW CARNEGIE delivered an address of welcome, to which Sir James responded.

Gen. SHERMAN received quite an ovation as he was being escorted to a seat on the platform.

Sir JAMES KITTSO then said it was intended to present a diploma of membership and a gold medal to the Hon. A. S. Hewitt, but he was not present owing to illness, so the presentation was not made.

Mr. HEWITT's speech was then given out to those present in printed form.

The first paper read was "The Development of American Blast Furnaces," by Jas. Gayly, of Bessemer, Pa.

Sir LOWTHIAN BELL then read a paper treating on the effect of more or less carbonic acid in furnaces.

INVITATION TO VISIT ONTARIO.

Sir JAMES KITTSO then introduced Mr. Archibald

Blue, the chief of the Statistical Department of Ontario, who addressed the Institute as follows:—

Sir James Kittson and gentlemen of the Iron and Steel Institute,—I have come at the instance of the Government of Ontario, whose officer and servant I am, to extend to you an invitation to visit that important Canadian commonwealth before you return home. Word has reached the Government that some of your number purpose passing through our country on their way down from the mining regions of Minnesota, Wisconsin and Michigan, and that a short stay is likely to be made at the nickel and copper mines of Sudbury. An earnest hope is entertained not only that they may be led to prolong their stay in Ontario and extend their visit to other mineral districts, but also that the whole body of the Institute may be prevailed to come and do likewise. It is recognized, I ought to say, that your Institute has come to America at this time at the generous invitation of the American Institute of Mining Engineers, and that you are here as the guests of that body. But on the membership roll of that association there are a goodly number of Canadians, one of its latest and best meetings has been in the capital city of the Dominion, its name embraces the continent, and it is international in aim as well as in name and complexion. Rather, it is cosmopolitan, as all science is, and therefore not cribbed or confined in the sphere of its interests by State or continental limitations. And so the Government which I have the honor to represent trusts and believes that it will not be regarded as an intruder when it sends cordial greeting to the members of the Iron and Steel Institute, and invites them to see Ontario and spy out some part of its mineral wealth before they have completed the American tour. It would be a pleasure to the Government to have an opportunity of showing civilities to the members of the Institute, representing as they do one of the greatest of the great industries of the Mother Land; and I am also authorized to state that in this agreeable undertaking the Government will be heartily joined by the Board of Trade of the city of Toronto, the strongest and most representative organization of the kind in Canada. You, gentlemen, are specially interested in iron and the supply of iron ores. You are now to a large extent dependent on foreign countries for the qualities of ores needed in the production of steel, and it may concern you to know that in Ontario we have immense ranges of iron ores, mostly of the magnetic variety, touched as yet only by the hammer of the prospector, and waiting for enterprise and capital to develop them and convert them into the best grades of iron and steel. You are expected to visit the famous Vermilion range in northern Minnesota, the annual output of whose mines has risen in five years from a few thousand to more than half a million tons. Well, sixty miles away, in the Province of Ontario, we have the same geological formation, and extensive ore bodies have recently been discovered there, while a hundred miles to the north-westward, midway between Lake Superior and Lake of the Woods, there is a mountain of rich magnetic ore, several miles in length, and claimed to be well suited for the production of Bessemer steel. We have also large bodies of clean magnetic ores in the eastern part of the Province, and others not so clean; but after the demonstration witnessed on this platform two days ago there is little fear, I think, but that the ingenuity of man will succeed in exorcising the evil. To the British ironmasters, some of the greatest of whom are here present, a brief statement of these facts may not be without interest or value even if they cannot all at this time be persuaded to come, and see, and know for themselves.

There is, however, another reason why the Government of Ontario and the Toronto Board of Trade desire that the Institute should accept an invitation. You have heard something of the existence of nickel ore in our province, and it is proposed, I understand, to spend a few hours at the mines and smelting works of the Canadian Copper Company of Cleveland, Ohio, the Hussey-Vivian Company of Wales, and the Dominion Mineral Company of Canada, all of which are in the vicinity of Sudbury. The experiments of Riley and Hall with nickel and steel are familiar to members of the Institute, for they were luminously presented by these gentlemen at your meeting of May last year. Since then, as I happen to know, these experiments have received the careful attention of one high in the counsels of the Government of the United States, and promptly following the tests upon armor plates made at the Annapolis navy yard a few days ago we saw nickel placed on the free list and a million dollars voted by Congress to purchase a supply of the metal, to be used in the manufacture of nickel steel for plating the new battle-ships. Here in the United States the impression appears to prevail that the ore exists in very limited quantities, and that unless it is at once secured a more favoured nation may get in ahead and take all. It is therefore pardonable in the members of the Iron and Steel Institute, living about 4,000 miles away, if they are no better informed than our neighbours on the extent of Ontario's resources in nickel ore. The fact is we do not know their exact extent ourselves. But we do know that great ranges of ore have been discovered over an area of several hundred square miles, and from

its occurrence in a particular formation we have reason to believe that it exists throughout a region several thousand square miles in extent, a vast portion of which is an unbroken wilderness, untrodden by the foot of man. It is never safe to prophesy unless you know, but I verily believe we have enough nickel ore in the Huronian rocks north of the Georgian Bay to plate the navies of the world for a thousand years, and to serve many other and better purposes besides,—assuming, of course, that the metal can be economically separated from its compounds, and there is barely a doubt that it can. No other colony of the British Empire is the equal of Ontario in agricultural capabilities, and in hewing farmsteads out of the woods, Britain's sons have done a great work there since 60 years ago. They came to us for the most part without other capital than stout hearts and willing hands, and in their chosen occupation they showed what British pluck and intellect have done in every calling of life, in every corner of the earth. We are making an effort at the present time to get more men of the same class, and we have room for many more. We have 200,000 square miles in Ontario, of which hardly the half has yet been occupied. What remains lies for the most part within the Laurentian, Huronian and Animikian belts, in which there are numerous occurrences of gold, silver, iron, nickel, copper and apatite, and hence more attractive to the miner and metallurgist than to the farmer. In nickel and iron ores it is especially rich, and we think that the time is opportune for the British ironmaster to seek to do there in his own industry what the British farmer and settler have so successfully done in agriculture. We are fellow-citizens with you, and where our institutions differ from those of the United Kingdom we believe they differ not for worse but for better. Sometimes we have thought that in your enterprises and investments you have shown greater partiality to the older son, Jonathon, than to the younger, Johnny Canuck. But we recognize the laws which govern business operations, and we do not doubt that success will come to those who work and wait for it, if they are worthy of it. We are living on excellent terms with Brother Jonathan, in spite of seeming rivalries at Ottawa and Washington in the building of tariff walls, and we have some of his capital and skill employed in utilizing our mineral wealth. But much more is needed, and if abounding deposits of iron and nickel ores are a temptation to the gentlemen of the Iron and Steel Institute, I know that I can give to them for the Government of the Province of Ontario and the Board of Trade of the city of Toronto the assurance of a kind and hearty welcome to the country of the great lakes.

AN INVITATION FROM THE DOMINION GOVERNMENT.

At the conclusion of Mr. Blue's remarks the institute was addressed by Dr. Selwyn, chief of the Geological Survey of Canada, who conveyed an invitation from the Dominion Government to the members to visit Ottawa and other portions of the Dominion.

Both invitations were most heartily received. Subsequently a conference was held by a large number of the delegates who desired to visit Canada with a number of Canadians present, consisting of Mr. Blue, Dr. Selwyn, Mr. Henry W. Darling, and Mr. Erastus Wiman. It was arranged that as the members of the institute would be compelled to adhere to a programme, the visit to Canada would have to be made after that of Washington. Under existing arrangements they will reach Sudbury Junction on the 23rd of October, Niagara Falls on the 24th (at which point they are to be entertained at luncheon by Mr. Wiman), then to Washington, where they are to be presented to the President. On the 26th and 27th they will return to New York, and from there go to Canada via Niagara Falls, say about the 29th or 30th of October. The number who have thus far expressed a determination to visit Ottawa is about one hundred. As they will not sail from New York until November 8th by the Etruria, they will have nearly a week to spend in Canada.

Annual Meeting of the Newfoundland Colonization and Mining Company (Limited).

The shareholders of this Company held their ordinary general meeting last month, at Winchester House, Old Broad Street, London, E.C., Mr. Charles Clark presiding.

The directors presented the following report:—"The directors herewith submit to the shareholders the accounts made up from the incorporation of the Company to June 30th, 1890. The directors, anticipating that the shareholders would like the latest information, have arranged that Mr. Wingfield Bonny, the general manager, shall attend the meeting, when he will give a detailed account of the present position and future prospects of the Company's operations in Newfoundland. It will be seen that the sum of £4,024 4s. 3d. has been spent in developing the La Manche lead mine, which has been vigorously pushed forward, and is now sufficiently opened up to enable the directors to consider the policy of selling the

mine, or of forming a subsidiary company to acquire their mining rights, in the shares of which they would retain a large interest, so that the shareholders of this Company might participate in eventual profits without further outlay of capital on their part. Owing to the unsettled state of the Western part of Newfoundland in connection with the fishery disputes, no work has been done on the Company's St. George's Bay grants, either in the way of prospecting or clearing land for colonisation; and the directors consider it would be undesirable to attempt this until the respective Governments have arrived at an amicable settlement of the matters in dispute. In accordance with the statement made in the circular of April 27th, 1889, Lord Thurlow accepted the chairmanship of the Company, but finding that he was unable to devote to it the amount of time which he felt it required, he subsequently retired from the board. He retains, however, his large stake in the concern, and continues to take a warm interest in the affairs of the Company. At the suggestion of a large number of shareholders in the West of England, Mr. W. W. Baker, of Bristol, was elected to a seat on the board. It will be necessary for the shareholders to appoint an auditor for the ensuing year; Mr. H. Cattley Stewart, who has audited the accounts for the past year, offers himself for election."

The Chairman, in moving the adoption of the report, after expressing regret at the retirement of Lord Thurlow from the board, said that in Mr. Bonny's report in November, 1888, £20,000 was mentioned as the estimate of the sum which ought to be raised in order to carry on operations satisfactorily, and that the directors gave them a promise that unless they saw their way to at least £10,000 they would not proceed to allotment. Having secured that minimum, and something more, to begin with, they were led to hope that a larger amount might gradually be obtained, and their best efforts had been put forth to obtain that. But, in common with many other companies which sought support from the public last year, they found that the desired additional capital was not forthcoming, and their total subscriptions up to the present time amounted to only £11,400. The shareholders would remember that in the same report Mr. Bonny called special attention to the La Manche lead mine as the enterprise offering the best prospects of early profit, and recommended that they should at once proceed to put it in such condition as would afford them the choice of either continuing to work it on their own account or selling it at a price which, in addition to recouping, might provide the capital required for their operations. That was the policy on which they had been acting, but they confessed that they were disappointed that they were not yet actually returning ore. The coal seams and the rock-salt upper crust could be generally developed as sufficient capital became available. Negotiations were in progress for leasing to a responsible firm in Nova Scotia the Company's timber-cutting right over 12,000 acres of forest land in the Gander Lake district on very advantageous terms. The board proposed to commence colonisation in the St. George's Bay district, but the unsettled state of matters in this region of the island through the fishery disputes had prevented any progress. The Chairman concluded by referring to the railways now in course of construction near the property of the Company.

Mr. W. H. Wilson seconded the motion.

Mr. Bonny (the general manager) having addressed the shareholders at some length with regard to the prospects of the Company, the report was adopted.

A Brave Miner.

Few pleasanter tasks fall to the lot of the journalist, says the *Pall Mall Gazette*, than that of recording those acts of heroism and self-sacrifice which from time to time brighten the most commonplace toil. There is not just now any great war, in which

many a darkness into the light can leap,
And shine in the sudden making of splendid names.

But these "special names" can be, and are, made all the same. Scarcely a day passes in which some brave soul does not meet danger and death in the service of mankind; hardly a week goes by without showing abundantly that the spirit of self-sacrifice still exists, and that it only requires opportunity to turn the dull round of many an humble life into splendid heroism. At Haydock, the other day, it was found necessary to sink a furnace-pit, in connection with what is known as a Queen Pit. Only very few men can work in such a pit at the same time, and operations can only be carried on continuously by the employment of gangs. The work naturally entails a good deal of blasting, and, failing the electric battery, which ought always to be used in such cases, the fuse has to be lit by hand. It does not need a very vivid imagination to picture an occasion when, for some untoward reason or another, the men are unable to leave the pits, and have to calculate their remaining moments of existence by the rate at which the powder of the fuse burns away. It was an occasion such as this which drew forth the heroism of

Richard Gill. Three men went down into the furnace-pit at ten o'clock at night. One of them was Richard Gill, the hero of this narrative, a man 44 years of age, living at Stone-row, Haydock. They started work, and about an hour after midnight their charges were all laid, and nothing remained but to light the fuse and leave the pit. The workmen are raised by means of a hoppet, which a steam-engine lifts or lowers as required. Upon the rope of this hoppet hang, literally, the lives of the men engaged at work in the pit. If, when the fuse is lit, the rope should break, or anything go wrong with the apparatus, certain death must be the doom of those below. Hence great care is taken to prepare the engine man for the crucial moment. A bell is rung five times in order that he may get ready, and then, when the fuse which conveys fire to the deadly charge is lighted, one final ring informs the engine driver that the men must, without a moment's delay, be drawn up. On the occasion in question Gill rang the bell. The engine man having thus been ordered to get ready, there was a pause while the men stood ready to apply the match. Everything seemed all right and the fuses were lit. Hurriedly taking their places in the hoppet, they once more touched the bell and gave the signal to hoist. But the hoppet did not move. And then, all at once, it flashed across Gill's mind that he had only rung the bell four times. There was not a moment to be lost. Fearing that the engine-driver had not understood the signal, he rushed from the hoppet and frantically cut at the fuses. One of the four had yielded to the knife, when to the horror of the men who remained in the hoppet, the rope tightened and they began to move. Slowly, but surely, the hoppet rose, leaving poor Gill alone, face to face with death. There was but one chance. They might ring to have it lowered again; and all three might yet reach the top in safety. The brave man's brave companions saw this, and shouted to him to ring that it might be lowered. But, standing near the fuses as he did, Gill could see that the explosion would not much longer be delayed. It was a question whether he should die alone or whether he should force his companions to share his fate. He decided without hesitation. "Go on," he cried; "better one should die than all three. Good-bye!" The hoppet disappeared and Gill was left to meet death alone. Help on earth there was none. To whom could he turn? His two companions, according to the newspaper account, "Distinctly heard Gill praying." But "short time had he for shift or prayer;" for, ere the hoppet could reach the top, the explosion had taken place. The hero was afterwards found lying on the ground close to the place where he had cut off the fuse. "He was," says the newspaper account, "terribly injured, his skull being fearfully fractured." But he was not unconscious. He remembered what had taken place, and he could still speak. His words were few, but characteristic. He blamed no one, nor did he repine at his accident. "It was my own fault," was all he said. "The ambulance was got," concludes one reporter, simply, "and Gill conveyed to the Haydock Cottage Hospital, where he now lies in a very precarious condition. He is not expected to recover."

Unions and Strikes.

At a recent meeting of the Church Congress, held at Hull, England Mr. David Dale, of Darlington, in a paper, said that circumstances had forced upon him an intimate participation in the various modes by which, during the past twenty-five years, the terms and conditions of labor had been settled in the great industries of Durham and the North Riding of Yorkshire, and he confined himself to the results of actual experience. The first difficulty experienced in seeking to bring about a peaceful solution of the labor questions had arisen from the reluctance of employers and of influential public opinion to recognise the justification of a men's union. But, while regarding unions as useful in proportion to their numerical strength, he disapproved of the employer being made to compel men to join a union. To admit his right to do so was to admit the converse right to say, "You must not belong to a union." Where the existence or influence of a union was sustained by pressure of this sort, there was some inherent weakness in its constitution or management, for the individual worker was wonderfully ready to disregard his immediate personal interests when they seemed to be at variance with the permanent interests of his class. Much had been heard of the folly and wickedness of strikes, on account of the misery they entailed; but there was another aspect in the heroism which accepted suffering for future advantage, and renounced what was easiest for a common cause. With such feeling to work upon, it was unwise to apply compulsion to non-adherents. Then employers objected to negotiate with men who had not been, or who had ceased to be employed in the industry they represented. The scale of industrial enterprise rendered it necessary that the affairs of an important union should absorb the whole time of paid officers. The Durham Miners' Association utilised

properly the services of four capable and intelligent agents. The acceptance of the functions of umpire by men of distinction was amply justified by the vastness of the interest at stake. In many industries wages could be regulated by a sliding-scale; and this had much to recommend it where the wages had varied in some steady relation to the selling price of the commodity produced. The plan furnished to the workmen absolutely reliable information, usually extracted by public accountants from the books of the employers. Sliding-scales had worked well for many years in the pig iron trade and the manufactured iron trade of the north of England, in the coal industries of Durham and Northumberland, in the ironstone mines of Cleveland, in South Wales, and in many other important localities and trades. In some industries workmen had terminated them without assigning definite reason; but they well deserved consideration as a machinery tending to secure, promptly and automatically, an adaptation of wages to varying conditions of trade. Sometimes the road of peaceful arrangement was abandoned by a new generation of workmen who had not inherited their fathers' experience of how much more was to be gained by negotiation than by strife. This, may be, led to conflicts until the new generation gained its own experience, but their education would not take so long as did that of their fathers. The retrograde movement resembled the receding wave in an advancing tide. Till recently the Church had shared the feeling that organised labor movements represented unreasonable unrest and revolt against authority, and its precept was, "Servants, obey your masters in all things." But now it was recognised that there are reasonable claims below the surface exhibiting extravagant language, accompanied in some cases by unjustifiable action. Naturally, the clergy—having no special means to probe the depths of industrial questions—had been impressed chiefly by those incidents and views which the Press in earlier time gave prominence to. Now the attitude of the Church was one of broad general sympathy with the aspirations of labour to secure conditions which would admit of life being more than a struggle for existence. It regarded organisations for this object as justifiable and needful agencies. It would say that freedom of individual action should be inculcated, with a sympathetic recognition of the natural feeling on the part of those who joined a union that those who do not are going to take advantage of what is gained without contributing to the effort or sacrifice of seeking it. On the other hand, we should not pass from the former assumption that the employer must be right to the contrary assumption that the employer must be wrong. Let both parties be united in an honest desire to be candid and reasonable, but with a perfect knowledge or appreciation of each other's claims. The cases were rare in which it was expected for the representative of the Church to proffer mediation; his function was rather to cultivate those Christian virtues which tend to avert strife, but to do it with an intelligent knowledge of modern industrial conditions and of the special rights and obligations that attach to them.

Coal Mining in Natal

A Natal correspondent writing to the *Colliery Guardian* says:—"Having gone up the river beyond Ladysmith to see the Biggersberg extension, I thought it would be a good opportunity to visit the various coalfields in the colony, as all of them, with the exception of Ingagane and Newcastle, are situated on the line of railway extension recently completed, or within easy reach of it. Coal-mining in Natal on an important and systematic plan was commenced so recently that the history of the workings of any company is necessarily a brief one. Coal was known to be in existence on the ground now worked by the Elandslaagte Company for many years, and as a matter of fact coal was mined there by the military during the Zulu War. Then the Elandslaagte Company—a private concern by the way—was found to mine for coal there. They sunk a shaft just above the spot where the military mined, but the coal extracted was found to be of very inferior quality—in fact, it was taken from too near the shaft to be of much value—so the shaft was ultimately abandoned. Another shaft was then opened further west, and a considerable quantity of coal was taken from it. Up to the present time seven shafts have been sunk by the company altogether. When I visited the mines only two shafts were being worked out of the seven existing. The hands employed by the company are 110 natives, 35 Indians, 6 Europeans, 1 Creole. The company make their own cages, wagons for use underground, and other appliances on the spot, a smithy and carpenter's shop being in operation for the purpose. Sidings are run from the railway right up to the mouths of the shafts, and as the wagons full of coal are brought up from the mine on to the elevated platform, they are run along to a tipping apparatus at the other end, and their contents emptied at once into the railway trucks, passing over a screen in their descent. The coal is further picked over as it falls into the trucks, so that any shale

may be cast aside. The output of coal in the last week up to the time of writing from the two shafts being worked was 411 tons, and the output during the present month is expected to be about 2,000 tons. Coal of better quality than that present being mined has been taken from another shaft recently sunk on the company's ground. The property is shortly to be tested for deeper seams of coal by means of the second diamond drill, which arrived in the colony a short time ago, and is about to be erected 800 yards north-west of shaft B, under the superintendence of Mr. J. Thompson, who up to the present has had charge of the old drill. Most of the plant is already on the ground, but one or two parts have gone astray up the line, and difficulty is also being experienced in obtaining labor to transport the remainder of the plant from the station to the site. Still, it is hoped the drill will be in operation in the course of two or three weeks. The drill is exactly similar to the one that has been to work at some time on the coast. Mr. Thompson was good enough to explain its working to me. The drills, or crowns, used vary in diameter from 7 in. to 3 in., according to the depth at which they are worked. When near the surface the larger drill is used, and smaller ones are affixed to the rods as the depths increase. The drill is driven by steam power and revolves at the rate of 300 revolutions per minute. The cutting power lies in the diamonds which are affixed in the drill, there being from three to nine of them. As the drill revolves the core of stone, coal, or other formation cut round, rises up the center of the tube to which the drill is fixed. I saw specimens as hard as the solid rock. When the drill has penetrated 10 ft. it is drawn up, the core is extracted, and the drilling is then recommenced. The diamonds in a drill may be worth as much as £130. Whitestone is the most difficult stone found in Natal to work through, and Brazilian diamonds have to be used in cutting it, the Kimberley diamonds not being hard enough for the purpose. One of the most troublesome duties of Mr. Thompson is to fix the diamonds in the drill, the steel having to be cut away to fit the stones. The diamonds used are of a dark colour, and dull. The drill here is capable of penetrating to a depth of 2,000 ft., but not half that depth of drilling is likely to be required in Natal.

Annotated List of Canadian Minerals.*

G. C. Hoffman, F. Inst. Chem., etc.

1. ACADIALITE.—The flesh-red, brownish-red, purplish-red and yellowish-red varieties of chabazite (which have been named Acadialite) are found at Partridge Island, Swan Creek and Two Islands (Cumberland Co.), in the Province of Nova Scotia.
2. ACRITE.—Forms an important constituent of some of the nepheline-syenites of Montreal (Hochelaga Co.) and Belœil (Rouville Co.), in the Province of Quebec.—Anal., B. J. Harrington, Trans. Roy. Soc. Can., vol. i, sec. iii, p. 81, 1882 and 1883.
3. ACTINOLITE.—A bed of actinolite, mingled with an asbestiform serpentine and talc, occurs in the Township of Bolton (Brome Co.), and a finely fibrous variety, without admixture, constitutes a bed in St. Francis (Beauce Co.), Province of Quebec.
4. AGALMATOLITE.—Of a greenish-white to olive-green color occurs in layers in an indurated clay-slate at St. Nicholas (Levis Co.); of a honey-yellow color, forming a thin bed in clay-slate, in the Parish of St. Francis (Beauce Co.), and of an amber-yellow, with chloritic slates, on Lake Memphrémagog (Stanstead Co.), Province of Quebec.—Analyses, T. S. Hunt, Geol. Can., 1863, pp. 484, 485.
5. AGATE.—Many beautiful varieties are found in the trap regions of Nova Scotia; as on the shore extending from Sandy Cove to the head of St. Mary's Bay (Digby Co.); near Cape Blomidon in large blocks (King's Co.), and fine moss agates are met with at Cape Santé and at Scotch Bay (King's Co.), also at Two Islands (Cumberland Co.). Agates are found in abundance in the amygdaloids of Lake Superior, and sometimes of considerable size and beauty. They abound in rolled masses on the beaches of Michipicoten and St. Ignace Island, at Thunder Bay and elsewhere along the shore of this Lake,—Province of Ontario.
6. ALABASTER.—Considerable masses of a very beautiful snow-white gypsum or alabaster are met with in the gypsum quarries of Hillsborough (Albert Co.), in the Province of New Brunswick.
7. ALBERTITE.—This beautiful mineral has, so far, only been met with in King's, Albert and Westmoreland Counties, the most important locality being in the Parish of Hillsborough (Albert Co.), in the Province of New Brunswick. It is not found in beds, but in true cutting veins, which, although at times coincident with the bedding, are as often oblique or at right angles to it. The chief deposits, those of the Albert mines (in Hillsborough), occur in highly bituminous and oil-bearing shales situated near or at the base of the lower Carboniferous; but, at points not widely separated, veins of the mineral are found penetrating, for short distances, the

underlying metamorphic rocks—supposed to be of Huronian age—and the overlying and little disturbed beds of the millstone grit. The maximum thickness of the vein as first found near the surface was twenty-two feet, that of the smaller veins only a few inches, while the veinlets were often not thicker than a sheet of paper. It is estimated that since its first discovery (by John Duffy in 1849) some 200,000 tons of this material have been raised at the Albert mines. The deposit has, however, now become practically exhausted, and the mine in consequence abandoned.—(From information communicated by Prof. L. W. Bailey, of the University of New Brunswick.)

8. ALBITE.—Large cleavable masses of white albite, with quartz and mica, constitute a granite found at the Lake of Three Mountains, on the River Rouge, in the Township of Clyde (Ottawa Co.), and a faintly greyish-white, almost white, albite, exhibiting a fine bluish opalescence, occurs in large fragments in a coarse pegmatite vein—composed of quartz, muscovite, microcline, with occasionally black tourmaline, garnet, etc.—cutting a greyish garnetiferous gneiss, in the Township of Ville-neuve, also in Ottawa County, Province of Quebec. See also note to "Peristerite."

9. ALLANITE.—Small crystals of this mineral were found, by Dr. T. S. Hunt, in a felspathic rock near Bay St. Paul (Charlevoix Co.), and in a rock composed of labradorite and hypersthene from Lake St. John (Chicoutimi Co.), Province of Quebec. Also occurs (Prof. E. J. Chapman, Can. Jour., new series, vol. ix, p. 103, 1864) in the form of a narrow vein in granitoid strata at Hollow Lake, the head waters of the South Muskoka, in the Province of Ontario.

10. ALMANDINE.—The red garnet from the Stickeen and Skeena Rivers, as also many of the other red varieties alluded to under "Garnet," will, most probably, be found to be referable to this variety.

11. ALUNITE.—A massive, fine granular, light reddish-colored alunite, has been met with—associated with a greyish translucent quartz and specular iron—at New Ireland Road, Parish of Alma (Albert Co.) in the Province of New Brunswick.

12. ALUNOGEN.—Has been found, in the form of a crust of from 5 to 5½ cm. thick, on an old heap of shale at the Scotia mine, Springhill coal-field, Cumberland Co., Province of Nova Scotia.—Anal., F. D. Adams, Rep. Geol. Can., 1878-79, p. 8 H.

13. AMAZON-STONE.—Occurs abundantly, and of good color, in the Township of Sebastopol (Renfrew Co.), in the Province of Ontario. It has also been found in the pegmatite vein, referred to under "Albite," in the Township of Villeneuve, and is again met with in the Townships of Wakefield and Hull (Ottawa Co.), Province of Quebec.

14. AMETHYST.—Often of great beauty, is found at many places on the shores of Cumberland, King's, Annapolis and Digby Counties, Nova Scotia. The best localities are: Cape Sharp and Partridge Island (Cumberland Co.), Cape Blomidon (King's Co.), and Digby Neck (Digby Co.). Fine specimens occur in veins around Thnder Bay—more especially at Amethyst Harbor, and at the mouth of McKenzie's River—and at other points on the north shore of Lake Superior, Province of Ontario.

15. AMPHIBOLE.—See under "Actinolite," "Asbestos," "Hornblende," "Nephrite," "Pargasite," "Tremolite."

16. ANALCITE.—Fine specimens of this mineral are found at Cape d'Or, Swan Creek, and Two Islands (Cumberland Co.), also at Cape Blomidon (King's Co.), in the Province of Nova Scotia. It has been observed, in association with natrolite, in some of the dykes cutting the Trenton limestone at the reservoir extension, Montreal (Hochelaga Co.), in the Province of Quebec. Also occurs in the amygdaloidal traps of the north shore of Lake Superior, Province of Ontario.—Anal., B. J. Harrington, Rep. Geol. Can., 1877-78, p. 45 G.

17. ANDALUSITE.—Occurs in pale, flesh-red colored crystals in a fine grained micaceous schist at Moore's Mills (Charlotte Co.), Province of New Brunswick. Also found, in somewhat micaceous argillites, on Lake St. Francis (Beauce Co.), in the Province of Quebec. See also note to "Chiolite."

18. ANDISITE.—Occurs in large striated, cleavable masses of a reddish color, with hypersthene and ilmenite, constituting a rock at Château Richer (Montmorency Co.), Province of Quebec. Analyses, T. S. Hunt, Geo. Can., 1863, p. 478.

19. ANDRADITE.—Is found in pale, yellowish, honey-yellow and brownish-yellow colored crystals, imbedded in chalcopryite, and in yellowish-green colored masses, in association with white fibrous tremolite and dolomite, at the Malaspina copper mine, northeast side of Texada Island, Province of British Columbia.

20. ANHYDRITE.—Is met with in considerable quantities, constituting beds, in the gypsum deposits of Nova Scotia and New Brunswick.

21. ANIMIKITE — HUNTILITE — MACFARLANITE.—The minerals thus designated occur at the Silver Islet mine, Lake Superior, Province of Ontario. The two first named were described by Dr. H. Wurtz (Eng. Min.

Journ., xxvii, pp. 55 and 124, 1879), the last by T. Macfarlane (Can. Nat., 2 ser., vol. iv, p. 463, 1870), the results of whose investigations of the foregoing are given in the Trans. Amer. Inst. Min. Eng., viii, p. 236, 1880. [The true nature of the individual minerals present in the Silver Islet ores is still to be determined, but there is probably present a silver arsenide (Huntillite), and perhaps also a silver antimonide (animikite) allied to dyscrasite—(Dana, Min., App. iii, p. 71, 1882.)

22. ANKERITE.—This is one of the most plentiful and characteristic of the minerals filling the numerous fissure veins occurring at the base of the southern slope of the Cobequid Mountains, Londonderry (Colchester Co.), Nova Scotia.—Analyses, H. Louis, Trans. N. S. Inst., vol. v, p. 49, 1879-82.

23. ANORTHITE.—This felspar is one of the component minerals of the coarsely crystalline intrusive diorite of Yamaska Mountain (Yamaska Co.), in the Province of Quebec.—Analyses, T. S. Hunt, Geol. Can., 1863, p. 479.

24. ANTHRACITE.—Of the carboniferous system is not known to occur in Canada; there are, however, deposits of this mineral, of cretaceous age, on the Queen Charlotte Island—the best known locality being at Cowgitz, on Skidegate Channel, at the southern end of Graham Island—Province of British Columbia. For reference to analyses, see under "Mineral Coal."

25. ANTHRAXOLITE.—This name has been given, by Prof. E. J. Chapman, but simply as a convenient term for present use, to the black combustible coal-like matter which is not unfrequently met with in the Provinces of Quebec and Ontario. He describes it as follows: Black, lustrous, resembling anthracite in general characters, but very brittle. Hardness equals 2.25—2.50; specific gravity, 1.35—1.55. Generally decrepitates when heated. Before the blowpipe a small fragment loses its lustre, but exhibits no further change. Composition, essentially carbon, with from 3—25 per cent. of volatile matter, including a small amount of moisture, and ash varying from 0—11 per cent. Exhibits under the microscope no trace of organic structure. Dr. T. S. Hunt, in speaking of this material, says: "It can scarcely be doubted but that it has resulted from the slow alteration of liquid bitumen in the fissures of the strata." This would explain the great variability in the percentage of volatile matter (exclusive of moisture) which is observed in specimens from different localities, the amount of alteration having in some instances proceeded further than in others. It never occurs in true beds like coal, but is found either lining fissures or filling veins and fissures, sometimes several inches in diameter, in the limestones, shales and sandstones, and even in the trap rocks which traverse these. Sometimes it occurs in buttons or drops, forming botryoidal masses. It has been met with in many places in the Province of Quebec, viz., on the Island of Orleans, at Quebec and Sillery (Quebec Co.), Point Lévis, and St. Nicholas (Lévis Co.), Lotbinière (Lotbinière Co.), Drummondville (Drummond Co.), Acton (Bagot Co.), in the vicinity of Châte River in Gaspé, and elsewhere. In the Province of Ontario it has been observed filling fissures in the chert beds among the upper copper-bearing rocks of Lake Superior.—Analyses, T. S. Hunt, Geol. Can., 1863, pp. 524—526.

26. ANTIMONY, NATIVE.—In a lamellar, or, more rarely, finely granular form, occurs, in association with stibnite, valentinite, senarmonite and kermesite, accompanied by quartz and a little brown-spar, in veins in argillite in the Township of South Ham, Wolfe County, Province of Quebec.

27. APATITE.—The variety fluor-apatite is very common in the Laurentian rocks of Canada, where it occurs both in the form of veins and of large irregular shaped deposits or lenticular masses. The most important deposits are in the township of Buckingham, Templeton, Portland and Wakefield (Ottawa County), in the Province of Quebec, but extensive deposits also occur in the townships of North and South Burgess and North Elmsley, in the Province of Ontario. This mineral also occurs in connection with crystalline limestone—being found in the form of olive-green terminated crystals, with rounded angles, together with grains of purple fluorite, and crystals of black spinel, imbedded in a yellowish crystalline limestone, in the Township of Ross (Renfrew Co., Ont.); and crystals of blue apatite and quartz are imbedded in a coarsely cleavable, sky-blue calcite at the Calumet Falls (Pontiac Co., Que.). Small hexagonal prisms sometimes an inch in length and one or two lines in diameter, transparent, of a pink or purple color, with surfaces often dull, and angles rounded, occur, in association with crystals of augite, in an intrusive mass of fine grained, grey dolerite at St. Roch, on the Achigan River, L'Assomption County, Que.—Anal., T. S. Hunt, Rep. Geol. Can., 1863-66, pp. 203, on the composition of Canadian Apatites. G. C. Hoffmann, Geol., Can., 1877-78, p. 14H.

28. APHRIDITE.—Is found filling fissures in the massive pyrrholite of the Township of Grenville (Argenteuil Co.), in the Province of Quebec.—Anal., T. S. Hunt, Geol. Can., 1863, p. 473.

29. APOPHYLLITE.—Green and white crystals, aggregated in plates or in square prisms, occur at Two Islands

and Cape d'Or (Cumberland Co.), Blomidon (King's Co.), and Margareville (Annapolis Co.), in the Province of Nova Scotia. Also, in foliated masses or plates, often of a red color, in association with calcite, on Prince's Location, Spar Island, Lake Superior, Province of Ontario.

30. ARGENTITE.—Occurs, with native silver, chalcocite sphalerite, etc., in a vein of calcite at Prince's mine; with native silver, in a vein of barite, celestite and calcite, on Jarvis Island; with native silver, sphalerite, and a little galenite and pyrite, in a vein of barite and calcite on McKellar's Island; and with sphalerite, pyrite, nicolite, etc., in a veinstone consisting of calc-spar, bitter-spar and quartz, on Silver Islet, Lake Superior. With native silver, in a gangue of calcite, at the Duncan mine—also at the Rabbit Mountain, Porcupine, Beaver and other mines in the district of Thunder Bay (Lake Superior), Province of Ontario.

31. ARQUERITE.—Is found with alluvial gold upon Vital and Silver Creeks, Omenica District, Province of British Columbia.—Anal., H. G. Hanks, Dana, Min., App. iii, p. 4, 1882.

32. ARRAGONITE.—Is met, in the form of acicular crystals, varying in size from microscopic minuteness to an inch or more in length, lining fissures or cavities in the ankerite, or implanted upon barite or calcite, in the ankerite deposits of Londonderry (Colchester Co.), Province of Nova Scotia. Has been observed forming stalactites and delicate fibrous masses in a calcareous rock in the township of Tring (Beauce Co.), Province of Quebec, and sparingly amongst the Lake Superior traps, Province of Ontario.

33. ARSENIC NATIVE.—Is found, in veins, seven miles up Watson Creek, west side of Fraser River, twenty-five miles above Lytton, Province of British Columbia.—Ann. Rep. Geol., Can., vol. ii, p. 9T, 1886.

34. ARSENOPIRYTE.—Is of exceedingly common occurrence in the gold-bearing quartz bands of Nova Scotia. Is found, according to Dr. Hunt, well crystallized with galena in a quartz vein on the Chaudiere, in St. Francis (Beauce Co.); and still more abundantly in small crystals, in association with galena, in a large vein of quartz on Moulton Hill, near Lennoxville (Sherbrooke Co.), Province of Quebec. Occurs in large quantities in quartzose veins in the township of Marmora (Hastings Co.), and it is also met with in the township of Tudor, in the same county, Province of Ontario.

35. ASBESTUS.—A more or less delicately fibrous variety of hornblende has been met with in the townships of Templeton and Buckingham (Ottawa Co.), Province of Quebec. In the latter township, mountain cork was found in quantity and in masses of considerable size at the Emerald phosphate mine. Mountain leather has also been met with in this township as well as at the Beaver mine in the township of O'Connor, District of Thunder Bay, in the Province of Ontario. The fibrous variety of serpentine, which constitutes a large proportion of what is known in commerce as asbestos, occurs in quantity in the eastern townships of the Province of Quebec.—See under "Chrysotile."

36. ASPHALTUM.—Occurs in the vicinity of Oil Creek, in the southern part of the township of Enniskillen (Lambton Co.), Province of Ontario, where it forms two layers of a viscid consistency, known as gum-beds, occupying areas of about an acre each in extent, and having a thickness varying from a few inches to two feet. Another bed of bitumen, of from two to four inches in thickness, is met with at Petrolia, in the northern part of the same township. The material of this bed, which is more solid than that of those just referred to, and mixed with a good deal of earthy matter, is readily separable into thin layers, which are soft and flexible. Very extensive deposits of a bituminous sand-rock occur for great distances along the banks of the lower Athabasca River, North-West Territory; these are described in Rep. Geol., Can., 1882-84, part C.C., and the results of the examination of the material appear in Rep. Geol., Can., 1880-82, p. 3H.

37. AUGITE.—Well-defined crystals of black augite are found imbedded in the dolorites of Montreal (Hochelaga Co.), Rougemont (Rouville Co.), and Montarville (Chambly Co.) Mountains, in the Province of Quebec.—Anal., T. S. Hunt, Geol. Can., 1863, p. 468.

38. AXINITE.—Is said by Dr. Bigsby to have been found, in fine crystals lining a cavity in a boulder of primitive rock, at Hawkesbury (Prescott Co.), in the Province of Ontario. It has been found *in situ* by Dr. R. Bell, in small veins in trap, on the east coast of Hudson Bay, about one mile and a half south of the mouth of Little Whale River. Here it occurs, of a purplish-brown color, in association with epidote, imbedded in a matrix of calcite with a little quartz.

39. AZURITE.—Has, so far, not been met with in characteristic specimens, but merely as an incrustation on copper-ores, or in the form of stains and small earthy masses in copper-holding rock. Among the many localities where it has been observed may be mentioned: The Prince of Wales mine, Upton (Bagot Co.), and at the Black River mine—in a drusy calcite, with sulphurets of copper in the form of small crystals.—St. Flavien (Lot-

binière Co.), Province of Quebec. With green carbonate of copper at Batchewanung Bay and Prince's mine, Lake Superior, Province of Ontario.

40. BARITE.—Occurs, sometimes in very beautiful crystalline masses, in numerous irregular veins or pockets in the slates of the East River of the Five Islands (Colchester Co.), Nova Scotia; in a vein cutting Laurentian limestone, in the Township of Hull (Ottawa Co.), Province of Quebec; and the following localities in the Province of Ontario, viz., the Township of Bathurst and North Burgess (Lanark Co.) McNab (Renfrew Co.), Dummer and Galway (Peterborough Co.), and Summerville (Victoria Co.); also, constituting large veins, on Jarvis, McKellar's and Pie Islands, Lake Superior. Red crystals, associated with purple fluorite, are found on Iron Island, Lake Nipissing; and isolated pale reddish-yellow crystals have been found by Prof. Chapman (Can. Jour., Nov., 1885), in veins, in the Township of Neebing, near Fort William, Thunder Bay, Lake Superior, and subsequently in other mineral veins in that region.

41. BENTHIERITE.—Is mentioned (Dana, Minn., p. 68) as occurring near Fredericton, Province of New Brunswick. Prof. Bailey thinks the locality referred to would most probably be the autimony mine in the parish of Prince William, about twenty-five miles from Fredericton (York Co., N.B.).

42. BERYL.—Crystals of this mineral, having a diameter of three inches and more, and a length of from twelve to fifteen inches, have been met with, by Abbé J. C. K. Laflamme, in the township of Jonquière (Chicoutimi Co.), and it has also been found in the township of Brassard (Berthier Co.), Province of Quebec.

43. BIOTITE.—A dark bottle-green mica from Moore's slide (Roche-Fendue channel) on the Ottawa River, has been referred to this species.

44. BISMUTH NATIVE.—Was recognized by Prof. Chapman in some rolled pieces of quartz from near Echo Lake, on the north-west shore of Lake Huron, and agreeably with the observations of Dr. Hunt, it also occurs, in traces, in a veinstone in the township of Tudor (Hastings Co.), Province of Ontario.

45. BISMUTHINITE.—Has been met with, in small lamellar and sub-fibrous masses in a quartz vein at Hill's mine, in the rear of Tudor township, Hastings County, Province of Ontario.

46. BISMUTITE.—Has been recognized, by Dr. Hunt, as occurring in a quartz vein at Hill's mine, in the rear of the township of Tudor, Hastings County, Province of Ontario.

47. BITUMINOUS COAL.—Of the carboniferous formation occurs in the provinces of New Brunswick and Nova Scotia. In the former, though covering a large surface area, more than two-thirds of the entire extent of the province, the carboniferous or coal-bearing rocks have afforded as yet but little promise of large or valuable deposits, and with the exception of the beds at Grand Lake in Queen's County, which are about two feet in thickness, no stratum of bituminous coal, sufficiently large or pure to be profitably worked, has as yet been discovered. In the Province of Nova Scotia there are three important coal basins, viz., those of Cape Breton, Pictou and Cumberland counties—the first mentioned occupying an area of at least 190 square miles, with a thickness of not less than 7,000 feet of the carboniferous strata; the second occupies an area of only some 22 square miles, but several of the coal seams are of extraordinary thickness; the area of the Cumberland field is likewise small, but includes several good coal seams. Coal is not found in the Provinces of Quebec and Ontario; the black combustible coal-like matter referred to under "Anthracolite" is, however, met with in small quantity at various localities in both these provinces. In the North-West Territory, in the Rocky Mountains, and in the adjacent foot hills, there are extensive deposits of a bituminous coal which, although of Cretaceous age, is in all respects—physical character and chemical composition—undistinguishable from coal of the Carboniferous, and the same may be said of the coal of the extensive and important deposits, also of the Cretaceous age, which exist in various parts of British Columbia. For reference to analyses, see under "Mineral Coal."

48. BOG IRON ORE.—Occurs in great abundance at numerous localities in the Provinces of Quebec and Ontario. In the former, the most important sites are in the Three Rivers district, or between the rivers St. Maurice, Batiscan and St. Anne. Other deposits occur in the townships of Stanbridge, Farnham, Simpson, Ascot, Ireland, Eardley, Hull and Templeton—the seigniories of Vaudreuil, Lotbinière, Lauzon, St. Vallier and elsewhere. In Ontario it is met with, in greater or less quantity, in the townships of Charlotteville, Middleton, and Windham (Norfolk Co.), Camden (Kent Co.), Bastard (Leeds Co.), etc.—Analyses, T. S. Hunt, Geol. Can., 1863, p. 510.

49. BORNITE.—Occurs, most commonly associated with chalcocite and chalcocite, in the townships of Cleveland and Melbourne (Richmond Co.), Acton (Bagot Co.), Leeds and Halifax (Megantic Co.), Sutton (Brome Co.), and elsewhere in this section of the Province of Quebec. It has been found at the West Canada Mines

on Lake Huron, also at some points on Lake Superior, in the Province of Ontario—and near the head of Salmon Arm of Jarvis inlet, and between that inlet and Howe Sound, Province of British Columbia.

50. BYTOWNITE.—The name given by Dr. Thompson to a greenish-white feldspathic mineral found in a boulder, near By-Town (now the City of Ottawa), in the Province of Ontario,—and which has since been shown by Zirkel (Tsch. Min. Mitth., 1871, 61,) to be a mixture. An analysis of a portion of the specimen upon which Dr. Thompson founded the species is given by Dr. T. S. Hunt in the Geol. Can., 1863, p. 479.

51. CACHOLONG.—Beautiful specimens of this mineral are obtainable on the coast between Capes Split and Blomidon (King's Co.), in the Province of Nova Scotia.

52. CACOCALASITE.—The cacocalsite of Prof. H. C. Lewis (The Naturalist's Leisure Hour and Monthly Bulletin, A. E. Foote, No. 87, Exposition Extra, 1885), has quite recently been submitted to a careful re-examination by Dr. F. A. Genth, and shown not to be a good species.—Am. Journ. Sci., 3 ser., vol. xxxviii., p. 200, 1889.

53. CACOXENITE.—Has been observed by Dr. Harrington as occurring in the form of beautiful little yellow tufts on the walls of cavities in calcite at the pyrite deposit near Brockville, in Elizabethtown, Province of Ontario.

54. CALCAREOUS TUFF.—See note to "Travertine."

55. CALCITE.—Is found in large rhombohedral, also modified crystals, at Partridge Island (Cumberland Co.), and on the coast between Capes Split and Blomidon (King's Co.), and a very fine apple-green calcite is found at McKenzie's River (Inverness Co.), Province of Nova Scotia. A coarsely cleavable sky-blue calcite occurs at the Calumet Falls in Lichfield (Pontiac Co.), also in the township of Wakefield (Ottawa Co.), and a yellow, cleavable calcite, also a fibrous variety, in the township of Templeton (Ottawa Co.), Province of Quebec. A salmon-red, cleavable calcite in the township of Sebastopol, Renfrew County, in the Province of Ontario. Crystalline limestone, suitable for employment as marble, for architectural purposes, occurs in most, and is very abundant in some of the provinces of the Dominion. White, red, grey, brown and black (and various shades of these colors) varieties are met with respectively at:—St. Armand (Missisquoi Co.), Caughnawaga (Laprairie Co.), Duds-well (Wolfe Co.), Point Claire (Jacques Cartier Co.), St. Dominique (Bagot Co.), St. Joseph (Beauce Co.), etc., in the Province of Quebec—and Annprior (Renfrew Co.), Cornwall (Stormont Co.), L'Original (Prescott Co.), Pakenham (Lanark Co.), and elsewhere in the Province of Ontario. See notes to "Dog-tooth-spar," "Foetid calcite," "Iceland-spar," "Nail-head-spar," "Travertine." For a list of minerals of the Laurentian limestones, see report "On the Laurentian limestones of North America," by Dr. T. S. Hunt, Rep. Geol. Can., 1863-66, p. 181, *et seq.*

56. FOETID CALCITE.—A milk-white, cleavable, foetid calcite, forms a large bed in the township of Grenville, and is also met with in the adjoining township of Chatham (Argenteuil Co.), Province of Quebec.

57. CANCRINITE.—Occurs in the nepheline-syenites of Montreal (Hochelaga Co.), and Beloeil (Rouville Co.), Province of Quebec.—Anal., B. J. Harrington, Trans. Roy. Soc. Can., vol. i, sec. iii, p. 81, 1882 and 1883.

58. CANNEL COAL.—Occurs at Little Glace Bay, Cape Breton, Province of Nova Scotia.—Anal., H. How, Phil. Mag., 4 ser., vol. xxxvii, p. 268, 1869.

59. CARNELIAN.—Is found at Blomidon (King's Co.), at Trout Cove (Digby Co.), and the north shore of Granville (Annapolis Co.), Province of Nova Scotia.

60. CASSITERITE.—Small quantities of this mineral, in the form of minute grains, were found to be associated with the Sperryite obtained at the Vermilion Mine, in the township of Denison, District of Algoma, Province of Ontario.—(H. L. Wells, Am. Journ. Sci., 3 ser., vol. xxxvii, p. 68, 1889). Very small quantities of this mineral, in the form of minute crystals, have also been found by Dr. Genth (prov. com.) in some tailings from the Battery lead, Malaga gold mining district, Queen's County, Province of Nova Scotia.

61. CELESTITE.—Occurs in white translucent crystalline foliated masses, which are sometimes radiated, and often several inches in diameter, in the Black River or Trenton limestone of Kingston (Frontenac Co.), in large crystallized masses, semi-transparent and of a bluish or occasionally, in parts, pale reddish color, in a vein cutting Laurentian limestone in the township of Lansdown (Leeds Co.), in radiating fibrous masses, constituting a vein in the Laurentian strata of Bagot (Renfrew Co.); a red variety, in cavities in dolomite, at the forks of the Credit, township of Caledon (Peel Co.) Other localities in this Province (Ontario) are:—Owen Sound, Drummond and Grand Manitoulin Island (Lake Huron), etc.

62. CENTRALLASSITE.—Is found in trap of Triassic age near Black Rock (King's Co.), in the Province of Nova Scotia.—Anal., H. How, Ed. N. Phil. Jour., new series, vol. x, p. 84, 1859; Phil. Mag., 5 ser., vol. i, p. 128, 1876.

(To be Continued.)

Some Ontario Magnetites.

By T. D. Ledyard, Toronto, Canada.

Sir William Logan, our great geologist, predicted that Canada would become eventually one of the greatest iron-producing countries of the world. Although possessed of numberless deposits of iron-ore, we have not yet done much to verify this prediction. Causes can be found for our backwardness, the principal one being the want of a market. A glance at the map shows that the small population of Canada is too scattered to support extensive iron manufactures. Six good-sized iron-mines would supply the ore necessary to make all the iron and steel used in Canada, even if we used nothing but our own make instead of importing the greater portion, as we do at present. And distances in Canada are too great in proportion to the small consumption to encourage home manufactures on a large scale.

But while Canada is suffering for want of a market, many parts of the United States would be benefited by the free admission of Canadian ores. The Eastern States could get cheap ores from Quebec and Nova Scotia, and many Pennsylvania furnaces could obtain Bessemer ores from Ontario at much lower rates than they are now paying for imported foreign ores.

GEOLOGY OF THE ONTARIO IRON-DISTRICTS.

Dr. Robert Bell, Assistant Director of the Geological Survey of Canada, in his "Geology of Ontario,"† says: "The name Huronian (derived from Lake Huron) was first given by the Geological Survey of Canada more than forty years ago, and has been adopted by geologists in other countries as universally as the term Laurentian, and is made to include all the rocks lying between the Laurentian below it and the Cambrian or earliest fossiliferous rocks above. Some of the rocks of the district stretching between the Counties of Lanark and Hastings in eastern Ontario, which were formerly included in the Laurentian series, are now believed by some to belong rather to the Huronian. An attempt has been made quite lately, among some American geologists, to restrict the name Huronian to rocks like some of those north of Lake Huron, although Sir William Logan and his colleagues, in introducing the term originally, described it as applying equally to the dark grayish and greenish schists, conglomerates, diorites, etc. The more extended investigations which have since been made in Canada and other parts of the world have confirmed the propriety and convenience of including under this name all the rocks which had been originally described as Huronian.

"The Huronian, as above defined, is the great metalliferous system of Ontario, as well as of northern Michigan and Minnesota, and hence its great importance in the economic geology of the country. The whole series is more or less metalliferous, but the various ores are not uniformly distributed, some occurring in one region or in some special stratum, while others may prevail in another section of country or in a different horizon in the series. Iron appears to occur most frequently in the lower or schistose portions of the Huronian system."

SOME MAGNETITE-DEPOSITS.

This paper will be confined to a short description of certain ores found in the Counties of Peterboro and Haliburton, and in the more easterly portions of the Province of Ontario. Those which will be mentioned are probably among the most important, yet comprise only a few of the ores which have come under the writer's notice. Magnetites only will be here taken into account, although hematites are found in these districts in deposits of considerable importance and sometimes of great purity.

Prof. E. J. Chapman, Ph.D., of the School of Science and University College, Toronto, says:

"This area of Ontario is traversed in a general north-east and southwest direction by belts of elevated rocky land, consisting of unstratified, probably eruptive, syenites or syenitic granites of a prevailing red colour. Between these belts lie rugged tracts of essentially synclinal structure, occupied in ascending order by strata of red and gray gneiss and by some crystalline graphitic limestones, succeeded more or less irregularly by dark green amphibolic and pyroxenic rocks, with which the iron-ores are chiefly associated."

The Belmont Iron-Mine.

About 110 miles east of Toronto, 6 miles north of the branch of the Canadian Pacific Railway, between Toronto and Montreal, on Lot 19 in 1st Concession of the Township of Belmont, County of Peterboro, is found a large deposit of rich magnetic ore, closely resembling in mode of occurrence some of the Lake Superior mines. Experts estimate that this ore-bed contains at least 1,000,000 tons of ore within 100 feet of the surface, from which there should be no difficulty in producing 400 or 500 tons a day.† The ore is very high in metallic iron, and by no means refractory in the blast-furnace. Samples taken from the pits possess a fine texture, and show but small traces of phosphorus and sulphur, with a high percentage of iron, constituting an almost ideal Bessemer ore.

The stripping is so light that the ore should be mined, by the use of compressed-air drills, at a cost of 50 cents

per ton, being so free from rock-matter that little culling will be required.* No trouble with water is to be anticipated, the ground possessing a natural drainage to the west, which can be improved and utilized at slight expense.

A special feature of this deposit is its proximity to the surface, necessitating but little expense for stripping, as mining can be done in pay rock almost from the commencement.† Some hematite is found on the east side in conjunction with soapstone.

Prof. Chapman says: "This is an exceedingly good ore, not too dense in texture, rich in metal, quite free from titanium and practically free from phosphorous and sulphur, and is well adapted for the Bessemer process."

The following analyses have been made, the first being from surface samples.

No.	Metallic Iron.	Phosphorous.	Sulphur.	Silica.	Manganese.
1	64.26	Faint trace.	0.04
2	65.36	0.002	Trace.	4.5
3	66.29	0.024	Trace.	3.19	0.42
4	68.88	0.006	Trace.	3.18
5	68.85	0.008	Trace.	1.96
6	69.99	0.012	Trace.	3.10

No. 1 was made May, 1884, by Prof. E. J. Chapman; No. 2, July, 1886, by W. F. Brugman, chemist of the Scranton Steel Co.; No. 3, November, 1887, by the chemist of the Joliet Steel Co.; No. 4, same date, by Prof. Davenport Fisher, Milwaukee; Nos. 5 and 6, August, 1888, by the chemist of the Cambria Iron Co.

Much of the rock-matter surrounding this ore-deposit is composed of epidotic diorite.

The Blairton Iron-Mines.

Four miles south of the Belmont mine are the Blairton iron-mines, at the village of that name, on Lot 8, in 1st Concession of Belmont, about 2 miles from the Canadian Pacific Railway.

At this place originally known as "the big ore-bred," there are large deposits of magnetic iron-ore, averaging probably 50 to 55 per cent. metallic iron, and low in phosphorous, with no titanium. Analyses have shown 0.035 phosphorus.

A considerable amount of ore has been taken out of these mines, as much as 300 or 400 tons daily having been produced here at one time. A large and deep excavation has been made, 150 feet wide by 250 feet long, and a second opening 160 feet deep lies south of the first.*

On the east side of the deposit is capped with Silurian limestone, while the west wall is a jaspery quartzite. The strike is west of north. In the wall, quartz and serpentine predominate. This ore is much mixed with rock, necessitating a good deal of culling, which renders mining expensive; and there has been sulphur in some parts of the deposit from the beginning.

This is one of the many iron-mines in Canada which cannot be worked at a profit for export under the United States duty of 75 cents per ton. If there were no duty this mine would doubtless be worked; it is capable of producing largely. At present the only use that can be made of such ore is to smelt it in a local charcoal furnace, there being plenty of hard-wood in the neighbourhood from which charcoal can be cheaply made, and limestone for flux not being far distant.

Central Ontario Railway Mines.

There are several large deposits of magnetic ore on or close by the Central Ontario Railway in the north part of the County of Hastings. Some of these ores are of Bessemer quality (after roasting out the sulphur), but unfortunately the mines are now lying idle, owing to serious dissensions among the owners. The statement has been made that these ores are worthless, and that the mines are not worked on account of the sulphur in the ore; but this is surely not the true reason. Nearly 800,000 tons of magnetic iron-ore are annually taken out of the Cornwall hills in Pennsylvania and used as Bessemer ore, although containing an average of 2 per cent. sulphur and only about 48 per cent. metallic iron; and nearly 700,000 tons of other sulphurous ores, some of them being hard magnetites from the States of New York and New Jersey very similar to Central Ontario ores, are annually used in the United States. The sulphur entails an additional cost in roasting; but where other injurious elements are absent, a sulphurous ore, after being properly roasted, often can be used in the manufacture of Bessemer iron.

The roasting should be carefully done in Davis-Colby or other suitable roasters, where plenty of oxygen is sup-

plied during the process. The ore should be broken up fine enough and plenty of time given to make the roasting effectual.* This should be done where fuel is cheap, at a cost not exceeding 25 cents per ton. The cheapness of mining and freight would much more than counter-balance this expense on some Ontario ores.

Many of the Central Ontario ores could be conveniently shipped to furnaces in Pennsylvania by returning American coal-cars, which bring coal into Canada, but now usually return empty.

SNOWDEN IRON DISTRICT.

The townships of Snowden, Galway and Glamorgan in the County of Haliburton, about 40 miles northeast of Lindsay, contain several valuable deposits of iron-ore.

Lots 25, 26 and 27, in the 4th Concession, Snowden, on the south side of Burnt river, contain several outcrops of magnetite extending about three-quarters of a mile. This ore is on high ground overlooking the river and railway-track, and most conveniently situated for mining by drifts or tunnels run into the hillside, the mine-cars running by gravity to the shipping platforms or pockets at the railroad.

The following analyses show these ores to be very low in phosphorus:

No.	Metallic Iron.	Phosphorus.	Sulphur.	Silica.	Titanium
1	61.48	0.01	0.16	None.
2	62.	Trace.	0.025	1.7	"
3	62.57	0.025	Trace.	"
4	63.	Trace.	0.025	3.1	"

No. 1 was made by Prof. E. J. Chapman; Nos. 2, 3 and 4 by chemists of different iron-works in Pittsburgh, whose names are not in my possession.

Concerning analysis No. 1, Dr. Chapman says: "A fine-grained, magnetic ore from the Howland mine, Lot 26 in 4th Concession, Snowden. The ore near the surface is very pyritous, but becomes almost free from pyrites in descending. The sample was taken from a depth of 81 feet from the surface. A second shaft has been sunk on another part of the deposit to a depth of about 30 feet. The deposit is apparently an elongated stock-formed mass of large extent. It has been opened over a length of about 80 feet."

The railway passes through Lot 20 in 1st Concession, Snowden, on which are several outcrops of magnetite, one of them cross-cutting the Monck road, where it was first discovered. Prof. Chapman has analyzed a surface-sample and found it to contain metallic iron, 60.18; phosphorus, 0.08; sulphur, 0.04; titanate acid, 0.73. He describes it as a black magnetic, fine grained ore, somewhat porous in texture. The deposit is apparently a stock-formed mass of large size, as shown by recent borings and excavations. Another analysis is given, showing metallic iron, 61.02; phosphorus, 0.052; and still others have shown metallic iron as high as 65%.

This district is about 200 miles from Buffalo, N.Y., to which point the ores could be delivered very cheaply in returning coal-cars. Moreover, these deposits are not much more than 100 miles from Midland, Ontario, whence ore could be shipped by boat to Chicago in returning grain-vessels. Limestone suitable for flux is found in close proximity to the ores, and there is abundance of hard-wood suitable for charcoal. There is also brown hematite in the neighborhood, yielding 45 to 48 per cent. metallic iron which would mix well with the magnetic ores in a charcoal-furnace.

The Paxton mine, in the adjoining township of Lutterworth, has produced several hundred tons of ore yielding 55 to 60 per cent. iron with no titanium and traces only of sulphur and phosphorus.

Ores from different parts of Galway Township, south of Snowden, have given the following analyses:

No.	Metallic Iron.	Mang. oxide.	Phosphorus.	Sulphur.	Titanium
1	62.37	Trace.	0.012	Slight trace.	None.
2	62.60	1.27	0.008	Slight trace.	"
3	65.	0.04	0.02	"
4	70.40	Trace.	Trace.	"

Nos. 1 and 2 were made by Prof. Chapman; Nos. 3 and 4 by Prof. Thos. Heys, formerly lecturer on chemistry in the Toronto School of Medicine.

VARIOUS ORE-DEPOSITS.

Professor Chapman has also made the following analyses of magnetites from this district which are free from titanium, viz.: Nos. 1,* from the Township of Glamorgan. A black crystalline, highly cleavable ore, carrying 70.38 metallic iron, with merely traces of phosphorus and sulphur. There are a few ore-exposures and needle-attractions showing a strong body of ore extending over a length of about 400 feet by 40 feet in width. No. 2 is an ore corresponding almost exactly in its cleavable structure and composition with No. 1, although it comes from another place several inches. Samples taken from a small trial-pit show 70.5 per cent. metallic iron with rock-matter under 3 per cent., but the ground is practically undeveloped.

No. 3. A black, fine granular ore from the vicinity of Apsley village, in the northern part of the township of Burleigh. Metallic iron, 63.68 per cent.; phosphorus, a trace only; and sulphur, 0.03. The intermixed rock-matter is essentially pyroxenic. Ground undeveloped.

No. 4. A very rich magnetic ore from the township of Madoc, the dried ore yielding 69.16 metallic iron; phosphorus, 0.04; and sulphur 0.03, with siliceous rock-matter, 3.32.

No. 5. A magnetic ore mixed with specks of actinolite from Madoc township. The sample contained nearly one per cent. pyrites and yielded iron, 60.32; phosphorus a trace; and sulphur, 0.52. Another sample from the same property gave iron, 62.54; phosphorus, 0.03. and sulphur, 0.38.

KINGSTON AND PEMBROKE DISTRICT.

The following analyses have been made of magnetic ores from the country tributary to the Kingston and Pembroke railway.

No	Metallic Iron.	Phosphorous	Sulphur.	Silica.	Titanium
1	65.33	0.017	None.
2	66.	Trace.	Trace.	2.14	"
3	62.	0.006	Trace.	4.12	"
4	60.	0.009	6.31	"
5	52.	0.055	0.10	6.53	"
6	65.07	0.07	0.05	6.66	"
7	66.34	0.14	Trace.	1.04	Trace.

No. 1 was made June, 1883, by Ledoux and Ricketts; Nos. 2, 3, 4 and 5 by a chemist employed by the Kingston and Pembroke Iron and Mining Co.; No. 6, November, 1871, by J. Blodgett Britton; No. 7 by a chemist unknown to me. This analysis, with Nos. 2, 3, 4 and 5, was published by the Minister of Agriculture in connection with the mineral exhibit of Ontario at the Cincinnati Exhibition of 1888.

TITANIFEROUS ORES.

In Minden, the township lying north of Snowden, there are large quantities of magnetic ores containing a considerable amount of titanium. A black, granular, strongly magnetic ore from near Lake Kushog showed by Dr. Chapman's analysis the following results: Metallic iron, 51.56; Titanium, 15.64; Sulphur, 0.17; Phosphoric acid, trace; Siliceous rock-matter, 4.08.

Similar ore is found on several adjoining lots, and there appears to be a good deal of titaniferous ore in this and neighboring townships.

There is an enormous deposit of black, strongly magnetic ore in the township of Glamorgan, about half a mile south of Burnt River. The deposit rises abruptly in the form of a succession of ledges to a height of from 80 to 100 feet above the general level of the ground, and is exposed in an easterly and westerly direction for at least 1,800 feet, with an average width of 140 feet. The analyzed sample contained 52.04 metallic iron; 8.11 titanium; 0.005 phosphorus; and 0.005 phosphorus; and 0.06 sulphur.

Another deposit of similar ore has been found some distance from the one just described. This ore carries from 8 to 10 per cent. titanic acid, which appears to be persistent throughout the whole ore-bed, the yielding of metallic ore being nearly 60 per cent.; phosphorus 0.007; and sulphur 0.08.

It may be remarked that titaniferous ores in these districts are generally very low in phosphorus, and if some treatment could be found whereby the injurious effects of the titanium could be got rid of they might be used in making steel.

Dr. Chapman remarks that "the presence of these titaniferous ores in close proximity to deposits in which no trace of titanium can be detected, is a fact of much interest hitherto apparently unrecognized in the iron-districts of Europe."

The writer feels warranted in protesting against the habit, which has prevailed in some quarters, of characterizing all Canadian ores as titaniferous. Nothing could be more unfair. Canada is a country of great extent, and it is just as absurd to class all Canadian ores as titaniferous because those objectionable ores are found in some places, as it would be to condemn Lake Superior ores because titanium is found in some parts of northern Minnesota.

Ontario contains, as I have shown, many ores perfectly free from titanium, although there are certain ranges or belts of territory in which titanium prevails to a considerable degree.

Many of the magnetite deposits in eastern Ontario are rich in iron, and carry, too, very low percentages of phosphorus and sulphur with no titanium at all. Others are high in sulphur but still free from other impurities, so that they require roasting only, in order to make them available as exceedingly pure 60 per cent. ores. Finally, the rates of wages in these districts generally range from \$1 per day for laborers to \$1.25 for miners; and, as has been observed, the commercial conditions of transportation are exceedingly favorable. Nothing seems to be lacking but access to the market of the United States.

MINING NOTES.

Nova Scotia.

(From Our Own Correspondent.)

Pictou County.

Mr. T. Turnbull, manager, and Mr. W. B. Moore, of the Vale Colliery, have resigned.

The engine-house at the East River mine, operated by Messrs. John Muir & Sons of New Glasgow, was destroyed by fire last month. The loss is estimated at between \$600 and \$700, not covered by insurance. The building has been rebuilt and equipped with a new boiler.

A party of 27 miners left Stellarton this month for work at the mines of the Alberta Railway and Coal Company at Lethbridge, Alta, N.W.T. Another party will leave shortly.

The Steel Company of Canada declared a dividend of ten per cent. at its last annual general meeting.

Cumberland County.

The Londonderry Iron Company is getting ready to put its second furnace in blast.

The English syndicate which recently acquired the Joggins mine in Cumberland County is reported to be in treaty for the railway connecting the mine with the Intercolonial Railway at Macan. The line, which is about eight miles long, runs parallel with the outcrops of the seams of the north edge of the basin, and will prove of value, as it connects with shipping facilities at the Joggins and River Hebert. The figure named is said to be \$180,000.

Mr. James Baird, formerly manager of the Chignecto colliery, is now in charge of the Joggins colliery, and is introducing the system of working from bond and pillar to long-wall. The miners are favorably disposed to the change, which they think will better their condition. Quite a number of men from the other mines are seeking employment under Mr. Baird's popular management.

The airways at the Springfield colliery have been enlarged, greatly improving ventilation. The shipments for September were fully 40,000 tons, and an increase in the returns for October is anticipated.

Cape Breton.

At the Caledonia mines there are ninety-five pairs of cutters employed, a larger force, probably, than ever before were employed. The output from the mine is close upon 600 tons per day.

In consideration of the early starts made by the miners, in order to give quick despatch to steamers, Mr. David McKeen, M.P., the popular managing director, has granted a bonus of one hundred dollars to Equity Lodge. This affords sufficient proof, says the *Stellarton Journal*, that our manager recognizes the Lodge as the proper party with which to do business. And Mr. McKeen is right; better to do business with a responsible committee than with a lot of irresponsible bodies.

At the Bridgeport collieries work continues steady, and is expected to continue so for some time yet.

At Sydney mines the output is estimated to be quite 700 tons per day. 118 pairs of cutters are employed.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

COXHEATH COPPER MINES.—Developments continue to be satisfactory to the management. The 260-foot cross-cut north from No. 2 shaft has cut vein "B" at 87 to 103 feet from the shaft, showing the width of the vein at this level to be 16 feet; it contains eight feet of good ore next to the hanging wall, the remainder being partly of lower grade, with streaks of rich ore. One of these streaks lying on the foot wall is 15 inches wide. The average of the vein is fully as high as at the 184-foot foot level, where it was estimated to be 10 per cent. copper. The hanging wall is dipping to the north and the foot wall to the south, indicating a further increase in width with depth. Shaft No. 1 is unwatered down to the 60-foot level. From this depth the old cross-cut south into the mountain is already in 70 feet, and will be at once continued to intercept known veins discovered since work at this shaft was suspended. At the new vein on the mountain the shaft is down 25 feet, the bottom being all in ore; this shaft will hereafter be known as No. 3 shaft. Tunnel between No. 1 and No. 2 shafts is in 130 feet. An additional force of 15 workmen are now cross-cutting the surface opposite the lake, 2,000 feet west of No. 2 shaft. Eight Rand power drills are now constantly at work on the property, and the other two will be started at an early day. Since the reports on the mine, rendered last July, over 6,000 tons of additional ore have been put in sight on vein "B" alone.

Caribou District.

The Halifax Mining and Prospecting Company have acquired the property adjoining the colliery to the Westward, formerly worked by Daniel Tonquoy, and are erecting light pumping and hoisting gear upon the same. The property is a wet one, and considerable water will have to be handled. Mr. Edward Whidden will have charge of the work.

Central Rawdon.

Work in the mines of the Northup Mining Company, Ltd., was suspended about the middle of September, but about the 10th of this month was partially resumed. The company are sinking two shafts by contract, and it is understood that other work will be suspended pending developments made by these shafts.

The yield of the Central Rawdon Company has also largely fallen off, and no large returns have been made for some time.

Whiteburn District.

The mills of the Rossignol and Queen's companies are rapidly approaching completion, and will probably be stamping quartz ere this is in print. Both are under the management of Mr. Julius Puttner, late of Malaga District.

Malaga District.

Matters seem to be very quiet here at present. The Parker-Douglas Company are working steadily, and report most excellent results from the Golden Gate concentrator which has been lately added to their mill.

From the Malaga Mining Company there is no news. Since Mr. McGuire resigned the superintendency Mr. Alfred Wade has been acting in that capacity. It is understood that the working force has been confined to the Rabbit Lodes.

Waverley District.

The Nova Scotia Syndicate, at the Windsor Junction mine, has ceased all work except that of widening and straightening the pump-shaft at the eastern end of the Union lode. It is proposed to make this the permanent hoisting-shaft for the present, and a skip-track will be put in as rapidly as possible. Manager MacDuff is putting in a new hoisting engine at this shaft, manufactured by W. W. Howell & Co., of Halifax.

The mill of the Lake View Company started up the last week of September, and has been running, with occasional stops for adjustments, ever since. The mill contains twenty stamps and eight fine vanners, and the manager, Mr. A. A. Hayward, claims to be losing less than 20 cents per ton in his tailings.

It is reported that a sale of the Gue and Wilson property has been made, but no facts are made public as yet.

In General.

"The fact that Nova Scotia coal is far inferior to Pennsylvania bituminous is no reason why the tariff should be removed on Canadian coal," said Harry A. Berwind, of the Berwind-White Coal Mining Company, recently, in speaking of Senator Sherman's reciprocity scheme. "The cheapness of the Canadian coal would make many people prefer it to the Pennsylvania coal without regard to the comparative value of the two, and for that reason the removal of the tariff would have some effect on the New England coal trade. Still, we don't fear the Canadian competition in the long run."—*Philadelphia Inquirer*.

The above paragraph is a very fair sample of the slip-

shod and wilful misrepresentations that are occasionally prominent in the columns of our contemporaries across the line. A gentleman very prominently identified with the coal interests of the Province, on being shown the paragraph, remarked: "There are good and bad coals in both countries, some coals better suited to one purpose, and some for others, but the writer of the paragraph in question evidently is indifferent to facts; he don't want to be set right, being content to make a political point regardless of truth."

Prof. Bailey, who has been conducting investigations during the summer in Shelburne and Queen's counties for the Geological Survey of Canada, reports the area of auriferous strata in these districts much larger than was generally believed, and predicts that important new discoveries will soon be reported from that quarter.

New Brunswick.

The Windsor Gold Mining Company, Limited, has made application for incorporation under the Joint Stock Companies Letters Patent Act, Capital \$100,000. Head Office: St. John, N.B. Directors: J. H. Harding, St. John, N.B.; W. W. Clark, St. John, N.B.; H. T. Harding, Truro; W. R. Stockbridge, Boston, Mass.; Gideon Havenor, St. John, N.B.; H. E. Hardige, Boston, Mass.

Quebec.

Eastern Townships District.

(From our own Correspondent.)

The American Asbestos Co. have placed a cable derrick in position on the hill above the main workings. This is the first derrick of this style that has been tried in the asbestos mines. By means of this derrick they are enabled to hoist the waste rock from the pits and haul it away from their openings without handling it by hand. It is a decided improvement on the boom derricks and could be used to advantage by other companies, especially those who have large pits, where it is impossible to place boom derricks to reach around to all parts. By stretching the cable across the pits loads can be lifted from any point. Their manager, L. A. Klein, has returned from an extended trip through the States.

Dr. James Reed has his plant nearly ready to run. It is expected that it will be running about October 25th. The doctor is also erecting some dwelling houses on his property for the workmen employed. Several pits are opened and are being worked with good results.

Work at the pits of the United Asbestos Co. is being carried on with good results. They have commenced taking off top rock in their large pit with a view to widening it. The bottom of this pit has been and still is very rich, but before taking any more from the bottom it was necessary to lighten the top. Several veins large, but discolored, have been struck on the top and give every indication of continuing at depth.

Work at the Anglo Canadian is going on as usual. They have taken down their large boarding house and are building smaller houses for their workmen.

Messrs. King Bros. are driving a tunnel under the railroad to reach good ground on the other side. The openings are all looking well.

The Laurier Co. are working on their lots, but we do not hear with what success.

Messrs. Walsh & Mulvena, of Sherbrooke, have done some exploring on a lot at East Broughton, near the property of the Scottish Canadian Asbestos Co. Numerous veins have been shown and it has every indication of being a good thing. Some very fine samples have also been taken from a property near Tring Station.

Capt. T. R. Davey, Harvey Hill Mines, leaves shortly for England on business.

Work at the Megantic Mines, Coleraine, has been suspended.

It was intended that the visiting members of the British Iron and Steel Institute and the German Association of Iron Smelters should have paid a visit to the Asbestos Mines in this district, the copper, smelting, chemical and fertilizing works at Capelton, the marble quarries at Marbleton and other points in the Eastern Townships, but it was found to be impossible to make any suitable arrangements that would permit the party to return to New York from Sherbrooke and it was accordingly reluctantly abandoned. The Messrs. Nichols too have no inclination to make a precedent of opening their works to visitors and refused permission to admit the visitors to their interesting and extensive works.

All the Thetford mines are working full time and making out-puts satisfactory to their owners.

Ottawa Valley.

Having completed all necessary arrangement Mr. Geo. Stewart has commenced operations at the newly acquired properties of the Phosphate Corporation, Limited. Mr. Stewart will exercise a general supervision of the mining work at the High Falls, Ross mountain and Murphy properties at each of which a force of 50 men will be at once employed. Mr. Stewart starts work on a guarantee to produce 10,000 tons of phosphate from the Ross mountain and High Falls properties, and there is no reason why his moderate anticipations should not be fully realized, both properties being most promising. The formal transfer of the properties to the corporation took place on Wednesday, 22nd, with befitting ceremonies. Mr. William Macintosh, Buckingham, will manage the Ross mountain under Mr. Stewart's direction.

Mr. O. M. Harris intimates that his exports to all points for this season will more than double his production last year. Large quantities of high test phosphate are daily being raised and shipped from the Canadian Company's pits.

It is thought that the export from the High Rock mines for this season will figure close upon 5,500 tons. About 2,000 tons of 60% ore have been exported with the higher test shipments.

Ontario.

The Standard Asbestos Company of Ontario, Limited, is the name of a new company incorporated to operate asbestos lands in the township of Elizier, County of Hastings. Authorized capital \$100,000, divided into 100 shares of value of \$100 each. Directors, Hon. J. E. Campbell, Hamilton, Ohio; D. U. Jennings, New York; F. J. Falding, Sherbrooke; R. H. Martin, New York. Head office, D. U. Jennings, secretary, 45 Broadway, New York.

Port Arthur District.

(From Our Own Correspondent.)

THE BADGER SILVER MINING COMPANY.—Your correspondent has recently visited this company's property, and through the courtesy of Superintendent Shear was shown through the various workings. The prediction made in these columns some time ago has been amply verified. The shipments have exceeded the estimate, as they are now making semi-monthly shipments of smelting ore and concentrates; each shipment consists of one carload, containing 17 tons. The "West End" vein has developed into a strong, well-defined lode having an average width of 3½ feet between the walls. The gangue is composed of calcite, zinc blende, galena, pyrites and black silver, having an average value of 150 ounces of silver to the ton of 2,000 pounds, the richest portion being along the bottom of the level, which appears to be driven over the top of a rich ore body. The breast of the level is now within a short distance of the intersection of No. 1 vein, at which point a shaft will be sunk and drifting commenced. It is also the intention to begin driving No. 1 level on No. 1 vein. When work ceased at this point last year the vein was five feet wide in the breast and carried 40 ounces of silver to the ton. At No. 2 vein, No. 1 level west from the shaft is being pushed on as fast as possible. The pay streak is 18 inches wide, the ore of which averages 1800 ounces to the ton. A winze is being sunk 175 feet east from No. 2 shaft. The vein in the winze is carrying its width down and is producing 100 ounce ore. No. 1 adit level, on No. 3 vein, is now in a total distance of 240 feet, and is in bonanza ground. The vein has a uniform width of 3 feet. The gangue is the same as at the "West End" and No. 2 veins. The ore from it is averaging from 1425 to 2140 ounces to the ton. No. 1 shaft on No. 4 vein is down 135 feet, and has been in bonanza ores for the last 65 feet. The ore on some portions of this ore body averages as high as 7,000 ounces to the ton.

SILVER ISLET CONSOLIDATED MINING AND LANDS COMPANY.—H. S. Sibley and Professor W. M. Curtice of Detroit, paid a visit this week to the Edward's Island location for the purpose of making an examination of the development work done. Their examination proved highly satisfactory; they left for home on the 14th inst. taking large samples of Arsenical silver with them. The vein is a true "fissure" averaging 3½ to 4 feet in width; it crosses a series of horn blende, porphyretic and trap dykes, every one of which it faults; it has been traced across the island, and shows up in a strong out cropping on the north point. The gangue of the vein in the shaft is composed chiefly of calcite, with some quartz and boryta, heavily mineralized with glena, blende, iron and copper pyrites and nickel; at a depth of 20 feet a seam of arsenical silver and nickel came in, and is continuing down as depth is attained. Selected samples assayed from 40 to 130 ounces of silver to the ton. A steam hoisting and pumping plant will be placed in position as

soon as the necessary buildings can be erected, Capt. Trethewey is at present engaged in opening up the company's copper property at Cape Maimaise.

THE BEAVER MINING AND MILLING COMPANY.—Extensive improvements have been made recently to the mill, four new vanners have been placed in position, three of which are the invention of the superintendent, and are doing excellent service in saving the fine silver from the slimmers. The last shipment was made on the 27th ultimo. It consisted of 17 tons of concentrates and smelting ore, valued at \$25,000. They have at the present writing 37 tons of concentrates on hand at the mill and at the C. P. R. warehouse at Murilla station.

Mr. Richard R. Paulison returned this week from a two months trip along the Bessemer Iron Range, contiguous to the Port Arthur, Duluth & Western Railway, now under active construction to the Minnesota boundary, 84 miles from Port Arthur, 40 miles of the road already having been completed this season.

Mr. Paulison also examined the vertical deposits on Hunter's Island. The most favorably known deposit of merchantable ore lies one and a half miles across the boundary in Minnesota, and consists of 160 acres of land belonging to the Milwaukee Iron Company. Commencing at the breakoff to the north, the ore lies nearly horizontal with a dip of only 5 degrees. A trench about two feet deep has been dug along the iron about 500 feet, and pits sunk passing through seven feet of ore, the top two feet of which certainly will average 67% of metallic iron, and the entire horizontal deposit produce large quantities of good shipping ore.

Two miles west from this property the Chicago Iron Company own a valuable location, and which they favourably tested last winter with a diamond drill. This range has been traced from these deposits in a north-easterly direction to the Canadian Pacific Railroad at Kaministiquia, a distance of nearly 80 miles, and on its course are located the Caldwell, Segwick and Paulison properties. The ore is distinctly different in appearance from that of the Vermilion and Hunter's Island ranges, and comes within the class of steel producing ores, and is black in colour, while the ranges immediately north carry the red and grey hematites. The entire range juts against the gneiss or so called granite overflow, and has a horizontal tendency. At the Caldwell and Segwick tracts, north of Gunflint Lake, several test pits have been put down, and prove conclusively the presence of ore in large quantities. This also applies to the thirty odd miles of deposits belonging to Mr. Paulison, north of North Aarrow and Whitefish Lakes, where the most prominent exposures of ore in place are found on 77 A., 88 A., 38 A., and numerous locations north of Round Lake. The "Wigwams" R. 257-258, in which the Sibley's, of Detroit, are interested with Mr. Paulison, have the largest body of ore in sight of any location on the range, and the essays average over 60%. Peewabic Mountain, still further to the north-east, has a good showing on its north and south face, but has not yet been thoroughly explored.

British Columbia.

At Illecillewaet the Selkirk Mining Company is running a 500-foot tunnel on the Lanark, the work being done by contract. This tunnel is expected to tap the ledge at a depth that will solve the problem.

The miners at the Union collieries, Comox, are very busy turning out good quantities of coal. The company's wharf is most favorably situated, and can accommodate as many as seven vessels at one time. The pits are turning out from 300 to 400 tons per diem.

The following are the official returns of the value of the exports of minerals from the ports of Victoria, Vancouver and Nanaimo for the three months ended 30th September:—

Minerals.	Victoria.	Vancouver.	Nanaimo.
	\$ cts.	\$ cts.	\$
Coal		18,511 00	389,116
Lime	1,061 85	1,517 50	
Stone		255 67	1,120

Returns of the value of coal exported from Nanaimo shows the following:—September, 1889, \$397,497.55; December, 1889, \$439,448.37; March, 1890, \$385,528.17; June, 1890, \$414,827; September, 1890, \$389,116.

A trial shipment of 100 tons of coal from the mines of the Canada North-West Coal Company at Canmore has been sent down by S. S. Walla to San Francisco to be tested. The H.M.S. Espeigle also Saturday, before she left the harbour, took on 25 tons, and will make a test on the coal. The result of the experiment will be sent to the Admiralty for their consideration.

McKinnon has a few men at work on the Maple Leaf, a claim adjoining the Lanark, and has five horses packing ore to the railway, for shipment to the Revelstoke smelter.

In the Hot Springs district the main subject of discussion is the success or failure of the Best patent smelter. The patentee is on the ground clearing a site for a plant of 20 tons capacity. The location selected is at the mouth of Woodbury Creek, two miles north of Ainsworth.

The pump and hoist for the Little Donald was brought in from Bute this week, and contractor Northey is now engaged in getting it up to the ground and in place.

The machinery for the Krao was ordered from Chicago some time ago; but the manufacturers made a mistake in shipping it, and a "tracer" found it down on a Southern Pacific sidetrack in Arizona. It is expected in next week.

In the Mountain District the only thing worthy of note is the ore shipments from the Silver King. Six days a week Joe Wilson's train of pack animals makes a round trip between the steamboat landing and the mine. The estimated value of the ore brought down daily is from \$1,000 to \$1,200, each sack of 100 pounds being worth \$15. The Surprise and barge transports the ore from Nelson to Bonner's Ferry making two trips a week.

At Eagle Creek, the Poorman Company is at work making preparations to start a tunnel that will tap the ledge at a depth of 300 feet. A Pelton wheel is being placed in position, and a Burleigh drill has been ordered. This company means business, and everything under taken is carried out successfully. The Royal Canadian has been examined by a number of "experts," and a deal is now said to be in progress, which, if made, will place that property in the hands of men backed up by Ontario capitalists who are not afraid to invest a few thousands in gold prospects.

Gold Mining in Australia.

Theodore West, Darlington, Eng., read before Cleveland Institute of Engineers.

The first part of this paper is descriptive of the colonies of New South Wales, Victoria, South Australia, Queensland, and West Australia, particularly with regard to their mineralogical characteristics. These colonies, the author states, are highly advanced, socially and politically, attributable mainly to the discovery of gold and other valuable minerals, as well as to the many other resources within them—the development of which affords employment for many of our surplus population.

He states that soon after the discovery of gold, nearly all the most productive spots were pitched on, specially where the metal was easily worked, and exhausted by the simplest of contrivances in the hands of men who knew little or nothing of mining or minerals.

The following is a section of the deposit in which the gold is usually found:—

On the surface is a thin layer of top soil, thin strong ferruginous sand, fine gravel, then alternating layers of sand and gravel, coarser and coarser the deeper one goes, then large pebbles, and, lastly, boulders resting on the rock. It is in the latter stratum that the largest finds were obtained, or in the chinks and holds of the bed rock. Sometimes the gravel and pebbles were naturally bedded together with clay which, on exposure to the weather, readily fell into pieces, whilst at other points it was found to be bedded hard with what was called cement, probably due to the lime, iron, or silica contained in it.

In estimating as to the probabilities of ground paying for gold working, the yield of gold per ton of material handled is only one of the elements which have to be taken into account, as it will greatly depend on whether the material is hard or soft, near the surface or requiring to be raised from a depth, wash-dirt scarce or plentiful, and a good supply of water obtainable near the site of the operations.

The process of washing the alluvial gold is next gone into and depends on the well-known theory that the heavier substances always sink to the bottom, consequently all the apparatus used in this operation is designed and constructed on the principle that, while water has the power to wash away the base material, the metal is almost entirely left behind. The processes

described and illustrated are:—(1.) By means of the "hand cradle," which is very tedious and laborious; (2) The "Tom," which better enabled poorer ground to be worked to pay than what could be done by the cradle; (3) By "sluice boxes;" (4) The "puddling machine," for clay wash-dirt; and (5) By "hydraulic sluicing," an American process, which is objectionable on account of the large amount of debris that was washed into the streams and water-course, and deposited on the low lying lands. It is stated that, as the alluvial deposits operated on were exhausted, and owing to the finding of small pieces of quartz with gold adhering to them, the attention of miners was directed to the quartz veins which were found traversing the various districts, some of them for miles. They are usually found to dip at an angle of 40°, although at times a flat-lying reef, several feet in thickness, is found extending over a considerable area, but generally poor in metal.

The veins are found to vary in colour from pure white to black; the clear white are usually barren.

In the mining of the veins, a depth of about 330 fathoms has been reached, necessitating the employment of experienced miners and the use of costly machinery and other plant for the purpose of raising the ore to the surface, and skilful application of refined chemical process, to be used for wholly extracting the gold from it.

The author gives a sketch of a ten-stamp battery used for crushing the ore, also of "Chilian Wheels," and many of the other machines in use many years ago, as well as descriptions of the various mechanical and chemical processes now in use—such as the Cassell's patent, acting on the principle of decomposition of common salt and crushed ore by galvanic action, dissolving the gold, which is filtered through asbestos cloth and precipitated; and also the MacArthur-Forest Amalgamator, by which the ore, after being firmly ground, is mixed with the cyanide of potassium stirred for 8 or 10 hours by a four-bladed propeller, then filtered through fine zinc, and deposited as a cyanide of gold.

How to Manage Steam-Engines.*

It is rather a difficult matter to write about the management and repairing of engines, as nearly all the repairs are what should be a machinist's job, as nearly all would require machine work to properly complete it, therefore it cannot be classed as a part of an engineer's business.

As regards the management of steam engines, it will be necessary to begin at the foundation, and give a minute description of the manner of setting up and adjusting work, which every engineer should understand in order that he may know what his engine needs when not doing its work properly. Every foundation for an engine requires the skill of a stone or brick mason to build, and when that is properly done then the engineer's duties begin, the first thing being to place the frame or engine bed upon the foundation, seeing that it is banded up and firmly held in its proper position. The next thing in order is to place the shaft in its bearings, seeing that it is on a proper level, and fits its bearings properly, to run easy and smooth. Then place the fly-wheel in position upon the shaft, taking care that it runs true (as it should be properly fitted when made), placing it equal distance between the shaft bearings, so that the weight will be alike on each. Next in order is the placing of the cylinder on the bed in its proper position; there should be no mistake about this, as there should be what are termed steady pins to hold it in its place.

To prove that the shaft and cylinder are properly placed, attach to the outer end of the cylinder a small piece of board, long enough to reach across its end and fastened with one of the bolts which holds the head on. Attach to this piece a fine strong cord or wire that will not break on being drawn tight, fasten on the farther end of the bed another piece of board, leaving enough to stand up as high as the center of cylinder, attach the other end of the cord to the latter piece, bringing it exactly to the center of cylinder, which can be done by calipers. Turn the fly-wheel over, bring the wrist pin to the line, and be particular that it is exactly in the center of the bearing on the pin; then reverse the fly-wheel, bring it to the line of the other center. If the line is on the center of cylinder, also on center of wrist-pin when turned on both centers, then your engine is on line; but if not then the cylinder must be out of line, or else the shaft is not square with the cylinder, in which case it must be brought to a perfect line, either by moving the cylinder, or pillow block the outer end of shaft. When these points are in a perfect line, put in the piston and attach the connecting rod to the cross-head, being sure that the cross-head comes in a perfect line with the center of cylinder.

When this is accomplished, all is ready for connecting the smaller parts, such as cut-off, rod-valve, &c. This brings us to an important part of the work, viz., the setting of the valve, of whatever kind it may be. I find this the most simple way to adjust in a slide-valve engine. Turn the fly-wheel to its furthest point, or in other words, to its center point, which will bring the piston

head to one end of cylinder; now set the valve so as to cover the port, leaving not more than 1/44th of an inch from the introduction of steam, when the crank is on its center, and see that the valve stands in the same position; if not, it may be adjusted by the length of connecting cut-off rod, until the valve stands in the same position at each central point. When this is done see that the exhaust port is clear, to relieve the cylinder of the steam at the proper time. I have seen engines set up with the valve of a length not to admit of a free exhaust, which caused the engine to work heavy.

Another important point in the arrangement of an engine is the steam feed and exhaust pipes. The rule generally adopted is, to have the exhaust pipe 1/2 inch larger than the feed pipe, but I find by experience that the exhaust should be 1 inch larger, which will cause the machine to run much freer, causing less strain than when a smaller pipe is used.

Another important point is the setting of the piston packing rings; these should be set very carefully, taking great care that the piston head is exactly in the center of the cylinder, using a pair of calipers in adjusting it.

As regards care and management of an engine, after being put in order according to the above named points, but little work is required, but it must be constantly watched and kept well lubricated in all its parts, the cylinder receiving special care. It should have a lubricator attached to the feed pipe just before it enters the cylinder, emitting two or three drops per minute, according to the load the machine is carrying, and great care must be taken with the packing rings to keep them just tight enough to prevent any leakage of steam, and not tight enough to cause any great friction.

I have found that one good qualification in an engineer is to know enough to let his machine alone when it is working well, and to know when it is doing well. I have known men in charge of machines to be constantly at work at them, and often getting them out of order instead of benefiting them.

Great care should be taken to keep all of the bearings just tight enough to run easy without any slack motion, which causes them to thump or pound at each revolution.

In setting up the keys I find it best to use a soft metal hammer, which will not bruise the end of the key. In using, hit it one blow on the point, which will give it a little back motion, just to give the bearings a free working motion.

It is the custom of many engineers to oil the cylinder three or four times per day with about one gill of oil, but this is not the proper way. A cylinder needs oil the same as any other bearing, in very small quantities and often.

Another important matter is in starting the machine. All drips should be opened and the water drained out, by letting a little steam in to warm up the cylinder before it is started, and then slow for one minute, giving it time to work off all water which has settled in it, getting it well warmed up before running at full speed.

The great point in management is to keep close watch and to know when the machine is not running right; then, if wrong, learn just what the trouble is before any changes are made, as the machine may be injured by not doing the right thing. An engineer should be a good machinist as well as a careful man, possessing good judgement, never doing repairs or making changes until he knows what is necessary to be done. If the above rules are strictly observed, very little repairs will be needed, except in case of breaks, and as to directions about repairs, no mechanic can tell just what to do until he sees just what the break is and determines its cause. Any other plan for repairs would be much like "ideal farming;" practical knowledge is the best.

*Prize article by B. Taylor, in the *Sawmill Gazette*.

Underground Pumping.

The mode of dealing with the large quantity of water often met with in sinking pits has always been a matter of great importance, because of the following obstacles which have to be overcome: First, having constantly to lower the pumps, together with a consequent lengthening of the spears or rods; second, the difficulty of keeping the valves and working barrels in order, in consequence of the quantity of solid matter which is necessarily raised with the water; and third, the difficulty of carrying on sinking work with pumping plant always at the bottom of the pit. A special form of sinking pump, recently designed by Messrs. Bailey & Co., of Salford, is now successfully at work at the Cadeby mine in South Yorkshire, and contends with the above difficulties in a very satisfactory manner. The pumps are hung in the shaft by wire cables from the surface and are easily lowered by means of powerful capstans as the sinking progresses. The special feature of this steam pump is that, instead of having an engine with foundations, connecting rod, quadrant and spears, all liable to wear and tear and mishap, the combined engine and pump is the only thing to be dealt with. Eye-bolts are provided at the top, by which it is suspended from chains or wire ropes, and

lowered to follow the falling water. The pump consists of three hollow plungers. The upper pair are stationary, and over them are sliding barrels which are connected to the steam piston. From the lower end of these barrels projects the bottom plunger, working into the third barrel, which is secured by means of connecting rods to the steam cylinder. Thus there are two smaller barrels in connection with the larger ram.

There is a group of valves in the junction between the smaller barrels and the larger ram, constituting the delivery valves; and another group of valves at the bottom of the large barrels, constituting the suction valves. The action of the pump is as follows: As the bottom plunger rises, the water follows it into the lower barrel; at the same time the water in the upper hollow plungers is forced into the rising main. In the down stroke, the water in the lower barrel is forced through the lower plunger and valves into the upper barrels and plungers, and thence into the rising main. Thus there is a continuous delivery in the up and down strokes. One of the upper plungers is open on the top and forms the discharge orifice for the water; and the other is closed, forming an air vessel, which is continuously charged with air through a suitable snifting valve fitted to the side of the pump nearest to that plunger, and below the discharge valves; this snifting valve permits a small quantity of air to be drawn in with every upstroke of the pump. The steam cylinder is fitted with the Davidson slide valve.

Six of these pumps have been supplied to the Denaby Main Colliery, which will raise 300,000 gallons per hour through 300 feet. Each pump has its own winding drum and steel wire rope, enabling each or all of the pumps to be raised or lowered at will. Two shafts are being sunk to a depth of 600 yards, and four pumps are in one shaft and two in the other. Each pump has a telescopic suction pipe, which enables a depth of nine feet to be sunk without lowering the pump.

The First American Tin Mill.

The *Rapid City Republican*, in a recent issue, gives an interesting description of the Elendale Tin Mining Company's new Tin Mill, the first of its kind established in the United States, and which is now treating the product of the Dakota Tin mines. Our contemporary states that the mill is located on Iron Creek, about 22 miles south-west of Rapid City, at the foot of the mountain on which the mines are situated. The mill proper measures 50 feet in width by 100 feet in depth, and is divided into 3 stories. It is unique in plan, compact and convenient, well built in particulars and protected from all dangers of fire, both by a system of water pipes and by having roofs, etc., covered by a thick asbestos coating. Either steam or water power may be used for running the machinery. The steam equipment consists of two 100 horse power boilers and 100 horse power high speed engine. The water power equipment consists of a flume 20 inches by 24 inches in section, bringing the water from a dam on Iron Creek, a mile and a quarter distant from the mill, giving a head 100 feet pressure at the wheel. About 500 miner's inches of water are supplied to the Turbine wheel. The water power will be used except during short cold snaps in the winter, the engine being placed in the mill as reserve power in case of accidents. The ore is hoisted from the main shaft and dumped first into an ore bin of 200 tons capacity, located high up the mountain over the hill. From this bin it is conveyed to the mill by a wire rope bucket tramway, the lode going downhill to the mill, hauling the empty buckets back to the mine. The ore buckets mechanically deliver their contents into a 175 ton ore bin, above and back of the mill. The large lumps of ore are crushed, first by a Gates crusher, then passed through a drier to a set of Gates improved cornish rolls, thence elevated to a set of rotary sizing sieves. From the sieves the finer sizes are conveyed to a set of Paradox concentrating tables, and the coarser sizes to common Hartz jigs. The concentrates are, for the present, being shipped to Chicago to be smelted, but it is the intention of the company to erect at once a smelting plant on the hills. Assays and tests from the different workings gave an average of 3 per cent. metallic tin, while picked or specimen rock is often blasted out that will yield over 30 per cent. of the white metal.

An Electric Well Oil Driller.—Wesley Webber, of Pittsburgh, has been granted a patent for a new device for drilling oil wells by electricity. The new invention is a novelty, and if a success will revolutionize the modus operandi of drilling oil wells. The device is intended to supplant the use of heavy tools and do in a scientific way that which has heretofore been accomplished in a crude way. The device, as distinguished from the power in the derrick used at present, is an apparatus comprising a series of motors in tandem, connected to one another so as to practically make one motor. The reason for using the motor in tandem is to get the power within a six-inch

diameter, so that the entire mechanism, which, to outward appearances, looks like the common boiler, can be lowered in the well and the power applied direct at the bottom, which is the true place of resistance in "making a hole." Projecting therefrom is a rod which resembles a piston-rod working in and out of the cylinder; upon said rod the drill bits are firmly fastened and the apparatus lowered in the well the usual way. The entire mechanism, with a number of improvements to adapt it to drilling, is about the same as propel the electric street car, and as a number of mechanics and electricians who have seen it say, "there is no reason why the thing won't work."

Uses of Asbestos in the Laboratory.—Asbestos in its various forms is a very useful substance, and can be employed very handily in many ways at the lecture table and in the laboratory, says Professor Markoe. Shredded or carded asbestos will serve as an excellent filtering material, used just the same as paper pulp. Asbestos twine is used in binding together parts of apparatus exposed to fire and strong acids. The professor often prevented a crack in the neck of a retort or flask from spreading by binding it with asbestos yarn or twine soaked in solution of sodium silicate, and then treated with a solution of calcium chloride, a perfectly insoluble cement being thus formed. Asbestos wool mixed with solution of silicate of sodium makes a fire-proof cement of great strength, also serves to mend cracks in stoneware. It can be made insoluble by subsequent treatment with calcium chloride, silicate of calcium being formed. Asbestos paper and card can be obtained of all degrees of thickness, and can be well employed as substitutes for wire gauze and the sand bath in small operations involving the heating of glass vessels. Asbestos paper and silicate of sodium are very useful for mending cracks in glass apparatus.

Look out for the Canadian Mining Manual, now in press.

SEALED TENDERS addressed to the undersigned and endorsed "Tender for recovering roofs of Engine, Boiler Houses, &c., Parliament and Departmental Buildings, Ottawa," will be received at this office until Friday, 31st Oct., 1890, for the several works required in recovering roofs of Engine, Boiler Houses, &c., at Parliament and Departmental Buildings, Ottawa.

Specifications can be seen at the Department of Public Works, Ottawa, on and after Thursday, 23rd October, 1890, and tenders will not be considered unless made on form supplied, and signed with the actual signatures of tenderers.

An accepted bank cheque, payable to the order of the Minister of Public Works, equal to five per cent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract, or fail to complete the work contracted for, and will be returned in case of non acceptance of tender.

The Department will not be bound to accept the lowest or any tender.

By order,
A. GOBEIL,
Secretary

Department of Public Works,
Ottawa, 18th Oct., 1890.

WANTED TO PURCHASE, AT A REASONABLE FIGURE, A good Asbestos Property.

None but principals dealt with.

Address, WITNESS OFFICE,
MONTREAL.

Want Column.

Fifteen cents per line; no advertisement to occupy less than two lines. Orders for this column, and for all transient advertisements, must be accompanied by cash.

Remittances.

Remittances should always be made by Bank Drafts, Cheques or Post Office Orders, made payable to the Manager. American Postage Stamps are of no use to us whatever, and will not be accepted in payment of small amounts.

Co-Operation Invited.

The publishers earnestly request the co-operation of readers of the REVIEW for information, communications that can be utilized, suggestions, news items, etc., etc. All such should be addressed to the Editor.

The Proposed Mining Tax.

The Lieut.-Governor of the Province of Quebec has intimated in the speech from the throne, at the opening of the present session of the Legislature, that among the proposed means for raising revenues is the imposition of a tax upon the mining industries of the Province.

We have repeatedly in these columns expressed the opinion that the true method of dealing with mining lands is to lease them on royalty, with compulsion of operation, or failing that, the forfeiture of the lease. This would put an end to the locking-up of valuable lands by speculators, would give the prospector and discoverer a chance of profiting by his enterprise, and would greatly add to the revenue of the Province. The monopoly and control of our mineral lands by men who have no intention of doing mining work themselves, and whose only effort is to "unload" the properties upon others at exorbitant prices, has become a crying evil, and we call upon the Government to put a stop to it. Henceforth let any applicant, with guarantees of continuous working, have the privilege of mining on Government land, paying a royalty on the output. The present system tends greatly to prevent the operation of mines, because the first purchasers being mainly speculators (often government officials who are able to pull wires

and get favorable grants), sell the lands at prohibitive prices; and many investors who would be willing to risk their capital in actual mining operations, will not pay in advance a large sum for the privilege of what is well known to be a hazardous risk. Men need to be *coaxed* into mining more than into any other industry; for though its profits are often large it has a great percentage of losses. It is stated in Chambers' Encyclopædia that 92 per cent. of the mining capital of the United States has been sunk. The great prizes occasionally won in that country have overcome this discouragement, and venturesome men still invest. But in the Province of Quebec our mines have not had time to yield but few brilliant results; there have been no great successes such as to tempt a large influx of capital, and it requires the most judicious consideration and every possible offer of inducement on the part of the Government to prevail upon capitalists to undertake mining ventures. Even if these fail to be profitable to the investors the money expended goes to the toilers of the country, and is of incalculable benefit in those regions now, unfortunately, so widely spread, where farming has become unprofitable or the lumbering business has declined. The mining industry is not one that is making such profits on the average that it can bear to be taxed. It has accumulated no gains by the fostering hand of government through a protective tariff, and owes no acknowledgement for favors received. On the contrary, the privileges given by government to manufacturers have operated in every respect adversely to the mining interest, increasing their expenses in every direction without the least compensatory return. If any single branch of trade is to be selected to bear a special burden of taxation let it be that which has been most fostered at the expense of the community. Let not the tax fall upon the one almost sole manly industry of Canada that is struggling unaided to its feet, and asks no privilege but "a fair field and no favors!" A tax on mines, coming in addition to the high prices demanded by present owners of mineral lands, would operate as a fatal blow to many prospective enterprises, and would prove to be in some cases the last straw that breaks the back of a struggling industry.

It is hardly in our province to proclaim schemes of political economy, but upon general principles we must condemn special taxation upon individual industries and demand that taxation, which is made presumably for the good of all shall be so levied as to be paid by all in some sort of equitable proportion to their means and privileges. A tax on all land values would more nearly approach to ideal equity, or a tax on incomes, though irksome and difficult, would be in the direction of justice. The Government having sold its lands for the greater part outright, would be guilty of breach of faith if it now demands further payments; and in the cases of late sales, where the possibility of taxation was intimated, assurance having been given by legal enactment that this res-

triction would not be enforced for a given period, a feeling was created that the Government was opposed in principle to such taxation and investment has been made in confidence that such a liberal policy would be continued. If any tax is to be levied we would suggest that it should be placed upon the mineral lands held in idleness by speculators; then they would either go to work or else abandon the lands, and in the latter case they could be leased on royalty to bona fide miners. Let industry be untaxed, but let monopoly, idleness and special privilege be made to pay richly for their usurpation of natural opportunities which ought to be ever fully available to all willing workers. The more mining is prosecuted the greater is the chance of discovery. Venturesome capitalists dared to pursue the dubious production of copper at Sudbury, and were unexpectedly rewarded by the discovery of nickel. For the interests of the country therefore we say,—Hands off from every struggling industry and let not the parent be the one to heap unnecessary burdens upon the child!

Another Bluff.

In another place our readers will find the full text of Mr. S. J. Ritchie's Memorandum to the Canadian Government praying for a liberal bonus to the Central Ontario Railway. Without commenting upon a proposition of so much magnitude, one cannot help comparing these, his latest utterances, with the promises so glibly given a few months ago to the Ways and Means Committee of the U. S. House of Representatives. On that occasion, Mr. Ritchie was prepared, in the event of the duty being removed from imports into the United States of nickel ore and matte, to utilize the natural gas of Findlay, Ohio, for the manufacture and treatment of his ores, indeed, he said, "we are contemplating bringing in all our ores to that place to be smelted." In the face of these contradictory statements we are compelled to accept with caution the very glowing promises he now booms out before the public. As a matter of public policy, the Montreal *Gazette* hits the nail squarely on the head, when it says:—

"We recognize and appreciate the immense value of our undeveloped, unused resources, but if the development can come only through government backing, then, by all means let the Government stand to reap the profit of the investment as well as the loss. Mr. Ritchie denies that his enterprise is a private and individual one, but surely this is a most transparent quibble! Other person may put money in the venture and so make the interest that of a community of shareholders, but none the less the public phase is wanting. And where is the line to be drawn? There are iron, silver, gold, coal, petroleum and other mineral deposits in various parts of Canada; is public money to stand behind private interest in the development of these resources? If not, why not, under the reasoning of Mr. Ritchie. Or is an exception to be made in his favour because he is an American citizen, who co-operates with the most gigantic monopoly in the United States, and has more than ordinary assurance in pressing for favours? The Sudbury mines are either valuable or worthless. If the latter, then the Government would be guilty of squandering public funds in using the receipts of customs to back up Mr. Ritchie; but if the former then the merit of the deposits should secure all the capital required. We fear our Ohio friend has been trying to play it on the Government, forgetful of the fact that a country may be young without being green."

Mineral Production in 1889.

The Annual Report, published under direction of the Division of Mineral Statistics and Mines, has been issued to the public. From these official returns we learn that there has been an increase over the year 1888 of three million dollars in the value of the minerals raised last year. Mr. Ingall is to be congratulated on the greatly improved compilation of this valuable volume, which contains a number of new features, greatly enhancing its utility as a handy reference book.

The following summary of the mineral production in 1889 is reproduced from the work:—

Product.	Quantity.	Value.	Compared with 1888.(a)
Antimony ore, tons.....	55	\$ 1,100	Decrease.
Asbestos, tons.....	6,113	426,554	Increase.
*Bricks, thousands.....	200,561	1,273,884	do
*Building Stone, cub. yds.	341,337	913,691	do
Cement, bbls.....	90,474	69,790	do
Charcoal, bush.....	1,593,300	93,463	do
Coal, tons.....	2,719,478	5,584,182	do
Coke, tons.....	54,539	155,043	do
Copper (fine, contained in ore), lbs.....	6,809,752	885,424	do
Fertilizers, tons.....	775	26,606	do
Fire Clay, tons.....	400	4,800	do
Flagstones, sq. feet.....	14,000	1,400	Decrease.
Glass and Glassware.....		150,000	do
Gold, ozs.....	72,328	1,295,159	Increase.
Granite, tons.....	10,197	79,624	Decrease.
Graphite, tons.....	242	3,160	Increase.
Grindstones, tons.....	3,404	30,863	Decrease.
Gypsum, tons.....	213,273	205,108	Increase.
*Iron, tons.....	73,231	2,763,062	do
Iron Ore.....	84,181	151,640	Decrease.
Lead (fine, contained in ore), lbs.....	165,100	6,604	do
*Lime, bush.....	2,948,249	362,848	Increase.
Limestone for flux, tons.....	22,122	21,909	do
Manganese Ore, tons.....	1,455	32,737	Decrease.
Marble, tons.....	980	980	do
Mica (exports of cut and crude, lbs.....)	36,529	28,718	Increase.
Mineral Paints, tons.....	794	15,280	do
Mineral Water, galls.....	424,600	37,360	do
*Miscellaneous clay products.....		239,385	Decrease.
Moulding Sand, tons.....	170	850	Increase.
Petroleum, bbls.....	639,591	612,101	Decrease.
Phosphate, tons.....	30,988	316,662	Increase.
Pig Iron.....	25,921	499,872	do
Platinum, ozs.....	1,000	3,500	Decrease.
Pyrites, tons.....	72,225	307,292	Increase.
Salt, tons.....	32,832	129,547	Decrease.
Sand and Gravel (exports) tons.....	283,044	52,647	Increase.
Silver, ozs.....	383,318	343,848	Decrease.
Slate, tons.....	6,935	119,160	Increase.
Soapstone, tons.....	195	1,170	do
*Steel, tons.....	27,873	973,282	do
Sulphuric Acid, lbs.....	10,998,713	152,592	do
*Tiles, thousands.....	10,526	134,265	do
Estimated value of mineral products not returned (principally nickel, iron and structural materials).....		992,838	
Total.....		\$19,500,000	Increase.
Total, 1888.....		16,500,000	

* Incomplete.

(a) Comparison of values only.

A Curious Blunder.

Much merriment has been caused among the miners of the Eastern Townships by the publication of the following remarkable news item in a recent issue of the *Engineering and Mining Journal*:—

"SCOTTISH CANADIAN ASBESTOS COMPANY, LIMITED.—The mines belonging to this company are equipped with seven air compressors, rock breakers, cornish rolls, revolving picking tables, screens, etc. About 2,000 men and boys are worked by the company. Last year 6,000 tons of ore were mined; the amount this year will be over 7,000 tons. Some of it sells as high as \$200 per ton; the average price for the year is from \$125 to \$150 per ton."

As our readers are aware this company has been in liquidation for a number of years, and

is not now in active operation. The item probably has reference to the asbestos industry in general, and has evidently been badly "mixed" through ignorance of the district worked.

Visit of the Iron and Steel Institute of Great Britain to Canada.

The recent visit to Canada of the Iron and Steel Institute of Great Britain is one which, taken in connection with the several excursions with which it has been associated, should be of the greatest importance not only to mining, but to the iron and steel industries of the provinces visited. The time at the disposal of the party was unfortunately limited to a week, and it was therefore totally impossible to show the visitors in this time, even a small portion of our industrial, commercial and mining industries. Still, it is hoped, sufficient has been done to give the visitors some slight impression of the growing importance of Canada, as a promising field for the judicious investment of capital. We can heartily re-echo the wish, so often expressed during their journeyings among us, that at some not very distant day, a full Meeting of the Institute may be held in one of our large industrial centres, when, with more time at its disposal, a better opportunity would be afforded of gaining a more thorough and comprehensive idea of the mineral, agricultural, industrial and commercial resources of the Dominion.

At Niagara.

The party, numbering some 200 ladies and gentlemen, arrived in Niagara Falls, Ont., at noon on Tuesday, 28th October. Of these, one hundred and twenty-five had signified their intention of taking part in the series of excursions provided by the Dominion Government; the remainder only desired to see the Falls and would return direct to New York.

The visitors were met at the station by Dr. A. R. C. Selwyn, Director of the Geological Survey of Canada, Mr. H. B. Small, Secretary to the Department of Agriculture, Mr. Thos. MacFarlane, F.R.S.C., Dominion Analyst, and Mr. B. T. A. Bell, Editor of the CANADIAN MINING REVIEW, these gentlemen acting as the Canadian Reception Committee, on behalf of Her Majesty's Privy Council, whose guests the visitors were to be. The party was accommodated at the Clifton House. After luncheon, the visitors divided into parties, and spent the remainder of the day viewing the wonders of the great Niagara, and in visiting the many scenic beauties on both sides of the famous old river. The glory and majesty of Niagara will doubtless linger long in the memory of the members of this party; but we venture to predict they will also carry home with them a very vivid, and perhaps more lasting impression of her hotel bills, cabmen's hires, toll dues and other extortions imposed on a colossal scale, only equalled by the great Falls themselves. A prominent member of the Institute gives it as his opinion: "I have travelled much and been occasionally extortionately charged, but never have I come across such wholesale extortion as was perpetrated on this party." A very fair idea of the shameful and scandalous nature of the extortion practised on members of the Institute, may be gathered from the following experience of one of their number:—

"As guests had to leave early on Wednesday morning I thought it wise to pay my bill overnight, and, being hurried, did not much question items. I should mention that my wife and daughter remained at the Clifton House until the afternoon of Wednesday, consequently taking luncheon. They are represented on the bill as one day, dinner, two persons, \$13. Finding great dissatisfaction expressed by my fellow-travellers at the varied extortions practiced on them, I, early next morning, asked at the office what was the \$3 item for, and was told it was for placing a cot in my room for one of the Canadian committee who had most kindly given up his room to two guests, who, no doubt, paid for it, as did the gentleman himself as his bill, room No. 106, shows.

"On my remonstrating at such a charge as \$3 for an extra cot in a room already paid for, I was told that it was correct and no deduction would be made. Consequently No. 106 must have paid some \$5 to the Clifton house for a simple cot in addition to his food, which would then stand at \$5.50, the total bill being \$7.50.

"It will be noticed that the baggage, etc., charge of \$2.50 was only to depot, and the baggage consisted of only one piece, a portmanteau, the other baggage having been expressed from Washington to New York."

The following members of the Institute left Niagara at nine o'clock in the morning of Wednesday, 29th October, on the Canadian excursion: James Allan, Coatbridge, Scotland; Charles Bell, Stirling, Scotland; Sir James Bain, Glasgow, Scotland; A. C. Bamlett, Thirsk, Eng.; Mr. and Mrs. Bantock, Wolverhampton, Eng.; Isaac Butler, Newport, Eng.; A. R. Byles, Bradford, Eng.; Mr. and Mrs. Thomas Cook, Sheffield, Eng.; J. H. Coghlan, Leeds, Eng.; W. Colquhoun, Tredegar, Wales; Mr. H. S. Craggs, and the Misses Craggs, Middlesboro-on-Tees, Eng.; Herr A. Diechman, Berlin, Germany; Mr. and Mrs. Dickinson, Wolverhampton, Eng.; Mr. and Mrs. Drummond, Bradford, Eng.; A. H. Dunnachie, Glasgow; Mr. and Mrs. Evans, Lanelley, Wales; Mr. and Mrs. Ellison, Worthington; W. Farnmouth, Swindon; S. F. Fellowees, Wolverhampton; A. Goldbach, New York; Joseph Gregory, Manchester; G. K. Harrison and Miss Harrison, Stourbridge; J. F. Hobson, Durham; Herr Hoffer, Genoa, Italy; Howat, Mr. and Mrs., Glasgow; Col. Holland, C.B., Tunbridge Wells; Prof. and Mrs. Huntingdon, London; W. T. and Mrs. Jackson, Burton; J. S. Jeans, London; Walter Jenks, Wolverhampton; James Johnstone, Manchester; W. H. and Miss Jones, Rotherham; Col. Kearsley, Ripon; F. R. Loeber, Leeds; R. Laybourne, Newport; J. F. Maclaren, Glasgow; Herr Marburg, Wiesbaden, Germany; B. Marsden, Manchester; C. Marsten, Wolverhampton; S. Vaughan Morgan, London; Miss Moss, London; A. Muir, Manchester; J. N. Muller, Middlesborough; Gerald R. Oakes, Derby; F. Oakes, Middlesborough; J. F. Pease, London; J. W. Perkins, London; W. D. Phillips, Aberdare, Charles Phillips, Newport; Edward Porritt, London; H. G. Powell, Wolverhampton; Joseph Richardson, Stockton-on-Tees; J. C. Ridley, Newcastle; F. H. Rummles, London; M. Salter, Bradford; Herr Siebel, Dusseldorf, Germany; J. Simpson, Whitehaven; Mr. and Mrs. Service, Glasgow; G. J. Smith, Sheffield; Mr. and Mrs. and Miss Snelus, London; Mr. and Mrs. Sparrow, Wolverhampton; J. C. Tannett, Leeds; J. L. Thomas, Aberdare, South Wales; F. Thomas, Sydbrook; W. H. At Hamilton.

The special train arrived at Hamilton at 10:30 a.m., the visitors being met at the station by the Mayor and members of the City Council, the President and members of the Board of Trade and other corporate bodies. After the leading members of the party had been introduced, the visitors were escorted to the carriages in waiting, and then driven through the principal streets, visiting the leading industrial establishments, the principal public buildings, and other points of interest in and around this enterprising and progressive city. A drizzling rain was falling when the party started from the station, compelling the use of closed carriages, but at the top of the mountain, the weather, fortunately, cleared, and permitted a delightful view of the lake and city, and the fine stretch of cultivated country lying beyond. On returning to the city an opportunity was given of witnessing some very creditable movements by the fire brigade, after which the party adjourned to the Arcade Hall for luncheon. The hall was beautifully decorated with flags, flowers, and evergreens. About 250 persons were at the tables. Mayor McLellan presided. After ample justice had been done to an excellent menu, a short toast list was proposed. In proposing "The Queen," the Mayor said: "It is a toast that is always received in Canada with hearty goodwill, and it would no doubt be so received on this occasion, both by British and German delegates. When the Queen's name is mentioned, 'not only Canadians, but Americans also, receive it with every mark of respect.'" The toast was received with ringing cheers, again and again renewed, and the National Anthem was sung with great heartiness. His Worship then extended to the visitors a hearty welcome to the city of Hamilton, stating that it was greatly to be regretted that their stay was not longer and that the weather was not more propitious. He trusted that their impressions of Hamilton would be favorable. (Hear, hear.) He then proposed the health of the Iron and Steel Institute of Great Britain. The toast was received with great enthusiasm. Mr. Snelus, in responding, said that the members of the Institute had been received in Hamilton with real brotherly love, and their kindly and hearty reception would not soon be forgotten. "We have seen to-day," he said, "a community of 50,000 people where not long ago existed a wilderness; and this community is not dependent on any one industry, but many diversified industries, for its prosperity. It is indeed a remarkable development."

Mr. Adam Brown, M.P., said the remarks of the last speaker were most encouraging and spoke well for Canada's future. Together with his colleague, Mr. McKay, he welcomed the delegates, on behalf of the Parliament of Canada, to the first important point they had visited in the Dominion. Pointing to the British flags which adorned the walls, Mr. Brown said that if the delegates wished to find evidence of the devotion of Canadians to the British Empire, let them look around. (Immense applause.) Mr. Brown then proposed the health of the German visitors. "He did so," he said "With the more pleasure, because some of the most valuable and

THE IRON AND STEEL INSTITUTE AT HAMILTON: A PHOTOGRAPH TAKEN ON THE STEPS OF THE CITY HALL.

prosperous citizens of Hamilton were Germans, who had come back from the old land to make their homes in this new country, where the difficulties and feuds of the old lands are forgotten."

Mr. Thomas Macfarlane, F.R.S.C., replied for the German visitors, and in doing so, remarked that the Germans and British were natural allies—allied in blood and kinship—and they would always stand together in the foreground of civilization. Sir James Bain, ex-Lord Provost, of the city of Glasgow, proposed "The Mayor," remarking that they had met with much kindness in America, but nothing like the fraternal feeling that had been shown in Canada under the British flag. "It was something the delegates would never forget." Mayor McLellan gracefully acknowledged the toast. The proceedings were brought to a close with "Auld Lang Syne," sung with great heartiness. At the City Hall the visitors were photographed; a reproduction of the group will be found in this issue. The party then left by special train for Toronto, which was reached at four o'clock in the afternoon.

In Toronto.

The party was met at the Union station by carriages and driven to a reception given in its honour at Government House. The guests were received and welcomed by Sir Alexander Campbell and his daughter, Miss Marjorie Campbell, in the large drawing room. A very large number of the prominent citizens of Toronto were present on invitation to meet the visitors, and a very pleasant couple of hours were spent enjoying the Lieutenant-Governor's hospitality. It was originally intended that the party should remain at least a day in the Queen city, but no satisfactory arrangement could be made by the Board of Trade or the City Council before the city of Hamilton came forward with its offer to receive their visitors. After leaving Government House the party had dinner at the Queen's, thereafter leaving at nine o'clock by Grand Trunk special train, consisting of four Pullman sleeping cars, for Sudbury via North Bay.

Wearied with the day's travel and pleasures, the visitors were soon snugly ensconced in their berths, and very few of them were about when North Bay was reached early in the morning. Up to this point progress had been somewhat slow, and the special was behind her scheduled time, but here C. P. R. Divisional Superintendent Bury took charge, and ran the 80 miles between North Bay and Sudbury in an hour and forty minutes. The road bed in this division is in magnificent condition, and to show the English and German visitors what could be done on a Canadian road, one section of 35 miles was covered in 32 minutes, and this without the slightest inconvenience to the passengers.

At Sudbury Mines.

The lively little town of Sudbury was found to be *en fete*. As the train drew up to the station platform at eight o'clock the town brass band played a stirring welcome. A reception committee of the leading citizens was in attendance, and escorted the visitors to the hotels. After breakfast, which had thoughtfully been provided by the local committee, the visitors assembled at the White House hotel, where Reeve Fournier, on behalf of the citizens of Sudbury, read the following address:—

LADIES AND GENTLEMEN OF THE VISITING ASSOCIATION,—We, the citizens of Sudbury, beg to tender you a hearty welcome to our midst, and trust that your visit to this region will be one of interest and pleasure to all. We will endeavor to entertain you to advantage, and trust you will leave us with the importance of our mineral wealth, especially in the product of nickel, vividly impressed upon your memories. We have, within a radius of 60 miles a supply of the mineral of the day, nickel, in sight that will probably furnish all requirements of the mercantile world for this and the coming generation. We understand and fully realize the fact that you must now be very much bored by the repetition of addresses which have undoubtedly been presented to you in this and our great and adjoining cousins' country, the United States, and for this reason will draw our address to a close by again, ladies and gentlemen, tendering you a hearty welcome.

Mr. J. S. Jeans, Secretary of the Institute, and Mr. James Richardson, Stockton-on-Tees, suitably replied. The visitors then took train and visited the mines and works recently opened by the H. H. Vivian Co. of Swansea. After these had been carefully inspected, the visitors took the cars and were quickly run out to Blezard, to the workings of the Dominion Mineral Company.

The mine, buildings, machinery, plant, smelters and surface equipment were very carefully inspected, and many favorable comments passed thereon. Nearly the whole party then descended the main shaft to a depth of 100 feet, and examined the methods of extracting the ore. These are the first and only mines in Canada using electric light below ground. About 300 men are employed. In the afternoon the party took a run out to the Copper Cliff, and the other large mines and works owned and operated by the Canadian Copper Company. A very pleasant and profitable time was spent here, the party

being conducted over the properties by Mr. Evans, the courteous manager of the company. The party returned to Sudbury a little after dark well pleased with their outing, and loud in their praise of the many courtesies extended to them by the members of the local Reception Committee and the managers and officials at the various mines. At eight o'clock a parting cheer was given to their kind hosts, and the Special steamed *en route* for the Capital.

Entertainment at Ottawa.

The train was timed to reach the Capital before eight o'clock on Friday morning and no little surprise was therefore manifested when the party found themselves in the depot a couple of hours in advance of this time. Carriages had been thoughtfully provided by the Citizens' Committee, and in these the visitors were rapidly driven to the Russell House, their headquarters during their stay in the Capital.

The programme for the day commenced with a visit to the City Hall, where the visitors were received by Mayor Erratt and the members of the City Council. Sir Adolphe Caron from the dais addressed them, welcoming them to the Capital of the Dominion on behalf of the Government. He said it gave Canadians very great pleasure indeed to receive as visitors the representatives of those works which have made the wealth and prosperity of the nations to which they belong. He could only say, as a Canadian, we could not show Canada too often to those who wished to visit her shores.

The Mayor then read an address, in which the pleasure of the people of Ottawa that the members of the Institute had made Ottawa one of their places of call was expressed. It went on as follows:—

"We recognize in your presence the fact that the mineral resources of Canada are more largely engaging the attention of the capitalists of the Mother Countries, a fact which indicates that the time has come for the development of the valuable fields for enterprise existing in our country. We feel convinced that the practical development of the iron and other mines of the Dominion will not only stimulate industry and increase the general prosperity here, but will also prove a certain source of profit as well as gratification to the capitalists of Great Britain and the European Continent, who will find here fields of promising enterprise, equal, if not superior, to what can be found in any land. We welcome you as citizens from across the Atlantic, regardless of your nationality, and as men engaged with ourselves in the great work of national development and moral and material progress."

Mr. Snelus replied on behalf of the association. He could not express too strongly the pleasure and surprise that their visit to Canada had afforded them. As representatives from the Old Country it gave them very great pleasure to see one of her children doing so well. They had visited Hamilton, and that great city Toronto. They had seen a little of Ottawa, and had been surprised at the magnificent buildings of which they had a glimpse. This visit would do more to cement the friendship between England and Canada than any amount of literature. They wanted to know each other better. He hoped that many would make a more extended visit, as he intended to do himself. He hoped that some would do as he had done, and take an interest in the country. He believed that they could trust Canadians as brothers to take care of moneys entrusted them. (Loud applause.)

A number of the members were then introduced to the Ministers and others. An inspection of the fire brigade followed, and at two o'clock carriages were taken by the whole party, who started on a tour of the points of interest in and around the capital, the industries about the Chaudiere engrossing most of the time of the sight-seers.

In the evening the members of the Institute attended a dance given in their honour in the Russell House. About seven hundred ladies and gentlemen were present, and dancing was kept up spiritedly until an early in the morning.

Reception and Luncheon.

During the forenoon the members were free to spend their time as they pleased, and in small parties visits were made to the Museum and Offices of the Geological Survey, the Parliament Buildings, Fisheries Exhibit, Art Galleries, and other points of interest.

By one o'clock all had got back to the Russell House, and shortly after that hour his Excellency Lord Stanley of Preston and Lady Stanley arrived. They held a reception in the parlor of the hotel. Sir John and Lady Macdonald, Sir John and Lady Thompson, Sir Adolphe Caron, Mr. Foster, Mr. Mackenzie Bowell and Mr. Carling surrounded their Excellencies, and introduced the ladies and gentlemen. This was one of the pleasant events in the series, all stiffness and formality being banished and the greatest good feeling and free interchange of conversation being indulged in.

The party then proceeded to the luncheon-room. His Excellency presided, having on his right Vice-President Snelus, who had escorted Lady Stanley to the room, Lady Macdonald sat on his left, having been escorted in by Colonel Holland, a famous British soldier

and traveller. The vice-presidents were Sheriff Sweetland, Sir Adolphe Caron, John Carling, C. H. Mackintosh, M.P., Honore Robillard, M.P., Mayor Erratt. The room presented a very brilliant appearance, having been handsomely decorated for the occasion. The *menu* was *recherche*, and a host of skilled waiters served the dishes deftly and perfectly.

After the good things had been disposed of, Lord Stanley arose and proposed the first toast, "The Queen," adding a few graceful words with respect to the position she holds in the hearts of her subjects. On rising to propose the second toast, he reminded the company that their guests were compelled to catch a train and therefore his remarks would be necessarily brief. There was one thing he said that Canadians desired to excel in, and that was the art of hospitality. Therefore it was with feelings of regret that they felt that they had to part with their newly made friends that day. They owed their friends across the line a good many benefits conferred. Perhaps Canadians do not always recognize and acknowledge these benefits, but they recognized the privilege which had been afforded them to-day through our American friends inviting the members of the Iron and Steel Institute of Great Britain and the German Association of Smelters to cross the ocean. It was not his place to speak of technical subjects before a body like this, but it would not perhaps be improper of him to allude to Canada's great mineral wealth, only requiring capital and skill to develop. Perhaps some of our neighbors thought that our resources were not developed as rapidly as they should be, but if their progress was somewhat slow it was solid and sure. Their future was certain, though perhaps not immediate. Their guests had probably seen the vast possibilities of production in the Sudbury region, and he could not but regard it as a fortunate accident that brought them to Canada's doors. He regretted that their stay had been so short, that they had not seen Nova Scotia's wealth of coal and gold, or the mineral riches of the Rocky Mountains. He welcomed also their German cousins, and concluded by expressing a hope that they would soon visit us again and stay longer.

Mr. Snelus, vice-president of the Institute, replied on behalf the visitors, thanking their hosts for their princely hospitality. They certainly would not regret their visit to the Dominion of Canada. He personally, and on behalf of the members of both associations, thanked Sheriff Sweetland, Dr. Selwyn, Mr. B. T. A. Bell, the Mayor, and ex-Mayor Macleod Stewart, for their unremitting kindness and attention. He and his colleagues had learned a great deal in this visit. Some eighteen months ago it was supposed that nickel was a rare production of nature, but the discoveries at Sudbury had revolutionized everything in the nickel world. They were glad and proud that their young daughter Canada had such a magnificent inheritance of metallic wealth. A friend of his in Alabama had said in reference to the mineral wealth of that State that when Dame Nature was distributing her blessings over the earth she let loose her apron strings when she came over Alabama. It seemed to him, however, that the place where the Dame had lost her hold of her apron strings was when she was over the Dominion of Canada. There she had dropped her heavy and rich ores—gold and silver and rich metals. An inspection of the Geological Museum proves how rich beyond measure she is. She had all the metals of value, beginning with gold and finishing with iron, and all the metals between these two. Then she had fuel which was so indispensable. There must be a great future for such a country. He spoke of the family feeling that existed between the Mother Country and her colonies, and recalled that Canadian boatmen piloted British troops past the dangers of the Nile. If any peril threatened the old land he knew they could look with confidence for assistance from Canadians. He concluded by proposing the toast of the Dominion of Canada, coupled with the name of Sir John Macdonald.

Sir John Macdonald on rising was received with a perfect storm of applause, in which the ladies joined very enthusiastically. He said the near approach of the hour for departure precluded his making a speech, even if he desired to do so, but fortunately those who preceded him made it unnecessary that he should do so. It was pleasant to hear their country praised by gentlemen who spoke with such authority as did their guests, and he expressed his great regret that they had to hurry away so soon. He thanked them for their kind reception of his name.

Sheriff Sweetland proposed the health of the Governor General, to which His Excellency replied very briefly. He particularly commended the social departure by which the ladies were able to be partakers of their pleasure on that occasion.

As arrangements had been made to leave for Montreal at half past four o'clock, and as but little time remained, a most successful banquet was thus somewhat hurriedly terminated, though not before ringing cheers had been given for the Queen, Lord Stanley and Sir John Macdonald. Prompt to the minute the special train steamed out of the

Canada Atlantic station amid a volley of small torpedoes, and many hearty cheers and counter cheers from the large crowd of citizens that had assembled to witness their departure and to wish them God-speed. At Vaudreuil the train made its only stop to allow acting Mayor Hurteau, Col. Stevenson, Aldermen Clendinning, Rolland, Villeneuve and others from Montreal, to enter the train and extend a hearty welcome to Canada's industrial metropolis.

At Montreal.

At 7.15 p.m. the Special rolled into Bonaventure depot, and the members were soon being driven in the carriages provided by the city, to the Windsor Hotel. During the evening Sir Donald Smith, Sir William Dawson, Sir Joseph Hickson, and many other prominent citizens called in at the hotel to welcome the members to Montreal. On Sunday, like all good people, the party went to church, the majority being present in the evening at a special musical service in the Church of the Gesu.

The visitors were early astir on Monday morning. About eight o'clock the civic committee arrived, and the party, embarking in carriages, set out for the Grand Trunk workshops, where they were received by Sir Joseph Hickson and Messrs. Edgar and Powell, who showed them through the works. A special train was taken at the Wellington Street crossing, and the party went through the Victoria bridge, stopping in the middle to examine it. The carriages were again taken at the Wellington street crossing and the party drove to the Canadian Pacific shops, arriving there after the noon hour when the men were all away from work. The inspection here was brief, and then McGill College was visited, a short time being spent in examining the Redpath museum, and the other interesting features of this excellent institution. Sir William Dawson and Sir Donald Smith received the visitors. This ended the morning's sightseeing, and the party drove to the Windsor for luncheon.

In the afternoon the party drove around the mountain. A start was made from the Windsor at half-past two, the route taken being along Dorchester Street to Fort, and up that street to St. Catharine. Here Ald. Clendinning led the party astray, going westward instead of east, but the mistake was rectified and the party drove up St. Mark to the Montreal College. The drive was along Sherbrooke Street and up Park Avenue to the mountain road. Half way up Mr. McGibbon, the Park Ranger, met the party and guided them the remainder of the way. It began to snow in a faint weak-hearted way. Nobody minded it. People who had wraps made themselves as comfortable as they could and people who had not wished that they had, and shivered. Then a mounted policeman was met. He was a very nice looking policeman and, moreover, he looked warm. This was the most cheering sight that had yet been seen. When the Look-out was reached everybody got out. The visitors were cold and didn't try to disguise it. The aldermen were also cold, but they endeavoured to hide the fact and maintained that it was not a very cold day. After admiring the view and buying a few souvenirs, the carriages were again entered and the descent begun. Several more warm looking mounted policemen were passed, in fact so many that the suspicions of some of the visitors were aroused, and they discovered that it was the same man, who had made short cuts and headed off the party in time to recover his statuesque position before the party again appeared. The further down the mountain the party got the warmer they felt, and when at last the Windsor was reached nearly everybody had made a start towards getting thawed out. It was too cold to enjoy the drive, but the visitors were able to appreciate the fact that at any time when the thermometer was not playing hide and go seek with zero that Montreal's mountain park must be a lovely spot. Nearly all the ladies of the party attended the drive around the mountain.

Banquet in Montreal.

Perhaps never in its long career has the St. Lawrence Hall had assembled within its walls such a representation of capital as was gathered upon the occasion of the banquet to the Iron and Steel Institute given by the City council, and certainly no banquet has ever been more successful and enjoyable. The speeches were most appropriate. The dining hall had been beautifully decorated with plants and flowers under the direction of Park Ranger McGibbon, and to add to the pleasure of the gathering Lavigne's orchestra played a nice selection of musical items at intervals during the proceedings. The guests were conducted to the dining hall by Piper Major Mathieson, who played a suitable selection on the instrument of Scotia.

Acting-Mayor Hurteau presided in the unavoidable absence of Mayor Grenier, and on his right and left were seated Mr. E. J. Snelus, Sir Donald A. Smith, Mr. H. A. Budden, Mr. E. P. Hannaford, Sir William Dawson, W. H. Bulmer, Col. Holland, C. B., Mr. D. Parizeau, Mr. R. Esdaile and Mr. T. G. Shaughnessy. The vice chairs were occupied by Ald. Clendinning, Prefontaine, Stevenson, Farrell and Villeneuve. In addition to the

aldermen and the members of the Institute, the invited guests also included Sir Casimir Gzowski, K. C. M. G., Prof. Bovey, Hon. Ed. Murphy, Hon. J. R. Thibeaudeau, Hon. Alexander Lacoste, Hon. W. W. Ogilvie, Hon. G. A. Drummond, Dr. G. M. Dawson, Dr. B. J. Harrington, Messrs. J. J. Curran, M.P., A. T. Lapine, M.P., H. McLennan, Richard White, S. W. Wanklyn, D. Preston, K. W. Blackwell, P. W. St. George, E. W. Dodwell, C. A. Massey, Herbert Wallis, J. P. Cleghorn, P. A. Peterson, J. T. Beland, James McShane, J. S. Hall, jr., M. P. P., D. McIntyre, D. Lockerby, Andrew Allen, W. C. Munderloh and Mr. Graham Fraser, manager of the Nova Scotia Steel and Forge Company.

The repast was of a most *recherche* character, and at its close the Acting-Mayor announced letters regretting inability to be present from Hon. G. A. Drummond, Hon. Edward Murphy, Messrs. Andrew Allan, W. C. Van Horne, W. Wainwright and H. Wallis.

The toasts of "The Queen" and "The Governor General" having been proposed from the chair, Ald. Stevenson submitted "The Army, Navy and Auxiliary Forces," which was responded to by Col. Holland.

The toast of "Our Guests" was entrusted to Sir William Dawson, who, in submitting the same, referred to the great and valuable deposits of iron ore in Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba and British Columbia, some of which, he remarked, was of the richest crystalline quality, and capable of producing the best kinds of iron and steel in the world. And we not only had the iron ore, but we had the coal to smelt it with. In the great western plains we had a vast quantity of mineral fuel of a somewhat different kind to that usually found in the mother country. We had great deposits of lignite and we had also bituminous coal. To despise those lignite deposits would be wrong as they would come to be of great economic importance by and by, for there were means by which they could be converted into the best kinds of fuel. If nickel steel should be the sort of steel required for the future, we could also show something in that line, as there were large deposits of the metal at Sudbury and in Newfoundland. In Nova Scotia and British Columbia there were also large deposits of gold which were not yet developed to their full extent. As for silver, there was no question about its being plentiful in the western regions. We had, therefore, in Canada much which might attract the attention of the members of the Institute if they were disposed to look at it from an economic point of view. In conclusion, he expressed an opinion that such a gathering was one in which they should all rejoice, as it tended to make the different portions of the Empire better acquainted with each other, a thing which was needed at the present time.

In responding, Mr. Snelus returned thanks for the hearty welcome which had been extended the Institute, and said they had been delighted to travel through Canada and to notice the evidences of prosperity which were everywhere visible. They had seen trade progressing on every hand, cities being built up substantially, and nowhere had they seen any beggars. Having referred to the great facilities which Canada possessed in its lakes and rivers, he alluded to its fine railways, 12,000 miles in extent, and passed an encomium upon the way in which they had been built. An idea of the vast extent of the country could hardly be gathered by so short a trip as the Institute had made, but when they remembered that they could easily deposit the British isles in one of our lakes without splashing the water over the sides, they could realize the extent of territory we had. He hoped that the members of the Institute would carry home with them such a good account of this country that they would induce a good many more English capitalists to bring money here. In conclusion, he spoke of the beauties of Montreal and its surroundings, and hoped that they would be able to visit it on some future occasion in more sunny weather.

"The Commercial and Mining Interests of the Dominion" was proposed by Mr. J. Stephen Jeans, who said that the members of the Institute had come into this country strangers as to the great resources and capabilities of Canada. They had been informing themselves as best they could with respect to these since they entered our hospitable domains, but it was not easy to speedily know much of a country which was thirty times the size of the British isles, and which had varied resources in every direction. In England they were given to understand that Canada was a land bounded by perpetual ice, a land barren and sterile in the highest degree; a land where it required the circulation of the *Daily Telegraph* to be able to stand the enormously cold temperature. But they came here and found it was a country which did not differ very much, except in the great extent of area, from England. Having spoken of the harmonious manner in which the two great races of the Dominion dwell together, he referred to the import and export trade between Great Britain and the United States and Canada. The British isles imported annually from the United States something like £77,000,000 of produce, and they exported only about half that quantity. From Canada they imported about £6,000,000 of produce and

exported to it about £8,000,000. This was a condition of things most of them would like to see reversed. He would not say how it was to be done, but he believed Canadians were working out their own destiny with enterprise and vigour, and he thought they would find a way whereby the condition of things to which he had alluded would be reversed.

Mr. H. McLennan responded to the toast and said he welcomed the Institute among us to come and see what progress we had made and to judge of what our future might be. Every Canadian to-day felt that an emigrant leaving the mother country and coming here would not suffer disappointment if he had the qualities that had made the men of this country and enabled them to accomplish what they had. We welcomed all to participate in the development of this country. Referring to the products of the Dominion, he expressed a hope that some practical solution would be found by which the mother country would show a preference for what was grown on the soil of the Empire. He would not undertake to say how the thing was to be accomplished, but he thought of adopting some system which would show a preference for the trade which went from British possessions. He had no doubt a solution of the problem would be found, but it behoved every man who had an interest in the prosperity of the Empire to recommend the importance of commercial intercourse as a great bond for cementing and perpetuating that sentiment of loyalty and fraternity which existed at the present day.

Dr. Selwyn, speaking of the mining resources of the country, said he had spent twenty years in studying them, and he felt to-day that he knew very little about them. What the Institute had seen in the Geological museum at Ottawa gave them but a very little idea of what he hoped these resources would be in the future. He regretted that time would not permit of the visitors seeing some other of the mines than those at Sudbury, for instance, the asbestos and phosphate mines, the former of which were very interesting. He hoped, however, that what the members of the Institute had seen would induce them to come here again.

The toast was also acknowledged by Mr. B. T. A. Bell, who said that the extent and importance of the mineral resources of the Dominion were beyond peradventure. They had only to refer to the Reports of the Geological Survey of Canada, and particularly to that excellent volume published in 1863, by Sir William Logan, to ascertain what a magnificent field really existed in the Dominion for the investment of capital judiciously applied. They need go no further than the Province of Quebec, where were found the richest phosphate and asbestos that now supplied the markets of the world—minerals in quantity and quality which were acknowledged universally to have no superior anywhere in the world. The Governments, Provincial and Federal, had spent much money on agriculture, in colonization, on railways, but they had shown most culpable apathy and neglect of the most important of them all—her mineral lands and mines.

Mr. Joseph Richardson submitted in felicitous terms "The Mayor, Aldermen and Citizens of Montreal," which was responded to by the acting Mayor, who spoke of the great improvements which have been effected in recent years.

Sir Donald Smith also acknowledged the toast referring to the fact that it was very little Englishmen knew of the resources of Canada until a few years back, and said we had not only a country of which we might be proud, but a country of which England and the whole Empire might be proud. He assured the visitors that what they had seen of Canada was only the threshold of the country, as, unfortunately, they had not been to the great North-West, which was a very great country indeed, and one to which hundreds of thousands of our fellow subjects on the other side of the water might come and do great good for themselves.

The remaining toasts were "The Ladies," and "The Press," proposed by Ald. Rolland and Mr. J. J. Curran, M.P., respectively, and responded to by Mr. W. D. Phillips and Mr. Richard White.

On the St. Lawrence.

The first feature on the programme for Tuesday was an inspection of the city's celebrated fire brigade on the Champ de Mars. Notwithstanding the bitterly cold morning and the very early hour at which the parade was held, the members turned out in full force, and were greatly pleased with the very fine exhibition given. This over, the party hastened to the Grand Trunk depot where, through the courtesy of Sir Joseph Hickson, a special train had been provided to convey the visitors to Lachine where it was intended to shoot the rapids and return to Montreal by boat.

Everybody was in good humor and enjoyed the short run to Caughnawaga, where all hands went ashore and took possession of the town. It is not to be wondered at that the aborigines viewed with distrust the first coming of the white man to America, if he acted with the lordly air of owning the earth which the visitors assumed in Caughnawaga. They invaded every part of the prim-

ative old town, and awoke the echoes of past centuries by their evanescent modern chatter. The natives received the party with modest courtesy and self-possession, but with no great manifestations of joy. The invaders advanced in procession up the main street of the struggling village, some entering the church and listening to the last sad rights of the church over one that had passed away, while others passed on to witness an entirely different scene.

AN INDIAN WEDDING.

A young brave named Joe Boover had that morning obeyed the scriptural injunction, and with the blessing of the church had taken unto himself a wife from one of the dusky daughters of the tribe. The happy couple happened to pass up the street and were espied and congratulated by the visitors. Joe accepted these congratulations with becoming dignity, while "Mrs. Joe" looked conscious but happy. His slim, lissome figure showed to advantage in the conventional frock coat and dark, wide trousers, the only point in which his dress differed from an ordinary city man being in the white felt hat he wore. His wife looked quite neat and charming in a brown satin dress, with her dusky hair done up in a neat coil at the back of her head and secured by a glass diamond pin. This, and a gold chain around her neck, were the only ornaments she wore. The marriage feast was being celebrated in a house near by, and whether invited or not all hands flocked in until the room was so packed there was no room for the dancers. Like a true gallant Ald. Roll and saluted the bride, and appeared to enjoy this always pleasant duty, and his example was followed by a large number of the gentlemen of the party. After a liberal collection had been taken up by one of the gentlemen, the party returned to the steamer and a move was made down stream.

The run through the rapids was greatly enjoyed, the visitors crowding on deck while the boat tossed and heaved in its passage through the foaming and turbulent waters. It was close upon two o'clock before the party landed at the wharf, each and everyone expressing their deep appreciation of the thoughtfulness of the Board of Harbor Commissioners in providing such a delightful outing on the old St. Lawrence.

Valuable Souvenirs.

A few minutes before six o'clock the members assembled in full force in the ladies' parlor to participate in a ceremony which will linger long and pleasantly in the recollections of the Canadian Reception Committee. In a few words Mr. Snelus gracefully referred to the part these gentlemen had taken in connection with their excursion, and then proceeded to hand each a handsome souvenir of their visit. Dr. Selwyn received a handsome tea service; Messrs. Small and Macfarlane silver plate; Mr. Bell a costly dessert service. Mrs. Snelus also presented Miss Selwyn and Miss Gisborne, the ladies who had accompanied the party, with beautiful gold bracelets. The recipients, who were not a little astonished at these unlooked for tokens of esteem and good will, each fittingly expressed their acknowledgements, and the gathering dispersed.

The party left Montreal the same evening, per special train, for Boston, where it was intended to spend a day visiting the Thomson-Houston Electric Manufacturing Works.

Good-Bye to the Iron and Steel Institute.

BY DR. R. W. RAYMOND, NEW YORK.

What! You're already going away?

Where is that ancient virtue, then,

We used to hear so much of, pray—

The "staying power" of Englishmen?

Your sires and ours were different stuff—

They didn't cleave the ocean foam

For one short month, then cry "Enough!"

And set their yearning sails for home.

Well, Science has made ocean trips

So trivial that you came with ease;

And now, alas! too many ships

Invite you to recross the seas.

Yet we take comfort, since we know,

Whatever else remain unknown,

We cannot lose you now; for though

You sail away, you'll not be gone.

When folks in such a hurry pack,

They make mistakes; and you will find

It is *our* hearts you carry back

And yours that have been left behind.

Yet both shall gain and neither lose,

Meum and Tuum, once apart,

In Friendship's furnace simply fuse

To make one "homogeneous" heart!

Such be our union—ductile, strong,

Well tempered, proof to shot or shell,

Elastic, beautiful, as long

As steel endures! Dear friends, *farewell!*

Proposed Taxation of Quebec Mines.

The Speech from the Throne on the occasion of the recent opening of the Legislature at Quebec, clearly foreshadowed the intention of the Quebec Government to enrich its depleted treasury by some taxation to be levied on provincial mines. The clause fell like a thunder clap upon the mining community in every section of the Province, for it was felt that any incubus at the present time would certainly retard, if not strangle the promising development and progress made in recent years. Speculation was soon ripe as to what form the proposed taxation would take, but enquiries made at Quebec failed to elicit any satisfactory explanation. A prominent Conservative paper ventured to predict a royalty tax on the output of phosphate to the extent of four dollars per ton—a most ridiculous proposition; while a gentleman understood to be well conversant with the movement at headquarters, intimated that no such royalty on any output was ever intended, the probability pointing either to an increase in the price of unsold mining lands, or a system of disposing of these lands on the lease and royalty system adopted and in vogue in Nova Scotia and elsewhere. The question, however, was of too grave a moment to be allowed to pass without a public expression of opinion upon it, and steps were at once taken to call meetings at Sherbrooke and Montreal. The first of these was the

Public Meeting at Sherbrooke,

which took place in the Art Rooms, on Wednesday afternoon, the 12th instant, at two o'clock.

There was a large gathering of mining men and mine managers. The following companies and mining firms were represented:—

Moulton Hill and Howard Mines, F. J. Falding, M. E., manager; G. H. Nichols & Co., Capelton, Messrs. Penhale and Spafford, managers; Eustis Mining Co., Capelton, John Blue, manager; Johnson Asbestos Co., Thetford, R. G. Johnson, M.P.P., manager; King Brothers & Co., Quebec, Mr. James King, manager; United Asbestos Co., Black Lake, Mr. J. J. Penhale, manager; American Asbestos Co., Black Lake, Mr. Wertheim, manager; Lucke & Mitchell, representing the Beaver Asbestos Co.; Memphremagog Mining Co., Brome, Capt. Warne, manager; Central Asbestos Co., Black Lake, W. A. Hale, manager.

In addition to these there were also present Messrs. Wm. Farwell, General Manager, Eastern Townships Bank; J. A. Chicoyne, Mayor of Sherbrooke; J. S. Broderick, J. R. Woodward, F. P. Buck, Major Wood, Robert N. Hall, M.P., W. A. Moorehouse, G. G. Bryant, Sherbrooke; Hon. Henry Aylmer, Richmond; Wm. White, Q.C., H. R. Brown, Q. C., Lieut.-Col. Felton, S. W. Jenckes, general managers Jenckes Machine Co., Col. King, R. D. Morkill, G. H. Bradford, James Addie, H. W. Mulvena, F. C. Thompson, J. H. Walsh, H. D. Lawrence, and many others.

Mr. Robert N. Hall, M.P., was elected chairman of the meeting, and F. C. Thompson honorary secretary.

The CHAIRMAN, in explaining the object of the meeting, said it was held in response to the circulars sent by the mining men of the Province, requesting them to meet at Sherbrooke and discuss the rumoured legislation about to take place at Quebec, as foreshadowed in the Speech from the Throne, as regards the intention of the Government to place a special tax on the product of the mines.

It was thought that such a tax would be injurious to the best interests of the Province, as the mining industries are yet in their infancy. We had a vast amount of mineral wealth in the Province, and this important industry, at all events in its present stage, required fostering rather than any burden placed upon it. The present meeting was, therefore, called for the purpose of taking the necessary steps to represent the matter fairly and impartially to the Government, so that they would have a true appreciation of the importance of the mining industries in the Province.

MR. H. B. BROWN, Q.C., explained at some length the injury the imposition of such a tax would cause upon any efforts to introduce foreign capital into the Province, which, after all, was mainly what we had to rely upon. He gave his own experience with a large American mining company whom he represented. They closely enquired into the question of taxation before investing the large amount of money they have since expended in the eastern townships, and the effect of this tax, if carried out, would most seriously embarrass their operations.

Mr. Wm. White, Q.C., referred to the permanent injury the imposition of this tax would cause to the labouring population employed in mines; in the eastern townships alone, he stated that there were something between three and four thousand men in employment in the various mines in the district, and the proposed legislation would undoubtedly have a most serious effect upon their general welfare—probably resulting in many of them being completely thrown out of employment, owing to the mass of the mines being obliged to close down, and the wages of those who might be retained being consider-

ably reduced. He could not but consider the policy as most detrimental to the mining interests of the Province, and felt confident that if the matter were properly represented to the Quebec Government that they would, no doubt, give it that serious attention which its importance demanded.

Speeches were also made by Capt. Warne, Mr. Penhale, Mr. Wm. Farwell, Mr. Johnson, M.P.P., Mr. James King (Quebec), Mr. Chicoyne, Mr. Wertheim, and others, all strongly condemning the proposed legislation.

The following resolutions were proposed and unanimously adopted:—

First. Resolved: That in the opinion of this meeting the proposed taxation of mining properties, as foreshadowed in the speech of the Lieutenant Governor at the opening of the present session of the Legislature of the Province of Quebec, is a serious menace to the mining industries of this Province, and cannot fail to have a disastrous effect on the development of our mining industries, either by foreign or home capital.

Second. Resolved: That the taxation of our mining industries, now in their infancy, is a suicidal policy, and totally at variance with the true interests of the Province. That most mining industries in this Province are not yet firmly established, and any excessive taxation will cause their discontinuance, thereby throwing some three to four thousand men and their families out of employment, and at the same time will tend to make those still carrying on operations reduce wages.

Third. Resolved: That it is extremely desirable that the exemption from municipal taxation, as contained in Article 1544 of the Revised Statutes of Quebec, should be continued in force for a further period of ten years, and that petitions urging the re-enactment of these exemptions be submitted to the Local Legislature.

Fourth. Resolved: That in order to bring the subject prominently before the public, it is desirable that a representative meeting of all mining men, and of all others interested in the development of the mining industries of the Province, should be held in Montreal at an early date, to take such steps as may be thought necessary to endeavour to influence the Provincial Government to favour the continuance of mining exemptions and to refrain from the imposition of any additional burden in the form of taxation, as intimated in the address of the Lieutenant Governor.

Fifth. Resolved: That an executive committee be formed, with power to call a general meeting of persons engaged or interested in mining in this Province, at an early date, to be held in Montreal, to make all necessary arrangements for such meeting, and to circulate petitions against the proposed legislation, and in favour of the exemption from municipal taxation as contained in Article 1544 of the Revised Statutes of Quebec.

The HON. HENRY AYLMEYER (Richmond) then spoke, condemning any legislation which would in any way tend to embarrass the mining interests of the Province. He expressed great surprise at a measure of this kind being contemplated by a Liberal Government, as, of course, that party was always identified with progress, and he questioned it, when the matter was properly represented to the Government, that they would entertain the idea of imposing an unjust or excessive tax, which would imperil the mining interests of the Province. At the same time he would exert himself, and would use what influence he possessed, against any legislation which he considered in any way detrimental to the interests of mining.

Letters of regret were read from the Hon. J. G. Robertson, M.P.P., Mr. B. T. A. Bell, Editor CANADIAN MINING REVIEW, Ottawa; A. W. Stevenson, Lomer, Rohr & Co., Dickson Anderson, Montreal; the Richmond Quarry and Asbestos Co., Theodore Hamel, Quebec; Prof. J. T. Donald, McGill University, Montreal; R. H. Tylee, Mayor of Ascot, and G. E. Rioux, M. D.

A large committee was at once formed, to complete the necessary arrangements for holding a general meeting of mining men from all sections of this Province at Montreal at early date. The committee is as follows:—

Richard Penhale, G. H. Nichols & Co., Capelton; F. J. Falding; H. B. Brown, Q.C., Moulton Hill and Howard Mines; Capt. Warne, Memphremagog Mining Co.; Hon. H. Aylmer; Jas. King, King Brothers, Quebec; Wm. White, Q.C., John Blue, Eustis Mining Co.; A. S. Johnson, Johnson's Asbestos Co.; A. S. Hurd, for Bell's Asbestos Co.; W. A. Hale, Mayor of Orford; J. S. Mitchell, Beaver Asbestos Co.; F. C. Thompson; L. Wertheim, for American Asbestos Co.

At a subsequent meeting it was decided that the general meeting of all mining men of the Province be called at the St. Lawrence Hall, Montreal, on Friday, the 21st inst., at 2 p. m.

There appears to be the utmost unanimity of feeling with regard to the proposed tax. The matter is looked upon entirely in a business light, the question of politics being absolutely excluded, and the representatives of both parties taking a prominent part in the movement.

Meeting of Ottawa County Mine Owners and Operators at Montreal.

Meanwhile the phosphate miners, and others interested in mining operations in the western portion of the Province, were not idle. In the Lievres district, at Ottawa, and elsewhere, the proposed taxation excited much speculation and a good deal of severe criticism. A hurried and informal meeting was held at Buckingham, from which a circular letter was issued calling a general meeting in Montreal.

This meeting was called for half-past eleven o'clock in the forenoon, and notwithstanding that it was the closing of the shipping season, and consequently a very busy time at the mines, the attendance was fairly good.

There were present: S. P. Franchot, Managing Director Ottawa Mining Company, Buckingham; F. Hilton Green, of Messrs. Wilson & Green, Montreal, representing the Phosphate of Lime Company; Capt. Robt. C. Adams, Managing Director Anglo-Canadian Phosphate Company, Montreal; Ed. Wertheim, Managing Director American Asbestos Company, Black Lake, Que.; F. J. Falding, M. E. Moulton Hill and Howard Copper Mines, Capelton, Que.; E. V. Wright, Lake Temiscaminge Silver-Galena Mines, Ottawa; Angus Cameron and Wm. Macintosh, mine owners, Buckingham, Que.; G. Capel, A. M. Perkins, A. W. Stevenson, Montreal; James Cooper, President of the Ingersoll Rock Drill Company of Canada, Montreal; Mr. B. T. A. Bell, Editor CANADIAN MINING REVIEW, Ottawa, and about half a dozen others.

Capt. R. C. Adams was called to the chair, and Mr. Bell asked to act as secretary.

After a general discussion, it was unanimously agreed to support any resolutions to be passed at the meeting in the afternoon, which would urge upon the Government the desirability of continuing the exemptions from municipal taxation as contained in Article 1544 of the Revised Statutes of the Province. The meeting expressed a very decided opinion that any royalty tax upon phosphate, however small, would seriously cripple active mining work, and would be entirely prohibitory to the investment of foreign capital in the lands and mines of the Province. A suggestion was made by Mr. Bell, that the time was now ripe to form a General Mining Association for the Province of Quebec. He pointed out that if such an association, representing the whole mining and quarrying interest of the Province, was formed, and operated judiciously and energetically, much good would unquestionably ensue to these industries. Such an association would always be prepared to cope with any emergencies that might arise in the future. The proposal was most favorably received. The meeting then proceeded to draft a Constitution for such an association. It was resolved to bring the matter before the meeting in the afternoon. The company then adjourned to unite with the other mine-owners and operators in the

Large Gathering in the St. Lawrence Hall.

Prompt at two o'clock the large company which had assembled in the rotunda of the Hall moved downstairs to the commodious meeting place provided by Mr. Hogan. Among those present were noticed: J. N. Greenshields, Q.C., Excelsior Copper Co., Montreal; W. H. Nichols, Capelton Chemical and Fertilizer Works, Capelton; W. E. C. Eustis, President, Eustis Mining Company, Capelton; Hon. George Drummond, President, New Rockland Slate Co., Montreal; A. Desjardins, M.P., Brompton Lake Asbestos Co., Montreal; S. P. Franchot, Managing Director, Ottawa Mining Co., Buckingham, Que.; R. N. Hall, M.P., Sherbrooke, representing Dominion Phosphate Co.; E. Wertheim, Managing Director, American Asbestos Company, Black Lake; W. Irwin, Anglo-Canadian Asbestos Company, Black Lake; O. M. Harris, Canadian Phosphate Co., Montreal; James King, Messrs. King Bros., Quebec; Thos. Trimble, Templeton and Blanche River Phosphate Co., Montreal; James Cooper, Ingersoll Rock Drill Co. of Canada, Montreal; E. V. Wright, Ottawa; A. Cameron, W. Macintosh, Buckingham; Hon. Wilfrid Laurier, Laurier Mining Co., Black Lake, Que.; F. J. Falding, M.E., and H. Brown, Q.C., Sherbrooke; A. W. Stevenson, G. Capel, F. D. Taylor, M.E., Montreal; Lucius Boyd, M.E., Sherbrooke; Mr. Penhale, Scottish Canadian Asbestos Co., Black Lake; W. A. Hale, Sherbrooke; John Blue, Supt. Eustis Mines, Capelton; Jas. S. Mitchell, Sherbrooke; Dr. James Reed, Reedsdale, Que.; A. Lomer, Messrs. Lomer, Rohr & Co., Montreal; and about fifty others.

On the motion of Mr. R. N. Hall, M.P., Mr. J. N. Greenshields, Q.C., was called to the chair, Mr. A. W. Stevenson, acting as secretary to the meeting.

MR. GREENSHIELDS briefly explained the objects of the meeting, which, he pointed out, was called to discuss a suggested taxation on the mining industry, contained in the Speech from the Throne at the recent opening of the Quebec Legislature. This was not the first time that such a tax had been mooted. In 1868 the Minister of Agriculture had proposed a similar tax. But it having been pointed out to the Premier at that time that the proposition was a most un-

reasonable one, and would, if carried into effect, militate seriously against the mining interests of the country, it was allowed to drop. He trusted that as a result of their deliberations representations of such gravity and weight would be made to the government as would induce them to forego the intention with which they had been credited—namely, to impose a tax upon the mines.

HON. GEO. DRUMMOND, President, New Rockland Slate Co., claimed that the question had no connection with politics, and politics should not in any way be called into their deliberations. The Government, like all other governments, wanted money, and they had picked upon the miners to supply their demand. It would be agreed upon all hands that the placing of a tax upon mineral products would act prejudicially upon the interests of the Province. Everyone knew that the Provincial Government was hard up for money; but to endeavor to obtain funds by taxing the mines would be simply to kill the goose in order to get the golden eggs (Cheers and laughter.) He warned the Government against the consequences of incurring the displeasure of so large and influential a body of men as the mine-owners of the Province. The imposition of this tax would not only affect one or two classes of people, but would recoil upon several classes, particularly the workingmen; and he urged that this point should be pressed upon the attention of the Government.

MR. R. N. HALL, M.P., for Sherbrooke, referred to the meeting of mine owners recently held in his town, at which he himself had been chairman. The unanimous feeling of that meeting was that it would be a great misfortune to place any burden upon the mining industries of the Province. (Applause.) It would prevent the introduction of foreign capital, and it would also injure the laboring classes, as Senator Drummond had pointed out. There could be no doubt that the future prosperity of the Province depends largely, if not wholly, upon the development of the mineral resources with which nature has so bountifully endowed the Province. We are so situated that we require foreign capital to aid us. He was afraid that damage had already been done by the very suggestion of this tax. He concurred in the view that the representations to be made to the Government should be free from political bias.

HON. WILFRED LAURIER having been called upon by the Chairman, said he had just dropped into listen, and had no intention of making a speech. He was personally interested in mining operations in the Province, and although he would not go so far as to say that after mines had reached a certain stage of development they should not be made to yield some public revenue, still he felt that to impose any new burden upon what was yet a new industry would not only be detrimental but fatal. (Cheers.) He deprecated the introduction of politics into the matter. He need not tell them that he was a supporter of Mr. Mercier (laughter and applause), but he was nevertheless ready to join those present in demanding that an industry in which he was to some extent interested should be safeguarded. He fully believed that when the bearings of the subject were placed fairly and justly before the Government they would shrink from the adoption of legislation injurious to the interests of the Province.

MR. B. T. A. BELL, Ottawa, agreed with the Hon. Mr. Laurier that it would be well to make haste slowly. The Government had not intimated any outline of its policy other than the vague and uncertain suggestions conveyed in the Speech from the Throne, and until it was known what form Mr. Mercier's proposition was to take, he thought great care and prudence should be exercised in any criticism. He thought the time had come for the organization of a representative mining association, which could be organized on a basis to cope with this or any other emergencies that might arise in the future. He hoped to submit a resolution to this end at a later stage, when the discussion on the proposed taxation had been ventilated.

MR. W. H. NICHOLS, of New York, operating the Albert Mines, and the Capelton Chemical and Fertilizer Works, said that as a stranger in a strange land it would be presumption for him to suggest to the Provincial or Dominion Government how they should raise their revenue. He could not, however, conceive it possible for a civilized Government in the northern portion of this continent to impose a tax upon the products of mines. He could understand such a proposition emanating from the Government of Bolivia or Ecuador. The firm with which he had the honor to be connected was engaged in copper mining in the Eastern Townships, and in the phosphate business in the Ottawa Valley. They were trying to bring both industries together, so as to be able to provide the farmers with a cheap fertilizer (cheers). Mr. Eustis and himself were operating on each side of Capelton Mountain, and he considered they conferred some benefit upon the people there. He hoped also that an effort would be made to secure a continuance of the exemption of mines from Municipal Taxation. Mine

owners wanted no bonus, but he thought they should receive some encouragement in other respects. Who opened up a new country? The farmers? The lumbermen? No; it was the miners (hear, hear and cheers). He had recently started to open up the old Huntingdon mine, but if he had heard about this tax he would have hesitated before doing so.

MR. W. E. C. EUSTIS, President Eustis Mining Company, Capelton, said that the mines at Capelton produced a copper ore of low grade, entailing every economy, and any increased taxation, either Municipal or Government, would unquestionably be prohibitory to further operations by his company.

MR. S. P. FRANCHOT, Buckingham, declared that the imposition of a tax upon the mines would simply mean ruin. The phosphate industry on the Lievres River alone employed thousands of laborers, and the result of the tax would be that these men would have to seek employment elsewhere. The development of the industrial resources of the Province was still in its infancy, and it would remain in that condition if legislation were passed which would have the effect of keeping foreign investors out of the country.

CAPT. ADAMS, Managing Director of the Anglo-Canadian Phosphate Co., Montreal, asserted that mine-owners had no disposition to evade contributing a just share to the revenue of the country. He was in favor of the principle of leasing mines on royalty, which obtained in Nova Scotia and other parts of Canada. Mine owners deserved great consideration from the Government, for theirs was the only industry which had stood manly and independent, and had never asked for any Government support. People engaged in other industries were rolling in wealth through cunningly devised legislation obtained in their favor from the Government. All they wanted was a fair field and no favor.

MR. R. W. HENNEKER, Sherbrooke, advised that great care be taken in approaching Mr. Mercier's Government. The Premier was a far-seeing, clear-headed man, who would listen patiently to any representations made to him in the interests of the country. If it were shown to Mr. Mercier that his ideas on expatriation would be seconded by the mine owners, who give employment to French-Canadians and thus keep them at home, he would pause before he imposed this tax. Mining was the forerunner in the opening up of a new country. This was apparent in that long stretch of country lying between Quebec and Sherbrooke, once a "howling wilderness," but now, under the pioneering influence of the miner, becoming a settled country.

MR. ED. WERTHEIM, American Asbestos Company, contended that if all the mines were worked at a profit, there might be no objection to the imposition of a reasonable tax, but the industry was young yet and many of the mines were only beginning to get their heads above water. Any taxation just now would be prejudicial to the best interests of the industry of the Province.

CAPT. R. C. ADAMS proposed the following resolution:—

Resolved, That it is extremely desirable that the exemption from municipal taxation, as contained in article 1544 of the Revised Statutes of Quebec, should be continued in force for a further period of ten years, and that petitions urging the re-enactment of these exemptions be submitted to the Local Legislature. Carried unanimously.

The following committee was appointed to watch any legislation affecting the welfare of the industry, and if necessary to wait upon the Hon. H. Mercier:—J. N. Greenshields, Q.C., Montreal; R. N. Hall, M.P., Sherbrooke, Que.; Hon. Geo. Irvine, Quebec, Que.; Capt. R. C. Adams, Montreal, Que.; Robert Blackburn, Ottawa, Ont.; S. P. Franchot, Buckingham, Que.; Wm. King, Quebec, Que.; W. E. C. Eustis, Capelton, Que.; W. H. Nichols, Capelton, Que.; Hon. George Drummond, Montreal, Que.; B. T. A. Bell, Ottawa, Ont.

MR. BELL then submitted his resolution, urging the organization of a General Mining Association. He contended that if this were done questions such as those dealt with at this meeting could be handled much more efficiently than at present. Apart from all questions of legislation, such an Association would greatly benefit the members by an interchange of knowledge and ideas, and much good to the Province could be accomplished by the dissemination of authentic information respecting the extent and value of its resources.

MR. W. H. NICHOLS, while agreeing with Mr. Bell that an Association would be a good thing, thought the matter deserved more consideration than could be given in the limited time at this meeting. He thought the matter should be held over until another meeting.

After some further discussion it was decided to leave the matter in the hands of the Committee, and the meeting adjourned after a vote of thanks to the Chairman and Secretary.

Proposition to Erect Nickel-Refining and Steel Works in Ontario,

The following is the full text of a letter from Mr. S. J. Ritchie, of Akron, Ohio, President of the Central Ontario Railway, and one of the leading promoters of the Canadian Copper Company, Sudbury, to Sir John Macdonald, praying for a Government bonus for the completion of the Central Ontario Railway, from Coe Hill to the Sudbury mines :—

OTTAWA, November 10, 1890.

To the Right Honorable Sir John A. Macdonald, G.C.B.,
Minister of Railways, Ottawa :

On numerous occasions during the last six years I have asked the Government to aid the Central Ontario railway in extending its line from Coe Hill to Sudbury. During the greater portion of the period there were many questions in connection with the metal interests of the country to be traversed and to be reached by the completion of this line which were only partially solved, and the success of the line when built thus rendered somewhat problematical; and to this cause I have attributed the failure of the Government thus far to comply with my request. Happily now, all these obstacles have been overcome and mastered, and the development and manufacture of these minerals in Canada has become a question second in importance to no other commercial question in the Dominion.

By cheap and simple processes even very low grades of magnetic iron ores can be converted into the highest and purest grade of ores which are offered in any of the markets of the country, and they are thus well adapted to the manufacture of the very best quality of steel. In addition to this you doubtless are well aware of the great revolution in metallurgy recently made known to the public by the alloying of nickel with steel, the product being known as nickel steel.

Nothing in the manipulation of metals since the discovery of Sir Henry Bessemer has created such widespread interest among the steel manufacturers of the world as the results obtained from the nickel steel. Wherever it will be possible to obtain this material the war vessels of the world, together with their armament, will doubtless be made from it. This statement I have from the highest officials having these matters in charge.

Its extensive use for commercial purposes where a metal of superior excellence is required is equally well assured. Canada possesses probably five-sixths of the world's supply of nickel. Such being the case she can control the markets of the world and the uses to which this metal shall be applied. She also has inexhaustible supplies of iron ore, which, until the invention above referred to, were neither available for manufacture at home nor saleable abroad.

The comparative close proximity of these iron ores to these nickel deposits, both of which are inexhaustible and almost incomputable supply, would seem to render any argument unnecessary as to the proper use to which they should be put. That they should be manufactured in Canada, and the manufactured material shipped to the markets of the world, instead of only the crude materials being produced in the country and shipped to foreign markets, would seem to be a question susceptible of only one answer.

After having mastered a solution of all these metallurgical questions and processes, after their importance has been acknowledged and passed upon by the highest authorities in the world, including, among hundreds of others, the owners and managers of the great steel works of Schneider & Company, of Le Creusot, France; the great works of the Steel Company of Scotland; of the world-wide known works of William Jessop & Sons, of Sheffield; of the results obtained by experiments and tests made in the interests of the French, German, Austrian, British and American Governments, I again come to you and ask your aid, not only for the completing of this line of railway, but also for the building up of a great steel plant which shall produce an article which can be shipped to and find a purchaser in every market in Europe. It may be said that the natural advantages here should be sufficient inducement for other investors or manufacturers without any Government aid, but you must remember that Canada is without any industry of that kind, and that her facilities and resources are not well understood by people of other countries where these industries are developed on a great scale, and no matter what her advantages are or may be it would be impossible to induce capital sufficiently large to engage in an enterprise of this kind without some Government backing. If the same opportunities, even in a small degree, existed in the United States, Great Britain, Germany or France, capital in any amount required could at once be had to utilize and develop them. But the conditions here at present are different, and if

Canada is to take her place among those countries which are producers of manufactured articles instead of a producer of raw materials, the Government must take the initiative and help those who are willing to engage in and push through this enterprise.

I therefore ask of your Government, on behalf of the Central Ontario Railway, a bonus of six thousand dollars per mile from Coe Hill to Sudbury, a distance of about two hundred and six miles; and that you grant a bonus of thirty-two hundred dollars per mile on the portion of the line already completed between Trenton and Coe Hill, a distance of about seventy-two miles; this last sum to be used in the building of blast furnaces upon the line of railway.

2. For the purpose of erecting and carrying on a large steel plant upon the line of railway for the manufacture of nickel steel from the iron ores along the line of road, and from the nickel ores of the Sudbury district, I also ask your Government to guarantee the interest at the rate of three per cent. per annum on a capital stock of five millions of dollars for a period of ten years, and in order that we may at once perfect our negotiations for carrying out this enterprise I would most respectfully ask that your Government pass an Order-in-Council granting this aid, under such safeguards as shall insure to the Government their successful completion and carrying out.

If the Government shall be pleased to make these concessions to the interests I here represent, a great industry will at once be built up in Canada, and she will sell to the markets of the world a manufactured article instead of raw materials. She will find a market for her labor at home, with a growth of all the varied interests which spring up around such large manufactures. To illustrate the possibilities of a great steel plant I may say that the business of Carnegie & Co's firm at Pittsburg during the present year is much larger than the combined business, during the same time, of every mile of railway and steamship owned or operated by both the Grand Trunk and Canadian Pacific Railways both in Canada and the United States. Yet the sources from which this great firm derives its supplies of raw materials are in the aggregate but a small percentage of extent to those to be opened up, connected and made available by the extension of this line of railway. The several interests in this railway and in the iron, nickel and copper mines which it will bring together will all be pleased to heartily co-operate with your government in building up a great industry in your country, if by your aid you will make it possible for them to do so. This whole subject in all its bearings and connections is quite well understood by your Government, but in order to place the matter in at least approximately definite form before you, I submit the following figures as illustrative of the importance of the enterprise for which I ask your aid :—

1. Line of Central Ontario—110 miles already completed with equipments...	\$2,500,000
2. Line to be built, say 210 miles with equipment	6,000,000
3. Capital for steel plant	5,000,000
4. Capital for working the copper and nickel mines with a capacity of ten furnaces, and about thirty miles of railway to connect all the various deposits with the central smelting plant, together with all the necessary machinery, houses and plant of every kind adapted to a capacity of ten furnaces, as well as to provide for the working of the iron mines, at least....	5,000,000

\$18,500,000

To recapitulate, then, I ask of your Government first a direct bonus to the railway of say (about 320 miles when completed)

\$1,500,000

This would involve to the Government an annual interest charge of about

\$50,000

The guarantee of five millions of stock for steel plant at three per cent. per annum for ten years—this would involve an annual interest charge upon the Government of

150,000

Or a total interest charge for ten years of

\$200,000

And of \$50,000 per year thereafter.

From such knowledge as you have of the importance of like industries in other countries, I submit whether your Government has ever incurred an obligation of like magnitude which promises so much in return for the development of your country, and I most earnestly urge your speedy and favorable action that we may be enabled to close our negotiations and to proceed at once in building up and carrying out this whole enterprise.

Very truly yours,

S. J. RITCHIE,

President Central Ontario Railway.

The Canadian Phosphate Industry.

The Chemical Manure Manufacturers' Association held a meeting in London last month, Mr. Hermann Voss, the president, occupied the chair. There was a good attendance. Mr. W. H. Hutchinson read the following paper on "The Canadian Phosphate Industry" :—

"A few weeks ago, when the president of the Chemical Manure Manufacturers' Association, knowing that I had been in Canada in the autumn of 1889, with the object of examining the phosphate industry, paid me the compliment of asking me to read a paper on the subject before your Association, I consented after a little hesitation to do so, in the hope that my paper, short and incomplete as it might be, would prove of interest to some and serve to evoke discussion, in which those who have greater experience and knowledge would give us the benefit of their views.

Not more than twenty years ago, the Canadian phosphate districts, which are now alive with the many signs of active mining operations, remained in a condition of almost perfect tranquillity. Here and there were a few small scattered farms, but the district being, for the most part, little suited for agriculture on account of the sterility of the thin soil overlaying the rocks, its solitude was disturbed only from time to time by the ring of the lumberman's axe and the occasional visit of some enterprising member of the Geological Survey. The latter had previously led to the discovery of apatite, and after further investigation and study had shown that there was every ground to calculate on the ore being present in quantities; mining operations were begun on a tentative scale, with results affording such good prospects of success, that gradually the district became transformed into its present state of activity. Now, during the busy season, the rattle of tramcars and carts hauling phosphate, the puffing of the small steamers passing up and down the Du Lievre river, and the frequent reports of explosives create a sense of bustle which would vex the soul and call forth expressions of strong disapproval from any disciples of Mr. Ruskin, if, perchance, any of them find their way to the neighborhood.

The phosphate-bearing districts cover a wide extent of ground, lying chiefly in the provinces of Quebec and Ontario, the more important being in the former, situated north of the Ottawa river and comprised principally in a broad belt of from twenty to twenty-five miles wide, passing through the townships of Templeton, Buckingham, East and West Portland, Bowman, and still further north. A lumberman told me that he had seen outcrops of the ore 150 miles further up country, but the more outlying districts are very wild and have still to be properly explored.

Phosphate is also found in other districts, for instance, in Wakefield, Hull, and Denholm townships, Ottawa County, but at present, not in such important quantities.

In the Ontario district the phosphate lies in the townships of Loughboro', Hinchinbrook, Olden, and Bedford, County Frontenac, and in the township of North Burgess, County Lanark, where, I believe, it was first mined.

Geologists point out that the phosphate districts particularly in the Quebec province are included in the belts or zones of pyroxenic rocks, which occur in the Laurentian rock formation—the oldest known formation. Pyroxenic rocks may therefore be termed the mother rock of the apatite, which occurs in it in veins, sometimes enlarging into pockets of great magnitude, sometimes "pinching in" to almost invisible strings, and sometimes dislocated by rocks thrown across by later formations. On the map—which is enlarged from one made by Mr. J. Lanson-Wills, of Buckingham, the mining expert—the supposed extent of the pyroxenic belt is shown. In the Province of Ontario apatite is also found in gneiss or similar rocks, which, however, often include crystals of pyroxene.

Apatite exists in almost all stratified and crystalline rocks in minute quantities, but has been found in commercial quantities only in Canada, Norway and in Spain; but in neither of the latter countries, owing to the difficulties of mining and transport, has the industry assumed large proportions.

How the apatite got into the rocks is a question which has exercised the minds of geologists, who, however, have not yet been able to arrive at a unanimous conclusion. Various theories have been put forward. Professor Dawson, in an interesting note on the origin of phosphate deposits, in a paper read by him before the Ottawa Field Naturalists' Club, in 1884, expresses the opinion that the apatite occurs as sediment, deposited in the earliest seas of which we have any trace, and which originally resembled those of later seas, but have become so completely altered that their materials have entered into new combinations, and have, by igneous action become entirely crystalline, resembling now the original deposit as little as do the crude ingredients of glass the finished product. In opposition to this, which may be termed the "sedimentary rock" theory, Dr. T. Sterry Hunt

also a great authority, at the conclusion of some technical remarks on the subject, says:—

"I am disposed to look upon the apatite as true beds, deposited at the same time in the enclosing rocks."

While Mr. Wurzbarger, an eminent mining expert who was with me in Canada, has formed the opinion that:—

"As chemical analyses show in the pyroxenite rock itself a small percentage of phosphate of lime, it may be considered as probable that the apatite in the veins and pockets have been extracted from the pyroxenite by hydro-chemical action."

There is yet another view, that the apatite is the result of purely volcanic action, having been thrown up from the bowels of the earth.

Where doctors disagree who shall decide? But although doubt may exist as to the origin of the ore, there is no uncertainty as to its quality and characteristics. Apatite is the purest form in which phosphate of lime is found to exist in quantities—containing when of the first quality from 80 to 87 per cent. of tribasic phosphate of lime and only 1 to 2 per cent. oxide of iron and alumina.

In a perfectly pure form it is composed of—

Phosphoric acid 42.26=tribasic phosphate of lime 92.26

Lime (oxide of	
calcium) ..	50.01
Calcium ..	3.96
Flourine ..	3.76
	99.99

The average analysis of "first" quality shipped may be recorded as—

Phosphoric acid 37.88=tribasic phosphate of lime 82.72.

Carbonic acid ..	1.80
Lime ..	54.65
Iron oxide and	
alumina ..	2.72
Silicious matter	0.62
Moisture ..	0.21
Flourine, sul-	
phur, etc. ..	2.12
	100.00

Any gentleman who would be interested in more detailed analysis will find a table of eight full analyses appended on the placards.

Shipping samples of a parcel now *en route* from the Aetna Mine show 85.05 phosphate of lime with respectively 0.95 and 0.90 oxide of iron, but this must be considered an exceptionally good quality.

The ore is generally, as shown by the samples in the table, of a heavy, close-grained character, but sometimes it is forthcoming of a looser nature, when it is technically known as "sugar phosphate." In some mines it exhibits a more distinctly crystalline character, some of the crystals being of very striking dimensions. There is one almost perfect in form in the Ottawa Museum. It measures 32 in. in length; the diameters being 22 in. and 17 in., and weighs, probably, about 7 cwt. On the Aetna Mine a crystal more than twice the size, estimated by Mr. Würburger to weigh six tons, and measuring 7 ft. high, with a diameter of 4 ft., was found. Unfortunately, owing partly to its great weight and to its surface being cracked from exposure to the frosts, it was found impossible to preserve it intact. A sample taken from it yielded 88.43 per cent. tribasic phosphate of lime.

The colour of apatite is usually dark green, but some mines, notably in the Ontario district yield large quantities of excellent phosphate of a red and reddish-brown colour. It is also found almost black, and again of pink and violet tints. The shades of colour appear to depend on the chemical composition of the mineral, the usual green tint being probably due to flouride of calcium, but the colouring matter is so minute that, when phosphate of different shades is ground, it is hardly possible to distinguish one from the other, all being of the whitish tint. The shade of colour is no indication of quality, which can be only ascertained by analysis.

It requires an eye, taught by considerable experience, to distinguish with certainty apatite from the surrounding rocks. In this respect it is very true to its name, which is derived from a Greek word meaning "deception." I heard of one farmer who, having discovered, as he fondly thought, a deposit of apatite on his property, worked at its extraction with all his energy until he had raised some hundreds of tons, when, wishing to turn it into cash, he discovered, poor fellow, to his intense chagrin, that he had wasted his time in raising a pile of the country rock, somewhat resembling apatite in appearance.

As might be expected from the high character of apatite, it is found to be a most excellent material for conversion into superphosphate. When treated with acid it yields a higher percentage of phosphoric acid, soluble in water, than any other raw phosphate material with, perhaps, the exception of Curacao phosphate. The first quality dissolved in acid of 140 deg. gives a superphosphate with 18 to 20 per cent. of phosphoric acid equal to 40 to 45 per cent. soluble phosphate of lime.

The condition, although dampish at first, becomes in a month's time dry, friable and everything that could be desired.

Although the existence of apatite in the phosphate districts had been long known to some geologists, it was not until about 1872 that mining operations were begun in Ontario, and about a year later in the Ottawa district. I have not been able to ascertain to whom belongs the honour of opening up the industry. In Ottawa city there seem to be several elderly gentlemen who claim the credit. Soon after I arrived there, an old gentleman introduced himself and explained that he was the first man to bring to Ottawa samples from a quantity extracted on his property. I was naturally much interested, and noted the circumstance. A few days later, another old gentleman informed me he was the first, and yet another old farmer impressed on me that he was really *primus inter primos*. There are probably more men who lay claim to the honour than there were Greek cities which claimed to be the birth place of Homer. In the first years of the industry, especially in the Ontario district, the raising of the apatite was conducted in a very primitive fashion. It was the custom to contract with local farmers to pay them a fixed sum per ton of apatite raised in a lot of land without stipulating how the work should be done. As a consequence, the farmers raised only the ore easily got at near the surface, and when it became necessary to expend more labour on its extraction, the working would be abandoned for a fresh surface outcrop; neither was sufficient care taken to keep the ore clean, the object being to raise the maximum quantity of ore with the minimum labour, apart from all other considerations. The contract system is still in vogue to a certain extent in the Ontario district, and is found, under careful supervision, to work well.

In the Ottawa district, however, where the phosphate occurs in larger masses, the contract system has never taken hold, the mines having been worked by the proprietors, at first, chiefly as open pits or quarries, but in the last few years, in the most important mines, where the phosphate has been followed some hundreds of feet down, by regular shafts and underground workings and galleries. The *Canadian Mining Review*, so late as 1885, wrote: "The system at present in vogue at almost all mines is much akin to open quarrying, and it is argued by scientific miners that this cannot be the most economical way of raising the ore, as it entails the removal of an unnecessary amount of rock. The nature of our phosphate deposits is, however, so different to that of other mineral veins, and their character so irregular, that it requires close and careful observation of the immediate vicinity to determine how the deposits can be worked with most advantage. At the present time powerful machinery and regular mining apparatus is brought to bear in the most important mines in the extraction of the mineral. It is still found, however, as year after year adds fresh experience and greater knowledge, that apatite mining is certain only in uncertainty. The deposits are so extremely irregular in extent and breadth, so liable to "pinch in" to a mere streak, to disappear altogether for some space, to be interrupted by a dyke of trap rock, or fault, as it is technically called, that it is hazardous to calculate on a regular large output from any one pit. One week the manager reports prospects of the rosiest character, the following mail brings news that the vein which promised so well is looking black, and instead of opening out into the hoped for pocket of some thousands of tons, has pinched in to almost nothing, perhaps disappeared, and before it can be again recovered a large amount of dead work must be done, involving some weeks of heavy, unremunerative outlay. As Captain Adams graphically described the phosphate occurrence in the words of an old miner: "It is long, and it is short; it is wide, and it is narrow; it is deep, and it is shallow; it is thick, and it is thin; it is here, and it is there; you have got it, and you haven't; you see it, and you don't see it." To counteract the effects of this uncertainty, the careful manager must therefore have several pits working at the same time, so as to keep up a good average permanent output."

In order to present to you a clearer idea of the Ottawa mining district and the mining process, I would ask you to mentally accompany me on a visit to one of the principal mines. Leaving Ottawa by an early train we arrive, after a railway journey of about an hour and a-half, at Buckingham station on the main line of the Canadian Pacific Railway, where an engine and a few carriages are waiting to convey us by a branch line about four miles long (constructed about five years ago and opened early in June, 1885, by Lord Lansdowne, on his way to pay a visit to High Rock Mine), to Buckingham Village wharf, where we jump into the little mail steamer, *Agnes*, probably 23 horse-power, which, after having taken in some packages for the mines, starts up the du Lièvre River. On board there are a few other passengers for the mines, and a party of lumbermen going to a timber limit up-country. Rather a rough set are they, chiefly French-Canadians, who beguile the time by singing choruses in patois. They will remain in the woods until the following spring, sleeping in a wooden shanty to be first erected by them, and living principally on salt pork, beans and

tea. In the spring time they return, fatter and stronger in health than they go up, in spite of the severe climate, hard work and not tempting food. This proves the healthfulness of the dry cold of the Canadian winter.

After leaving Buckingham wharf the steamer proceeds up the river for about thirty miles. When I was there in the autumn, the water in the river was so shallow that when we came to the Little Rapids, about twelve miles up the river, we had to disembark, make a *detour* on foot, and embark on the other side of the rapids in another steamer. On the way up the gorgeous and brilliant colours of the foliage on each bank of the river, and the beauty of the views on either side, have filled us with admiration. At the wharf we are met by the manager of the mine, who gives us a warm welcome, and we go by a tramway drawn by a horse up an incline to the manager's house, about two miles distant, where we are vociferously greeted by a chorus of dogs. After having, through the hospitality of the manager, satisfied our hunger, sharpened by the exhilarating air, we are introduced to the pets of the place, consisting, beside the dogs, of three large bears, raised from babyhood by hand, very sleek and tame, a fox and a squirrel. We are then shown over the building, strongly built of timber, and comprising a cook house, savoury at the time with the odour of cooking joints, the sleep house, &c., and afterwards proceed to the workings. We descend the pit either by a ladder, which is rather difficult climbing to a Londoner, or by the bucket attached to a derrick, and, arrived at the bottom, find miners at work loading the phosphate into the tub to be hauled by the derrick to the pit mouth. The manager guides us by the light of a candle along a side gallery, where the miners are at work with the rock drills, preparatory to the use of explosives, and we are shown the thick vein of ore, from which it is hoped to win some thousands of tons. It is, in fact, a rich pocket of fine quality. The shaft is down about 150 feet, and is one of several being worked on the mine. There is very little water drainage to the pit, the surrounding rock being of too hard a nature to admit of much percolation. After examining the mining process and admiring the fine quality of the extracted ore, we are hauled to the top again, where we see how the mineral is loaded into the cars running along a narrow tramway. Jumping into one of these, we are conveyed to the cobbing house, where the important process of separating adhering bits of foreign rock from the apatite takes place. We remark how the apatite is first passed through an inclined circular sieve, worked by machinery, the finest part of the ore passing through the $\frac{3}{8}$ in. mesh of the upper half of the sieve, while the more granular particles pass through the coarser mesh of the lower half of the sieve. The finest portion is first and second quality, and the coarser thirds. This simple classification is practicable, because the apatite, being more friable and easily broken than the harder associated bits of rock, the finest portion is freer from impurities than the more granular. The lumps and larger bits rejected by the sieves pass into the hands of boys who cob it—that is, with small hammers knock off the impurities and separate the practically pure ore from pieces of associated rock. By the process of sifting and hand-cobbing, three qualities are prepared—1st quality, 80 to 85; 2nd, 70 to 75; 3rd, 60 to 70 per cent.

We are then shown how the ore is loaded again into tramcars, which convey it rapidly down the incline to the wharf, where scows are waiting into which it is loaded direct from the wharf. There we leave the mine, having spent a pleasant and instructive day. From the wharf the ore is conveyed by scows—flat-bottomed barges—to the wharf at Buckingham, where the ore is loaded into the railway cars and forwarded either to Montreal for shipment to Europe, or—and especially the lower grades—to the mills at Buckingham, to be ground for the American market. In the autumn, when the water in the river is low, one steamer brings the scows to the Little Rapids, and another steamer to the wharf at Buckingham. Sometimes the water is so low as to seriously inconvenience the passage of the scows.

The cost of mining, cobbing and transporting to the wharf, varies according to the character of the deposit and purity of the ore, depth of working and local circumstances, from 5 dols. to 10 dols., say average 8 dols.=£1 12s., and the cost of shipment to Europe from the mine wharf, say £1, thus first cost delivered in Europe, £2 12s. per ton, but of course this does not include anything for interest on capital, management, machinery, roadmaking, and wharf-building, other development work, amortization, neither does it take into calculation the possibility or rather probability of the mine sometimes looking black, and the necessity of doing a great deal of dead work, upon which items the success of the mine really depends.

The value of apatite at the present time in the United Kingdom may be noted at for the respective qualities of—

84 per cent., 1s. 4d. per unit, with 1-5th d. rise, equal to.....	£5 17s. 6d.
80 per cent., 1s. 3½d. per unit, with rise, equal to.....	5 3s. 4d.

70 per cent., 1s. $\frac{1}{2}$ d. per unit, without rise, equal to..... 3 12s. 11d.
60 per cent., 10d., equal to..... 2 10s. 0d.
per ton in bulk, unground, ex-ship, sampling on discharge, and analysis, the mean of two well-known chemists, agreed upon at time of sale.

The wages paid in the district are approximately :—

Foreman.....\$ 2.50 per day with board.
Miners.....1.25 “ “
Cobbing boys.....50—70 “ “

At several of the mines the miners are paid 30 dols. per month, from which 11 dollars are deducted for board and lodging. During harvest time labor is scarce and difficult to obtain.

The principal mines in Canada are now :—

In the District. Belonging to.
Du Lievre. High Rock, Phosphate of Lime Co. ...
North Star, Dominion Phosphate Co.
Union Mines, Canadian Phosphate Co.
(Star Hill, Crown Hill, Ruby and William.)
Squaw Hill and Aetna, Anglo-Continental Guano Works.
Emerald and Central Lake, Ottawa Mining Co.—Not being pushed.
Little Rapids, W. A. Allen.—Only slightly worked.
Templeton. Blackburn, East Templeton District Phosphate Mining Co.
Ontario....Foxton, Foxton Phosphate Mining Co.
Otty Lake, Bobbs Lake, &c., Anglo-Canadian Co.
Eagle Lake, St. George's Lake, Captain Boyd Smith.

And the total quantities raised were approximately as follows :—

1880 .. 7,500 tons.	
1881 .. 10,307 “	Including 2,402 to U.S.
1882 .. 15,556 “	2,080 “
1883 .. 17,160 “	220 “
1884 .. 20,461 “	32 “
1885 .. 24,876 “	745 “
1886 .. 20,440 “	532 “
1887 .. 23,152 “	733 “
1888 .. 23,290 “	1,000 “
1889 .. 28,198, of which 4,176 exported to U.S.	
1890, estimated 22,000, including a large quantity of second quality.	

The average prices of Canadian apatite, 80 per cent. quality, have been :—

1882.. 17d. with 1-5th rise	1887.. 11 $\frac{3}{4}$ d. with 1-5th rise.
1883.. 16	1888.. 11 $\frac{1}{2}$
1884.. 13	1889.. 12 $\frac{1}{2}$
1885.. 13	1890.. 15 $\frac{1}{4}$
1886.. 12 $\frac{1}{2}$	

the lowest having been in 1888, 11 $\frac{1}{4}$, and the highest 16 $\frac{1}{2}$ in this year.

Having now given a cursory review of the Canadian phosphate mining, we have finally to consider whether we, as consumers of phosphate, can look forward to receiving regular and permanent supplies from the colony, and, in connection with this question, what are the present position and prospects of the industry.

During the year 1888 there was a growing feeling on the part of some of our more important chemical manufacturers that the prospects for our future supplies of raw phosphatic material were not so reassuring as could be wished, and this feeling found expression in a paper “On our Supply of Phosphate for the Manufacture of Super-phosphate,” read before you on December 10th, 1888, by the present president of your Association.

This paper attracted considerable public attention, and served to stimulate enquiries and search after phosphate throughout the world. Canada participated strongly in this awakened feeling. Phosphate lands came rapidly into active demand, and, passing from hand to hand, rushed up in value. Options of even quite undeveloped lands were eagerly sought for, and mine owners were urged to place their properties for sale in the hands of company promoters, who promised to secure for them a high price.

The *Canadian Mining Review*, in its review of the season for 1889, described the position pithily as follows :—“Cables began to pour into Canada asking for offers of land, and in a little while a good portion of the phosphate district was for sale in the London market. Some of the leading mine owners and business men went to the scene of the excitement. Even eminent statesmen started for England with bonds of lands in their trunks, though the reporters were told to announce to the newspapers that the visit was ‘purely a pleasure trip.’ Prospectuses were soon drawn up offering Canadian land to the public at from two to five times the prices asked by the holders, which were generally quite the full value to begin with. An evening paper attacked these schemers, exposing the inflation, and the issues

fell flat. The summer came and the boom collapsed to the sorrow of many landowners, who had been repeatedly told by letter or cable, ‘The thing is done; the scheme is placed; your lands are sold. The company is fully underwritten; it is certain to go.’”

The abortive projects to float several ill-advised extravagant schemes will be within your recollection. This occurred in the spring and summer of 1889. When I was in Canada, in the autumn of that year, although the boom had subsided, the holders of lots still retained exaggerated notions of their value. The belief seemed to prevail among them that Canada is destined some day to furnish the bulk of the world's supply of phosphate, that other sources are dying out, and therefore that the key of the position rests with them. As an illustration of the prevailing idea, I may mention that some days after my arrival at Ottawa, a lady quite unknown to me telephoned to me at the hotel, requesting an immediate interview. As a married man I hesitated, and under pretence of being fully occupied, asked her to write me. It turned out she had a phosphate property, not developed, which she was anxious I should purchase for £4,000, payment on the following day.

It is the custom to speak of Canadian phosphate mining as being quite in its infancy, or as having just got on its legs, but it must be remembered that operations commenced nearly twenty years ago, about the same time that operations commenced in South Carolina, where now about 800,000 tons are annually raised.

In the Somme district, in France, the mining commenced only in 1887, and last year's extraction reached over 200,000 tons.

The Belgian phosphate was first excavated about ten years ago, and over 100,000 tons have been raised annually for some years.

In the Liege district it was started only this year, and over 20,000 will be raised.

In Florida, which, so far as phosphate is concerned, was, in 1888, almost a *terra incognita*, between 20,000 and 30,000 will probably be shipped this year.

In Canada, on the other hand, the output during the past six or seven years has not very materially increased. There are several companies engaged in the industry, with ample capital, using powerful machinery, and having the advantage of some years' experience; but, nevertheless, each mine seems to find it exceedingly difficult to beat previous years' record of 6 to 7,000 tons, and I believe no company has yet succeeded in raising 10,000 tons of cobbled apatite in one year. Indeed it is estimated that the total quantity raised this year, in spite of the high price stimulating the highest possible production, will not much exceed 20,000, of which a large quantity will be second quality.

These considerations lead to the conclusion that the uncertainty and irregularity of the apatite veins and deposits are most serious obstacles against any material augmentation in the whole output, and that, although larger supplies would be very welcome, we can hardly calculate on receiving them.

No doubt very large quantities of the ore exist hidden and buried in the bosom of the rocks, but the difficulties of raising it are very great. It is sometimes necessary to remove hundreds of tons of rock to get at the wished-for phosphate. This difficulty in apatite mining is not confined to Canada, because both in Spain and Norway, where ore of equally high character exists, mining operations were begun more than twenty years ago, but the difficulties have hindered any decided development of the industry.

As you are aware, a new enterprise of some magnitude in connection with Canadian phosphate mining has recently been launched, and it is hoped that it will lead to a rapid and extensive development of the industry. The phosphate placed on the market by it will be welcome, but we must not calculate upon it before it is raised and shipped. If the new concern buys up mines in full working order, the quantity raised will remain approximately the same, because experience has shown that the production of phosphate cannot be forced. Only a few men can work in each pit, and the mining must proceed methodically, carefully and patiently. If undeveloped properties are taken, then some time must elapse before phosphate from them will be shipped, because the development of a mine takes time, particularly in Canada, where the long winter throws such great impediments in the way. Wharves have to be built, roads and tramways planned and constructed, buildings put up, miners engaged—and during summer they are scarce—and machinery transported, &c.

Even if large quantities could be raised, then other obstacles to delivery would intervene. There are already difficulties in getting to Montreal during the short shipping season the quantities raised, and freights across the Atlantic show a tendency to go up. But if, instead of having 20,000 or 30,000 tons to ship, there were double the quantity, the difficulties would become most serious, and the freight across the Atlantic would jump up to a limit which would seriously interfere with the margin of profit.

I will not enter into the financial side of the question

as the success of a Canadian mine depends so much on the amount of capital invested, good management, and favourable position for transport. Some gentlemen in the room can give us interesting and reliable information on this important subject. If the tendency of my paper is to discourage over sanguine hopes, and encourage steady progress in sound undertakings, I shall be satisfied.

To sum up: while we may expect to continue to receive moderate, and, perhaps, slightly increasing supplies of valuable phosphate from Canada, we cannot look for any great increase. When people talk of Canadian shipments reaching 100,000 tons, or other enormous quantities, we remain sceptical, and continue to base our calculations on much more moderate figures.

We all wish success to the Canadian phosphate industry; we hope it will continue to progress steadily, soberly, and satisfactorily—not at one time inflated by wild schemes, resulting in serious prejudice to its real interests, and not unduly depressed; but advancing, year after year, as an industry standing on a solid basis, and meriting the success which we hope it will achieve, and, therefore, I may fittingly conclude my paper in giving expression to the wish—Success to the Canadian Phosphate Industry.

The Chairman expressed the thanks of the Association to Mr. Hutchinson for his well-prepared and interesting paper, delivered, as it had been, under some difficulties. (Mr. Hutchinson was suffering from a severe cold which somewhat affected his voice.) As president of the Association he expressed regret that the prospects of increased supplies of phosphate from Canada were not more encouraging. When asked by Colonial and Continental buyers to supply superphosphates with 18 to 20 per cent. soluble phosphoric acid they must look for raw materials of corresponding quality, and at one time they hoped that Canada would be able to supply large quantities of beautiful high grade phosphates. From a national standpoint it was desirable we should be drawing supplies from our own colonies. The prospects were not so bright as could be wished; still, with sufficient energy and sufficient capital, no doubt a decent supply of Canadian phosphates would always be forthcoming. The paper to which they had just listened had been so exhaustive that it would be difficult to add anything to it, but he hoped some gentlemen present who had just come from the country would be able to supply some additional information.

Mr. Henry F. Moore, editor of *Bell's Weekly Messenger*, said he appeared there rather at a disadvantage, having arrived in London from Canada only the previous day, and having as yet not had time to look at any notes or papers collected during his visit to the phosphate mines. He had brought back some of the latest figures with regard to the industry, and must confess that they hardly agreed with the estimates given by Mr. Hutchinson. In the Lievre district the output for this year was estimated at 30,000 tons, and the figures given him for the same district for last year were 23,000 tons. Mr. Hutchinson's figures, however, were for both the Ontario and Quebec mines, and his were for the latter only. He thoroughly agreed with all Mr. Hutchinson had said in description of the mines; in fact his description had been so complete and accurate that there was nothing more to be said. He also agreed with him in the caution given with respect to Canadian phosphate lands. “Phosphate lands” might mean anything. No doubt many useful mines would be found; but at present many of the so-called “phosphate lands” were mere bush, destitute of any commercial value for mining until they had been explored thoroughly, and likely spots “developed.” Before lands were bought they should be properly developed and the mine started. He thought there was a future before the Canadian phosphate mining industry, but did not see that it would be helped in any shape or form by investments in mere so-called “phosphate lands,” unless the land was developed, and had, in the manner stated, its commercial value ascertained. In addition to that the mines will be economically managed, and by men having a knowledge of the district. Mr. Hutchinson had asked a question as to the discoverer of Canadian phosphate. The discoverer, so far as was known, was an officer of the 15th regiment, Lieutenant Engalls, who was in the district in 1829, and was the first to publicly announce that these were phosphate lands.

Mr. Pickford (Pickford and Winkfield) said his firm sold the first parcel of Canadian phosphate that came to this country, about 1872, and five-sixths of all that was imported until 1880. He could endorse everything said by Mr. Hutchinson, who had exhausted the various points referred to in his paper. He was personally very much opposed to those who held exaggerated views about the future of Canadian phosphate, as, although some parcels shipped have analysed as high as 86 per cent., the average of high quality cannot be estimated over 80 per cent., and in the quantity of Canadian phosphate at present shipped, say 25,000 tons, not more than one-third is of high quality. In 1880 Mr. Pickford first visited the “High Rock” property, at which time there was no regular means of transport; he was rowed in a small

boat against a strong current by three men, and landed on the bank at the edge of a forest, with scarcely a track to guide one to the phosphate shown on the top of the mountain. From that time working the phosphate gradually progressed, although only by hand labor, chiefly surface work which was raised by horse labor and derrick to a depth of 20 ft. to 30 ft., when the various pits were temporarily abandoned for want of machinery which was not introduced until 1884, though only then to a limited extent. Up to that time the only means of transport was by sleigh over the snow in winter, but no possibility of transport in summer, until a steamer was introduced in the river Lievre, to tow the scows (barges) to Buckingham village, a distance of three miles from the Canadian Pacific Railway over very bad roads. Representations were made to the railway company, and in view of facilitating the transport the company constructed the branch line, which, as stated by Mr. Hutchinson, was opened in June, 1885, by His Excellency Lord Lansdowne (the then Governor-General of Canada), accompanied by Dr. Sterry Hunt and Dr. Grant (now Sir Jas. Grant) and Mr. Pickford, as noticed in the *Montreal Gazette* of June, 1885, when on a visit of inspection to High Rock Phosphate Mine, where they were enabled to examine in detail the well systematized operations carried on. At that time the phosphate had to be carted a distance of about two miles to the scows, but since then a tramway has been made, and the transport is organized as well as possibly can be. The difficulty of transport is the great drawback to various properties, many of which can only forward the phosphate on sleighs in winter. Mr. Pickford said he had visited the Canadian phosphate district annually since 1880 (some years twice), having made about twelve journeys, and, being thus conversant with all details, would point out how disastrous may be the incorrect statements put forward in regard to properties that have been offered to the public during the last five years, and what an injurious effect it has had in the Canadian phosphate industry.

Mr. Hunter (Andrew Hunter & Co.) said he had listened with the greatest pleasure to the paper read by Mr. Hutchinson. In the short time at his disposal he had given a particularly interesting and graphic account of the Canadian phosphate industry from its commencement to the present time. At present, primitive modes of working had to a large extent been superseded by more scientific methods, but there still existed considerable difference of opinion as to the most economical method of working the mines. Some could be worked best on the old, and others on the new methods of mining. With regard to the future of Canadian phosphate mining, he must say the remarks made by Mr. Hutchinson were very much to the point. The success of any new enterprise depended on the capital employed and the ability and honesty with which its affairs were managed, and, as far as the Canadian phosphate industry was concerned, any really good mine, fairly and honestly managed, and having a fair slice of luck, would always show profitable results to its shareholders. To manufacturers the most important point was to know what prices would rule next year. An old proverb said: "Never prophesy unless you know." He would not venture upon any rash prophesy, but he thought it was likely that high-grade rock would about maintain its price. The greater supplies from Florida would be counter-balanced by decreasing shipments of high-class phosphate from France.

Dr. Newton (Cannon and Newton) wished to refer to a point in connection with the analysis of pure apatite quoted by Mr. Hutchinson. He thought the figures given for calcium and fluoride, 7.70 per cent., were too high. Pure crystals of apatite contain a little over 93 per cent. of tribasic phosphate of lime, and a little over 4.25 per cent. of calcium and fluoride, the balance being made up of calcium oxide, a singular fact which was first discovered by Mr. Landsdell, of Messrs. Nesbitt, Landsdell, and Co., and afterwards independently carefully worked out by Dr. John Voelcker. Mr. Hutchinson may have been misled by some analysis in which the phosphate of lime was determined, and the calcium fluoride put in by difference.

Mr. H. H. B. D. Shepherd, referring to the question of analysis raised by Mr. Newton, remarked that the pure Canadian apatite crystal was formerly supposed to consist of three molecules of calcium phosphate to one of calcium fluoride, whilst pure Norwegian apatite was held to contain three molecules of calcium phosphate to one of calcium chloride. Subsequent investigations, however, showed that in both descriptions of the mineral calcium chloride and fluoride were found together, and might in fact, be considered to some extent to be interchangeable, though the fluoride preponderated in the Canadian variety and the chloride in the Norwegian, and in all cases the proportion was as three of phosphate to one of fluoride and chloride. Dr. J. A. Voelcker had, however, recently shown that this formula required still further modification, inasmuch as there is present an excess of lime over and above that required by the acids, the chlorine and the fluorine present. The percentages of calcium phosphate and fluoride quoted by Dr. Hutchinson as the composition of apatite in a perfectly pure form were

clearly not intended to represent the actual analysis of any particular shipment, but the theoretical composition of the pure mineral calculated upon the basis of three molecules of calcium phosphate to one of calcium fluoride.

Mr. B. E. R. Newlands (Newlands Brothers) had used Canadian phosphates a great many years ago in the manufacture of superphosphate, and had then considerable trouble in getting the acid to decompose the phosphate. This was owing to the fact that the phosphate was not sufficiently finely ground. Improvements since made in grinding machinery had apparently removed all difficulties connected with the solubility of these phosphates.

Mr. Crowder confirmed the statement of the preceding speaker, and said no difficulty now existed in dissolving Canadian phosphate. The chief difficulty was in getting it into condition when dissolved. The stuff was very apt to become greasy, and would remain in that state a considerable length of time. By using strong acid, however, they could get fairly dry material. It was in bad condition when it first came out of the den, but after a time the condition improved. He might point out the difference between apatite and ordinary phosphate. Ordinary phosphates, such as Somme, Bull River, &c., were sedimentary deposits; that is, they resembled mud in regularity of deposition and distribution. Apatite, on the other hand, resembled various mineral ores, such as copper, &c.; it was found in veins and "pockets," and was most uncertain. A deposit of sedimentary phosphate was, more or less, calculable as to quantity, but a vein of phosphate was quite incalculable. The search for apatite would always be subject to the same uncertainty as the search for minerals that are found in veins, and is quite different from sedimentary deposits. The structure of apatite differs from phosphates, formed by sedimentary deposition, inasmuch as it is crystalline, having distinct lines of cleavage, whereas the sedimentary deposits are generally some kind of hardened mud, without lines of cleavage, and which is tough in grinding (for example, Bull River phosphate). The consequence is that when submitted to blows or pressure, it breaks up with greater facility than Bull River in the milling operations. Comparing apatite with Bull River, we can grind one ton of apatite against only 15 cwt. of Bull River per hour.

Mr. G. M. Bauer having been asked by the chairman to give his experience of Norwegian and Spanish phosphate, said that the mining in Norway seemed to be very similar in character to that in Canada. The Norwegian mines also produce apatite of a crystalline nature, and also rock. The only mine in Norway able to produce largely was the "Bamble," which he believed had worked in the past sometimes at a profit, and sometimes at a loss, but was now yielding good profits. The present outturn amounted to about 6,000 to 8,000 tons of high-class phosphate, analysing 82 to 90 per cent. tribasic phosphate, nearly the whole of which was shipped to Germany, where it commanded extraordinarily high prices. In addition to the high grade phosphate, they obtained about 5,000 tons about 65 per cent to 70 per cent., which contained only about 3 per cent. iron and alumina, and was workable. Besides that they obtained another quality 55 per cent. to 60 per cent. Considering that a very good gross profit was realized on the high-class phosphate, it looked for the present like a very remunerative enterprise, but the former outlay in deadwork machinery and on means of transport to place of shipment, if not amortized, must of necessity sensibly influence net profits. With regard to Spanish Estremadura phosphate his experience had been of a doubtful character. The average analysis of these phosphates was about 50 to 60 per cent. He had heard of cargoes testing 80 per cent., but the quantity of such high-grade material in Spain was extremely limited. When the very low prices of Charleston prevailed, viz., about 7d., the mines with which he had been connected had been obliged to stop mining, and they were not working at the present moment. He believed that in Estremadura there were deposits of high-class phosphate which it might pay to work if there was a surety of a large quantity, but so far the quantity had failed. There were two distinct qualities in Estremadura, one in which nearly all the impurities consisted in carbonate of lime, and the other in which silica formed the chief impurity. The phosphate was generally very free from iron and alumina, and very workable, and would doubtless be used freely provided it could be obtained in sufficient quantities, and this depends on prices remunerative to raisers. All shipments were made from Lisbon, and during some years were very considerable, and exceeded 50,000 p.a. There are phosphates in Spain which have been put on the market as Spanish phosphates, but should not be confounded with Estremadura, inasmuch as they contain a rather large percentage of iron and alumina, which, as already stated, is not the case with Estremadura. These inferior deposits are in the south, and shipments are made at Seville, and are likewise not worked at present.

The Chairman said that as manufacturers they were ready to receive any quantity of high-class phosphate from Canada. They could grind it, and, as they had heard, there was no difficulty in making it into super-

phosphate, and he was quite sure the chemists were prepared to analyse it. One thing to which, as manufacturers, they objected was the 1-1-5d. rise per unit in price. Another thing was the uncertainty as to time of delivery of Canadian phosphates. It was generally sold for shipment during the shipping season which extended from about May to November. He thought that in all contracts the time of shipment should be more closely defined. Another point was that if 80 per cent. was sold, 80 per cent. should be delivered, not 78 or 79 per cent.

Mr. Hutchinson briefly replied. With regard to the quantity of Canadian phosphate which will be raised this year, his estimate of which was queried by Mr. Moore, he had derived his figures from shipping agents in Montreal, who were more likely to be right than the mining captains, who are usually of a sanguine temperament. As to the analysis of pure phosphate, he took his figures from a work on phosphates by George Jones, F.C.S., and gathered from Mr. Shepherd's remarks that the analysis was theoretically correct.

Mr. Anderson moved and Mr. Pickford seconded a vote of thanks to Mr. Hutchinson, which was carried with acclamation, and the proceedings then terminated.

MacArthur-Forrest Process of Gold Extraction.

(Mr. J. S. MacArthur in the *Journal of the Society of Chemical Industry*.)

The author describes briefly a number of the different mechanical and chemical processes hitherto in use, by which the metal has been separated from the ore. After experimenting on ores from all parts of the world, the inventors adopted the following process, which may be stated in the author's words:—"The ore is ground to about the fineness of sand. If, instead of ore, we are working tailings from the amalgamation process, these are generally not re-ground, but treated as delivered. The finely-divided material is mixed with a solution of cyanide, say cyanide of potassium, containing on an average 0.4 per cent. of cyanogen as the cyanide of potassium or other alkali or alkaline earth. The ore and solution are stirred together for six hours, more or less; and when the gold is known to be dissolved, the pulp is discharged into an ordinary filtering tank, where the filtration may, if necessary, be assisted by suction, and where the ore is washed by water or by the waste cyanide solution from a previous operation. The ore, after treatment with cyanide solution, is unchanged to the eye, as almost nothing but the imperceptible proportion of gold present has been removed. The gold now being in solution, the next object is to get it precipitated, and here we encounter a serious difficulty. Gold and cyanogen have such a strong mutual affinity that it is difficult to get any substance that will separate them. The gold cannot be precipitated by any ordinary method, such as the use of ferrous sulphate or oxalic acid; even sulphuretted hydrogen and sulphide of sodium will not precipitate gold from its cyanide solution, though they precipitate silver. We had noticed, however, by experiment, that zinc precipitated gold very feebly, and tried this in the same way that copper is precipitated from its ordinary solutions by scrap iron, but scrap zinc had no effect; then granulated zinc was tried, with a most imperfect and disappointing result; then heating in presence of scrap and granulated zinc, but this had only the effect of forming urea, and assisting the precipitation very little indeed. Further, we tried zinc dust, but still there was no success. Finally we prepared some zinc in a form like saw-dust, porous, and with a large surface of bright metal. On allowing the cyanide of gold solution to trickle through a mass of the zinc we found that it trickled out gold free, and, better still, we found that the action became more vigorous and pronounced after a portion of the gold had been precipitated on it, doubtless as gold and zinc formed together a more powerful electro-chemical precipitant than zinc by itself. An arrangement of a porous mass of zinc like a sponge formed a chemical filter, which at once precipitated and collected the precious metal; indeed, so like an ordinary water purifying device was this zinc filter that many non-technical visitors formed and held tenaciously to the idea that the gold was in suspension in the cyanide solution, and the zinc was used merely because of its durability. Improvements in detail were made in the direction of increasing the surface, and decreasing the weight of the zinc, till now we have it in threads, 1 lb. of which occupies about two gallons measure. The zinc in this form is possessed of enormous chemical activity of which the strongest and most direct evidence is the fact that it burns in the air like thin shavings of wood. When the gold has been deposited, it is necessary to separate it from the excess of zinc present. The filiform structure of the zinc, and the exceedingly fine powder, as which the gold is deposited, render this an easy matter. The filiform mass of zinc, with gold powder adhering, is vigorously shaken in water, and the gold falls off, and the fibrous particles of the zinc may be collected in a sieve. The gold settles easily, is collected, and fused directly into bullion."

MINING NOTES.

Nova Scotia.

The Local Legislature are preparing a representative exhibit of the minerals of the Province for the Jamaica Exhibition.

The Canadian Smelting and Refining Company is the name of a new concern seeking incorporation. Capital \$100,000. Head office: Yarmouth, N. S.

Another new company, the "Canadian Smelting and Refining Company," is also seeking incorporation. Directors: E. K. Spinney, J. R. Wyman, E. F. Clements. Authorized capital, \$100,000. Head office, Yarmouth, N.S.

Application for incorporation under the Joint Stock Companies' Act has been made by the "North Star Mining Company." Capital \$40,000. The incorporators are: H. K. Fisher, Isaac's Harbor; R. Macdonald, W. G. Brookfield, W. H. Johnson, W. M. Cameron, all of Halifax; George Whitelake, Mason, N.H.; and G. W. W. Churchill, of Hantsport, N.S.

The coal miners of Nova Scotia are endeavouring to secure the eight-hour system. In accordance with resolutions passed at a meeting of the Grand Council, at Pictou, recently, it has been decided to apply at the next meeting of the Legislature of Nova Scotia for a law providing that eight hours per day be the fixed time of labor in all the coal mines of the Province. Another subject of discussion by the Grand Council was the "boys and education." The result of the discussion was the adoption of the following resolution: That the Legislature be asked to enact that, "No boy under the age of twelve years shall be permitted in or about a coal mine, and no boy of 12 years or over shall be permitted to go to work unless he be able to read, write and count as far as fractions." The passage and enforcement of such a law would do a great work for the sons of miners. Under its operation every father would be compelled, by self-interest, to send his sons to school.

Pictou County.

Mr. T. Turnbull and others are opening up the old Haliburton mine, near the Vale Colliery.

Messrs. John Muir & Sons have fully recovered from the effects of their recent fire, and are raising coal again at East River.

The Foord pit is slowly being repaired and opened up. Preparations are being made to erect coke ovens here, the coal from the pit having a very high reputation for coking purposes.

The drift from the Douglas Slope to the Cage-Pit Seam is almost completed, and we may expect to see coal coming from this seam by the Douglas Slope early in the new year.

At the Drummond Colliery the foundations are being put in place for a new and powerful winding engine on surface, which will enable them to raise all their coal to bank in one lift instead of two as at present.

The New Glasgow Coal, Iron and Railway Company has purchased a site at the Forks of the East River, for its blast furnace.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. FULLER & CO'S
41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, NS.

Cumberland County.

The shipment of coal from the pits of the Cumberland Railway and Coal Company aggregated fully 50,000 tons, while the gross output, including quantity used for colliery consumption, will carry the amount to at least 54,300 tons. It is noteworthy that whereas the number of men employed in 1887 to get about 43,000 tons was over 1,500, there are only about 1,200 men and boys employed at present, so that this increased output means considerably more to each person employed than formerly. Springhill is recovering rapidly from its late troubles.

Long-wall working was commenced at the Joggins colliery six or seven weeks ago, and it is apparent to all concerned that the system might have been introduced with benefit long ago. The output from the mine has largely increased and the quality of the coal has improved. A number of improvements and repairs are being made to workings here.

Waverly District.

The Windsor Junction Mine, operated by "The Nova Scotia Syndicate, Limited," has just put in a new twenty horse-power engine and boiler. Mr. G. Macduff, the manager, states that it is the intention of the syndicate to sink the shaft when the new plant has been located to a depth of from 400 to 500 feet, and test the ground by cross-cuts and drifts. Little else than development work will be done this winter.

The Lake View Company cleaned up for the first time on the 31st October. No weights of the material crushed were kept, but the Superintendent, A. A. Hayward, estimates 1,000 tons passed through the mill. The resulting gold bar weighed only 97¾ ounces, or an average per ton of about \$1.90. Considerable vibration is observed in the mill when running, and is due to the design of the structure, which is modelled after a mill built in Maine during the silver excitement there some years ago. Whether the vibration is sufficient to cause any material injury is a matter for time to tell. The structure is said to be the finest mill ever built in Nova Scotia, and to have cost over \$16,000.

Cape Breton.

The Bras D'or Marble Company is making a large outlay on channelling and other quarry machinery. It expects to begin shipping marble in the spring. Its lime works have been enlarged during the past season, but have not been able to meet the demand.

Assays of average ore samples from late developments at the Coxheath Copper mines show the following results: Sample from 250 feet level of vein B, on hanging wall side, copper 12 per cent., gold 0.21 ounces per ton, silver 2.75 ounces per ton. Sample from middle of vein B, copper 6.4 per cent., gold 0.10 ounce per ton, silver 1 ounce per ton. Sample from foot wall, vein B, copper 14 per cent., gold 0.23 ounces per ton, silver 2.5 ounces per ton. Sample from bottom of shaft No. 3, new vein, copper 13 per cent., gold none, silver none. No. 3 shaft was only down 21 feet when sampled, and the precious metals are not looked for until further depth is attained.

Killag District.

Advices from this district are to the effect that the property of Mr. Stuart, et al, has been sold to an American syndicate; the price is not made public.

South Uniacke.

This district is very quiet. The Withrow property is not working to any extent, and no returns have been made from the Thompson property for some months.

Oldham District.

The mill of the Oldham Gold Company is building slowly; all the machinery is on the ground excepting the water-wheel, and the management do not set any date for completion. The old mill is still in commission and will be until the new one starts up.

The Standard Gold Company have their new hoisting engine at work and everything is in readiness for the Rand compressor, which is nearly a month overdue. The new pumping plant will be put in in December, and the management hope to have all the new machinery in operation January 1st, 1891.

Whiteburn District.

It is reported that the mine owned and operated by Evans & Parker has been closed down on account of ore being too low grade to pay.

The accounts of the "Graves" mine have been settled in full, and some work is now being done under the direction of Mr. Geo. J. Partington, formerly with the Oxford Co. at Lake Catcha.

Malaga District.

The mill of the Boston Gold Mining Co., Mr. Baldwin, superintendent, is rapidly being completed, and the stamps are expected to be dropping in December. The quartz upon this property is reported as richer than upon the other properties in the district, but as few mill tests have been made the statement may be premature.

The Parker-Douglass Co. have curtailed work and discharged twenty men; the mine has been working for over two years, but upon very low grade ores and the results have been discouraging.

Wine Harbor District.

The mill now building by Mr. McNaughton upon the Caledonia property is nearly ready to run. The "Middle Lode" property, leased from Mr. Harding and associates, by Mr. McNaughton, yielded 128 ounces last month from 300 cart loads, an average of over \$12 to the ton. As the belt worked exceeds eight feet in thickness the margin for profit is a large one.

Mr. Harding is now doing some development work upon the "Judge Henry" property at the eastern end of the district.

Quebec.

We hope in our next issue to be able to publish full returns of the exports of Canadian phosphates.

A special general meeting of the shareholders of the Templeton and Blanche River Phosphate Company has been called for Monday, 1st December.

The Phosphate Corporation, Limited, has commenced active work on the Stewart properties. We are indebted to Mr. J. Lanson Wills, manager of the company, for a very unique and handsome little photographic souvenir of the recent opening of the High Falls property. This tastefully designed little booklet contains the following views:—1. Group seated on debris of first blast; 2. Passenger boats on the Lievres; 3. Government works at the "Little Rapids;" 4-5. Long Rapids; 6. The High Falls.

The Montawa Gold Mine Company is the latest company seeking incorporation under the Companies Act of the Province. The authorised capital is \$24,000, divided into shares of a value of \$10 each. The first directors are: Ed. Guilbault, A. Magnan, A. Cabana, J. Rivard, J. H. Renaud, Hon. J. A. Ouimet, J. A. Renaud, J. H. Ostigny, all of whom, excepting the Hon. J. A. Ouimet, are of the town of Joliette. The chief place of business will be at Joliette.

Coke-Making in Australia.

At Fort Pirie, on Spencer's Gulf, South Australia, the manufacture of coke for smelting silver from the Barrier silver mines has become a well established and growing industry, and the quality of the product compares favorably with that of the English cokes heretofore used for the purpose. The town owes its advancement in manufactures to the completion of the narrow gauge railway recently built from it to Broken Hill, there being now in the town the smelting works of the British Broken Hill Company, the refining works of the Proprietary Company, and the coke works above referred to owned by the British and Australian, and the Westport companies.

The coal used in making coke at these works is all crushed by being passed through a Carr's disintegrator before being taken to the ovens. As the coal leaves the disintegrator it is carried by an ordinary conveyor belt to a series of elevated bins, having a capacity of some 230 tons; from these bins it is drawn through chutes into laries running along over the tops of the coke ovens. There are at present 42 ovens in operation, 30 by the British and Australian Coke Company, on the Intercolonial wharf, and 12 at Solomontown by the Westport Coke Company, the monthly output being between 300 and 400 tons, an amount too small to meet the present demand.

No attempt has yet been made to use any of the by-products. The ovens are not of uniform size, and have been built at different times. The original ovens were twice blown down and had to be rebuilt, while the latest additions erected under the management of Mr. F. J. Jones, are of greater size than those put up at the start. Ten of these ovens carry charges up to 10 tons, though the average charge is about 8 tons, the time occupied in burning being about 48 hours. The necessary iron work and bricks for 10 more of the same size are on the spot, but so far the work of construction has not been commenced. The remaining 20 ovens carry from 3 to 5 tons and take about three days to finish the process, the 12 ovens at Solomontown being of the same size. The coke

made at these works is admitted by practical men to be of a very superior character. The coal coming from New Zealand, contains about $\frac{3}{4}$ per cent. of dust, while the coke averages 2 to $2\frac{1}{2}$ per cent. of ash. This compares very favorably with the English cokes, that made in Newcastle averaging 4 per cent. of ash, some of the Lancashire 2.70 per cent. and the Welsh 3.26 per cent. while some of coke which is imported in the colony runs from 4 to 7 per cent. of ash.

Alloys of Nickel.

Hitherto in the manufacture of the binary alloys of nickel and iron, known as ferro-nickel and steel-nickel, either metallic or pure nickel, or the crude nickel or nickel mattes, derived from the smelting of oxidized nickel ores carried on only up to the point where the elimination of the iron would begin, are employed. The first of these is, however, expensive, and, on the other hand, crude nickel contains a considerable amount of foreign matter, which is not desirable.

An invention by H. Marbeau, of Paris, consists in the manufacture and employment for the production of ferro-nickel or steel-nickel of a carburetted alloy containing nickel, iron and manganese obtained by the reduction of oxidized nickel ores with iron ores and manganese ores, preferably in a blast furnace. This alloy, which might be called nickelo-spiegel, is cheaper than pure nickel, and is purer than crude nickel. The proportion of the three ores will vary according to the percentage of the three metals required in the carburetted alloy. The following may be given as an example: Nickel ores (10 per cent. nickel), two tons; iron ores (50 per cent. iron), 12 cwt.; manganese iron ores (10 per cent. manganese and 40 per cent. iron), one ton. In the employment of this nickelo-spiegel for the production of ferro-nickel or steel-nickel the nickelo-spiegel can be treated in a converter so as to obtain steel-nickel or ferro-nickel containing the required percentage of nickel. The presence of the excess of manganese in the nickelo-spiegel permits of obtaining the heat necessary for the good working of the operation in the absence of silicium.

Apatite in Sweden.—The apatite discoveries in Northern Sweden, especially in the Gellivara district, continue to attract much attention, and have of late been examined and reported upon by a special committee. The members of this committee have now completed their report, but do not agree on all points. One of the experts holds that the apatite is in general so closely combined with magnetic iron ore, that it will be necessary to grind the ore, and separate the iron magnetically, but it is a question whether crushed iron ore is fit for the production of pig iron, at least so far as large and high blast furnaces are concerned. The largest deposits of iron ore and apatite contain from a few per cent. up to 10 or 11 per cent. of the latter; there is, however, also an ore in considerable abundance which contains 19 per cent. of apatite, and, finally, one which contains as much as 60 per cent. of apatite, but as to the extent of which no definite information has as yet been obtained. Another member of the committee is of opinion that the apatite itself is sufficient to make the breaking and further handling remunerative. The residue can, however, be subjected to further treatment, either a further crushing and separation, or smelting down with lime or quartz for the purpose of obtaining Thomas slag and phosphoric iron for the basic Martin process. The question of the apatite and other resources of Northern Sweden will, however, not be allowed to drop, and a large party of Swedish M. E.'s have lately visited these districts to examine matters for themselves.—*Engineering*.

Brickmaking in Bagdad.—The British Consul General at Bagdad, in his latest report, states that there are about twenty-five large and small kilns at work at Bagdad in the hands chiefly of Jews and Christians, but the turnout is far behind the demand. The kilns are dotted over the desert outside the city. The usual prices of bricks at the kiln side are £1 16s. per 1,000 of 12 in. square, and 18s. per 1,000 of 7 in. square. The bricks are carried from the kiln on small donkeys, each taking not more than ten large or twenty-five small bricks. In the course of transit they get much broken, as the best, though good to look at, and of a chrome yellow color, are very brittle. Another great promoter of the demand for bricks is the absorption of water every winter, bricks suffering equally with the mortar in which they are laid, owing to their porousness. Thus, there is hardly a house, or wall, or brick pathway in Bagdad which does not constantly call for patching or rebuilding with new bricks. The old city walls, thrown down about 1870 by Midhat Pasha when Governor-General, remain still, in spite of years of burrowing and abstraction, a mine of broken bricks. Under a late regime it was said that the right of taking these away and selling them was conferred as a substitute for pay on the soldiery; but at present all classes seem to help themselves to them. These remarks serve to show what a good opening there is in Bagdad for brickmaking after some simple but scientific method.

Annotated List of Canadian Minerals.*

G. C. Hoffman, F. Inst. Chem., etc.

Continued from page 145.

63. CERUSSITE—Has hitherto been met with only in small earthy masses and incrustations, associated with the galenite of certain localities in British Columbia.

64. CHABAZITE—Is found in large and very perfect crystals at Swan Creek (Cumberland Co.), Mink Cove and Sandy Cove, Digby Neck, and Williams' Brook (Digby Co.), and Pinnacle Island (Colchester Co.), in the Province of Nova Scotia. See also note to "Acadialite."

65. CHALCEDONY—Is found in many parts of the trap district of Nova Scotia, where, according to Dr. How, an almost unique blue chalcedony is found on the coast between Capes Split and Blomidon (King's Co.), and a very fine milk-white chalcedony near Trout Cove, Digby Neck (Digby Co.). It occurs of an olive green colour, in small veins, on Belanger's Island, lying off the entrance to Richmond Gulf, eastern coast of Hudson Bay; in thin bands or veins, with Jasper, on the River Ouelle (Kamouraska Co.), in the Province of Quebec. In veins in the amygdaloidal traps of Lake Superior, Province of Ontario, and elsewhere in Canada.

66. CHALCOCITE—Is found, most frequently in association with chalcopryite, or chalcopryite and bornite, in the townships of Leeds and Halifax (Megantic Co.), Brome, Sutton, (Brome Co.), Shefford, Stukeley (Shefford Co.), Melbourne, Cleveland, Brompton (Richmond Co.), Acton (Bagot Co.), and Tingwick (Arthabaska Co.), in the Province of Quebec—at the Canada West mines on Lake Huron, and Prince's location, Lake Superior, in the Province of Ontario.

67. CHALCOPYRITE—Is widely distributed throughout many of the Eastern Townships of the Province of Quebec. In some of them it is occasionally met with unaccompanied by other ores of copper, but it is more frequently associated with chalcocite or bornite, or both. The more important localities lie in the townships of Bolton, Brome, Sutton (Brome Co.), Leeds, Halifax (Megantic Co.), Stukeley (Shefford Co.), Ascot (Sherbrooke Co.), Acton (Bagot Co.), Cleveland, Melbourne (Richmond Co.), Chester (Arthabaska Co.), and Ham Wolfe Co. Other noteworthy localities are—the township of McKim, and adjoining townships, in the District of Nipissing; the West Canada mines, Lake Huron, and Point-aux-Mines and other places on Lake Superior, in the Province of Ontario.

CHIASTOLITE—Occurs in a fine grained micaceous schist at Moore's Mills, Charlotte County, Province of New Brunswick; and in the somewhat micaceous argillites on Lake St. Francis in Beauce County, Province of Quebec.

CHLORITE (PENNINITE)—Occurs, most frequently, in admixture with other minerals, forming beds of chloritic slates as in Bolton (Brome Co.), Shefford (Shefford Co.), Ascot (Sherbrooke Co.), Cleveland and Melbourne (Richmond Co.), and other Eastern Townships of the Province of Quebec. In some of these townships, however, as for instance those of Potton and Bolton (Brome Co.), and Broughton (Beauce Co.), beds of pure compact chlorite are met with, and occasionally, as in Cleveland (Richmond Co.), the chloritic slates are traversed by thin well defined veins, which are filled with pure scaly chlorite. Anal., T. S. Hunt, Geol. Can., 1863, p. 607.

70. CHLORITOID—Is of common occurrence in the micaceous schists of the Eastern Townships, in which it is disseminated in small grains and crystalline plates, or small lamellar and spherical masses. It is thus found in the townships of Leeds (Megantic Co.), Brome and Sutton (Brome Co.), in the Province of Quebec. Anal., T. S. Hunt, Geol., Can., 1863, p. 498.

71. CHONDRODITE—Is often met with in the crystalline limestones of the Laurentian series. It is found, in grains, in the limestones of St. Jérôme (Terrebonne Co.); in a magnesian limestone in Aldfield (Pontiac Co.), Province of Quebec—and, with small scales of graphite, in a white crystalline limestone near Newborough in North Crosby, also in South Crosby (Leeds Co.), in the Province of Ontario, and elsewhere in these provinces.

72. CHROMIFEROUS GARNET—A very beautiful emerald-green chromiferous garnet occurs, in granular masses and minute crystals, thickly disseminated through a vein of white cleavable calcite, on the east side of Brompton Lake, in the township of Orford (Sherbrooke Co.), and a very similar garnet is found, associated with apatite, pyroxene, calcite, orthoclase, tourmaline and idocrase, in the township of Wakefield (Ottawa Co.), Province of Quebec. Analyses, T. S. Hunt, Geol., Can., 1863, p. 497; B. J. Harrington, Can., Nat., 2 ser., vol. ix, p. 305, 1881.

73. CHROMITE—Is found in pockets, scattered through serpentine, at Mount Albert, Shickshock Range (Gaspé Co.), and in considerable quantity, in connection with serpentine and other magnesian rocks of the Quebec group in the townships of Bolton (Brome Co.), Ham and Wolfstown (Wolfe Co.), and Leeds (Megantic Co.),

in the province of Quebec. Analyses, T. S. Hunt, Geol. Can. 1863, p. 504.

74. CHRYSOCOLLA—Is found sparingly amongst some of the copper ores of Lake Superior, province of Ontario.

75. CHRYSOLITE—Occurs in the form of grains, and occasionally as ill-defined crystals, in a dark grey dolerite, near South Lake (Antigonish Co.), province of Nova Scotia. In well defined green crystals, and olive or amber colored imperfect crystals, and small honey-yellow grains, in the eruptive rocks of Rougemont (Rouville Co.), Montarville (Chambly Co.) and Montreal (Hoche-la Co.); in red angular masses in a dyke at St. Anne's (Jacques Cartier Co.), and of a pale yellowish to greyish-green color, forming rock masses at Mount Albert, Shickshock Range (Gaspé Co.), in the province of Quebec. Olivine has also been detected in several of the eruptive rocks of British Columbia. Analyses, T. S. Hunt, Geol. Can., 1863, p. 464; B. J. Harrington, Rep. Geol. Can. 1877-78, p. 39 G.

76. CHRYSOTILE—Often constitutes seams, sometimes nearly seven inches thick, in the serpentine of the Eastern Townships of the province of Quebec: the more important localities comprising—the townships of Thetford and Coleraine (Megantic Co.), Shipton and Melbourne (Richmond Co.), Ham (Wolfe Co.), Broughton (Beauce Co.), and Bolton in Brome county. Analyses, E. G. Smith, Am. Journ. Sci., 3 ser., vol. xxix, p. 32, 1885.

77. CINNABAR—Occurs, *in situ*, sparsely disseminated through a fine crystalline granular limestone, at the Ebenezer mine, Hector (Kicking Horse) Pass, Rocky Mountains, British Columbia.

78. CLAY IRONSTONE—Is found everywhere in the Coal Measures of Pictou county, Nova Scotia, in irregular beds from five to forty inches thick. Occurs in layers and nodules, in connection with a small seam of coal at Gaspé, province of Quebec. Is widely distributed in the North-west Territory, in some localities in considerable abundance, in the form of nodules and nodular sheets. Analyses, G. C. Hoffmann, Rep. Geol. Can., 1880-82, p. 8—12 H.

79. COCCOLITE—A greenish-grey granular pyroxene or coccilite, occurs in the township of Portland, and the same mineral, of a pale green color, is met with in adjoining township of Buckingham (Ottawa Co.), province of Quebec.

80. COOKEITE—A micaceous mineral having all the blow-pipe characters of, and which may prove to be identical with, Cookeite was found sparsely disseminated through a specimen of galenite from Otter Tail Creek, province of British Columbia. Annual Rep. Geol. Can., vol. 2, p. 10 T., 1886 (where, however, the locality is erroneously given—read as above).

81. COPPER—NATIVE.—Is found, in the form of grains and irregular shaped masses, occasionally several pounds in weight, in veins and fissures traversing the trap at Cape d'Or and Spencer's Island (Cumberland Co.), Five Islands (Colchester Co.), Margaretville (Annapolis Co.), Briar Island (Digby Co.), and many other places in this section of Nova Scotia. More abundantly, however, in the province of Ontario, occurring in fine particles, filaments, grains or masses, the latter sometimes more than one hundred pounds in weight, in amygdaloidal traps and greenstones, in veins and fissures traversing these, and in sandstones associated with the same, in many localities on the north and east shore of Lake Superior, some of the more important of which are—Battle Island, the Islands of St. Ignace and Michipicoten, also at Mamainse and Cape Gargantua.

82. CORACITE—Is said to form a vein about two inches in width, at the junction of the trap and syenite, at Mamainse, east side of Lake Superior, province of Ontario.

83. CORUNDUM—Has been found in small light blue crystals imbedded in crystalline Laurentian limestone, also in rose-red to sapphire-blue grains, disseminated through a rock made up of felspar, quartz, calcite, mica and sphene, in the township of Burgess (Lanark Co.), province of Ontario.

84. COVELLITE—Occurs in nodular form, with nodules of more or less altered chalcocite, at New Annan (Colchester Co.), province of Nova Scotia. Analyses, H. Louis, Trans. N. S. Inst., vol. iv., p. 427, 1878.

85. CRYPTOMORPHITE—Is found, in conjunction with ulexite, Howlite, mirabilite, halite, Arragonite, calcite and selenite, in gypsum depo its at the Clifton quarry, Windsor (Hants Co.), province of Nova Scotia. Anal., H. How, Am. Journ. Sci., 2 ser., vol. xxxii, p. 9, 1861.

86. CUPRITE—Has been found, in association with a little native copper and blue and green carbonate, in quartz, at Spencer's Island (Cumberland Co.),—the collector, Mr. C. W. Willmott, informing me that it occurs, *in situ*, at Bennet's Brook, one mile east of Horse-shoe Cove, and at intermediate points between that and Cape d'Or, one mile west of Horse-shoe Cove (Cumberland Co.), Nova Scotia. Also occurs, but in small quantity only, in some of the copper deposits of the Eastern Townships of the province of Quebec, as at Acton (Bagot Co.), where it has been observed in the form of cinnabar-red stains upon blackish shales.

87. CYANITE—Occurs in the form of radiated colum-

nar aggregates of a pure blue, light bluish-grey and greenish-grey color, imbedded in a granular quartz, on the North Thompson River, British Columbia. Anal., G. C. Hoffmann, Rep. Geol. Can., 1878-79, p. 1 H.

88. **DAWSONITE**—Occurs in the joints of a white felspathic dyke, cutting the Trenton limestone, near the western end of McGill College, Montreal (Hochelaga Co.), province of Quebec. Anal., B. J. Harrington, Can. Nat., 2nd ser., vol. vii, p. 305, 1875; see also vol. x, p. 84, 1883.

89. **DIALLAG (HYDROUS)**—Small masses of a pearly, translucent, celadine-green diallag, occur in a rock in the township of Orford (Sherbrooke Co.), and a coarsely cleavable, bronze-colored variety of diallag, forming a rock, is met with in the township of Ham (Wolfe Co.), province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 469.

90. **DIOPSIDE**—See note to "Malacolite."

91. **DOG-TOOTH-SPAR**—Large scalenohedrons of calcite have been found at the Bruce and Wellington mines on Lake Huron, also at the Silver Islet and Duncan (formerly Shuniah) mines (at the last named, Professor Chapman observed, in a *vug*, a bunch of crystals many of which measured upwards of eighteen inches in length), Thunder Bay, Lake Superior, province of Ontario. Good specimens of dog-tooth-spar are also found at Tenny Cape (Hants Co.), Black Rock (King's Co.), Partridge Island and Two Islands (Cumberland Co.), etc., in the province of Nova Scotia.

92. **DOLOMITE**—In the form of rock-masses, is of very common occurrence in Canada. Besides forming great beds among the Laurentian limestones, dolomites make up the chief part of the so-called Calciferous formation, and are developed on a great scale in its geological equivalent, the Quebec group. The so-called limestones of the whole of the Middle and Upper Silurian series in Ontario are, with few exceptions, dolomites, including the Clinton, Niagara, Guelph, and Onondaga formations. See also note to "Pearl-spar."

93. **DOMEYKITE**—Has been found, in admixture with niccolite, in a vein cutting a bed of amygdaloid on Michipicoten Island, Lake Superior, province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 506.

94. **ELAEOLITE**—Is mentioned, by Dr. Hunt, as occurring in orange-red grains, with black hornblende, in a white felspathic rock, which is found in boulders on Pic Island in Lake Superior, province of Ontario.

95. **EPIIDOTE**—Characterizes large portions of the metamorphic rocks of the province of Quebec, in many parts of which occur beds which are entirely made up of quartz and epidote; sometimes in distinct grains, at other times forming a homogeneous, generally pale green, very tough and sonorous rock. Characteristic specimens of this rock are met with in the township of Melbourne (Richmond Co.), but beds of the same occur in numerous localities in this section of the province. This mineral has been met with in the crystalline form, in a concretionary epidotic rock, at St. Joseph (Beauce Co.), province of Quebec; also in some of the amygdaloidal traps and greenstones of Lake Superior as— at Mamainse, where crystals of the same are found implanted upon mesolite—in the province of Ontario.

96. **EPISTILBITE**—Is found with stilbite on ledges of trap at Margareville, about seven miles east of Port George, Annapolis county, province of Nova Scotia. Analyses, H. How, Am. Journ. Sci., 2 ser., vol. xxvi, p. 33, 1858.

97. **EPSOMITE**—Occurs at the Clifton gypsum quarry, Windsor, Hants county, province of Nova Scotia. As an efflorescence on the black shales of Utica formation near Montreal (Hochelaga Co.), and upon the black shales of Quebec (Quebec Co.), province of Quebec. As an efflorescence on a serpentine rock near the iron-ore bed of Crow Lake in Marmora (Hastings Co.), and as a crystalline incrustation upon sheltered surfaces of the dolomites at various points along their outcrop from Niagara Falls to Lake Huron, and near Niagara is said to be found, with gypsum, in geodes in the rock—province of Ontario. Also occurs, in association with mirabilite, as an incrustation upon the cliffs of shale at Fort St. John, Pease River, British Columbia. Anal., G. C. Hoffmann, Rep. Geol. Can., 1875-76, p. 421.

98. **ERYTHRITE**—Is found as a rose-red incrustation on calcareous spar, at Prince's mine on Lake Superior, province of Ontario.

99. **ESSONITE**—Occurs, in small crystals with crystals of idocrase, pyroxene and zircon, in calcite at Grenville (Argenteuil Co.), and both massive and crystallized, in the townships of Portland and Wakefield (Ottawa Co.), in the province of Quebec.

100. **FAHLUNITE**—Is mentioned, by Prof. How, as occurring in granite on the road between Windsor and Chester, Hants county, province of Nova Scotia.

101. **FASSAITE**—A black, occasionally blackish-green, pyroxene from the township of Templeton (Ottawa Co.), province of Quebec, would seem, from its chemical composition and other characters, to be referable to this variety. Anal., B. J. Harrington, Rep. Geol. Can., 1877-78, p. 17 G.

102. **FLUORITE**—Occurs, in green octahedral crystals,

with barite, lining fissures in porphyry on an island three miles east of Gravelly Point; in green cubes, associated with quartz and calcite, at Prince's mine; of a purple color, filling veins in syenite, on the main land opposite Pic Island, and also, with calcite, in amygdaloid three miles east of Cape Gargantua; in cubes two or more inches in diameter, associated with large crystals of amethyst, in *vugs* in the large irregular veins in the syenite at the mouth of McKenzie's River, Thunder Bay; in veins near Black Bay and Terrace Bay; on Flour Island in Neepigon Bay, and elsewhere on Lake Superior, province of Ontario.

103. **FREIBERGITE**—An argentiferous tetrahedrite, associated with some galenite and sphalerite, in a gangue of quartz, is found at Cherry Creek, thirty-three miles east of the head of Okanagan Lake, province of British Columbia.

104. **GALENITE**—Is very widely distributed throughout Canada: both in interstratified masses, veins, and small crystalline aggregations, etc., scattered through rocks of various kinds. Some of the most noteworthy localities of its occurrence are situated—in the counties of Carleton, Lanark, Leeds, Frontenac, Hastings, and, Peterborough, and on the north shore of Lake Superior, as at Prince's Mine, Thunder Cape, and Point des Mines etc., in the province of Ontario. Extensive deposits of galenite exist in the Illecillewaet district,—at Mount Stephen (Tunnel Mountain), and at Hot Springs and Hendryx Camp's, Kootanie Lake, etc., in the province of British Columbia. Fine specimens consisting of more or less perfect octahedra, the axes of some of which were five centimetres in length, have been found, in *vugs*, at the Silver Islet mine Lake Superior.

105. **GARNET**—Is very frequently met with, and in nearly all parts of the Dominion. The following comprise some of the many localities of its occurrence. In the province of Quebec: small beds of granular red garnet occur at St. Jérôme (Terrehonne Co.), in Rawdon (Montcalm Co.), and at the north-east side of Bay St. Paul (Charlevoix Co.): white lime-alumina garnet, mixed with serpentine, is met with at Orford, (Sherbrooke Co.), and an apparently homogeneous rock composed in great part of a similar variety, occurs at St. Francis (Beauce Co.): red and yellowish-red varieties are met with in the townships of Chatham and Grenville (Argenteuil Co.); a rose-red iron-alumina garnet is found disseminated in small masses through gneiss on the Rouge River and vicinity in the township of Clyde, and dark red garnet in the townships of Villeneuve and Templeton, and large and handsome crystals of colorless, light brownish, pale olive-green, and brownish-yellow garnet in the township of Wakefield, Ottawa county. Magnificent crystals of red garnet occur, imbedded in micaceous schist, on the Skeena and Stickeen rivers, and a massive brownish-red manganian lime-iron garnet is found near Foster's Bar, Fraser River—in the province of British Columbia. Analyses, T. S. Hunt, Geol. Can., 1863, 496. See further under "Almandite," "Andradite," "Chromiferous garnet," "Essonite," "Grossularite," "Spessartite."

106. **GENTHITE**—A mineral apparently identical with Genthite has been met with in a vein on Michipicoten Island, Lake Superior, province of Ontario. Analyses, T. S. Hunt, Geol. Can., 1863, pp. 506, 507.

107. **GIESECKITE**—Dysyntribite occurs at Arisaig pier and Frenchman's Barn in Antigonish county, province of Nova Scotia.

108. **GLAUCONITE**—Occurs in a sandstone of the Lauzon formation, near Point Lévis (Levis Co.), and on the Island of Orleans, in the province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 487.

109. **GRENILITE**—Has been found at Cape Blomidon (King's Co.), and Two Islands and Five Islands (Colchester Co.), in the province of Nova Scotia. Analyses, A. A. Hayes, Am. Journ. Sci., vol. xxv., p. 78, 1834; O. C. Marsh, ib., 2 ser., vol. xlv, p. 362, 1867; A. B. Howe, ib., 3 ser., vol. xii, p. 270, 1876.

110. **GOLD**—The most important auriferous regions of Canada are situated in the provinces of British Columbia, Quebec, and Nova Scotia; the first on the Pacific coast, the last forming the extreme eastern portion of the Dominion. Gold is, however, also found in some of the rivers of the North-West Territory—in the Lake of the Woods and Lake Superior region, and in the district north of Lake Ontario, in the province of Ontario,—and is reported to have been found in a few localities in the province of New Brunswick. In British Columbia mining has been almost entirely confined to the placer deposits. In the vicinity of the Lake of the Woods, and of Lake Superior, gold occurs in veins associated with silver and other ores. In the counties of Madoc and Marmora (province of Ontario), in auriferous misspickel. In the province of Quebec the placer deposits of the Chaudière region and of the township of Ditton are the only ones in which much work has as yet been attempted. The gold of Nova Scotia is found in quartz, the alluvial gold so far discovered being quite inconsiderable in quantity.

111. **GOTHITE**—Is mentioned by Dr. Harrington, as occurring, in association with black oxide of manganese and calcite, in veins cutting the Lower Carboniferous

limestone at Black Rock, near the mouth of the Shubenacadie, province of Nova Scotia.

112. **GRAPHITE**—This mineral is met with in most of the stratified rocks of the Laurentian system; not only the limestones, but the gneiss, pyroxenite, quartzite and pyrrholite beds sometimes hold disseminated graphite. It is also met with in the iron ores of the series, as in the township of Hull (Ottawa Co.), in the province of Quebec. Apart from its being met with in a disseminated form, it occurs in beds or seams from a few inches to two or three feet in thickness. These are often interrupted giving rise to lenticular masses, which are sometimes nearly pure and at other times mingled with carbonate of lime, pyroxene, and other foreign minerals. The most important deposits are in the townships of Buckingham and Lochaber (Ottawa Co.), and Grenville (Argenteuil Co.), province of Quebec; but it is also found in the townships of Burgess (Lanark Co.), Loughborough and Bedford (Frontenac Co.), province of Ontario, and, in small quantity, in other localities in these provinces. It is also met with, in a disseminated form, at French Vale and Glendale, in the province of Nova Scotia; in the vicinity of St. John, province of New Brunswick; and at Alkow Harbor, Dean's Canal, in the province of British Columbia. Localities and general mode of occurrence, T. S. Hunt, Geol. Can., 1863, pp. 529, 793, and Rep. Geol. Can., 1863-66, pp. 218-223. Analyses, etc., of Canadian Graphite, G. C. Hoffmann, Rep. Geol. Can., 1876-77, pp. 489-510: analyses of disseminated graphite from Nova Scotia and New Brunswick, G. C. Hoffmann, Rep. Geol. Can., 1878-79, p. 2; ib., 1879-80, p. 1 H.

113. **GROSSULARITE**—Handsome specimens of a white lime-alumina garnet are found in the township of Wakefield (Ottawa Co.), province of Quebec (G. F. Kunz, Analyses, C. Bullman, Am. Journ. Sci., 3 ser., vol. xxvii, p. 306, 1884). The white lime-alumina garnet from Orford (Sherbrooke Co., P. Que.), referred to under "Garnet," is also referable to this variety.

114. **GYPSEUM**—Occurs in connection with the Lower Carboniferous limestones in enormous deposits in the province of Nova Scotia. It is largely quarried at Windsor, Newport, Walton, Wentworth, Shubenacadie, and a number of other places. It is a very abundant mineral in the province of New Brunswick, the deposits being both numerous and extensive. They occur in all parts of the Lower Carboniferous district, in King's, Albert, Westmorland, and Victoria counties. Rock masses of granular and compact gypsum, more or less mixed with dolomite, characterise the Onondaga formation of western Ontario. They occur largely in the valley of the Grand River, more especially in the townships of Dumfries, Brantford, Oneida, Seneca, and Cayuga, etc.—It is also met with in the province of Manitoba. See also notes to "Alabaster," "Selenite."

115. **GYROLITE**—Is found on apophyllite in trap, about twenty-five miles south-west of Cape Blomidon, between Margareville and Port George, Annapolis county, province of Nova Scotia. Anal., H. How, Ed. N. Phil. Journ., new series, vol. xiv, p. 117, 1861.

116. **HALITE**—An important deposit of rock salt is known to exist along the eastern shore of Lake Huron, embracing the counties of Bruce, Huron and Lambton, in the province of Ontario. It was first met with at Goderich, in 1866, in a depth of 964 feet; in the year following at Clinton, at a depth of 1,180 feet, and in the succeeding year at Kincardine, at a depth of about 900 feet; subsequently at Seaforth at 1,035 feet, and again at Kingstone's Mills in Warwick, at 1,200 feet. A boring made in Goderich in 1876, and which was carried to a depth of 1,517 feet, has shown the existence of no less than six beds of rock salt, one of which is close upon 31 feet, and another very nearly 35 feet in thickness. For geological details, records of borings, and analyses of brines and salt, see following reports by Dr. T. Sterry Hunt—"On Brine-Springs and Salt," Rep. Geol. Can., 1863-66, pp. 263-272. "On the Goderich Salt Region," ib., 1866-69, and pp. 211-242, and a second report on the Goderich salt region, ib., 1876-77, pp. 221-243.

117. **HALOTRICHITE**—Has been found in some heaps of shale and slack coal, at the Glace Bay coal mines, in Cape Breton county, province of Nova Scotia. Anal., E. Gilpin, Trans. N. S. Inst., vol. vi, p. 175, 1883-86.

118. **HELIOTROPE**—Reported by Prof. How, as having been found by Dr. Gesner in small nodules or fragments of rock on the beach of Chute's Cove (Annapolis Co.), has been found, *in situ*, by Mr. C. W. Willmot, at Two Islands (Cumberland Co.), province of Nova Scotia.

119. **HEMATITE**—Important deposits of red hematite are met with at several localities in Pictou and other counties in Nova Scotia. It occurs, in association with specular iron ore, among the Huronian strata of the Quaco hills, and more abundantly in those of West Beach and Black River, St. Johns county, province of New Brunswick. Forms an extensive bed in the township of McNab (Renfrew Co.), and is further found in the townships of Dalhousie and Beckwith (Lanark Co.), Palmerston (Frontenac Co.), Madoc (Hastings Co.), Leeds (Leeds Co.), etc.—at Gros Cap, north side of Michipicoten Harbor, and other localities in the Lakes Superior and Huron

region, province of Ontario. See also notes to "Micaeous iron ore," "Specular iron ore," "Martite," Mineral associations of hematite, B. J. Harrington, Rep. Geol. Can., 1873-74, pag. 212. Analyses, by various analysts, ib., pp. 223-226, and subsequent Reports.

120. **HEULANDITE**—Fine specimens of this mineral are met with at Isle Haute, Partridge Island, and Two Islands [Cumberland Co.], also at Black Rock, Hall's Harbor, Long Point, and Cape Blomidan [King's Co.], in the province of Nova Scotia.

121. **HORNBLende**—Black crystallized hornblende enters abundantly into the diorites of Yamaska Mountain (Yamaska Co.), and Mount Johnson (Iberville Co.), and occurs sparingly in the trachytes of Brome (Brome Co.), and Shefford (Shefford Co.) Mountains: beds of black hornblende, holding garnets are associated with the serpentines of Mount Albert in the Shickshock Mountains (Gaspé Co.), and black or greenish hornblende is very commonly disseminated through the felspathic rocks of the Laurentian series, giving rise to syenite and syenitic gneiss: also forming beds of hornblende rock, as at Lake St. John (Chicoutimi Co.), Province of Quebec. Black or dark green hornblende, in cleavable masses, is found associated with the magnetite of Bathurst and South Sherbrooke townships (Lanark Co.), Province of Ontario. Anal., B. J. Harrington, Rep. Geol. Can., 1873-74, p. 201.

122. **HORNSTONE OR CHERT**—Occurs, in veins traversing syenite in the township of Grenville (Argenteuil Co.), in the Province of Quebec; in great abundance, in nodular masses and thin layers, in the Corniferous formation, and occasionally, in a similar form, in the limestones of the Trenton and Niagara groups; also, in layers, in the lower beds of the silver-bearing rocks of Thunder Bay (the lower division of the upper copper-bearing rocks of Logan), Lake Superior, Province of Ontario.

123. **HOWLITE**—Occurs, in the form of nodules which are generally about the size of filberts or pigeon's eggs, and occasionally, but rarely, as much as two inches in diameter, imbedded in anhydrite and gypsum at Brockville, and in gypsum at Winkworth, Newport Station, Noel, etc., in Hants county, Province of Nova Scotia. Analyses, H. How, Phil. Mag., 4 ser., vol. xxxv., p. 32, 1868.

124. **HUMBOLDTINE**—Has been observed as a sulphur-yellow incrustation upon the black schists at Kettle Point in the township of Bosanquet, Lambton County, Province of Ontario.

125. **HURONITE**—The Huronite of Dr. Thompson—an impure or altered form of anorthite—is found, *in situ*, near Sudbury (District of Nipissing, Province of Ontario), where it occurs in rounded or somewhat angular masses, in a dark green dyke of diabase. Anal., B. J. Harrington, Trans. Roy. Soc. Can., vol. iv., sec. iii., p. 82, 1886.

126. **HYACINTH**—Cherry-red, transparent crystals of zircon, are mentioned by Dr. Hunt as occurring in the crystalline limestone of the township of Grenville, Argenteuil County, Province of Quebec.

127. **HYALITE**—Good specimens of this mineral were obtained by Mr. J. McEvoy from cavities in a dark grey foliated basalt occurring near Hih-hum Lake, South of Loon Lake, British Columbia.

128. **HYPERSTHENE**—Occurs, in broad lamellar masses, with andesite and ilmenite, constituting a rock, at Chateau Richer (Montmorency Co.), and in the parish of St. Urbain near Bay St. Paul, Charlevoix Co., in the Province of Quebec, also Paulit at Paul Island, Nain, coast of Labrador. Anal., T. S. Hunt, Geol. Can., 1863, p. 468.

129. **ICELAND-SPAR**—Fine cleavable and transparent masses of calcite occur at Harrison's location on St. Ignace Island, Lake Superior, and in the township of Galway (Peterborough Co.), Province of Ontario.

130. **ILMENITE**—Occurs in vast beds or masses in anorthosite rock in the parish of St. Urbain, at Bay St. Paul (Charlevoix Co.), and in a similar rock in Chateau Richer (Montmorency Co.), and in Rawdon (Montcalm Co.) Large deposits, associated with labradorite rocks, have also been observed near the mouth of Rapid River (Bay of Seven Islands), on the Saguenay River, on the shores of Lake Kenogami, and it has also been met with in several other localities in the Province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 501, and Rep. Geol. Can., 1866-69, p. 260.

131. **ILVAITE**—A substance which, from its composition and physical characters, was regarded as a variety of lievrite, was found in the form of a boulder, in the vicinity of Ottawa (formerly Bytown), Carleton County, Province of Ontario. Description and analysis, T. S. Hunt, Geol. Can., 1863, p. 465.

132. **INFUSORIAL EARTH**—Is found occupying the bottoms of lakes in several of the counties of the Maritime Provinces. The deposits are not unfrequently of considerable depth, and the earth remarkably pure. Some of the more important localities are—Fountain Lake, Amherst (Cumberland Co.), Folly Lake (Colchester Co.), and Merigonish (Pictou Co.), in the Province of Nova Scotia, and Fitzgerald Lake, about seven or eight miles from St. John (St. John Co.), Pollet

Lake, Mechanic Settlement, and Pleasant Lake, about six miles to the south-west (King's Co.), in the Province of New Brunswick. Anal., G. C. Hoffman, Rep. Geol. Can., 1878-79, p. 4 h.

133. **IRIDOSMINE**—Occurs, as first observed by Dr. T. S. Hunt, in the form of small hard steel-grey plates, associated with the native platinum found in the gold washings of the Rivière du Loup, Beauce County, Province of Quebec.

134. **IRON-ochre**—Extensive deposits of iron-ochre (*var.* limonite) are met with in numerous localities in the Province of Quebec. A remarkable deposit of this material is found in St. Anne (Montmorency Co.), and very large beds of the same occur in Cap de la Madeleine (Champlain Co.), and in Pointe du Lac (St. Maurice Co.). Amongst other places, where deposits of more or less importance occur, may be mentioned the Counties of Bonaventure, Joliette, Laval and Vaudeuil. In the Province of Ontario, beds of ochre are met with in Walsingham (Norfolk Co.), Esqueving (Halton Co.), Sydenham (Grey Co.), Nottawasaga (Simcoe Co.), and other townships. Chemical examination of iron-ochres, T. S. Hunt. Geol. Can., 1863, p. 512.

NOTICE

Re ONTARIO CROWN LANDS.

CROWN LANDS DEPARTMENT,
TORONTO, Nov. 29th, 1890.

NOTICE IS HEREBY GIVEN that the lands lying between the east limit of the Township of Awrey, in the District of Nipissing, produced north and south, and the west limit of the Townships of Esten and Spragge, in the District of Algoma, produced north, are withdrawn from sale or location from, and including the first day of December, now next, and no further sales or locations will be made of lands within said limits until further notice, except in cases:—

1. Where application has been duly made and the purchase money has heretofore been paid into the Department; or

2. Where application has been made and a large proportion of the purchase money has heretofore been paid, and where a substantial expenditure of money has been heretofore made in developing or in completing a survey of the location.

No application heretofore made unaccompanied by the purchase money for lands in the said limits except as aforesaid, will be considered.

ARTHUR S. HARDY,

Com. Crown Lands.

SEALED TENDERS addressed to the undersigned, and endorsed "Tender for Caïsson," will be received at this office until Friday, the 5th day of December next, inclusively, for supplying, erecting and completing in place, a Wrought Iron Caïsson for the Dry Dock now in course of construction at Kingston, Ont., in accordance with the plan on exhibition at this office, and at the Engineer's office, 30 Union Street, Kingston, and with the conditions and stipulations contained in a Form of Tender, copies of which can be obtained on application to the undersigned, and W. O. Strong, Esq., Resident Engineer, 30 Union Street, Kingston, Ont.

Tenders will not be considered unless made on form supplied, and signed with the actual signatures of tenders.

An accepted bank cheque payable to the order of the Minister of Public Works, equal to five percent. of amount of tender, must accompany each tender. This cheque will be forfeited if the party decline the contract or fail to complete the work contracted for, and will be returned in case of non-acceptance of tender.

The Department does not bind itself to accept the lowest or any tender.

By order,

A. GOBEIL,
Secretary.

Department of Public Works,
Ottawa, 19th Nov., 1890.

GEO. A. SPOTSWOOD, C.E., Mining Engineer,

And PHOSPHATES.

24 PARK PLACE,

NEW YORK.

ST. LAWRENCE CANALS.

RAPIDE PLAT DIVISION

NOTICE TO CONTRACTORS.

SEALED TENDERS addressed to the undersigned and endorsed, "Tender for the St. Lawrence Canals," will be received at this office, until the arrival of the eastern and western mails on Wednesday, the 3rd day of December next, for the construction of a lift lock, weirs, etc., at Morrisburg, and the deepening and enlargement of the Rapide Plat Canal. The work will be divided into three sections, each about a mile in length.

A map of the locality, together with plans and specifications of the respective works, can be seen on and after Wednesday, the 19th day of November next, at this office, and at the Resident Engineer's office, Morrisburg, where printed forms of tender can be obtained.

In the case of firms there must be attached to the tender, the actual signatures of the full name, the nature of the occupation and residence of each member of the same, and, further, an accepted cheque on a chartered bank in Canada for the sum of \$6,000, must accompany the tender for Section No. 1, and an accepted cheque on a chartered bank in Canada, for the sum of \$2,000 for each of the other sections.

The respective accepted cheques must be endorsed over to the Minister of Railways and Canals, and will be forfeited if the party tendering declines entering into contract for the works at the rates and on the terms stated in the offer submitted. The cheques thus sent in will be returned to the respective parties whose tenders are not accepted.

This Department does not, however, bind itself to accept the lowest or any tender.

By order,

A. P. BRADLEY,
Secretary,

Department of Railways and Canals,
Ottawa, 7th November, 1890.

Money Orders.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion and Newfoundland; also in the United States, the United Kingdom, France, Germany, Austria, Hungary, Italy, Belgium Switzerland, Portugal, Sweden, Norway, Denmark, the Netherlands, India, Japan, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4	2c.
Over \$4, not exceeding \$10	5c.
" 10, " " 20	10c.
" 20, " " 40	20c.
" 40, " " 60	30c.
" 60, " " 80	40c.
" 80, " " 100	50c.

On Money Orders payable abroad the commission is:

If not exceeding \$10	10c.
Over \$10, not exceeding \$20	20c.
" 20, " " 30	30c.
" 30, " " 40	40c.
" 40, " " 50	50c.

For further information see OFFICIAL POSTAL GUIDE.

Post Office Department, Ottawa,
1st November 1889.

North-West Mounted Police.

RECRUITS.

APPPLICANTS must be between the ages of Twenty-two and Forty, active, able-bodied men of thoroughly sound constitution, and must produce certificates of exemplary character and sobriety.

They must understand the care and management of horses, and be able to ride well.

The minimum height is 5 feet 8 inches, the minimum chest measurement 35 inches, and the maximum weight 175 pounds.

The term of engagement is five years.

The rates of pay are as follows:—

Staff-Sergeants \$1.00 to \$1.50 per day
Other Non-Com. Officers.. 85c. to 1.00 "

	Service pay.	Good conduct pay.	Total.
1st year's service,	50c.	—	50c. per day
2nd "	50	5c.	55 "
3rd "	50	10	60 "
4th "	50	15	65 "
5th "	50	20	70 "

Extra pay is allowed to a limited number of blacksmiths, carpenters and other artisans.

Members of the force are supplied with free rations, a free kit on joining and periodical issues during the term of service.

Applicants may be engaged at the Immigration office, Winnipeg, Manitoba; or at the Headquarters of the Force, Regina, N.W.T.

Ontario's Nickel and Copper Ores.

One of the events of the month in mining affairs was the visit of the Toronto Board of Trade to the Sudbury district. Much as has been written on the great deposits of nickel and copper ore in the region north of Georgian Bay, there are few persons who have a right conception of the progress already made in raising and smelting the ore. The view of the President of the Toronto Board of Trade, and which he was frank enough, at the close of the visit, to confess having held, is no doubt that of most people in Canada, viz: that speculative holes were being sunk upon veins in the hope of starting a boom to sell locations. But Mr. Davidson knows that steel is believing, and he has no doubt now that there are immense bodies of valuable ore in the Sudbury country, and that mining enterprise as carried on there is substantial and permanent. The thirty or forty solid and sober business men of Toronto will be able to tell their fellow-citizens and the people of Ontario generally, that all reports heretofore published have been in no respect extravagant. One of the most careful of their number, Mr. Robert Jaffray, was impelled to say, as the Queen of Sheba said after seeing for herself the glory of Solomon, that the half had not been told them. He might have said much more within the limits of moderation, and had

an open and positive confession been made of the injustice done to newspaper and other reports upon the Sudbury mines it might have done the souls of the doubting Thomases of the party some good. The justification is tardy, but we rejoice in its having been made at last, and we earnestly trust that the Toronto capitalists will proceed to show their faith by their works. The authoritative statement of the experts sent by the Government of the United States to report upon the supply of ore, leaves no room to doubt that the quantity is enormous. "There are 650,000,000 tons of ore in sight," those experts stated after having carefully explored the five mines in the vicinity of Sudbury, and the great ranges discovered in Creighton, Denison and Graham. Here is enough to last for eighty years, were mining to be carried on annually at the highest rate yet reached in all the iron mines of Michigan, Wisconsin and Minnesota. But how much greater the quantity is we can only determine when the depth of the ore is ascertained and all the ranges of the district are discovered. Multiply the Washington experts' estimate of ore in sight by one thousand, and we are probably within the mark. Let us be modest, however, and see what the estimate of ore in sight implies. The nickel contents, computed at an average rate of two and a half per cent., would be 16,750,000 tons, or 33,500,000,000 pounds. At fifty cents per pound, which is about the present price of refined nickel the product would represent the enormous value of \$16,750,000,000, and even if the price fell to ten cents per pound it would represent \$3,350,000,000, or more than enough to pay off the public debt of the Dominion of Canada twelve times over! The copper contents computed at 5 per cent., would be 67,000,000,000 pounds, which at ten cents per pound (the current rate is 15 to 16) would equal \$6,700,000,000. These figures are so large that we can scarcely realize them, but they will at all events serve to demonstrate the value of the industry which was started only four years ago at Sudbury. Recent experiments with alloys of iron and steel have made clear the fact that Ontario is wondrously rich in her mineral possessions, and if a proper spirit of enterprise is exhibited, she may look forward with confidence to the occupying of a foremost place among the countries of the earth in the production of economic metals. She has great supplies of rich iron ores as well as ores of nickel, and it will be the fault of her own people if she does not become the seat of the world's nickel-steel industry. The members the Toronto Board of Trade know the possibilities before them. Their visit to Sudbury has given them an education such as few others have had an opportunity to acquire, and we shall be disappointed in their pluck and enterprise if they do not turn what they know to a useful and practical account. It

ought not to be difficult in a city of the size and importance of Toronto to organize a company with a capital of \$1,000,000 to refine the matte produced at the Sudbury furnaces, open up one or more of the great iron ranges in Hastings, Peterborough or Haliburton, put up one smelting furnace and a steel converter of good capacity, and carry on the manufacture of nickel steel. They possess rare opportunities, and they cannot begin too early to take advantage of them.

The Mining Tax.

The following are the resolutions, affecting proposed taxation of mines, to be submitted by the Hon. Mr. Mercier's Government, during present sitting of Quebec Legislature:—

Resolved, 1.—That from the first day of May, 1891, a royalty shall be levied in favour of the Crown upon every mine which is now or may hereafter be sold, conceded or otherwise alienated. That such royalty shall, unless otherwise determined by letters patent already granted, consist of a percentage of three per cent. of the merchantable value of the products of all mines and minerals, upon the following:—

Iron, including iron pyrites, and chromic and titanite iron ores, copper, nickel and cobalt, manganese, antimony, lead, zinc, aluminium, molybdenum, baryta, silver, gold, including alluvial gold, mercury, tin, asbestos, phosphate of lime, graphyte, mica, coal, petroleum, ochre, soap stone. On gold, $2\frac{1}{2}$ per cent. of the gross weight, estimated at \$18.00 per ounce, and on silver at $2\frac{1}{2}$ per cent. of the gross weight.

Resolved, 2.—That the Lieutenant-Governor in Council may appoint the officers he deems necessary for the carrying out of the law, to be based upon the resolutions, and fix their rank and salaries.

Resolved, 3.—That any person, firm or company may obtain from the Commissioner of Crown Lands an exploration permit, with the right to make all necessary works to establish the mining value of any land; which permit is valid for three months.

Resolved, 4.—That the holder of such permit may afterwards obtain the sale of the mine by paying the price mentioned in the law to be based upon the resolutions, and by complying therewith as well with the regulations passed thereunder; the whole subject, however, to the right of preference allowed to the proprietor of the surface, to the exclusion of any other, to acquire the mines and minerals found, or that may be afterwards found under the surface of his property.

Resolved, 5.—That the application for such permit shall contain as exact a description as possible of land required to the satisfaction of the Commissioner, and shall be accompanied by the following fees, as the case may be:—

1. If the mine is upon private lands, five dollars for every fifty acres.

2. If the mine is upon Crown Lands, ten dollars for every fifty acres.

Resolved, 6.—That any person may obtain from the Commissioner the sale of one or more mining concessions upon the following conditions:—

1. Upon private lands, after the owners thereof have been placed *in mora* to take a deed of sale thereof; if they refuse to avail themselves of such right; the whole in conformity with the law to be based upon these resolutions.

2. Upon public lands, by complying with the provisions of the said law.

Resolved, 7.—That a mining concession shall comprise a minimum superficies of fifty acres and a maximum of one hundred acres.

That the direction of the exterior lines of mining concessions shall be determined by the Commissioner.

Resolved, 8.—That the costs of survey and setting of bounds, as well as of setting up the posts under the law to be based upon these resolutions, are payable by the applicant.

Resolved, 9.—That every post which is destroyed or removed shall be replaced at the expense of the owner, within one month; and the proceedings to have it replaced shall be the same as for the original placing of boundaries.

Resolved, 10.—That, if need be, the owner shall pay to the owner of the surface the damages that may be caused by the taking possession and the opening and working of the mine.

Resolved, 11.—That every owner of a mining conces-

sion who neglects to again set up the posts or to replace those which have been removed or destroyed, as required by the law to be based upon these resolutions, shall be liable to a fine not exceeding twenty-five dollars for each post which he neglects to set up or replace.

Resolved, 12.—That every person who wilfully destroys, damages, breaks or removes such posts shall be liable to a fine not exceeding one hundred dollars for each offence.

At last the Quebec Government has shown its hand, and the foreshadowings of the speech from the throne have materialized in a proposal to levy a royalty of three per cent. upon the merchantable value of the products of all mines and minerals. Assurances had been privately given members of the Legislature that it was only contemplated to introduce a system of leasing lands upon royalty, that no tax would be placed upon mines already sold. We were disposed to credit this; for we entertained the opinion expressed by Mr. W. H. Nichols, of New York, at the meeting of mine owners in St. Lawrence Hall, that it was incredible that any civilized government, in this age of the world, could place a discouraging burden upon mining industries. We have repeatedly expressed approval of the idea of granting leases upon royalty subject to compulsion of working; but as far as we can see in the proposed resolutions there is no requirement of productive effort. This we presume would be provided for, as it is hardly to be supposed that a phosphate lot of 200 acres now held by the Crown at the price of \$1,000, is to be sold for \$40, without obligation of working. If so, speculators would speedily tie up the whole country, and all the present evils of an unproductive monopoly would be intensified. But our objections are directed against the proposal to tax the product of mines that have been sold outright, and have been fitted up, operated by the purchasers with confidence in the good faith of the Government, and the belief that a sale was a sale. Apart from this breach of contract, which we stigmatize as a downright act of dishonesty, we declare that the mining industries of this Province are not in so prosperous a condition as to be able to bear the burden of a direct tax. If the proposal meant a tax upon profits it would be a different thing, and prosperous mines could afford to pay it; but mining is the most speculative of all industries, and a tax upon output would often be an additional loss to a losing enterprise. If any branch of industry is to be singled out to bear the strain of Quebec finance, let it be one that receives Government favors and enriches itself by legal aid. The sugar refineries are favored by the Dominion Government with a protection against foreign competition to the extent of 2 to 3 cents per pound. If the Quebec Government demanded one cent a pound out of this benefit, there would be some reason in it, but instead of levying upon protected and favored industries, the attack is made upon the one unprotected and unfavoured industry of Canada, which in addition to the burden of its own natural difficulties, is saddled with the restrictions made to benefit pampered and petted pursuits, by

which the cost of all its supplies is increased and, if it is true, that protection raises wages, the cost of its labor is enlarged.

We denounce this piratical attack upon a struggling industry as a violation of honesty and propriety, and we warn the Quebec Government that our mining men represent an amount of influence and determination that it is dangerous to trifle with. Their manliness is shown by the fact that they have not gone whining for Government bonuses and protection, but have been content to take their chance in a fair struggle with nature's conditions, and this same characteristic will make them resist oppression by every resource within their power.

The Phosphate Season of 1890.

The close of navigation on the St. Lawrence brings the day of reckoning for all those industries whose products seek their markets beyond the sea. Perhaps no other industry in Canada is so dependent upon ocean freight as is phosphate mining. Of home market it practically has none; and its small trade with the United States consists entirely of low grade ore. All the high grade output and the great bulk of the whole production, is sold across the Atlantic, the chief portion to the United Kingdom, considerable to Germany, and a little to Holland and Sweden. The total exports, as per official returns furnished us by the shipping agents and Customs manifests have been:—

Lomer, Rohr & Co.:

To Europe	11,338
" United States	252

Tons..... 11,590

Millar & Co.:

To Europe	5,915
" United States	1,207½
" Canada	185

Tons..... 7,307½

Wilson & Green:

To Europe	5,688
" United States	263¾

Tons..... 5,951¾

Irwin, Hopper & Co.:

To Europe	938
-----------------	-----

Tons..... 938

Anglo-Canadian Co.:

.....	275
Tons.....	275
	26,062¼

Or a total export to all points of 26,062¼ tons; as compared with 29,987 tons during the same period last year. The distribution of these exports has been as follows:—

To Liverpool	12,647	To Newcastle....	200
" London	5,239	" Swansea	130
" Glasgow	1,752	" Queenstown ..	84
" Hull	820	" Bristol	60
" Hamburg	2,800	" United States..	1,723¼
" Grimsby	422	" Canada	185

The decrease is due partly to the lessened production of some mines, but chiefly, as we have already pointed out, to the fact that owners of phosphate lands have maintained a selling attitude instead of adopting a working policy.

As nearly all the expectations of making fortunes by land sales have been disappointed, it is to be hoped that the proprietors will now try to secure for themselves the abundant wealth that they have confidently expected to dispose of to others.

The year has been a most favorable one for the business; given the phosphate and all else has been smooth sailing. It has not had to go begging for a purchaser, vessels have been ready and eager to take it, and facilities for rail and water transport from the mines to Montreal and the methods of handling it there have been better than ever before.

Ocean freights have varied from 8s. 9d. down to nothing when some tramp, going to an outside port, was in need of ballast; but the bulk of the shipments paid from 6s. to 8s. 6d. A larger supply of cheap tonnage would have been available had not the deal freights flattened out in the summer to so low a rate that vessels turned away from the St. Lawrence to seek more lucrative business, and therefore the demand for phosphate as ballast under the deal cargoes was lessened.

Prices have been very satisfactory for the higher grades; 1s. 4d. for 80 per cent., with one-fifth penny per unit rise has been obtainable in London, and 1s. 5d. in Hamburg. The London price for 85 per cent. phosphate was therefore 1s. 5d. per unit, equal to about \$26 per ton in Montreal. A few choice lots have gained this handsome figure, but the bulk of the shipment have averaged much lower and there has been a reduction of price for the lower grades amounting to double the usual sliding scale, so that prices for 75 per cent. have been 1s. 1d. to 1s. 2d. and for 70% 11d. to 1s. per unit. At the latter price a ton of 70 per cent. phosphate in Montreal would realize only a little over \$13, or about one half of the value of 85 per cent. phosphate. Here is where the profits lie, and happy is he who strikes a bunch of the pure green rock, as did one of our operators in November, and from the labor of fifteen men made a clean profit in four weeks of \$1,500. The reduced price of the lower grades is due to the large supply of Carolina and Florida phosphates which analyze from 55 to 60 per cent. In the rivers of Florida beds of this material have been discovered, which can be raised by suction and pumped into boxes at trifling expense. On the lands of this State also great deposits of phosphate rock have been found, which were said to be of the highest quality and sufficient in quantity to supply the demand of the world. A Florida boom thereupon arose, which drowned out of sight our little Canadian boom; companies were floated and fortunes were made in land sales. Perhaps some day phosphate of higher grade will be produced in such quantities as to depress the price of the Canadian article, but at present the impression prevails that the deposits are less persistent and the quality more uncertain than the boomers have represented. There has cer-

tainly been a depressing effect from this source upon low grade phosphate and Canadian 60 per cent. which sold in the Spring at 10d. could not find a buyer in the fall at 7¼d.; and yet the price of higher grade keeps up and sales have been made for next year at 1s. 3d. for 80 per cent., 5,000 tons being said to have been placed at this rate by the representatives of the new General Phosphate Corporation.

The advent of this company into the field has been the chief feature of the year. They have made judicious selection of good lands in the Lievres River district, and have shrewdly made their payments to depend partly upon the output. All who are interested in the growth of this industry will heartily wish success to this enterprise. The visit of Mr. Hutchinson, of the Anglo-Continental Guano Works, of Hamburg and London, last year, resulted in the purchase of the Squaw Hill and Aetna Mines adjoining the Emerald Mine, and effective work is now in progress there. Mr. Hutchinson's paper, reproduced in our last issue, is unquestionably the most accurate description of the phosphate industry that has ever been given by a visitor and shows a remarkable mind that could grasp the salient features of a mining industry in so brief a survey. Among other new undertakings are those promoted by one of our most enterprising phosphate operators, Mr. Adolphe Lomer, of Montreal, who, in addition to the Foxton mine, has organized work upon an adjoining property, and has formed companies to operate upon the Blackburn and the MacLaurin properties, besides doing some work upon other leased lands. An ingenious method has been put into practice by this gentleman in his grinding mill at Buckingham for the mechanical separation of the impurities from the phosphate, which will tend largely to increase the profits of mining.

Some alarm has been caused by the intimation that the Quebec Government would seek to raise its revenue by imposing a tax upon minerals. Indignation meetings have been held by the mine owners at Sherbrooke and Montreal, and the excitement aroused may bear good fruit, not only in combating the imposition of any burdensome tax, but also in inducing the miners of the Province of Quebec to unite in forming an association, which shall be ready to take action upon any threatened legislation detrimental to this industry, and shall also afford means for mutual communication and instruction. In this latter aspect such associations of special industries prove most valuable, and we have had illustrations of the practical benefits of these societies in the production of such papers as the one just referred to, written by Mr. Hutchinson, and that presented previously by Mr. Hermann Voss, to which was due a great deal of the interest that was directed last year to Canadian phosphate.

One notable feature of the situation is a disposition to reduce the capitalization of com-

panies and the valuation of lands. It is proved that from well selected lands under good management, profitable returns may be secured from phosphate mining, but it is also perceived that the great prizes incident to gold and silver mining are not characteristic of the phosphate industry, and that it is desirable to keep nominal values low enough to permit of profits to show a fair percentage upon the investment. This healthful indication augurs well for future success, and with the assurance of a good and ever increasing demand for high grade phosphate, we may confidently predict the continued growth and prosperity of the Canadian phosphate industry.

A Wholesome Reminder.

Ontario papers have been making much ado lately over an announcement that Mr. T. A. Edison had made heavy investments in Canadian nickel lands. Here is the truth tersely stated by Mr. Edison's private secretary: "Mr. Edison has read your letter of 12th inst., and in reply thereto has instructed me to say that he is *doing nothing* at the present time in the Sudbury district and *will not, until owners* of property in that neighborhood *come to their senses.*" The italics, which are ours, furnish good food for reflection to our speculator friends. Shrewd business men of the calibre of the great inventor are quick to forsee a good field for judicious investment in our nickel deposits; but they are not to be deceived by wild-cat schemes or schemers; nor are they prepared to accept their ridiculous notions of the value, of what are often "mere prospect holes," entirely unproved and in many cases worthless. The sooner these over-sanguine individuals rid themselves of their chimerical ideas and get down to more rational figures, the better for themselves and the development of the country.

The Tariff on Mining Machinery.

The following Order-in-Council, under date of 28th ult., should simplify entries of mining machinery not manufactured in Canada, and it is hoped will obviate entirely the tedious and vexatious delays that have been characteristic of recent interpretations of the meaning of the Act:—

"His Excellency, under the authority of Section 252 of the Customs Act, and by and with the advice of the Queen's Privy Council for Canada, is pleased to order that there be required, in addition to such other evidence in each case as may be deemed necessary by the Minister of Customs, a special oath to be subscribed to by the importer before a Collector or other proper officer of Customs, whenever any free entry is rendered of Mining Machinery under item 291 of Section 11 of the Act 53 Vic., Chap. 20, such oath to be in the following terms:—

"I,, the undersigned importer of the machinery mentioned in this entry, do solemnly swear that it is Mining Machinery within the true meaning of the word, and that at the time of its importation was of a class and kind not manufactured in Canada, and that it is imported for use in mining only, at the mine, situated in the Province of and will be used for no other purpose whatever"

Sudbury Mineral Lands Withdrawn from Sale.

The Commissioner of Crown Lands for the Province of Ontario has taken the important step of withdrawing from sale and location, until further notice, all lands lying within what is generally known as the nickel bearing district of the Province. The official notice defines the territory thus withdrawn as lying between the east limit of the Township of Awrey, in the district of Nipissing, produced north and south, and the west limit of the Townships of Esten and Spragge, likewise produced. Upon referring to the map it will be observed that the former of these townships lies south and east of Lake Wahnapiatae, and the latter some fifteen or twenty miles west of the mouth of the Spanish river. The total width of the territory is about one hundred miles, and it extends from Georgian Bay and French river, on the south, to James' Bay on the north, embracing the valleys of the Spanish, Wahnapiatae and Moose rivers. There is no further intimation of the policy of the Government than the statement that the lands lying within the prescribed limits are withdrawn from sale or location "until further notice;" but it may be presumed that a policy will be determined upon and authorized before the close of the next session of the Legislature. The reasons which have influenced the Commissioner have not been divulged, but they are obvious enough to any person who knows the workings of the boom in the Sudbury district during the past year or two. Many locations have been taken up over that territory, for the most part by speculators, and since the action of the United States Congress in appropriating \$1,000,000 for the purchase of nickel, to be used in the manufacture of armor plates, there has been a great rush of prospectors, miners and speculators to secure locations. No doubt the Commissioner thought a time had come in the interest of the people, as well as of the Government of Ontario, to call a halt in the disposal of valuable public lands, and no doubt also that the future policy will be dictated by a greater regard for the public interests than was obtainable under the old one. To secure a larger revenue will naturally be one of his aims, while another should be the furtherance of active mining operations. If nickel realises the hope of some of the best practical metallurgists of America and Europe, it is almost certain that great activity will characterize mining enterprise in the Sudbury country henceforward; but the Commissioner will fail in his duty as well as of his opportunity if he neglect to make provision against the locking up of any portion of the mining territory by speculators, to be held for their exclusive benefit. The public interest should be the great consideration, and the best policy is that which will produce the greatest good for the benefit of the greatest number. We hope to have an opportunity of dealing with this subject at greater

length before the Government has settled down to what they are going to do about it.

A Mining Association for Quebec.

As the outcome of the miners' meeting held in Montreal last month, a circular has been issued and liberally distributed among the mining community calling attention to the proposition to establish a general mining association for the Province of Quebec. This is an important step, and if the proposal is carried into effect—and there is no good reason why it should not be—it will unquestionably result in great good. Experience has shown that united action is absolutely necessary in Quebec in order to counteract measures, which, if carried into effect, are calculated to do serious injury to its mining interests. Apart, however, from public questions, such an association would confer an immense boon in the propagation of knowledge respecting the true state of our mineral resources, in the interchange of ideas by wholesome discussion on subjects alike of interest to the owner and the operator, and in smoothing over these petty professional jealousies which unfortunately are sometimes too noticeable among a few of our mining men.

LETTERS TO THE EDITOR.

Accidents While Thawing Dualin.

TORONTO, 26th December, 1890.

The Editor :

With each winter season we are called upon to record a number of so called accidents, resulting in the death of one or more workmen. The class referred to are the too oft recurring premature explosions while thawing dualin near a fire, stove or other dangerous manner, in which the dualin is exposed to direct heat or flame, which draws to the surface of the cartridges the over heated and mechanically mixed nitro-glycerine, of which the dualin is largely composed. This over heating or sweating, is the whole cause of the danger, and the accidents which result from it. The proper way to thaw dualin, and the manner in which it is recommended by the manufacturers, is to place the cartridges in a tin, zinc or metal box, which is made with a space for hot water between its outside surface, and with another zinc or metal box which may be lined with wood or the outside surface to prevent too rapid cooling of the hot water. These boxes are sold by the manufacturers whose responsibility ceases when they recommend a safe means of handling the articles they expose for sale. The responsibility, then, rests with the purchaser who causes workmen to use a dangerous article in a wrong manner by not providing the proper means or box for use in thawing dualin. If a box is provided by the employer or purchaser of the dualin and the workmen neglect or do not use it, then the employer is not responsible, but the blame rests with the careless workman, who endangers his own life and that of those around him. We have known instances where the managers of works have been asked to furnish boxes but neglected to do so, or objected on the pretence of cost, which he or they considered unnecessary, and accidents resulted in consequence of thawing the dualin in a wrong way. These officials were then responsible, and ought to have been prosecuted for criminal negligence in exposing the lives of their workmen to danger. This circumstance calls to mind the enquiry, Where is Ontario's Inspector of Mines and Quarries? Does he condescend to note the death of a miner or quarryman? Is he not appointed to protect workmen in seeing that due care is taken in conducting mining and quarrying operations? In the case of the

Ontario Inspector is he not too busily engaged praying for aid from heaven for the poor widow and orphans of the deceased workman, and thereby filling only one end of his lawful calling? Truly this is a wise appointment (an ex-Baptist parson) by the over faithful Premier of Ontario in the interests of those employed in mines and quarries. In the case of Quebec, the Inspector is evidently not required to look after such things as accidents, for the Hon. Mr. Mercier has liberally appointed clerics to Government positions, and the Inspector knows that these can say masses enough for the unfortunate miners and quarrymen who prematurely "go up" as a result of their own or some other person's carelessness in not providing proper protection to employees in mines and quarries.

J. S. T.

Canada's Mineral Wealth.

The following is the pith of Mr. Erastus Wiman's memorable speech at the banquet given to the Iron and Steel Institute at Niagara:—

Mr. Wiman said:—"Canada is a land of surprises, and even to those who know her she is ever revealing some new source of wealth. Who could have imagined that Canada possessed within herself the potentialities for the defence of the world? Yet the visit just made by the Iron and Steel Institute to the Sudbury region, only twelve hours' run from Niagara, discloses the fact that her deposits of nickel are the greatest the world has ever seen. Now, it has recently been discovered by tests made at the United States navy that nickel-plated armour for ships is practically impenetrable for defensive purposes. Well was it said that these tests rendered it possible to make Behring Straits a closed sea, unless, indeed, the British Government drew on Canada for supplies of nickel with an alacrity equal to that with which the United States are making haste to gather it in from the same source." So impressed was the speaker with the importance to Great Britain of obtaining the supplies, that he had communicated an offer on behalf of the Canadian Copper Company to the authorities in Great Britain, tendering them a free supply of nickel from Canada for the tests contemplated at Shoeburyness. "The nations of Europe," Mr. Wiman continued, "seek with anxiety this peaceful land for the force for the defence of the world, as is shown by the visit of a member of the firm of Messrs. Krupp, who seeks, incognito, in the wilds of Sudbury, the power that will make guns unburstable, and armour impenetrable. A contribution to the peace of the world may thus be made by Canada. That may not be the least of her many surprises, but with nickel in Canada, in the region hurriedly passed through by the Iron and Steel Institute, will be found sister minerals in abundance. Thus, in copper the deposits in the regions just visited are the largest in the world. The Aladdin-like story of the Calumet and Hecla mines, of sixty millions of dollars of profits and premiums on the capitalisation of less than three millions on the south shore of Lake Superior, can be retold in Canada in the Algoma district on the north shore, for here there is copper in sight at least twenty-five times the extent of the American deposits. The silver deposits, too, are most extensive, and their character is told in the familiar story of the Silver Islet, which a few years ago yielded within its small area more silver to the square foot than an equal space of the earth's surface had ever given forth. Gold is here also found, and the promise of the Vermillion and other mines equals the prospect of early California or later South Africa. Platinum is found in unusual quantities in these regions; and so complete are the surprises in this treasure-house of the continent that an entirely new metal has been revealed, and named sperrylite, in honour of the graduate who discovered it. Canada is a surprise in that she especially possesses almost untold deposits of the greatest of the world's assets, the Imperial metal, iron, stretching far out to sea in the pier-like projection of Nova Scotia. Within six miles of the Atlantic is found an assemblage of the finest iron side by side with pure limestone, and with coking coal in seams 20 feet thick. These and other near-by deposits so splendidly located are testified to be equal in value to the mineral deposits of Pennsylvania and New York combined, furnishing a providential proffer to New England in her hour of need, if only she will accept it. Quebec, communicating with the iron sands of the St. Lawrence, contains throughout the province enormous deposits, awaiting only the touch of enterprise and an open market for a vast output. In Ontario the recent report of the Royal Commission makes it clear that a surprise awaits the world in the extent and importance of the iron deposits of that fairest and richest portion of the continent. The freedom from phosphorous in Canadian ore is important, and it has been aptly said that what the devil is to religion phosphorous is to iron. In British Columbia, a mineral wealth exists, only equalled by her enormous timber regions, her 5,000 miles of coast line fisheries, and her unlimited coal de-

posits, which recalls another of the surprises of Canada—namely, that it is only within her territory that coal can be found on the sea board equally on the Atlantic and Pacific, a fact of profound significance if this continent should ever wake up to the realisation of the advantages of a foreign trade. Time fails to tell of the numerous other revelations which Canada makes to the observer of natural phenomena, such, for instance, as the possession of natural gas in great abundance within a radius of ten miles of Niagara Falls, to supplement the vast water power which flows at your feet, and which is but a commencement of inexhaustible force in the water powers of the St. Lawrence, the Ottawa, and the great rivers of Quebec, for it is well to realise that Canada, besides being larger than the United States, and in area being 40 per cent. of the British Empire, has more than one-half the fresh water of the globe. Still further surprises await him who follows the development of the oil deposits in the North-West, where, in the Mackenzie river basin, are found deposits of petroleum, the magnitude of which exceed that of the known deposits of the rest of the world. The gypsum deposits in Nova Scotia are the most valuable on this continent, while the eager hunt for asbestos in Canada confirms the recent boast that that Province alone possesses sufficient of the important mineral to pay the Dominion National Debt. In addition to this vast mineral storehouse, one recalls the enormous areas of the wheat-producing regions of the North-Western Territory, the future granary of the world; the five thousand miles of coast line fisheries, the limitless forests to supplement the treeless prairie of the West, and other great national assets. But of all surprises in relation to Canada, that is the chief which blinds both Canadians and Americans, not only to the value of the country, but to the advantage of an unrestricted intercourse between them. It is especially surprising that the people of the United States, now so thoroughly equipped and needing new opportunities for continued expansions of trade, have not yet realised the influences they may set in motion towards shaping that commercial destiny of the continent. This they can do by opening up their markets, promoting development, and making haste to get control by occupancy and by individual purchase of a region far more desirable than Africa, which England and Germany carve in two for the purpose of trade. The Iron and Steel Institute of Great Britain have seen much of the United States, and have, no doubt, been duly and properly impressed with the greatness of their development, the magnitude of their trade, and the beneficial example for the good of mankind. But here, under the British flag, lies a region full of promise, possessing areas, potentialities, and a people fitted for just as great a career, and needing only the magic touch of freedom and appreciation of the American people to enormously enrich them, and yet still be the brightest jewel in the British Crown, without a red coat and without a ship of war. This vast treasure of the British nation may be left exposed as a hostage of peace in the practical safe-keeping of the American people. They will not capture it by conquest, neither will they seek to acquire it by territorial or national purchase, not even imitating their own policy of the past, but will follow the British policy of the present in the acquiring of breweries and other industrial interests by the English capital sent hither. Thus, without a change in the political condition or the deprivation of a foot of British territory, would be healed, by trade and commerce, the great schism of the Anglo-Saxon race on this continent in a new union of interests that nothing could dissolve."

Nickel Steel Tried in Europe.—Commander F. M. Barber, United States Navy, recently received the following cable despatch concerning the latest trial of armour in Europe:—"The Russian navy made a comparative test of three plates of Ohta, the 11th of this month. The plates were ten inches thick. One was of plain steel made by Schneider & Co., of Le Creusot, France; the second was a compound plate made by Brown & Co., of Sheffield, England, and the third was a steel plate made by Vickers, of Sheffield. Each plate received five 6-inch Holtz chrome steel projectiles, weighing 90 pounds each. The first two were fired with a striking velocity of 1900 foot seconds, and the three others with 2100 foot seconds. The Schneider plate arrested all the projectiles and broke three of them. The penetrations were 22 and 27 cm. In the Brown plate the first two penetrated 34 cm., the three others traversed the plate and backing and fell 750 m. in the rear. In the Vickers plate the penetrations were 23 cm. The Brown plate showed large cracks; the two steel plates had only fine cracks. The trial showed once more the absolute inferiority of the compound plate and the superiority of the Schneider plate, a superiority which would have been greater if the plate fired at, at Ohta, and delivered by the Le Creusot works a year ago had been of the same fabrication as the nickel steel plate tried at Annapolis, embodying the latest improvements in the Schneider plates."

Our Portrait Gallery.

[A series of portraits and biographical sketches of Canadian mining engineers, mine managers, inspectors, geologists, explorers, etc.]

Nos. 7 and 8.

Mr. William Madden and Mr. Patrick Neville,
Deputy Inspectors of Mines for the
Province of Nova Scotia.

In this issue we give our readers two very good portraits of the gentlemen who act as Deputy Inspectors for the Provincial Department of Mines, for the Province of Nova Scotia.

The district assigned to Mr. Madden, embraces the Counties of Cumberland, Colchester and Pictou, on the mainland, while Mr. Neville is more particularly concerned with the Island of Cape Breton. Their duties are more inti-

they are frequently called upon to visit gold and other mines, and localities being prospected or in the course of development.

At first the mine managers were apprehensive of undue interference on their part, but it has been found that the frequent friendly inspection has been beneficial to all parties. The men, when they have any cause of complaint in the matters covered by the Mines Regulation Act, can readily turn to the Deputies who live near at hand, and the mine officials benefit by the observation they feel is kept constantly directed on them. A record is kept of all visits of inspection made by them, and an annual summary is published in the report of the Department. These gentlemen were selected for their practical acquaintance with the details of coal mining, and have, since their appointment, won the respect of the coal miners of the Province

by their kindness and tact and evident anxiety to see that everything possible was done to ensure their safety.

Mr. Neville is a native of Cape Breton, having been born at Bridgeport, on the 25th March, 1834. He commenced mining in the employ of the General Mining Association, slope driving and coal cutting, and continued at this work and mining in general until he received the appointment of underground manager at the International Colliery. This appointment he held until May, 1879, when he was transferred to his present important position.

It should be mentioned that Mr. Neville discovered and opened up the Reserve, Emery and Lorway seams, now owned and operated by the Sydney and Louisburg Coal and Railway Company.

Mr. Madden was born at Pictou, N.S., on the 30th November, 1848. For a number of years he was employed underground at Acadia mines and at the Drummond Colliery, after which he worked as a cutter in Maryland, U. S. A. Returning to Nova Scotia, he was engaged in various capacities in mining operations at the Drummond, Springhill, and other collieries, finally receiving his present appointment in 1883.

Good Words for Canada.

(The Colliery Manager.)

Mr. Erastus Wiman in speaking to the members of the Iron and Steel Institute of Great Britain, whom he was entertaining at Niagara Falls, drew such a picture of Canada as must arrest the thoughtful attention of every one who reads it—certainly of every British subject. To the young men—full of life and hope—in our own industry, this thrilling account of the vast resources of Canada must have a charm that those of us who are getting on in years cannot be affected by. Canada, he says—and Mr.

Wiman has a clear knowledge of his subject—possesses almost untold deposits of the greatest of the world's assets—iron. Within six miles of the Atlantic is found the finest iron, side by side with pure limestone, and with coking coal in seams 30 feet thick. Enormous deposits are awaiting only the enterprise of capital to develop them and an open market for the output. We are sorry to find Mr. Wiman turning to the United States for co-operation in opening up the vast resources of the Dominion. Why should not some portion of the British capital which is at present utilized in the United States, or, at any rate, some portion of that which we are told is about to be transferred there, be taken to Canada? Instead of long-ing for reciprocity arrangements with the States, as Mr. Wiman appears to do, the Canadians would be wiser to court extended business relations with their mother country, whose ports are free and where there are no prohibitive protective duties. Stimulated by the freedom of Canadian ports, the commercial relations between the two countries would be enlarged and cemented to the permanent advantage of both. The old country has capital and population—Canada has an abundance of Nature's richest endowments. Canadians have plenty of energy and enterprise, but their entire population is absolutely useless for any speedy recovery of the wealth underlying their enormous tracts of undeveloped country. Surely it can only be necessary to make known how rich the country is, to attract to it the capital and the labour by which its riches can be developed.

MR. WM. MADDEN.

mately connected with the coal mines. Each mine is visited once a month and carefully gone over, particular attention being paid to the air ways, ventilators, and the state of the currents in the working places. The various officials are interrogated as to their care in carrying out the general and special rules, and the state of the roof and walls of the working places receives attention. Usually any neglect or omission referred to by them is readily remedied, but it is sometimes necessary for them to ask the Inspector to assist in a matter involving a fair difference of opinion. Should any matter appear of serious moment the Inspector is notified. The powers of the Deputies for all purposes of inspection are equal to those of the Inspector, and they have full access to all parts of the mines, etc. In addition to this work,

MR. PATRICK NEVILLE.

So far as the deposits of nickel are concerned, the future of Canadian mining appears to have been assured by recent metallurgical discoveries. The value of the metal is shown in the fact that the United States Government has just voted \$1,000,000 with the intention of obtaining a sufficient supply of the metal for armour-plate construction; and the researches of Messrs. Riley, Hadfield and Schneider have been followed by results which undoubtedly give nickel a permanent place as an alloy of steel. The United States' contemplated purchase of the metal, under the impression that it could thus monopolise the entire available supply, does not take into account the enormous resources of Canada in this respect. It would be almost impossible to form an adequate conception of the illimitable supplies in that country. It is known that nickel exists in great abundance over an area of several hundred square miles, and it is safe to conclude from surface indications that the ranges continue for many thousands of square miles, some of them passing through long stretches of unbroken wilderness. It is believed in one district alone, north of Georgian Bay, there is sufficient nickel to be found to serve the world's requirements for a thousand years to come. This estimated supply, too, is made on the assumption that the metal will enter very largely in the future into the manufacture of armour-plates. The

value of nickel for toughening steel has become so generally recognized that at least one eminent firm of continental ordnance manufacturers has been personally enquiring into the resources of Canada in nickel, with a view to obtaining supplies of the metal, and only lately an offer was made on behalf of the Canadian Copper Co. to the authorities in Great Britain tendering them a free supply of nickel from Canada for the tests contemplated at Shoeburyness. The value of nickel as an aid to the perfection of metallurgical processes is so assured to the countries in which it is to be found in any abundance, and this will be particularly the case where the metal can be more economically treated than at present—for we firmly believe that the time is not far distant when nickel will be separated with the greatest facility and cheapness from its compounds. With such admirable possibilities for nickel in the future there is an obvious opening in Canada, which will without doubt lead to practical results in a very short period. This period will undoubtedly be shortened in proportion as the commercial relations between Canada and Great Britain are strengthened since there is every probability of English capital being available to better purposes than that of other countries which still have their own internal resources to develop. Present financial conditions are not favorable to a new boom, but, when the next boom comes Canadian investments are not unlikely to be its object. This is the more probable because it is evident that the opening afforded to new Canadian developments by the McKinley Tariff Bill is not likely to endure beyond the presidential election in 1892.

Meeting of the New Vancouver Coal Mining and Land Company, Limited.

The semi-annual general meeting of the shareholders of this Company was held last month at the Cannon Street Hotel, Mr. John Galsworthy (Chairman) presiding. There was a fair attendance.

The SECRETARY (MR. JOSEPH RAMSDEN) having read the notice convening the meeting, the report and accounts submitted for the six months ended 20th June, 1890, were taken as read. They showed a net profit for the half-year of £7,462 3s. 9d. The total net output of coal for the half year was 121,971 tons, and the sales were 128,390 tons. During the half year over which the accounts extend, the coal market at San Francisco slightly improved; prices have since become still firmer, the continuance of the miners' strike in Australia having given the market an upward tendency; for the remainder of the present year, therefore, the outlook is encouraging. In regard to the East Field Mine, the net output during the half year was 33,477 tons. The coal in the No. 1 north level, north level incline, and No. 3 north level continues good, and about six feet thick. Of the No. 2 South Field Mine, the net output during the half year was 65,428 tons. In the No. 1 and No. 3 east levels the coal is still good, and from seven to nine feet thick, but in some of the other levels faults have been met with which have reduced the thickness of the coal, or cut it out altogether. In order to maintain the output here, the directors have determined to put down another shaft near the No. 6 bore, South Field, where coal was found about nine feet thick at a depth of 496 feet from the surface. The sinking of this additional shaft is now in progress. No. 3 South Field mine was re-opened about the 23rd June last, the market having improved, and 7,082 tons were extracted up to the close of the half year. At the present rate of output, it is estimated that there is about a year's supply still to be obtained from this mine. In new No. 4 slope, South Field, several patches of good coal have been met with, and it is hoped that a good seam may yet be found here; if not, the slope will be used to open up the coal ground to the dip of the main slope at the No. 2 south field mine. The quantity of New Wellington coal extracted from the North Field mine during the half year was 15,984 tons. The quality of the coal continues hard and good, but the seam is not so thick as was expected. The coal is principally used in the domestic trade at San Francisco, and is much appreciated. The daily output from this mine cannot exceed 250 tons until the air shaft is completed; this is being pushed forward with all despatch, and it is believed will be completed before the close of the present year. The superintendent reports that the outlook in this mine is favourable. Mr. Tendron, a member of the board, the report states, very kindly made a visit to the mines in August last, and after fully inspecting the mines and the property of the Company was well pleased with the progress made since his former visit, as also the progress of the Company. A further dividend was declared of £2 per cent. (out of the amount of profit transferred from the old Company), payable on the 20th of December, 1890, (free of income tax), to the holders of shares in this Company, on the 3rd day of December, 1890, on which day the transfer books will be closed.

The CHAIRMAN, in moving the adoption of the report and accounts for the six months ending the 30th June, 1890, said it would not be needful for him to speak at any length, the more especially as more important business had afterwards to be transacted at the extraordinary meeting which was to be held later on. I will, therefore, he continued, content myself with the remark that during the past half-year steady and satisfactory progress has been made in the development of our property, and that, what with the great strikes in Australia, together with a strike on a smaller scale upon a property adjacent to ours, a good business has been done. We have received as usual reports from our agents as to what has been done and is being done down to the present time in the different portions of our property, and these all go to show the different mines are being gradually fully explored and examined, and as a rule with the best results. But these exploratory operations, as you know, require money. We have made a considerable profit, it is true, but that profit is already exhausted in these operations; and without the aid, therefore, of some finance other than our own we cannot continue the work. It is this necessity for further funds, as you are aware, which has resulted in the provisional agreement which has been concluded on our behalf by Mr. Tendron with Messrs. Rosenfeld's Sons, and which will shortly be submitted to you for your approval. You will note that we have declared a dividend of 2 per cent. That is a very small dividend, but we cannot help it, for we have not the money to pay more. It comes from the profits which came over to us from the old company, and I may add that it pretty well exhausts those old profits. We could, it is true, have paid another 1 per cent.—and, indeed, we shall pay that extra 1 per cent. if our financial arrangements are not upset by the rejection of the agreement with Messrs. Rosenfeld's Sons. I have nothing more to say just now, so I will at once move the adoption of the resolution in regard to the report and accounts. (Hear, hear.)

Mr. FRY seconded the motion, which was agreed to unanimously.

Mr. BLUNDELL: In regard to our having no money available, sir, I should just like to point out that, according to the accounts, we have £2,000 invested in Metropolitan Stock, so that unless our holding has since been sold out we have there a very considerable sum available. I am glad to learn from your explanation where the £2 divided is obtained from, since, as far as I can see, there is nothing in the accounts to show it.

Mr. DAY: What is the difference in the selling value, roughly, between the New Wellington coal and the ordinary coal? The new kind, we are informed, is highly appreciated for certain purposes, and apparently it is more valuable than the older sort. What is the difference in value?

The CHAIRMAN: The Wellington business is virtually in a state of chaos at this moment in consequence of the strike, and very little coal is being sold. This is advantageous to us, since it has enabled us gradually to get more and more of their business, though we are not able to supply very much at present—only 250 tons per day, in fact. For that, however, we are getting about half a dollar more than the Nanaimo coal, and about the same price as the Dunsuir coal.

A SHAREHOLDER: I see that no less than £2,000 has been expended during the past six months in repairs and maintenance. Are we not making it a very good thing, indeed, for Messrs. Rosenfeld's Sons by all this outlay, which would represent an enormous sum if capitalised?

The CHAIRMAN: You do not quite understand the matter, I think. It is absolutely necessary, in our own interest, that money should be expended in repairs and maintenance.

Mr. TENDRON: There is much apprehension over this agreement. Perhaps, sir, as the author of it, you will allow me to explain to the meeting that, in regard to the particular point raised, any capital charges which henceforward are debited to us, will afterwards be repaid by Messrs. Rosenfeld's Sons. Already over £67,000 will be paid in this way by them. Whatever we spend out of profits will have to be repaid by them on this basis. We must try to put the property into better condition for our own sake. It is absolutely necessary that we should have money to carry on current work. Whence are we to obtain it? We have been unable to get it from our shareholders or from the public. Messrs. Rosenfeld's Sons have, on the other hand, helped us for years. They have a high opinion of our property, so high an opinion, indeed, that they are anxious to become partners in it to a still larger extent, and we, for our part, being in want of funds to develop it, are quite prepared to agree to this upon favourable terms. And it has been to this end that the agreement in question has been drawn up. We think its terms are favourable, and we hope that you will think the same. We shall still have the right to retain a one-third in the whole. The bargain is one, indeed, by which we cannot lose, and have everything to gain. If Messrs. Rosenfeld's Sons do not buy ultimately, they are bound to take up £50,000 of our shares at par.

The CHAIRMAN: In regard to Mr. Blundell's question about the dividend, I should have stated just now that

we took over £20,000 from the old company. With this 2 per cent. we shall have distributed £15,400, leaving a balance of £4,600, and we propose to give you another pound if we have the money. In the accounts, the balance is, of course, in the amount carried forward.

The resolution was agreed to without dissent.

• The extraordinary general meeting was then held.

The SECRETARY having read the notice convening the meeting.

The CHAIRMAN said: The following is the resolution which I have to make:—"That the agreement dated 1st September, 1890, negotiated by Messrs. Tendron and Robins on behalf of this company (provisionally) with Messrs. John Rosenfeld's Sons, of San Francisco, for extending the period for bonding the company's property at Nanaimo to them from the 31st December, 1890, for providing funds for certain specified explorations and works, and for other purposes, be sanctioned and adopted, and that the directors be authorized to carry the same into effect." You have all had copies of the agreement, and it will only be needful for me to refer to one or two points in it. First of all I would call your attention to the fact that in clause 5 an important alteration has been made since the draft which you received was printed. As originally drawn up, 20 per cent. was the amount fixed upon to be paid in a certain event. That proportion has since been altered from 20 per cent. to 33½ per cent. Well, in regard to the agreement itself, it was brought about, as you know, in consequence of the visit of Mr. Tendron to America last summer, and was only arrived at, as he will tell you, after prolonged and laborious negotiations. The only point in the agreement to which any real objection is at all likely to be taken is clause 5, which runs "At any time during the currency of this agreement, the firm to have the call of £150,000 new shares, or any part thereof on which 33½ per cent. is to be paid by them on issue, subject to the Articles of Association of the Company. The Company's indebtedness to the firm to be received in payment or partial payment for the shares. The other share capital to be issued without the firm's consent." I think you will be justified in taking the earnest advice of the Board upon this matter, and sanctioning this agreement, in the complete assurance that the interests of the Company have been protected and advanced by it in every way, and that it cannot fail to have any but a beneficial effect upon the fortunes of the Company. I may, perhaps, just remind you in conclusion, that should the agreement be rejected by you, we shall find ourselves placed in a most embarrassing position, from which I cannot tell how we should extricate ourselves. I beg to propose the adoption of the resolution which I have read to you.

Mr. TENDRON seconded the motion, which was carried unanimously.

A Large Electric Mining Plant.

The electric power plant being put in by the Virginus mine at Ouray, Col., is one of the largest in the world, and is the first electric power of such extensive proportions used in mining. A power house has been erected at the confluence of Imogene and Sneffles creeks, which is 30 x 60 feet. Two heavy copper wires are poled from here to the mine, 19,000 feet away, to convey the electricity to the mining and milling machinery. In the power house are two dynamos of 400 horse power each. The dynamos are operated by water power, obtained through a mile of pipe line, driving two mammoth Pelton wheels. The water is taken from Canon creek, and has a fall of 600 feet. The pipe line is nearly complete, and the machinery is about all in place, and it is expected to start the new plant in about three weeks. All the machinery for mine and mill will be operated by electricity at both the Virginus and Terrible mines. The largest Knowles duplex mining pump in the world will be placed at the tenth level of the Virginus mine, and will be operated by a 50 horse-power motor attached. This pump will throw a 6-inch column of water 700 feet, to the adit level, or surface. A great amount of money is expended in the large electric plant, but the reader will readily understand how well this expenditure is justified when it is stated that the Virginus and Terrible have been using 13 tons of coal per day, at \$20.80 per ton, every day in the year. This vast expense will now be cut off. The coal supply has been packed from Ouray, a distance of 13 miles. The cost to the Virginus for fuel since 1887 would give any individual all the money he would ever need to live in luxury. Since electric power has been used in mining it would have saved several hundred thousand dollars at the Virginus. With the new power plant and pump the Virginus will be one of the best systematized mining enterprises in America. —Black Diamond.

The Hauraki Gold Mining District, (Northern Section) Auckland, New Zealand.

BY D. H. BAYLDON, M.E., THAMES, NEW ZEALAND.

[Proceedings of the Federated Institute of Mining Engineers.]

The Hauraki mining district, in the Province of Auckland, New Zealand, lies between latitudes $36^{\circ} 25'$ and $37^{\circ} 40'$ S., and longitudes $175^{\circ} 20'$ and $176^{\circ} 0'$ E., is about 100 miles long by an average of 25 miles wide, the greater portion being known as the Coromandel Peninsula.

It is bounded easterly by the Pacific Ocean and westerly by the Firth of Thames and the beautiful fertile valley of that name, the extreme northern limit being Cape Colville, and extends southward beyond Te Aroha mountain, 3,173 feet high.

The country for the most part is rugged and mountainous, covered with dense forests of ever-green trees, intersected by innumerable streams of various sizes, which afford at all times of the year a magnificent supply of pure water for mining, timber floatage, and domestic use.

The timber on the ranges is of vast extent. Here is found the celebrated Kauri pine, from 70 to 150 feet high, some of the boles of which have been known to exceed 20 feet in diameter. Other valuable timbers exist, suitable for building, cabinet, fencing, mining, and domestic purposes. The Kauri gum, a hard substance, somewhat like amber in appearance, and which is exuded from the pine of that name, is found in the existing and extinct forests in great profusion, and is a source of wealth to the country; it is exported to England and America, where it is highly esteemed and manufactured into the finest carriage varnish.

The valleys are salubrious and fertile, composed of deep alluvium, and are, to some extent, cultivated by the Maori miners, and settlers. The crops are such as are grown in England. All English fruits are abundant and good. Stock of all descriptions thrive and do well.

The situation of the Hauraki mining district is some-

FIG. 2.

what unique as a gold-field, the facilities offered for the export or import of material being all that can be desired, sea carriage being afforded almost up to the pit-mouths in the instances of Thames and Coromandel. The noble and picturesque harbour of Auckland is within 40 miles of the former and 30 miles of the latter town, where ships of any draught may lie and discharge at the wharves with the greatest safety.

Local steamers carrying passengers and freight run at regular and frequent intervals between Auckland, Thames, Coromandel, and Mercury Bay, from whence they distribute their freight to other points by drays, coach, or river.

The Thames or Waihou River drains the south-western section of the district: it is navigable for small steamers and craft for some 60 miles on its course. Inside the river, for several miles, exists a natural harbor, suitable for vessels up to 600 tons register. The land is rich and fertile, forming a broad valley 15 to 20 miles wide, perfectly flat, intersected by other streams. The ground is somewhat swampy, which is natural from its conformation, but for the most part easily drainable. Here the *Phormium tenax*, or native flax, covers large

areas and fringes the river banks; the white pine, a very useful timber, is also abundant. Much of this land, especially in the upper part of the valley, is reclaimed, and flourishing farms are to be seen as far as the eye can reach.

The lands on the eastern bank of the river are now nearly all occupied by a hardy, industrious class of farmers, many of whom are now and have in days gone by been engaged in mining pursuits.

FIG. 1.

Such is a brief outline of the Hauraki mining district, and it will be seen that mining and agriculture can go hand in hand. Twenty years ago it was a howling wilderness: now there are many small towns, and villages, the country dotted over with farms, the miners penetrating the hills in search of the precious and other metals, and the country made accessible by roads and bridges. The future of such a country is not hard to predict.

The principal centres of mining in the district are Coromandel, Hastings, Thames, Hikutaia, Ohinemari, (comprising Karangahake, Owaharoa, Waihi, and Waite-Kauri), Te Aroha, including Waiorongomai.

Gold was first discovered at Coromandel in the year 1851, and attracted a considerable number of miners, but through native troubles, and superior attractions elsewhere, the diggings became comparatively deserted until 1861, from which time mining has been carried on, with more or less success, to the present day. Considerable tact was required to be displayed in dealing with the natives to induce them to open their land to the miners for prospecting and mining. All these difficulties have for many years been overcome; cordiality and mutual good understanding now prevails on both sides.

Coromandel is situated on a beautiful little harbour, and mining for gold is carried on from the sea beach across the main range toward the east coast. Coal and other minerals are found throughout the district, but are undeveloped.

The principal gold mines are the Kapanga and Coromandel (English companies), Tokatea, West Tokatea, Royal Oak, Pride of Tokatea, Success, Onslow and many others.

Throughout this district the outcrop of a main or mother reef can be traced for many miles, averaging 25 to 30 feet thick, with a northerly strike and westerly underlie of about 45 degrees. It has not been found payable, but the lateral veins, which have an east and west strike and northerly dips of varying angles, are found to yield good paying ore, which, as a rule, lies in "chutes" or chimneys of varying widths and depths. These lateral veins vary from a few inches to several feet in thickness. The Tokatea Mine, in which this system of reefs is well illustrated, is situated on the main range, the highest point being about 1,400 feet above sea-level; it is worked by adits down to a depth of 900 feet, the lowest level being about 2,500 feet long.

The Kapanga Mine is situated about one mile westward of the main reef; two well defined reefs have been

worked from the surface to a depth of 550 feet. It is worked from a main shaft, properly equipped with pumping and winding machinery, capable of going to a much greater depth.

Some of the ore from this mine was exceedingly rich, and in places highly charged with metallic arsenic, which, in the course of amalgamation, had the effect of sickening the quicksilver, which, consequently did not do its work, entailing considerable loss of the precious metal.

The Coromandel Mine is situated on the sea-shore, above high-water mark. The company are doing good work, opening up new blocks 280 feet below sea-level.

The pumping and winding machinery is situated on the sea-beach, the mine being worked by two shafts about 450 apart. The inland shaft, being about 120 feet above sea-level, and the deepest by 100 feet is connected by sweep rods to the pump-

ing engine, the water being pumped to the 180 feet level, from whence it runs back to the seaward shaft, and is then forked to the surface. The drainage water from the mine is settled in a reservoir and used for milling purposes.

The country rock in which the lodes are encased is of igneous origin, of a tuffaceous nature, highly charged with undecomposed pyrites, below water-level sometimes coarse and rotten, in other cases fine grained and hard, and has been termed "tuffaceous sandstone," and in this class of country rock only have the lodes been found payable. Alternating with the tuffaceous sandstone are to be found slates, diorite-porphry, and felsites.

Hastings, some 20 miles south of Coromandel, is a small mining township. Considerable quantities of gold have from time to time been found in the various gullies and spurs off the main range, chiefly in decomposed slate and tuffaceous sandstone. No deep mining of any consequence has been done here.

Thames is the center and most important locality in the Hauraki mining district. It was opened for mining in the latter part of the year 1867, and has been constantly worked since that date.

The population was at one time 10,000 to 11,000, but being chiefly composed of miners, otherwise diggers, who are a roving set of men, attractions elsewhere has reduced the number to something like 4,500 at the present time.

The auriferous portion of the Thames is several miles wide, and the distance back into the ranges uncertain, as not more than about six miles in a straight line has been explored for gold.

The country rock is composed of tuffaceous sandstone, alternating with diorite and andesite dykes. The latter are extremely hard to penetrate, and are known locally as "hard bars." The highest points in the locality are chiefly composed of this class of rock. The country is broken and irregular, intersected by gullies and cracks, which afford excellent opportunities for mining by means of adits or tunnels.

The lodes have varying strikes between 10 degrees and 80 degrees northeast, and usually underlie to the north-west of angles ranging from 22 degrees to 80 degrees from the horizon. They are variable in thickness, from a few inches to 20 feet, and all are more or less gold-bearing while traversing the tuffaceous sandstone.

The pay ore, as is usual, lies in "chutes" of varying lengths and depths, the best paying reefs have hard walls, to which the quartz, in a great measure, adheres, which gives the impression that when the rocks were in a state of fusion they emitted certain gases, which, with other combinations when the rocks cooled, caused the deposition of gold in the veins. The deposition of gold is especially noticeable where lateral breaks occur, and which have the appearance of water channels.

Where the break does not cross the lode the chute of rich ore is of much greater extent, and the lode richest on that wall which has been subject to fracture, and the deposit of gold becomes weaker the further it recedes

FIG. 6.

History Museum on Sunday afternoons, and thus afford all who wish to avail themselves of the privilege, an opportunity to read and study the sermons from the *work* of the Creator, which there lie open for perusal, written as it is in the only original, universal and uncorrupted language, and one with which the whole human race is more or less familiar.

Sermons, silent it is true, yet—especially to the student of the language—unsurpassingly eloquent—sermons which, I venture to say, would be more intelligible and more interesting to most minds, and no less useful, if regarded from a moral and educational standpoint, than those sermons from the *Word* of the Creator, which some at least of the afternoon Museum congregation may have listened to during the forenoon in Church, which may, or may not, have been either interesting or eloquent. As official reports are seldom read, I may be excused for quoting here the following remarks which were made in my annual official report in 1885, on the subject of Museums:—

“Referring to Museums, it may not be out of place to call attention to what is being done elsewhere in this connection. In New South Wales, one of the Australian Colonies, with a population of only about 850,000, I find from a report recently received, that the appropriation for the year 1884 for the maintenance of the museum in Sydney was £8,750 stg., or about \$43,750. The figures relating to the visitors to the Sydney Museum are also somewhat remarkable. They are for 1883; 137,401 being for week days, 86,114, Sundays, 51,287. Apparently—I might have said conclusively—showing that there is a very large class of persons whose daily avocations prevent them from taking advantage of the means of instruction and the ennobling influences which these studies of nature's wonders in a well-arranged museum cannot fail to afford. In this matter the Australian Colonies must be conceded to have made an advance in the promotion of knowledge and civilization. I would respectfully suggest for the serious consideration of the Government the desirability of permitting the Ottawa museum to be open for visitors on Sunday afternoons.”

No action was taken on this suggestion and in 1888 the subject was again referred to in my official report, when I said:—

“The result of this course having been adopted at the Australian Museum in Sydney shows that on the 52 Sundays—afternoons only—the daily attendance was largely in excess of that of the 313 week days; the average being 986 on Sundays and only 275 on week days. Such a fact needs no comment, and I venture again to express a hope in the interests of education and knowledge that the time is not remote when a similar experiment will be tried in Ottawa.”

There will, doubtless, be strong objections urged against such action, based chiefly, if not entirely, on the very erroneous, but unfortunately very prevalent, idea that a museum is a place of amusement, whereas it is essentially as much a place of instruction as are the Churches and the Sunday Schools. And the principal difference between them, concisely stated, is, that in the Museum the *work* and in the Church and Sunday School the *word* of the Creator is expounded. This admitted, as I think it must be, there seems no obvious or intelligible reason why the one establishment should be closed and the other opened on the Sabbath. And now with your permission I shall make a few remarks on the past and present position and prospects of the Ottawa Museum. In the early reports of the Survey, there is so far as I am aware, no reference to the Museum nor any statement of its first establishment, or of its annual growth—like Topsy, however, it “grewed.” In the preface to the *Geology of Canada*, 1863, on pages xiii to xv it is briefly described, and we learn that “the Museum has gradually assumed a value and importance which at the present time (1863) render it second to few on the continent for the special purpose to which it is devoted.” It was then divided into two parts Mineralogical and Paleontological, about 1,500 species of fossils were exhibited, and an unrecorded number of specimens of rocks and economic minerals. It was located in an old dwelling house on the corner of St. Gabriel Street and Fortification Lane. Prior to 1873 no record was kept of the number of visitors, but in that year 1,000 names were recorded; in 1874, 1,017; in 1875, 1,728; 1877, 1,980; 1879, 1,603, 1880, 1,183.

In 1881 the Museum was removed from Montreal to its present location in Ottawa. In 1882 9,000 persons visited it; and during the year just closed the number of visitors has reached 18,300. During the past twenty years, it has been my constant endeavour to increase the practical and the educational value, as well as the attractiveness and popularity of this Museum.

In this endeavour I have always received most valuable co-operation and assistance, without which my endeavours would have been fruitless, from the gentlemen who have been, or still are, associated with me in the work. Judging from the number who now visit the Museum, I am, I think, justified in assuming that our united efforts have have met with some measure of success, notwithstanding

the difficulties and hindrances that have been encountered, incidental chiefly to the very inadequate accommodation and unfitness of the building for the purposes to which it has been adapted. A far more serious consideration, however, in connection with the building, is its location and surroundings. These are now such as to constitute an ever present danger of the whole of this large and invaluable collection being at any moment destroyed by fire. This danger can easily be avoided by taking prompt action with a view to erect as speedily as possible a suitable and wholly isolated and fire proof building to receive the collection. Should it in the meantime be destroyed the loss would be wholly irreparable, while the few thousand dollars required to place it in safety are comparatively quite insufficient, and I can only express an earnest hope that no injudicious parsimony will be permitted to interfere with the accomplishment of this important public work.

The establishment of the Royal Society in 1882 through the enlightened and active influence and interest which was shown by the Marquis of Lorne in the promotion and encouragement of all matters pertaining to literature, science and art, and the subsequent recognition of the important functions of the Society by Parliament, in providing funds to defray the cost of publishing the annual record of its proceedings, was a memorable event in the progress and promotion of literature and science in Canada, and a boon for which all literary and scientific workers in the Dominion must always be grateful. Now, one, and by no means the least useful, of its functions is that of constituting a headquarters, or nucleus from which sympathy, support and encouragement is extended to local societies, and where annually a report can be made, and a record published of their several proceedings. Nineteen societies are now affiliated with, and send delegates to the annual meeting of the Royal Society. Of these there are four in Montreal, three in Quebec, four in Ottawa, three in Halifax; and one each in Toronto, St. John, Belleville, Hamilton and Winnipeg. There is, also, the very useful Entomological Society of Ontario whose meetings are, I believe, held in London. Only eight of these societies receive a small annual subsidy from the respective Provincial Legislatures while the others are entirely dependent on the members subscriptions and on voluntary contributions. Nearly all the Fellows of the Royal Society are also members and active workers of one or other of these local societies. I have not been able to ascertain the total aggregate membership of the local societies, but it must constitute a numerous and influential body of workers, probably two to three thousand strong, whose labours are certainly deserving of a larger share of material support and recognition than has hitherto been accorded them by the public, and it is to be regretted that in some instances even the small public grants hitherto awarded have been withdrawn. However, we must not be discouraged or turn aside, but continue the good work, patiently, industriously, honestly and hopefully to the end, forgetful of self and seeking only the truth as it is in nature, actuated by these motives our cause will triumph and our work will meet its reward.

* NOTE.—The considerable increase in the number of visitors between 1875 and 1879 may be ascribed probably to two causes: The awakened interest in the mineral resources of the country caused by the preparation of the collections for the '76 Exhibition in Philadelphia and the '79 Exhibition in Paris, and secondly to the subsequent publication of the descriptive catalogues of the exhibition, and also the publication of the lists of the Survey publications in 1873, 1876 and 1879. The much greater increase after removal to Ottawa from '82 to '89 is in great part the result of the scope of the Museum having then been enlarged to embrace Natural History or Biology as well as Geology and Mineralogy, and thereby having been made interesting and attractive to a much larger number of persons. The list of publications just issued, of which copies are on the tables, gives further details respecting the Museum and the Survey publications to the close of 1889.

British Returns of Colliery Labor.—An analysis of the return of the hours worked at collieries made for the Miners' Federation of Great Britain, by the checkweighers and lodge secretaries in the federated districts, shows that at 679 collieries, employing 183,720 men underground, the general average time worked at the face by the collieries is 8 hours 25½ minutes per day; boys, 8 hours 48 minutes per day; and day laborers, 8 hours 49 minutes. The average time spent in travelling underground is stated to be 39 minutes daily. According to the parliamentary return compiled by H.M. Inspector of Mines the average number of hours worked per day from bank to bank by men and boys engaged in getting minerals in the United Kingdom is 8½ hours, as compared with 7½ hours, the average time per day actually worked at the face. The usual number of days worked in the United Kingdom averages 5½ days per week.

MACHINERY AND INVENTIONS.

The Well's Light.

There has long been a demand for a powerful, portable lamp or service in situations where night work is required to be carried on, as in the case of repairs on railways, in the construction of engineering work, in open quarries, in building operations, upon docks, wharves, etc., and until lately, the only methods of illumination in use for these and similar purposes have been the employment of hand lamps and torches, which are, in nearly all cases, utterly inadequate for the purpose; or of the powerful central lights as represented by the lime light and the arc electric light. The last named devices, while affording ample illumination for the required service, have certain disadvantages with which all of us are familiar, the principal of which are the blinding effect upon the eyes, of their intense and concentrated light, and the blackness of the shadows which they throw, and which result in rendering objects, not directly illuminated by the light, more obscure than where a number of lights of feebler intensity are employed.

To meet the needs of night service in situations where a strong but diffused light is the desideratum, powerful oil lights have been devised, ingeniously controlled by mechanical feeding devices, so as to place at the service of the workman a light of any desired intensity, and with a large volume of flame. In this respect these oil lights differ radically from the powerful concentrated light afforded by the electric systems. They are capable of yielding an equal amount of light with the last named, but the light, being made by a flame of considerable volume, the eye is not paralysed by its dazzling glare, and the shadows cast are not objectionable in their contrast with the directly illuminated spaces.

We describe and illustrate herewith the construction and operation of one of these oil lights for night service, or for underground works, that has achieved a remarkable success in England, and that is now being introduced into Canada by Mr. James Cooper, Montreal. It is known as the Wells Light, and the accompanying description will be made intelligible by consulting the illustrations.

The Wells Light involves the use of Kerosene oil, confined under pressure in a strong reservoir, from which it may be automatically fed to the burner, the reservoir containing a quantity of oil capable of burning a number of hours. Fig 1 shows a sectional view of one of the Wells Lights. It consists of a steel tank, constructed so as to be air-tight, and therefore capable of holding the

oil without leakage under considerable pressure. When the light is to be operated, oil is first pumped into the tank by the aid of the pump M, until it is about two-thirds full. By this action the air in the tank is compressed, and the pump is again used, if necessary, to develop the pressure up to 20 pounds as will be indicated by the gauge; and with this pressure the light will run for four hours without further attention.

The mode of starting the light is as follows: Preparatory to opening valve B., by which oil is admitted to the burner, a small quantity of oil is placed in the dish C, and ignited, while a chimney and back guard cover the burner, (as shown in fig. 1, A), thereby directing all the heat into it. When the burner has become sufficiently heated, which takes seven or eight minutes, the valve B is opened, when the pneumatic pressure drives the oil through the stand pipe A, running from near the bottom of the tank to the burner. When the oil reaches the generating rings of the burner, it is vaporized, and, passing out of the jet N, through the rings, keeps them at a suitable heat continuously to vaporize the oil as it flows to the burner, and as an excess of heating surface is allowed in the rings, the light burns as well in bad weather as in fair weather, and is neither affected by the rain cooling them partially, nor by the wind, as the burner can be swiveled to run with it.

The whole apparatus is simple and strongly made. Any laborer, after one lesson in its use, can manage it successfully. The Wells' lights are given solely into the care of the laborers on the Manchester ship canal in England, and are said to be the only artificial lights used on this great engineering enterprise, where they have contributed materially to the rapid prosecution of this work.

Fig. III, illustrates the No. 1 Wells Light, showing how readily it can be carried about the work from place to place, where the job is not very extensive. Different arrangements have been devised to adapt the lights to all

purposes. Among these may be mentioned a carriage to carry it about; a tripod stand so that the light may be situated away from the tank when this becomes necessary or desirable; and different kinds of posts for elevating the light in fixed places.

The following valuable and useful features are claimed for this invention: It gives a powerful light, is portable, entirely self-contained, requiring no exterior motive power, is simple in construction, easy to manage, and requires little attention.

Steam Boiler Tests as a Means of Determining the Calorific Value of Fuels. *

By D. W. Robb, Amherst, N.S.

It will be recognized by those who use large quantities of fuel, especially of bituminous coals, that they differ very greatly in value, even coals which are taken from adjoining areas give very different results, so that it is sometimes very puzzling to the consumer and difficult to decide upon the merits and proportionate values of the fuels within his reach. It is likewise difficult to determine when the greatest practicable amount of work is being obtained from the fuel, and consumers are frequently subjected to great loss from the want of this knowledge. There are three recognized methods of determining the calorific value of fuels, viz.: by chemical analysis, by the use of calorimeter, and by actual measurement of the water evaporated by a definite amount of fuel in a steam generator. By the first method, it is possible to ascertain the constituents of the fuel in their various proportions, and to determine the theoretical heat value when combined with a definite proportion of pure oxygen, and approximately to compute the amount of heat which would be converted into work when combined with ordinary air, and consumed under usual conditions. But this becomes a complicated problem, as will be seen when it is considered that the heat absorbed and wasted in heating the non-combustible constituents of both the air and the fuel must be taken into account, and that these wastes vary with the amount of superfluous air admitted through the grate, and with the proportion of noncombustible matter in the fuel, therefore, any estimate of the practical value of a fuel deduced from chemical analysis can only be approximate. In testing fuels by a calorimeter, a sample of the fuel mixed with chlorate of potassium is placed in an open mouthed copper vessel, which is submerged open mouth downward, like a diving bell, in a vessel containing a measured quantity of water, combustion of the fuel takes place and the heat produced is absorbed by the water, the total quantity of heat being determined by the rise in temperature of the water. This method has some advantages over an analysis and, if care is exercised in the selection of samples to be tested—or a large number of samples tested—is perhaps the best means of establishing a theoretical standard calorific value of a fuel, but the quantity tested is necessarily small and may not fairly represent the fuel; it also leaves out the heat absorbed by the non-combustible portions of the air and fuel, which is an important factor in the combustion of fuel, under ordinary conditions. The method by which the fuel is consumed under actual conditions and in large quantities, in evaporating water in a steam boiler is generally regarded as a test of the efficiency of the generator, rather than as a test of the value of the fuel, but somewhat extended observation of the performance of various steam generators using similar grades of coal has convinced the writer that the steam boiler test, when properly conducted, is quite as valuable as a means of determining the calorific value of fuel, and of comparing various fuels as for finding the efficiency of the generator; in fact, the latter is the more uncertain of the two, because, unless a boiler is tested with a fuel of a known calorific value, it is impossible to arrive at its actual efficiency or to compare it fairly with any other form of generator. In testing the heat value of fuel in an ordinary steam boiler two elements of uncertainty are introduced, viz., loss through imperfect combustion of the fuel, and the escape of gases at a higher temperature than the atmosphere, but as these losses, as well as the heat absorbed by the noncombustible portions, the air and fuel are unavoidable in the present state of science, they should be taken into account in making a practical test of fuel, and strict accuracy only requires that the loss be uniform and minimum in result. Practical experience teaches that almost perfect combustion may be attained in any of the common forms of steam generator by careful and regular stoking with a proper air supply; and, that the skill necessary to produce this result is possessed by many ordinary stokers, who have no knowledge of the laws which govern the combustion of fuels, will doubtless be admitted by many persons who have observed locomotive firemen or others, who are compelled to get a high rate of steam production. It is of course impossible to transfer all the heat produced in combustion to the water

in a generator, because the gases cannot be reduced below the temperature of the water or steam within the generator, and a certain temperature above the atmosphere is necessary to produce draught in the chimney, but it is quite possible to so proportion the grate surface to the heating surface of the boiler that the gases will be reduced to a certain minimum temperature, and maintained at that temperature during a test. The temperature may be indicated by a pyrometer or high registering thermometer at the base of the chimney, and the rate of flow of the gases may be ascertained by the use of a draught gauge. Frequently an attempt is made to analyse the waste gases, this gives an uncertain result on account of the difficulty of getting representative samples of the gases, but from observation and examination of many tests the writer believes it unimportant, if the stoking and air regulation receive proper attention. The surface of the grate should be so proportioned to the heating, or heat absorbing surface of the generator that the gases will, when they reach the uptake, be reduced to say 400° Far.; the skilful firing and air regulation will produce practically perfect combustion, and uniform temperature. It is not of so much consequence either, as some people imagine, what kind of generator is used. The brick furnace is supposed to possess an advantage in maintaining the temperature necessary to perfect combustion, while contact with the cooler surface of a water lined furnace is supposed to prevent ignition of the volatile hydro-carbons coming from some fuels, producing carbonic oxide; but the writer is convinced that, by a proper regulation of the fire, so that the air will pass through and the gases pass over a bed of hot coals, or incandescent carbon, with frequent and even distribution of the fuel, as perfect combustion may be, and is, obtained in a water lined furnace as in a brick one. The water lined furnace avoids the radiation of heat and admission of air, both of which are an uncertain but certainly wasteful feature of the brick furnace. Steam boiler tests, although attended with some difficulty, are quite within the reach of ordinary consumers, and deserve to be better understood and used more than they are. In addition to their value as a method of determining the heating properties of fuel, they furnish the best possible means of ascertaining the condition and efficiency of the generator, and of checking, and if necessary correcting waste on the part of the stoker. It is desirable that such tests should be made frequently, because steam boilers are very liable to deteriorate and become wasteful, especially when set in brick, through the cracking of the brick walls, as well as by the coating of heating surfaces with scale or other deposits on the inner, and soot or ashes on the outer surfaces. It is quite practicable for steam users to have tests made by their engineers and ordinary assistants, but it is preferable to have an occasional test made by a professional engineer who has had experience in making such tests, as he will have gained special knowledge which will enable him to detect and locate imperfections in the generator more readily than those unaccustomed to such work. The writer would suggest to steam users the following practice: That one or more tests be made by an expert to determine the efficiency of the generator, and that he may direct any necessary repairs or corrections in the generator. After this has been done, and a standard of efficiency established, a good water meter should be inserted in the water supply pipe, so that a record of the water used may be continuously kept, and the stoker or engineer should keep a log and make daily reports of the coal consumed and the water evaporated. The meter readings will need correction, if absolute accuracy is desired, but for practical purposes this may not be necessary. It may seem like unnecessary labour and expense to weigh all the coal used, but a short trial will undoubtedly prove its value, as it will not only indicate, constantly, the condition of the generator, but to a certain extent, be a check upon the working of the engine and the amount of power used by the establishment, and it will furnish a constant incentive to the engineer, stoker, and those in charge of the steam machinery, to improve its working and reduce the amount of fuel consumption to its lowest limits. A general practice of this kind throughout the country would induce a rivalry in the saving of fuel, parallel to that found in marine practice, where it is claimed a horse power is produced by from one and a-half to two pounds of fuel per hour, instead of four to ten pounds,—the last named quantity being not uncommon in ordinary steam plant, and would in course of a few years cause an enormous saving to the country, as well as to individual consumers. Rules governing the standard system of boiler trial, adopted by the American Society of Mechanical Engineers may be found in the transactions of that Society, vol. vi, 1884. The following simple instructions will enable any steam user to conduct a test of his boilers for the purpose of comparing the values of fuels, etc., after the efficiency of the generator has been established by a complete test by an expert, (observations of the quality of steam, strength of chimney draught and analysis of gases are omitted as they require special instruments and skilled manipulation).

INSTRUCTIONS FOR CONSUMERS' TEST.

A test to be of any value should be continued for not

* A paper read on Dec. 8th, 1890, before the Nova Scotia Institute of Science, Halifax, N.S.

less than ten hours, and will require the constant attention of not less than four persons besides the regular attendants, appointed as follows:—One or two men to weigh the coal, and one or two to attend to and weigh the water; one clerk to keep the log of the coal and water weighed, and one clerk to record the pressure of steam, temperature of feed water, temperature of chimney gases, and to keep a gross account of the coal and water as a check to the regular log. These should be careful men, well posted as to their duties. Three good platform scales will be required, and two tanks, or clean tight casks, to weigh water in. Preparation should be made so that the water can all be delivered into the two tanks, which are placed upon two platform scales, and the water pumped alternately from the tanks to the boiler. A piece of hose attached to the suction pipe of the pump or injector will be convenient to transfer from one tank to the other. It will be advisable to procure from reliable instrument makers one or two accurate thermometers for the purpose of taking the temperature of the feed water and chimney gases. The temperature of the feed water should be taken by inserting a brass or copper cup in the feed pipe near its connection with the boiler. This cup may be filled with oil and the thermometer set in the oil. The temperature of the cold water before it enters the injector or feed water heater should also be taken. Great care should be exercised that all scales, steam gauges, etc., are correct, and that there are no leaks about the pumps, pipes or boiler, by which any water may escape without being evaporated. Steam leaks are not material except as misrepresenting the consumption of the engine. The temperature of escaping gases may be taken by inserting a brass or copper pipe, with closed end in the smoke connection where it leaves the boiler. This cup, which should reach the centre of the escaping gases, may be filled with oil and a high registering thermometer placed in it. Previous to the hour for starting, say at 6.30 o'clock, steam should be up to the working pressure and the tubes and all surfaces and flues should be swept clean. The ash pit should be cleaned and the first charge of kindling and coal, or the fuel to be used, should be weighed, every man should be at his post, those who are to note the various readings provided with ruled forms for recording the gross, tare and net weights of fuel and water, and others for the pressure of steam, temperatures of feed-water and escaping gases, which should be noted every quarter hour. At the hour for starting the height of the water in the boiler should be marked on the gauge glass, so that it may be brought to the same place at the close of the test, and the fire should be drawn quickly and replaced with the weighed kindlings and fuel, (wood kindlings are generally taken at $\frac{1}{10}$ the value of coal by weight). The working of the boiler may be conducted as usual in every way, the stoking should be done carefully, so that no waste may occur through dead spots or holes in the fire, or uneven distribution of fuel. If the fire is too thick, some of the gas will pass off unconsumed for want of sufficient air, and if the fire be too thin, too much air will be admitted. The draught or air supply should be regulated by the ash pit doors or registers, and an even fire and steady pressure of steam maintained throughout the test. If work is to be suspended at mid-day, or any time during the test, the drafts may be closed, the fire banked, and an attendant left in charge who will regulate the fire if necessary, so as to keep the pressure constant. At the close of the test the water should be brought to the same level in the boiler as at the beginning and the fire withdrawn and deadened quickly with water. The remaining coal should be weighed and deducted from the quantity charged to the boiler, and the ashes may also be weighed. The net weights of coal and water may then be summed up and the result of the test ascertained and recorded in the following manner:—

Test of boiler at	
day of	18
Kind of boiler	
Dimensions	
No tubes	
Size of fire-box	
Grate surface	sq. ft.
Heating surface	do
Height of chimney	
Size of chimney	
Duration of test	hours
Kind of fuel	
Boiler pressure (by gauge)	lbs.
Temperature of feed-water entering boiler	degrees Far.
Temperature of feed-water entering pump or injector	degrees Far.
Temperature of escaping gases	degrees Far.
Total fuel consumed	lbs.
Percentage of moisture in fuel	per cent.
Equivalent dry fuel	lbs.
Total weight of ash	lbs.
Equivalent combustible	lbs.
Total water evaporated	lbs.
Water evaporated per hour	lbs.
Water evaporated per pound of dry fuel	lbs.

Water evaporated per pound of dry fuel from and at 212° lbs.
 Water evaporated per pound of combustible from and at 212° lbs.
 Horse power developed.

The above particulars are determined in the following manner:—The pressure of steam and temperature of feed-water and gases are taken from the average readings of the same.

The total quantities of fuel, ash and water are taken from the net summing of log, great care being taken that no error is made. The percentage of moisture in fuel is determined by drying a sample of the fuel for 24 hours and getting the difference between the wet and dry weights, which difference is multiplied by 100 and divided by the weight of sample before drying.

The equivalent dry fuel is found by multiplying the total quantity of fuel by the percentage of moisture and dividing by 100, which is deducted from the total quantity of fuel.

The equivalent combustible is found by deducting the total amount of ash from the total quantity of fuel.

The water evaporated per hour is the total quantity of water divided by the number of hours duration of test.

The water evaporated per pound of dry fuel is the total quantity of water divided by the total quantity of dry fuel.

The water evaporated per pound of fuel from and at 212° is found by multiplying the water evaporated per pound by the total heat, or heat units, of one pound of steam at the average pressure, less the total heat of one pound of feed water at the average temperature of feed water before entering the pump or injector, and dividing the product by 966, which is the total heat in units, of one pound of steam at 212°.

The horse power is determined by deducting the total heat units of one pound of feed water at the average temperature before entering pump or injector, from the total heat units of one pound of steam at the average pressure, and multiplying the product by the quantity of water evaporated per hour and dividing by 1110.343 (which are the heat units required to raise one pound of water from 100° and evaporate it at 70 lbs. pressure), the quotient should be divided by 30, which will give the horse power according to the American standard. The following is an example of this method of finding the horse power:—

Total quantity of water evaporated=2,000 lbs.
 Steam pressure (by gauge) 60 lbs.
 Temperature of feed water before entering pump, 40°
 Total heat of 1 lb. of steam at 60 lbs. pressure=1175.710 B. T. U.
 Total heat of 1 lb. of feed water at 60 lbs. pressure 40° =8 B. T. U.
 $1175.710 - 8 \times 2,000 \div 1110.343 + 216.33 \div 30 = 70$ H. P.

Example of finding the equivalent evaporation from and at 212°.

Water evaporated per lb. of fuel, 10 lbs.
 Average pressure by gauge 60 lbs.
 " temperature of feed water, 40°
 Total heat of one lb. of steam at 60 lbs. pressure, 1175.710 heat units.
 Total heat of one lb. of feed water at 40°, 8. heat units.

Example:

$$10 \times 1175.710 - 8 \div 966 = 12.08 \text{ lbs}$$

In comparing fuels as well as in comparing the efficiency of boilers, the quantity of water evaporated per pound of fuel from and at 212° should always be used. The actual quantity of water evaporated per pound of fuel will differ with variations of temperature of the feed-water entering the boiler, and also with the steam pressure or temperature at which the steam leaves the boiler, but the quantity evaporated per pound of fuel from and at 212° allows for these variations and gives a true comparison of the value of fuel if the efficiency of the generator is constant, or of the efficiency of the generator if the calorific value of the fuel is known. The temperature of saturated or dry steam always corresponds with the pressure, but if from any cause the steam be not dry, it will carry away less heat in proportion to weight, or, if the steam be superheated by contact of the products of combustion with the steam surface of the boiler, it will carry away more heat. In either case the result of the test will be vitiated unless the quality of the steam be ascertained and accounted for. This is usually done by means of a calorimeter, one of the best of which, known as the "Barrus Calorimeter," was designed by Mr. Geo. H. Barrus, of Boston. No attempt has been made to ascertain or account for the quality of steam in the simple test given, because it would complicate the work, it is intended that a professional test of the boiler should include this important item, and, if the boiler is found to be abnormal in this respect, the expert should either give directions for the removal of the cause, or provide a formula for the correction of the error due to wet or superheated steam in future tests.

The following table will be found useful in ascertaining the equivalent rates of evaporation, horse power, etc.:—

STEAM TABLE.	125	352.8	1189.555	FEED WATER.	200	168.7
	120	350.	1188.695		190	158.6

Remarkable Increase in the Value of Platinum.—Five years ago platinum was seldom used in the United States, being employed only in the evaporating stills for the concentration of sulphuric acid and in the manufacture of jewellery. It was then \$3 and \$5 an ounce, six months ago it had increased to \$14, and it has now gone up to \$20 an ounce, which is only a few cents less than the gold quotation.

Uses of Asbestos.—Asbestos in its various forms is a very useful substance, and can be employed very handily in many ways at the lecture table and in the laboratory, says Professor Markoe. Shredded or carded asbestos will serve as an excellent filtering material, used just the same as paper pulp. Asbestos twine is used in binding together parts of apparatus exposed to fire and strong acids. The professor often prevented a crack in the neck of a retort or flask from spreading by binding it with asbestos yarn or twine soaked in solution of sodium silicate, and then treated with a solution of calcium chloride, a perfectly insoluble cement being thus formed. Asbestos wool mixed with solution of silicate of sodium makes a fire-proof cement of great strength, also serves to mend cracks in stoneware. It can be made insoluble by subsequent treatment with calcium chloride, silicate of calcium being formed. Asbestos paper and card can be obtained of all degrees of thickness, and can be well employed as substitutes for wire gauze and the sand bath in small operations involving the heating of glass vessels. Asbestos paper and silicate of sodium are very useful for mending cracks in glass apparatus.

Pneumatic Hoisting.

By H. A. WHEELER, ST. LOUIS, MO.

[Transactions of the American Institute of Mining Engineers.]

The great depths attained by some of the older mines, and the much greater depth at which they will have to be worked in the not distant future, strongly emphasize the imperfect and inadequate character of our present hoisting practice. The depth of 3,000 feet having been exceeded at several places, and 4,000 feet almost reached at Mons, Belgium, we are brought to face the unpleasant fact that in these instances the mere dead weight of the rope itself is not only the principal part of the load on the winding engine, but that the limit is being rapidly approached at which the ordinary cylindrical rope cannot safely be used, lest it break by reason of its own weight.*

pean engineers have reduced the consumption of fuel by different systems of counterbalancing, while by the use of tapered ropes they have very much extended the practical working length of the rope before it will break of its own weight. Theoretically the tapered rope has no such limit, but practically, as used at present, it has its limit, though very much exceeding that of a cylindrical rope.

In attempting to replace the rope system of hoisting, on account of the disadvantages alluded to, the French engineers have tried the endless chain system of Saint Jacques at Montlucon, the Mehnman engine at Anzin and Rohnchamp, and the Blanchet pneumatic system at Epinac. The two former systems were found in practice to be too complicated, too expensive in repairs, and too dangerous, and have been abandoned; and while the pneumatic system was not a success, the failure to find workable coal and the consequent incompleteness of the plant explain that result and leave this most promising of the new systems still entitled to consideration.

The pneumatic system is entirely free from the above mentioned defects of ropes, since it is not subject to the influence of depth, and gives no initial heavy dead load due to the weight of the rope, being in this respect a theoretically perfect medium for "pulling" mineral out of the deepest possible mine. These advantages seem so great, in view of the rapidly increasing depth of mines,† that a sketch of the practical application of this system at Epinac, France, which the writer had an opportunity of visiting last summer, is herewith given. A complete description giving the details of the construction, calculations, and operation of the plant, with illustrations, will be found in the *Annales des Mines* of September and October, 1878, Paris.

THE BLANCHET PNEUMATIC SYSTEM.

The pneumatic system, as installed at the Hottinguer shaft of Epinac Colliery, Saone-et-Loire, France, was designed by M. Zulma Blanchet, who was the managing director of a large company operating several mines and a local coal railroad at Epinac, in central France. The first suggestion for thus using air was made in 1852 by M. Gruner, the director of the School of Mines of St. Etienne, and a model constructed on this principle was exhibited by M. Cave at the first Paris Exposition; but the credit of first putting the system into practical operation is due to M. Blanchet. The vertical Hottinguer shaft, started in 1863, had reached a depth of 2,133 feet in 1871, and was to be sunk to a depth of at least 3,300 feet; but unfortunately for the company and the entire mining world, no workable coal has thus far been met with, so that instead of developing a large mine to raise over 700 tons a day, it still remains (1889) a prospect, while the plans of M. Blanchet were not satisfactorily completed on account of the great expense of installation and the discouraging nature of the explorations. So, although a thorough test of the system was not made, according to M. Blanchet's more advanced ideas, yet sufficient experience was gained to furnish evidence as to the practical desirability of this novel system of extraction.

M. Blanchet's plan was to have one or two continuous air-tight sheet-iron cylinders or large tubes extending from the bottom to the top of the shaft. See sketch. Within the cylinder moved a piston, to which was hung a cage with as many decks as desired, nine decks being used at Epinac, while suitable air-tight doors open out at each level for allowing the decking of the cars. It was operated by exhausting the air from above the piston, and as the lower side was open to the atmosphere, the piston was raised by the difference in pressure of the atmosphere and the vacuum produced by the air-pump. For lowering, it was merely necessary to allow the air to re-enter above the piston by a throttle-valve while the speed could also be regulated by throttling the escape of the expelled air from below the piston. It is obvious that, neglecting the friction of the piston, any lifting capacity desired can be obtained, for a given vacuum, by merely increasing the diameter of the tube, while the speed of hoisting will depend on the capacity (size of speed) of the exhausting engine to maintain this vacuum.

Besides its legitimate function as a hoisting device, M. Blanchet was enthusiastic about the additional services it would perform in cooling and ventilating the mine through the introduction at each trip of the volume of air represented by the depth of the shaft and the diameter of the cylinder. He also proposed to make a special use of the system in fiery coal mines by closing all openings of the mine, and then by working the exhausting engine, to aid

the disengagement of the fire-damp which is supposed to take place freely during a barometer depression. He urged that on subsequently re-opening the mine and sweeping out the gas with the regular ventilating appliances, the mine would be made much safer.

EXPERIMENTAL PLANT.

Before the erection of the final plant, an experimental one was built consisting of a tube $6\frac{1}{2}$ inches in diameter by 95 feet high connected with a 12 horse-power vacuum pump. With a vacuum of 18 to 19 $\frac{3}{4}$ inches, a velocity of 1,181 feet per minute was attained in lifting 264 pounds, which is equivalent to any efficiency of about 80 per cent.† of the engine power. The friction of the piston in the tube amounted to 10 per cent.

The load of 264 pounds was made up as follows:—

	Pounds.	Per cent.	Per cent.
Dead Load { Piston.....	31.9	= 12.1	
	Cage.....	37.4	= 14.2
	Cars.....	7.9	= 3.0
Live Load, or Coal.....	186.8	= 70.7	
Total.....	264.0	= 100.0	100.0

From these very encouraging figures the following estimate was made for the final plant, in which the tube was to be 63 inches diameter:—

Piston.....	2.25 gross tons =	18.75 per cent.	
Cage.....	3.00 " =	25.00 " "	
9 cars, at 0.25	2.25 " =	18.75 " "	
Coal.....	4.50 " =	37.50 " "	
Total....	12.00 gross tons =	100.00 per cent.	

The time required for the round trip at the greatest contemplated speed, 3,280 feet, was estimated at 7 minutes, as follows:—

	Min. utes.	Sec. onds.
To load at bottom (3 deckings).....	0	30
To hoist.....	3	00
Discharging at surface (3 deckings).....	0	30
Descent.....	3	00
Total time for round trip.....	7	00

If this speed could be maintained, it would give a capacity of 33 $\frac{3}{4}$ gross tons per hour from a depth of 3280 feet with a single tube. With two tubes, the capacity would not alone be doubled, but a great advantage would be gained by operating them together, the exhaust engines alternately exhausting and discharging from one into the other, practically counterbalancing one piston with its cage, cars, etc., against the other. Accordingly, M. Blanchet designed the Epinac plant, to be operated with two tubes.

FINAL PLANT.

The tube or cylinder was made of sheet iron, 0.27 to 0.31 inch thick, in circular sections $4\frac{1}{2}$ feet in length, having butt joints for the vertical seams, secured by countersunk rivets. The sections were bolted to one another by flanges made of angle iron, using rubber packing to keep the joints tight.

The alignment of the tube was preserved and its weight sustained by suitably connecting it to the shaft timbers, so that the tube stood vertical, within the enclosing special timbering, without bearing any excessive weights on its base.

Cast-iron doors, opening outward, were placed at the landings, it being arranged at Epinac to load three decks at once, in order not to lose too much time in handling the nine cars, as each deck only accommodated one car.

The chairs or catches for sustaining the cage at the landings passed through stuffing boxes, to prevent any leakage of air, and were operated in the usual manner.

The total weight of a single tube, 63 inches diameter and 1,979 feet high, with all its doors, valves, chairs, hanging rods, bolts, etc., was estimated at 342 gross tons, of which the tube alone amounted to 245 $\frac{1}{2}$ gross tons.

The train, or moving members, consisted of an upper double piston, to which was hung the cage with its nine decks, and a lower or guiding piston, the whole having a vertical length of about 52 feet. The pistons were packed with leather, backed by springs, and the whole train was made as light as possible by using steel in its construction.

For indicating the position of the piston, push, or touch buttons were located along the tubes, which, on being touched by the piston in moving past them, made an electrical connection indicated on a series of tell-tale dials in the engine room. Barometers and second chronometers were also used as additional safeguards for indicating the position of the cage. The latter did so in a rough way, by the time usually required to make a trip, while the former were connected with the tube about

† A subsequent statement gives 18 horse-power instead of 12, as above, for the vacuum pump; and only 50 per cent. instead of 70.7 per cent. of the gross load as live or coal load, while the gross efficiency is given as 40 per cent.; as the live load is only half of the gross load, 20 per cent. is the net or coal raising efficiency for the system, beginning with the vacuum pump as the source of power or 100 per cent.

While we Americans are not apt to borrow trouble by anticipating the problems of the future involved in the latter feature, the first named defect of the present system of hoisting deserves our immediate attention, because it calls for an excessive consumption of power and consequent increased cost for fuel and plant. The Euro-

* Taking the weight of a cast-steel hoisting rope of $1\frac{1}{4}$ inches diameter at 2 pounds per running foot, and its breaking strength at 84,000 pounds, it should, theoretically, sustain itself until 42,000 feet long before breaking from its own weight. But taking the usual factor of safety of 7, then the safe working length of such a rope would be only 6,000 feet. If a weight of 3 tons is now hung to the rope, which is equivalent to that of a cage of moderate capacity with its loaded cars, the maximum length at which such a rope could be used, with the factor of safety of 7, is 3,000 feet or

$$2 \times 6000 = \frac{84,000}{7} \therefore x = 3000 \text{ feet.}$$

† To appreciate the rapid rate at which the mines in some of our older camps are growing deeper, it may be well to mention that the Comstock lode, of Nevada, was first worked in 1850, and had reached a depth of 3250 feet by 1886, when work was abandoned in the lower levels. The Lake Superior copper district, which has several very deep mines, was first worked in 1884, and the Tamarack Mine, though only started in 1882, has already attained the depth of 2820 feet, and is sinking two more shafts that are expected to cut the lode at a depth of 3700 feet within four years (a rate of over 1000 feet per year has been attained at this mine in shaft sinking). A new mine, called the Tamarack Junior, is likely to reach a depth of over 4000 feet within the next ten years, if a chute of copper is found that has thus far been very persistent.

every 100 yards, and so showed the progressive position of the cage. Suitable valves at the landings, connecting with the atmosphere and the exhaust engine, permitted the safe and easy landing of the cage, on their being operated by the lander, while safety valves were used at the top and bottom of the tube to check slowly the velocity of the cage, and prevent the piston from knocking out the tube heads, in case of inattention on the part of the lander.

After seven months spent in erection, a single tube, 63 inches diameter was ready for trial in 1876, it having been decided to first build only a single tube, and to subsequently add a second, making it a duplex plant, if found desirable.

A temporary exhaust engine was improvised from a former hoisting engine of 64 horse-power, which raised a gross weight of 6 tons in 20 minutes, with a vacuum of 9.45 to 9.85 inches of mercury, from a depth of 1,970 feet.

The piston was lubricated with very dilute soap-water, containing 0.27 per cent. soap, and 0.1 per cent. oil, and from 11 to 55 pounds were used per trip, depending on the dryness of the atmosphere.

Of the 64 horse-power developed by the exhaust engine, 75 per cent. was utilized during the period of ascent, but as no useful work is accomplished during the preliminary exhausting of the tube, in producing the vacuum by which the train is finally started, the average efficiency was 56 per cent.; and as 50 per cent. of the gross load was coal or net weight, this gives a net efficiency of 28 per cent. of the engine power, with a single non counterbalancing tube.

The final exhaust engine is a duplex, direct, horizontal engine of 739 horse-power, with 46 x 46 inches steam cylinders, 46 x 113½ inches air cylinders, and when making 23½ revolutions per minute, with 75 pounds steam pressure, cutting off at ½ stroke, has a calculated efficiency of 70 per cent. With this powerful engine the time required to make a round trip, going a distance of 1979 feet, was as follows:—

	Min-utes.	Sec-onds.
For the ascent.....	2	30
For the descent.....	6	00
For making the landings.....	3	00
Total time for round trip.....	11	30

The load raised was as follows:—

Weight of pistons, cage, etc	6,600 lbs.	} = 54 per cent.
Weight of 9 cars @ 550 lbs.....	4,950 lbs.	
Weight of 9 car loads coal @ 1,100 lbs.....	9,900 lbs.	} = 46 per cent.
	<hr/>	
Total... ..	21,450 lbs.	= 100 per cent.

The live load or coal amounts to 46 per cent. of the total weight raised.

With the conditions for hoisting at the other shafts at Epinac, using tapered manilla ropes, winding on reels, with one cage counterbalancing the other cage, M. Blanchet makes comparisons at different depths of rope and single tube pneumatic hoisting as shown in table on following page.

These figures are favourable to the pneumatic system, as with only a single tube the useful efficiency is greater in all cases, and decreases at a less rapid rate than with rope hoisting for increasing depth, while the coal consumed per ton of coal raised is in consequence very much less in the pneumatic than with the cable system of hoisting. With two tubes, where the dead loads of the pistons, cage, cars etc. (amounting to 54 per cent. of the total load), counterbalance one another, the efficiency would be correspondingly greater, and *very much higher* than in cable hoisting. This feature was unfortunately never developed at Epinac, as the second tube was not erected, and hence the minimum working cost of the system was not attained.

ADVANTAGES OF THE PNEUMATIC SYSTEM.

M. Blanchet sums up the advantages of the pneumatic system of hoisting as follows:

1. It permits the working of mines at all depths.
2. It gives, with a single tube, a higher efficiency than cables, which increases as the depth increases; with two tubes, the efficiency will be still greater.
3. It does away with ropes, and is therefore more economical.
4. It assists in the ventilation of the mine, with the lowering of the temperature resulting therefrom.
5. It permits, while the miners are absent, converting of the entire mine into a pneumatic receiver, and by the creation of an artificial barometric depression, facilitates the removal of the escaping fire-damp and so make the mine safer.
6. It leaves the shaft readily accessible for examination, repairs, and sinking, without interfering with the hoisting.
7. It removes the danger of accidents through the breaking of cables.
8. It gives greater security to the miners in ascending and descending.
9. It not only permits the lowering of the men, timber, filling, etc., without the expenditure of any power,

but utilizes the work produced by the descending train in imparting a higher pressure to the air escaping from the bottom of the tube.

The only disadvantage, in M. Blanchet's opinion, is the greater cost of installation, which in his first estimate for the Hottinguer shaft he places at about 20 per cent. greater than that of the rope hoisting.

The statements made thus far concerning the Epinac plant have been quoted from the several brochures* by M. Blanchet, and as he was an enthusiastic advocate of the pneumatic system, his claims in its favour demand investigation.

CRITICISM OF THE PNEUMATIC SYSTEM.

I. The statement that the pneumatic system has no limit in depth is certainly true theoretically, and there seems to be no practical difficulty in applying it to the greatest depth attainable. This is the salient and vital idea of the system, which would seem to entitle it to precedence over ropes after a certain depth has been attained.

II. That the efficiency of the pneumatic system is greater than that of cables must necessarily follow *if the depth is very great and the ropes are not counterbalanced*, as the principal part of the load is then the cable; but if the ropes are counterbalanced, especially if by an under rope, then the pneumatic system cannot be equal in efficiency to cables, if both systems are operated on the double or duplex plan, so as to counterbalance the dead weight of the cage, cars, etc. For if we start with equal amounts of energy in the delivery of the steam cylinders of the exhausting and winding engines, in the one case this must overcome the appreciable friction of the stuffing box, piston and valves of the vacuum cylinder, suffer the decided waste of energy due to the clearance of the valves, ports, etc., overcome the slight frictional resistance of the air travelling through the connecting pipes, valves, and tubes, do the useless and uncertain work of removing the air brought in by leakage at joints, valves, stuffing boxes and doorways of the tube, and overcome the friction of the pistons in the tube

Depth in Feet.	Cable Hoisting.			Pneumatic Hoisting.			Coal Consumed per ton Coal Extracted.	
	Horse Power.			Horse Power.				
	Expended.	Utilized.	Efficiency Per Cent.	Expended.	Utilized.	Efficiency Per Cent.	Cables.	Pneumatic.
820	225	90	40	800	360	44	55 lbs.	16'5 lbs.
1,640	500	180	36	862	360	42	110 lbs.	33'0 lbs.
3,280	800	224	28	985	360	36	220 lbs.	66'0 lbs.

before it begins to be usefully expended in raising load. In the other case a direct first motion hoisting engine must overcome the friction of the shafts of the drum and sheaves (well lubricated), expend the small amount of energy required to bend the rope about the drum and sheaves, and overcome the slight friction of the cage in its guides before it can be utilized in useful work. While these losses of energy can be expressed in an equation, the coefficients by which they should be modified have not all been satisfactorily determined. M. Blanchet puts the losses in the vacuum pump alone at 25 per cent. (and the makers say 30 per cent.), while the friction loss of the piston in the tube was 10 per cent. in the experimental tube, though undoubtedly it is much less in the large tube when well lubricated.

The entire loss of energy and rope practice usually range from 10 to 20 per cent. Leaving out of consideration the greater efficiency of a direct-acting hoisting-engine over a vacuum pump, and assuming that the friction of the air through the pipes, valves, and large tube do not consume more power than that required to bend the rope over the sheaves and drum, we still have the inappreciable friction of an ordinary cage in its vertical guides, which is almost *nil* with proper alignment as against the decided and unavoidable friction of the air-tight piston in the tube. So that while M. Blanchet's figures speak strongly for the greater efficiency of a single tube air system, when compared with a duplex cable hoist they will not bear investigation. His own broad and sanguine statement that the efficiency of the vacuum pump plant will be as great as 70 per cent. at once gives an effective or coal raising efficiency of only 32.2 per cent., when it is remembered that only 21.450 of the load raised is coal, whereas he quotes about 42 per cent. for the pneumatic system and 36 per cent. for the cable system. As he does not give the details by which he obtained his figures, further errors cannot be specifically pointed out.

The actual fuel consumption, when the pneumatic plant was operated at Epinac, amounted to 10 tons per day in raising from 10 to 50 tons of coal; but as the fuel was inferior coal, and as hoisting in carrying on prospecting is very irregular as well as petty in amount, this excessive

consumption cannot fairly be charged against the system, though it certainly does not encourage the hope of a marked economy in fuel.

III. That there will be no expenditure for ropes in the pneumatic system follows necessarily, together with the avoidance of their renewal every six to eighteen months. But with proper size of drums and sheaves, feed screws to prevent side cutting of the rope as it winds on the drum where the engine is close to the shaft, and springs at the capping, a first-class steel rope should, as it does in the best English practice, last from two to five years, or raise from 200,000 to 600,000 tons of ore or coal before it is worn out. But while the cables are dispensed with, the new feature is introduced of a thin wrought-iron cylinder, held by countersunk rivets, which deteriorates every time that the snugly-fitting piston passes through it. The piston packings, of which there are three sets, need frequent removal, as they must be kept tight to avoid leakage; while there is quite an appreciable daily outlay for lubricating the tube, as from ten to fifty-five pounds of 3 per cent. solution is used per trip. If the shaft is not so wet as to prevent the decay of the timber, the heavy timbering system required to sustain the tube will also need renewal, at no small cost, while the expense of maintaining a very large, fast running, expanding exhausting engine, with all its valves, will be greater than that of an equivalent direct hoisting engine. Unfortunately the Epinac plant was not operated long enough to develop these maintenance expenses, but it is quite evident that the repairs and renewals of a cable plant will finally be decidedly less than those of the pneumatic system.

IV. The aid to ventilation is of some advantage, particularly in metal mining, where only natural ventilation is so largely depended on. With a tube 3,000 feet long and 63 inches diameter, there would be delivered into the workings during a round trip of twelve minutes, a volume of 5,425 cubic feet of air per minute, which *positive acquisition* would be no insignificant item; and the deeper the shaft the greater would be the volume of air

expelled at each trip. In coal practice, however, this amount of air would be entirely too small to be entitled to much consideration.

V. The novel application of the exhausting engines, through the medium of the tube, to the production of an artificial barometric depression throughout a tightly sealed mine, is at least attractive to miners troubled with gas, and undoubtedly would be advantageous in some cases. Where the gas is generated in the goaf or old rooms, and consequently its escape into the workings is facilitated by the lowering of the atmospheric pressure, a benefit will be derived in thus frequently forestalling nature and keeping the air safe. But where the gas is being given off by the slow continuous escape under great pressure from the coal (which is the case most frequently, though, fortunately, is usually not so dangerous), or where the gas results from blowers due to falls in the roof or breaks in the floor (the most dangerous instances), no good will result in thus turning the mine into a vacuum chamber. It is also obvious that in very extensive workings the time required to produce an appreciable lowering of the pressure of such a huge volume of air would exceed the period of an off-shift, while no repairing or other off-shift work could go on, on account of the danger of gas, with the ventilation at a standstill. Hence only Sundays or holidays could be used for this purpose during the regular working of the mine, which is not frequent enough to make it perfectly safe. If the proof is badly broken, especially if the breaks connect with the surface, the application will be useless, while in many cases it will be difficult to prevent excessive leakage into the mine at the shaft entrances. This novel feature, therefore, is capable of only a few applications in the gas troubled mines, and even then may not be valuable on account of the magnitude of the workings. Finally, in any mine troubled with gas from any source, the regular ventilating facilities should be on so large a scale that the gas is so diluted as to preclude any danger of explosion, except from sudden large blowers.

VI. The ease of repair of the shaft is greater in the pneumatic system, since it is possible from the capstan engine to make any inspections or repairs in the shaft,

short of renewing the tube, without in the least interfering with the hoisting.

VII. While accidents due to cable breakage disappear, a more serious danger arises in the much greater vigilance required on the part of the lander in keeping trace of the noiseless invisible cage, as the tell-tales, though ingenious, are hardly satisfactory. The unreliability of electric sounders or tell-tales in damp shafts are well-known, while barometers are very crude aids in making a landing, where the margin for dropping the cage on the chains is so small. Although a large safety-valve is placed at the top and bottom of the tube to slowly cushion the cage and prevent accidents arising from carelessness in over hoisting, it is evident that the momentum of a ten ton train will demolish any such device should it pass the terminal landing with its speed unchecked in spite of any reasonable margin for over-hoisting. Furthermore, while the breakage of the ropes has by no means ceased to occur, good devices can be used, at least on vertical shafts, that act promptly and arrests the cage in case the rope breaks, if *reasonable attention* is bestowed upon keeping the safety-catches in good condition.

VIII. That the pneumatic system will be more exempt from accident than the cable system seems hardly probable in view of the previously mentioned want of a reliable, continuous system of recording the positions of the cage in the tube. Overwinding or carelessness on the part of the landers or engineers, quite a frequent cause of accidents at present, seems likely to become even more dangerous in the pneumatic system. The trouble arising from the distortion of the shaft with consequent jamming of the cage in swelling or heaving ground, would be exaggerated in the pneumatic system, with its train fifty-two feet long; for while the tube stands free by itself away from the shaft lining, the displaced timbers supporting it would so distort and throw it out of line as to readily cause the jamming or sticking of the train in the tube.

The Epinac was not operated sufficiently long to develop reliable figures as to accidents with the pneumatic system. It created, however, a favorable opinion among the miners as being at least a very pleasant way of being raised and lowered.

IX. The want of merit in the last claim over rope hoisting, when properly operated, is self evident, and needs no comment.

How well these claims were realized at Epinac is most quickly appreciated upon finding a winding engine busy in the same shaft in carrying on the exploratory work, while the pneumatic plant along side of it, with one tube and its massive vacuum engine in complete running order, has been idle for several years, as it was too expensive in operation.

One item of excessive cost in the pneumatic system, to which M. Blanchet makes no allusion, is the greater labor expense per ton hoisted. If worked at full speed, the Epinac plant could raise about 250 tons in ten hours.

The force required was as follows: four firemen, one engineer, one runner, two landers, four cagers, one machinist; total, thirteen men, or $\frac{2.50}{13}$ — 20 tons per man in the hoisting department.

Winding engines of even less power, hoisting from as great a depth, frequently raise from 1,000 to 1,500 tons in ten hours, with a force no greater than two more cagers, or hoisting from 60 to 100 tons per man, making the labor charge for hoisting $\frac{1}{3}$ to $\frac{1}{2}$ of that of the pneumatic system.

THE COST OF THE PNEUMATIC SYSTEM.

Before alluding to the outlay involved in the Hottinguer shaft, it is necessary to deal with the great difference between French and American practice in plant expenditure.

The French mining engineers, with usually an abundance of cheap money at their disposal, are characterized by their very heavy outlays in permanent plant. They make everything to last, and also, be it said to their credit, design, with regard to appearances and artistic effect. Hence there is a large outlay at the Hottinguer shaft for a masonry lining for the entire shaft, and a very large, substantial, brick shaft house, with a high brick chimney for the boilers which would be regarded as extravagant in America. Moreover, in executing their plans, they have recourse to a staff of trained engineers that is as yet far in advance of our so-called "practical" way of doing the same work. For these reasons, there has been a lavish outlay at the Hottinguer shaft, that is, by no means, to be all charged against the pneumatic system. The statement by one of the directors, that the experiment had cost them \$500,000, refers to the entire outlay at the shaft. The expense of the pneumatic system proper, is given to me by M. Nagerode, the present superintendent, as follows:

Tube and connections.....	\$ 70,000
Erection, including winch engine, etc.....	74,000
Exhausting engine (or vacuum pump).....	42,000
Total.....	\$186,000

These figures show that the erection of the tube cost more than the tube itself, and that the tube (with its con-

nection) cost about \$35 per running foot. As there are 775 pounds metal per linear foot this shows a factory cost of the tube of about $\frac{1}{4}$ cents per pound, a figure that is about half what such work would usually cost in this country, when it is remembered that 72 per cent. of the metal required makes up the countersunk rivetted main tube. It is probably safe to say, that such a tube erected complete in this country would cost over \$100 per linear foot. This does not include the vacuum engine, boilers, housing, and the primary cost of first sinking the shaft. So that a pneumatic plant, complete, would call for at least double the capital of a rope hoisting plant of equivalent grade, and when finished, aside from probably much greater operating expenses (fuel and repairs), would not have a fifth of the capacity of the cable system, as reckoned on the actual figures of the Epinac plant.

SUMMARY OF THE PNEUMATIC SYSTEM.

With a so much heavier investment of capital, with such a very small capacity compared with winding engines of equal power, and with the probability of a much greater daily operating expense, it is needless to say that the pneumatic system, as thus far developed, can not compete at all with the rope system of hoisting in spite of the theoretical and the few practical advantages it possesses over the cable system.

It is, therefore, necessary to look deeper into our American winding practice, to search for opportunities for improvements, so that the requirements for increased depth in the not distant future may be met.

CONSIDERATIONS FOR THE FUTURE.

Theory indicates that tapered ropes have no limit in depth, and consequently, that by tapering and counterbalancing, ropes may be used in the deepest mines; but practically, in using flat ropes with reels as they are now made, there is great risk of the rope slipping off the top coils and jamming down in the narrow V space between the side of the reel and the coiled rope, with dangerous consequences, if the rope tapers to half of its extreme width. By using a guide sheave to wind the rope hard against one side of the reel, this danger may be overcome, though at the expense of more rapid wear of the rope, especially of the lacing. Flat ropes are now successfully and easily made of tapering section, and perhaps a better device can be used than the above guide roller, to avoid jamming in the reel.

Round ropes are made tapering, and if the drum is grooved to properly receive the rope, it gives no trouble in winding like the flat rope. But the American rope makers do not as yet advocate round tapering ropes on account of the difficulty of manufacturing with perfect reliability, though I understand that they are made in a satisfactory manner in Germany.

If tapered ropes are ignored on account of their greater cost and because of the objections of manufacturers, cylindrical ropes may still be used for unlimited depth by submitting to the low efficiency of the system adopted at the deepest shaft of the colliery of the "Societe des Produits," at Mons, Belgium, where a duplex, first motion engine hoists from 1000 meter (3280 feet) level to the surface. At the 1000 meter level another hoisting engine, run by compressed air supplied from the surface, hoists from the 1100 meter level, the lowest producing level at present, though the shaft is being sunk to the 1200 meter level (3937 feet). The surface engine is $27\frac{1}{2}$ by $78\frac{3}{4}$ in. with a 25 foot reel, on which wind is a flat manilla rope that tapers from 11 inches down to $6\frac{1}{2}$ inches, while the cage holds only 2 cars. The air is supplied by a duplex Dubois-Francois air compressor with $15\frac{1}{2}$ inches by 59 inches air cylinders, run at 18 revolutions per minute and furnishing air at 45 to 50 pounds pressure.

While such a system of establishing new hoisting stations with engines run by compressed air whenever the rope becomes inconveniently long (it is not counterbalanced at the above pit) can be carried on indefinitely, the outlay for plant becomes so great, the extra labor and time involved in charging cages at the intermediate levels are so expensive and the efficiency of a compressor plant is so low, with its consequent heavy fuel consumption, that the cost of installation is almost as great as in the pneumatic system, while the operating expenses are probably greater.

IMPROVEMENTS IN AMERICAN HOISTING PRACTICE.

The simple, first motion, cylindrical rope hoist, constructed with the latest improvements, possesses a limit so far beyond our present practice, when properly designed, that there need be no anxiety for a very long time to come as to its range of application. It possesses the advantage of a minimum cost of installation, the cheapest operating plant and the greatest capacity of all known systems of hoisting. Thus far, in America, our hoisting practice with few exceptions, is anything but creditable. We are behind European practice. The following suggestions show how we can still very much exceed our present limits:—

(a) *By Counterbalancing the Dead Load.*— If the system is arranged duplex, or with a double compartment shaft, the dead loads of the cage and cars counterbalance one another, and if the ropes are counterbalanced, which

is perfectly effected by an under-rope, then there remains only the work of raising the coal or live load plus the small effort necessary to overcome the friction due to the dead load (rope, cage, cars). Hence only a moderate sized engine is called for, instead of the large engines that are so frequently seen at our deep mines. Thus, in the Lake Superior copper district, where over 7000 tons of copper rock are raised per day from a depth of 1000 to 2500 feet, 60 to 75 per cent. of the engine power is wasted (except at two mines), by using single hoists in which a skip weighing from $1\frac{1}{2}$ to 3 tons, and a rope weighing $1\frac{1}{2}$ to 4 tons, are hoisted each trip in bringing up $1\frac{1}{2}$ to 2 tons of rock: while the energy of the descending 3 to 7 tons of skip and rope adds to the expense by wearing out the brakes by which the speed is kept within a safe limit. Such a grossly extravagant system of hoisting not only calls for an excessively large hoisting engine, but the fuel consumption is about three times as great as it should be to do the above amount of work.

(b) *By Using a Smaller Factor of Safety for the Rope.*— For hoisting ropes the factor of safety should be made as low as possible, consistent with uncertainty in manufacture, abuse in use, sufficient margin to permit the reduction in section due to wear, and a working strain safely below the limit of elasticity. For the larger the factor of safety used, the greater is the section of the rope for a given load. This increases the dead load due to the rope's own weight, which even if counterbalanced augments the mass to be put in motion each trip, with the consequent strain in starting.

The increased size of the rope decreases its life, as the greater the diameter, other things being equal, the more severe are the bending strains and the quicker the rope destroys itself.

Now the factor of safety usually taken for steel ropes is 7, with 5 as a minimum and up to 10 as a maximum. For standard practice I would advise 4, provided: that the diameter of the sheaves and drums be at least 100 times the diameter of the rope for slow hoisting and at least 150 times for fast hoisting; that a spring* be interposed between the cage and the rope capping, to ease the sudden strain in starting; that the rope be kept properly oiled; and that the rope be inspected daily for its entire length, for careful observation of the condition of the wires and prompt rejection of the rope when a certain number are broken.

By thus easing the bending of the rope by the use of much larger sheaves and drums than is usual in American practice; by removing the shock due to starting; and by frequent oiling to prevent corrosion, they would last at least as long as they now average in American practice. By lagging the sheave with wood; by having the engine set far enough from the shaft to avoid side thrust and consequent lateral wear of the rope at the sheave and drum (carrying the rope on wooden rollers from the sheave to the engine if necessary); and by carefully maintaining the entire hoisting plant in proper alignment, the life of the rope would probably be found to be considerably greater than at present, in spite of the much smaller factor of safety used. By thus using a factor of safety of 4, the safe working length of the $1\frac{1}{2}$ inch cast-steel rope, when sustaining a 3-ton cage load, will be increased from 3,000 feet to 7,500 feet.

By decreasing the speed of hoisting, the wear of a wire rope is diminished; but this necessitates increasing the load to maintain a given output in the same time. Aside from the other disadvantages of excessive load, the maximum size of the cars used is frequently fixed by conditions that it is not economical to change in order to use large cars. Hence the more rapid wearing out of the ropes due to high speed in deep hoisting is willingly tolerated, in order to secure the capacity and economy due to fast hoisting; and the tendency of the times is to use larger and more powerful engines in order to obtain higher speeds as the mines become deeper; so that this method of prolonging the life of a rope is not in favor at present.

(c) *By the Use of the Best Material for the Rope.*— Fiber and iron ropes are no longer used in deep hoisting in American practice, but the term "steel" covers a very broad range of material used in our present practice. The very soft steel ropes certainly possess the greatest flexibility, but they are deficient in strength, as the material has a breaking strength of about only 60,000 pounds to the square inch. The best grade of plough steel, on the contrary, has a strength of 300,000 pounds per square inch, but does not always give satisfaction as used with sheaves only 50 to 100 times the diameter of the rope, since the wires break too readily under such sharp bending. But if used with sheaves and drums 150 to preferably 200 times the diameter of the rope, and if the wires are laid at an easy pitch with the "Lang lay," no such trouble should arise; with such a high grade plough-steel rope of $1\frac{1}{2}$ inch diameter, the safe working length, using

*The intervention of an elastic connection, whether a spring or solid rubber, between the capping and the cage, need not in the least interfere with a chain connection of the rope to the cage, by which latter device the cappings have to be less frequently renewed.

a factor of safety of 4, would now be about 30,000 feet, or 12,500 with 10 as the factor of safety. While this represents the highest grade of the rope that is made to-day, we see that it is possible to hoist with perfect safety with a cylindrical rope from a depth that is vastly beyond any limit that we can reach, on account of the heat alone.

The price of aluminum has not yet permitted a thorough investigation of its use for hoisting ropes as the basis of trustworthy predictions. But the unprecedented progress made in the past year in lowering the price from \$6 to \$1.50 a pound, and the encouraging outlook for further material reduction of the present price, makes the possibility of using this metal or its alloys for hoisting ropes worthy of consideration.

The very low specific gravity of aluminum, 2.6, which is about one-third of that of steel, and its great strength, make it an ideal metal for a deep hoisting rope, where a minimum of weight and a maximum of strength are demanded. If this metal or its alloys should prove to have the requisite flexibility, toughness, and strength, to make a reliable, durable, hoisting rope, the question of deep hoisting with only cylindrical ropes is again settled beyond all cavil.

(d) *By Designing the Cage with a Minimum of Weight.*—As our mines get deeper, economy demands that we shall not only use at least 2-deck cages, but rather 3 or 4 or even 6-deckers, as used at some of the deep mines in Belgium. The prevalent objection to multiple deck cages is the time required in decking, even if the decking is carried on simultaneously from two landings or levels. To deck from more than two, or at most three, landings or levels at once, makes the stations very complicated underground and is not desirable, even should the surface plant be so arranged that there is no objection to having the ore or coal coming off on two or three levels. As our American plants are too frequently arranged, the time required to run off the loaded and run on the empty car seldom takes as little as 10 seconds, more frequently over 15 to 20, and sometimes even 30 seconds; and if this amount of time is multiplied by 4 or 6, for a 4 or 6-deck cage, it makes a serious inroad into the hoisting capacity of the plant.

But with ample facilities for accommodating both

loaded and empty cars at the landings, with sufficient help to quickly handle the cars, there is no reason why we should not at least do as well as the Belgians, who load and unload a 6-deck cage in 30 seconds, or 5 seconds per deck as their regular daily speed.

A multiple deck cage, with only one car on a deck, can be designed of steel, with a very light, and yet stiff strong frame, in which the ratio of the cage weight to that of its contents is decidedly less than with our much heavier single deck cages; so that the strain on the rope due to the weight of the cage (immaterial as to whether it is operated duplex so as to counterbalance) will be a very much less for a given carrying capacity, than with our usually strong, needlessly heavy single deck cages. Hence the rope can profit by this decrease of its load in sustaining its own weight for a still greater depth.

If two cars are run on a deck with the idea of saving the time that is supposed to result therefrom in decking, the cage weight per ton of carrying capacity will be increased over that of single decks, in consequence of the much stronger bracing required for a cage long enough to carry two cars.

The six-deck steel cage at the Sacre Madame pit weighs 3600 pounds, while the weight of the 6 loaded cars is about 9000 pounds, which gives a ratio of cage weight to carrying capacity of 1 : 2.5.

CONCLUSION.

The pneumatic system of Blanchet is practicable, quite safe, and unhampered by depth; but the installation is very much more expensive than that of the cable system (approximately twice as great), while the operating expenses are greater for labor, repairs and fuel.

The cable system can be so improved by counterbalancing as to materially decrease the present expense of hoisting, while by more careful designing and operating,

†At the "Sacre Madame" Colliery at Charleroi two men and a girl pull off the loaded cars from one side of the cage, starting it off before the cage rests on the chairs, while two stout girls push on the empty car from the other side at the rate of 5 seconds per decking. The cars weigh 600 pounds each, and hold about 880 pounds, and 350 to 400 tons of coal are raised per day. The shaft is 2625 feet deep, and 80 to 90 seconds are required to make the trip, with a 600 horse-power engine (using a flat manilla rope made of 8 strands, that tapers from 12½ inches down to 7½ inches in width.)

without materially increasing the plant outlay or the operating expenses, the present type of cylindrical ropes can be used for depths beyond what we are likely ever to attain by making the weight of the cage a minimum, by using a lower factor of safety, and by adopting the strongest rope obtainable.

The possibility of using aluminum may still further increase the range of the cylindrical rope.

When our manufacturers meet with sufficient demand to encourage them to perfect the round type of tapering rope, there will then be absolutely no limit to the range of cable hoists, although the best grades of cylindrical steel ropes will carry us, with the highest factor of safety ever used (10), to a greater depth than we will probably ever be able to attain.

A Remarkable Invention.—James Morgan, mechanical engineer, at present employed at the American Iron Works, Pittsburg, Pa., is the inventor of a remarkable labour-saving device in connection with the manufacture of steel rails and armour-plates. This invention is known as an overhead feeder, for use in blooming and finishing mills. It consists of an apparatus which can be worked by a boy with a lever, by which the ingot can be sent back and forth on the roll-table, and thence through the various grooves in the rolls without the aid of any of the skilled labourers at present employed for that purpose. A first-class mill-roller and a boy to work the levers is all that is required to operate the machine. The entire workings are controlled from a pulpit where three hydraulic levers are placed; one of these controls the blooming roll-table, the other the telegraph by which the piece is conveyed to the roll-table, attached to the finishing train of rolls, and with the third lever the entire workings of the latter train are managed. It is possible and practicable by this piece of mechanism to turn the ingots into rails without the assistance of any manual labour except that mentioned. The great labour-saving involved in this device can be imagined when it is known that many of the mills employ as high as seventy skilled labourers to do the work which Mr. Morgan claims can be done by the hydraulic levers.

MINING NOTES.

Nova Scotia.

(From our own Correspondent.)

Pictou County.

The opening up of the Foord Pit continues satisfactorily, and from present appearances should be in working order by the New Year. 25 coke ovens, bee-hive pattern, will be ready to receive the coal, and others are to be built as the work progresses.

When the company are in a position to secure suitable engines, the "English slope" will be driven a further depth of from 1,600 to 1,800 feet, to connect with the Foord pit. This will make the slope some 3,600 feet in length.

At all the other mines work is steady. In our next issue we hope to review the season and publish returns of production and export.

It is rumoured that a new lift will be sunk this winter in the old slopes at the "Drummond." The sinking in the Scott pit is progressing favourably; the coal all the time said to be improving in quality.

A rumour has been current that the Nova Scotia Steel works at New Glasgow had been sold to English capitalists for \$600,000. We are authorized to say that while an English syndicate did have an option at somewhat larger figures, the matter is now off.

Cumberland County.

The Springhill collieries continue to maintain an average output of 2,000 tons per diem.

The output from the Joggins has increased from 150 to 300 tons, and the colliery is rapidly coming to the front as a producer. Long-wall working has now been in operation for nearly three months, and has been found highly satisfactory to employers and employed.

We are glad to learn that a movement is on foot to unite the colliery owners, managers, engineers and officials into a strong association for the interchange of knowledge and ideas. This is a move in the right direction, and if carried into effect, should result beneficially to the owners, the men, and the industry.

(From Press Committee Gold Mines' Association.)

Waverley District.

Mining will be resumed upon the Gue and Wilson property (Chebucto Mining Co.) in January, and a small mill will be erected as soon as the weather will permit of breaking ground and laying foundations.

The Lake View Company have completed a crushing of a test lot of clean quartz from the Taylor lode, which yielded $5\frac{1}{2}$ dwts. per ton, according to report. The mullock which has been going to the mill has yielded between two and three penny weights per ton, and has not contained more than from 30 to 60 per cent. of quartz.

Renfrew District.

Mining in Renfrew is almost at a standstill. The Free Claim owned by Mr. McDonell and others, is only working three men. The Empress Company are working only only a small force and employees report pay to be three months behind. It is greatly to be regretted that this district should be so dull; it was a magnificent producer years ago, and has had really no deep mining test made.

Central Rawdon.

Little or no news is reported from this once booming village. The Northrup Mining Company are doing nothing but sinking one shaft and prospecting winze, with a few men.

Killag District.

The Stuart property has been transferred to a syndicate known as the "Evans, Parker, McGuire and McKay." Mr. McKay will be the superintendent. The old mill is being rapidly renovated and will soon be crushing quartz from the rich lode cut in the swamp.

Lake Catcha.

The Oxford Co., under management of Mr. J. M. Reid, are putting in a fine air compressor and drill plant. The compressor is a duplex 10 x 16, of the latest Rand type and is a beautiful machine. Extensive changes and additions are also being made to the old

surface plant, including a new 40 horse-power boiler, new mortars for the mill, &c., &c. All the machinery will be placed and in working order before spring, and the "Oxford" will be expected to report "fine work" during next summer.

Yarmouth.

The whole plant and property of the "Huntington Reef Mining Co." has been offered for sale. This property had a newspaper boom last spring, and over \$14,000 was expended on machinery, &c.; now the owners are desirous of selling out at a fraction of the cost; the moral is beware of newspaper boomed mining properties.

Malaga District.

Reports from this district are not encouraging for the future. The mill and mine buildings of the Caledonia Company were destroyed by fire on Friday, the 12th inst., and the loss will not fall far short of \$15,000. It is reported that the company will not rebuild this season.

The Malaga Mining Company are working out the reserves in the Rabbit and other lodes, and are not opening much if any new ground. On this work the mine is paying handsome dividends, but the policy is a shortsighted one.

Mr. Ballou, of the Boston Gold Mining Company, reports that the new mill is expected to start on the 19th or 20th inst. The mine has been opened during the last nine or ten months and a considerable amount of quartz of good quality awaits crushing.

Gay's River District.

The work in the 50 stamp mill of the Coldstream Company is going rapidly ahead, and the completion of the mill is announced for February next. It is reported that all mining work has been discontinued for the present, thus following the lead of most of the other Evans-Parker mines, which have closed down this month.

Quebec.

The Jenckes Machine Co., of Sherbrooke, were, on 29th ult., granted supplementary Letters Patent, whereby the total capital stock is increased from \$75,000 to \$150,000.

About 100 men and boys are employed at the Temiscamingue Galena mine, in the Temiscamingue district. Main shaft sunk 100 feet, and cross cuts driving to the west in rich galena ores. One-half of concentrating plant in place, consisting of Blake ore-breaker, two pair rolls, revolving screens, crushers and four jigs, rotary table, furnished by the Fort Scott Foundry Co., etc. Mill driven by Corliss engine, built by Laurie & Bros., Montreal. Ingersoll compressor furnishes air for hoist and drills. Mill turns out from 6 to 10 tons concentrates per day (24 hours) according to ore. Shipments to the extent of 100 tons have been made to date, mainly to Ballbach & Son, Newark Smelting and Refining Works, Newark, N.J. Owners well pleased with result of their operations.

Mr. Obalski, Mining Inspector for the Province, has issued his annual report, which is published as usual, in conjunction with the Blue Book of the Commissioner of Crown Lands. A useful sketch of the progress of operations during the year is given. We are glad to see that the tabulated statement of individual outputs, which gave so much offence last year, has been dropped, for until sworn returns are compulsory, it is absolutely impossible to publish any correct statistics.

Most of the mines in the Eastern Townships and Ottawa valley have shut down during the holidays. In the main the season has been a prosperous one.

Ontario.

The Standard Oil and Gas Company of Ontario are seeking incorporation under the Companies' Act. Capital, \$1,000,000; divided into 10,000 shares of \$100 each. Alex. Dow, secretary, Stratford, Ont. This company has acquired some five thousand acres of land at, or near the Town of Stratford, and will commence drilling when fully organised.

The Collector of Customs at Buffalo, N.Y., recently submitted to the Treasury Department the question as to whether natural gas imported into that port from Canada is liable to duty under the tariff law. He says that the Buffalo Natural Gas and Fuel Company is engaged in laying a large eight-inch main pipe across the Niagara River for the transmission of natural gas produced in Canada to be used on this side for fuel purposes. In replying to the Collector, Assistant Secretary Spaulding says: "Under the circumstances mentioned the De-

partment concurs with you in the opinion that illuminating gas is wholly different from electricity, and that as it is a merchantable commodity which can be measured as readily as liquids and other gases, it would be liable to duty on importation. The proper rate of duty would seem to be that prescribed for unenumerated unmanufactured articles, viz., 10 p. c. ad valorem."

British Columbia.

At the mines of the Revelstoke Mining and Smelting Co., at Hot Springs, development is being pushed with vigor, and by the spring there should be a large quantity of ore ready for smelting. At the United there are at present 1,100 tons ready to ship, and about 500 tons at No. 1.

The South Fork of Quésnelle, Hydraulic Co. has completed the survey of the fifteen mile ditch for their works, and excavating has begun. The 16 or 18 inch pipe, pipe, which it is proposed to put in, will give a dead fall of 350 feet, and be the biggest work in sluicing in the Province. No returns are expected from the claim until next year, all that has been done being purely preliminary.

Mr. Hepden's claim, adjoining, also promises well, but the location of the ditch has not yet been completed. It will probably be 18 or 20 miles long, and a gang of men will be working at it all winter. Half a mile above is another good claim—at least the ground is promising, but as yet there is no prospect of water.

Placer mining continues to occupy the attention of the Chinese, one firm—the Chin Fan Co.—reporting \$8,000 or \$9,000 for this year. In the last twelve or fourteen years they have alone taken out \$50,000 or \$60,000.

Reports of good finds in the Omineca district continue to be received. Mr. George Kenny, an experienced miner who has just returned from that district, reports that a certain portion of Tom's Creek is yielding richly, some \$30,000 having been taken out this season by sixteen whites, together with Indians and Chinese.

The Black Jack quartz mill (water power), situated on William's Creek, opposite Stout's Gulch, shut down Nov. 6th for the winter. The managers have sent down to the Government test mill their concentrates to be worked by the chlorinating process. The company, at the 64-foot level of their incline shaft, drifted some twenty feet to the left and struck the surface formation of an eight-foot ledge, carrying a rich body of ore. Not being able to run their water mill in the winter the company held a meeting and decided to sink their incline shaft forty feet more to strike the ledge and will send the ore to the test mill to be worked this winter.

The Harkaway Gravel Diggings Company, in the same district (Barkerville), are hard at work drifting from their sixty-foot level under Broadway, the main street of Barkerville, and expect to strike it rich this winter.

Mr. A. Dick, Inspector of Mines, has just returned from Tumbo Island where he states the Tumbo Island Coal Company has struck a seam of coal at a depth of 328 feet. The seam is said to be a thick one but as yet it is not known what quality it is. It burns well and makes gas freely, but until a shaft has been put down, its value will not be known.

Dr. Hendryx, who is so well known in connection with the development of the Kootenay district, was the subject of a dastardly assault a few Sundays ago. It appears that Dr. Hendryx, accompanied by Mrs. Hendryx, went out of the house after dark; Mrs. Hendryx carrying a lantern and walking ahead, the doctor slightly behind. When a short distance from the house, a shot was fired, evidently at the doctor, by some one concealed in the shrubbery near an outhouse in the vicinity of the dwelling, the shot passing close to Mrs. Hendryx and striking the ground near the doctor. An alarm was at once given to the men in the mine boarding-house close by, but no trace could be found of the miscreants. A boat was sent over to Ainsworth, but unfortunately the people there were not warned; and, although the men in the boat saw a boat land near the Siwash lodges, the occupants escaped to the timber before they could be recognized. So far there is no clue as to the identity of the would-be murderers. There appear to have been two men, as two tracks were discovered on the road or trail the following morning, leading away from the spot from whence the shots were fired.

It is announced to be the intention of the New Vancouver Coal Company to complete, as rapidly as possible, the second shaft which they have for some time been

engaged in sinking. As soon as they attain the required depth, which is expected to be by January 15, they will put on an extra force of at least 150 men, for whose accommodation they contemplate putting up additional buildings. The Nanaimo *Free Press* anticipates that the Company will further reduce the price of their product to \$6, delivered in Victoria.

Mr. J. W. Jeusen, manager of the Laura Hydranic Mining Co., at Rock Creek, gives the following description of recent workings on the claims owned by his Company:—"Two years ago, work was started, and the sawmill and hydraulic plant erected. The gold all lies in alluvial deposits on the banks—80 to 90 feet high—on each side of the Creek. The hydraulic power is taken from the Creek itself, and has a pressure of 85 feet fall. This throws a five-inch stream from the nozzle of the pipe, with a force which cannot be conceived without being seen. It washes away the gravel and rends the huge rocks from their beds with a mighty power, which shakes the solid earth. This stream has been digging and tearing away the banks continuously since April 24, and the amount of pay dirt washed into the flumes and boxes would seem incredible were it estimated in cart loads. Despite the fact that a vast deal of machinery and work, including 27 new boxes and a large amount of fluming, has been put in the mine this year, it has not only paid expenses but turned out an overplus. This means that next year—when no more work of this kind, to reduce the profits, will occur—a very handsome return will be realized. Even as it is, it is claimed that the output of gold from this claim has been larger during the past season, than that of any other in this Province.

Our old friend Dr. A. C. Lawson, who has been resident in Vancouver for several months, has gone to California to fill the position of assistant Professor of Geology in the University of California, a post which his abilities and knowledge will enable him to fill with success. The hearty good wishes of his friends in Ottawa, and his more recent acquaintances on the Pacific, follow him to his new vocation.

Local papers give very graphic descriptions of the new works of the Hamilton Powder Company at Northfield, in the Wellington district, Vancouver Island. The quality of the powder turned out by this company is, as everybody knows, first class.

A Retrogressive and Obnoxious Measure. The Mining Tax Adopted

In the Quebec Legislature, 29th December:—

HON. MR. DUHAMEL moved the house into committee on a bill amending the law regarding mines.

MR. POUPORE said: I have an amendment to propose to the bill, but before doing so I wish to call the attention of the Government to the absurdity of the clause respecting prospectors. That class of persons complained of the want of security to them under the present law, but what would they think of the bill before them. Fancy a fee of \$5 for permission to explore on fifty acres of private property, and \$10 on fifty acres of public domain, which permit will only hold good for three months. This is an extraordinary condition. Take other countries where mining is carried on. No such fee is imposed. On the contrary every inducement is held out to a prospector to encourage him to go on with his onerous duty of making new finds. Without such work the most important dormant resource of our province would remain undeveloped for perhaps the next century. The bill in its entirety is a great mistake, and is certain to prevent foreign capital from coming in. The tax, after all, is small, but those who are already losing money in working mines will find it too much. Take the case of the Moulton Hill mine's iron pyrites, which is worked only for sulphur. In the shipment of the products of that mine to the United States quite recently the rate per ton realized was \$5.40, and the cost of delivering it was \$5.50, showing a loss of ten cents on each ton. Take another instance, the Bristol iron mines. The president of that company declared to me the other day that they lost \$1 on every ton of ore sold so far; but they expected eventually to be recouped. Is it not a fact that in all countries when mining was in its infancy, and after attempting to raise a revenue by the imposition of a royalty or taxes, they were obliged to abandon that system as it retarded the development of mineral resources, and only after the business became established and paying was the tax imposed. Certain mines are alluded to as making large fortunes and should contribute to the cost of administration or state. This may be true enough, but our province is too backward in its mineral development to attempt that system yet. If

we want to encourage capitalists to come in with their money we must be able to show examples of paying mines and for one mining organization that is making money you will find ten that are not. The Commissioner points out that in England in coal mines large incomes are received by private companies every year, and that he wants to prevent that system here and secure that the Government should receive that income and not private individuals. The comparison is an unfair one and not at all to the point. If the private companies alluded to in England had not invested their money to develop those mines they, in all probability, would have been undeveloped still, and hundreds of thousands of men would be unemployed. The effect of the proposed tax will retard the development of our mines, not, perhaps, on account of the tax itself, which, after all, is small, but because of the feeling of insecurity which it will create. The Commissioner says any predictions in this case will be like those made in relation to additional timber dues and ground rent charged by the Government three years and that the present law is so good that the lumbermen doubled their operations. If lumbermen doubled their operations last year they regret it now, because they cannot sell their timber, and the Commissioner will live to scratch a grey head before he realizes the same revenue again. In fact, I predict now that the revenue from woods and forests next year will not be two-thirds what it was last year, and every year it will become perceptibly less. Our mineral resources should be left perfectly free to develop, and when they are sufficiently advanced to bear a tax, that will be the time to raise a revenue from them and not before. I, therefore, move, seconded by Mr. Nantel:—That this House regrets that, instead of reducing the ordinary expenses of administration to its normal figure and thus saving over one and a half million dollars since their advent to power, the Government persists in imposing taxes upon our mines, the development of which is yet in its infancy, thus preventing capitalists from investing their money to assist in the development of our vast interests, and taking away from a large class of laborers a profitable and permanent source of employment. This House regrets also that instead of encouraging the prospector to make new discoveries the Government intends to impose new burdens upon that class of persons, the effect of which will be to stop further prospecting and the development of our mineral resources.

HON. MR. DUHAMEL said the measure was intended to prevent speculation in public lands. Lumber merchants were taxed, and why not miners. The law was not without precedent, as in many countries, even in the United States, such taxes were levied and still the mining industry flourished.

At the second sitting Mr. Duhamel continued for some time, but said little that was new.

HON. MR. BLANCHET followed, and dwelt upon intimate relations that existed between agriculture and the mining industry. The mines procured work for farmers in winter, and thus prevented emigration. So far the mining of phosphate and asbestos were practically the only kinds of mining that were really successful. Last year \$600,000 from this source was paid out as wages, and since it first commenced three millions had been paid out. By imposing this tax the people might be deprived of a source of revenue and the Government would get nothing.

MR. LUSSIER also declared himself strongly against the measure.

MR. ROBERTSON said: I am opposed to taxation of particular industries or the selection of particular branches of trade or commerce and placing taxation on these. Every one should contribute if taxation is necessary. I opposed the tax on commercial corporations on this principle. I am particularly opposed to taxation of those industries engaged in developing the latent natural resources of the province. These ought to be encouraged by every means in our power. To develop our mining industries, which have hardly begun yet, capital is absolutely necessary. Foreign capital is required and should be encouraged to seek our Province. To tax this capital would prevent its seeking investment. To prevent capital from coming here will have the effect of throwing thousands out of employment and obliging our labouring population to work for less wages or leave the country. In either case it will bring distress and suffering on the families of our miners. The tax proposed is unequal. To tax the net profits of any mine might be in some respects admissible, but to tax the gross output of a mine regardless of whether the product costs more to produce it than it is worth at the mines or whether there is a profit in mining, is totally unfair and unjust, upon any fair principle of justice. The ores of our country are mostly of a low grade. Copper often yields only 4 or 5 per cent. to the ton. If that is worth say \$8 per ton at the mine the net profit when manufactured is only \$1 per ton. A three per cent. tax on \$8 is 24 cents and on the profit when manufactured 24 per cent., equal to about 25 per cent. on the net proceeds of a ton of crude ore. More valuable kinds of ore are worth say \$20 a ton at the mine. The tax on this

would be 60 cents. This ore when manufactured might be worth \$10 a ton, making a six per cent. on the net proceed, whereas in the other case it would be 24 per cent. There is no kind of equality in this kind of taxation. It may be said that if mining does not pay people will abandon it; but mining operations are in all countries uncertain, and it is impossible at first to know what is underground and whether the kind of mineral sought for may not be found in greater quantity and richness when more developed. This encourages parties to go on working and gives labour to the miners and support to their families in the meantime. The proposed tax will stop all preliminary examination and working and leave possibly valuable metals undiscovered, which it is in the interest of the country to aid in developing rather than in preventing their full development. He instanced a number of large mining companies which were shipping at a loss. They made large expenditures of capital, employ large numbers of men, pay large amounts in wages, but the quality of the copper is of low grade. It is sent to the United States for smelting purposes, and were it not for the sulphur in the ore used there to manufacture sulphuric acid the works must stop. He wanted the Government to fix the tax for ten years only, so parties would know what to expect, but they refused. The tax may be doubled next year. He wanted to show the House the true state of things and let the Government take the responsibility.

MR. MCSHANE made one of his usual vehement speeches justifying the tax. Speculators were making fortunes out of our mining lands, and could surely bear a little miserable tax. He was glad this tax had been imposed. Government land had been stolen in the past, though it should have been kept for the benefit of the people. These speculators should be made to pay a royalty.

The amendment was lost on a division of 40 to 20, Mr. Lovell voting for the amendment and Mr. Lussier abetting on the ground that he had paired with Mr. Bourbonnais. The bill was then adopted.

At six o'clock the House rose.

Annotated List of Canadian Minerals.*

G. C. HOFFMAN, F. INST. CHEM., ETC.

(Continued from page 165.)

135. IRON SAND—Occurs at St. Mary's Bay, Digby County, Province of Nova Scotia. Considerable deposits of the same are met with at Moisie, Portneuf, Bersimis, Mingan, and Natashquan, in Saguenay County, and at Batiscan, in Champlain County, and elsewhere in the Province of Quebec. It is also found on the shores and islands of Lakes Superior, Huron, Erie, Ontario, and many of the smaller lakes in the Province of Ontario. Mode of occurrence, examination and analyses, T. S. Hunt, Rep. Geol. Can., 1866-69, pp. 261-269.

136. ISERITE—Constitutes a certain portion of the black magnetic sands met with at St. Mary's Bay, Digby County, Province of Nova Scotia, on the north shore and gulf of the St. Lawrence, Province of Quebec, and on the shores and islands of Lakes Superior, Huron, Erie, and Ontario, etc., in the Province of Ontario.

137. JAMESONITE—Is stated to occur near Fredericton, New Brunswick. Prof. Bailey (of the University of New Brunswick) informs me that should such be the case, it would most probably be at the antimony mine in the parish of Prince William (about twenty-five miles from Fredericton), York County, Province of New Brunswick.

138. JASPER—A red and purple striped, and red and yellow striped jasper, is abundant at St. Mary's Bay (Digby Co.), and a red variety is found on Briar Island, in the same county, on Partridge Island (Cumberland Co.), Long Island, and at Woodworth's Cove (King's Co.), in the Province of Nova Scotia. A blood-red jasper, often finely clouded, occurs near Sherbrooke (Sherbrooke Co.), a small bed of dark green and reddish-brown jasper, traversed by small veins of white chalcodony, at River Ouelle (Kamouraska Co.), and a dark red jasper in the township of Hull, Ottawa Co., Province of Quebec. This mineral also enters largely into the composition of the beautiful jasper conglomerate—consisting of pebbles of red and reddish-brown jasper and smoky quartz, thickly imbedded in a white quartzite—which constitutes great beds on the north shore of Lake Huron, Province of Ontario.

139. KALINITE—Is mentioned by Prof. Chapman as occurring in considerable abundance on the exposed faces of some high bluffs of argillaceous shale on Slate River, a tributary of the Kaministiquia, about twelve miles west of Fort William, Lake Superior, Province of Ontario.

140. KAMMERERITE—Is mentioned by Dr. Hunt as occurring, with chromite, in serpentine in the townships of Bolton (Brome Co.), and Melbourne (Richmond Co.), in the Province of Quebec.

141. KAOLINITE—Is met with in masses, sometimes half an inch thick, in fissures in a sandstone of the

Sillery formation, just below the Chaudiere Falls (Lévis Co.). The masses have a greenish or yellowish-white color and are composed of minute soft scales, very unctuous and slightly coherent. (Anal., T. S. Hunt, Geol. Can., 1863, 495). This mineral has also been found in the form of minute pearly scales of a yellowish white color, unctuous and plastic, lining cavities in a rock in the township of Acton (Bagot Co.), likewise in the Province of Quebec. Anal., G. C. Hoffmann, Rep. Geol. Can., 1874-75, p. 314.

142. KERMESITE—Occurs, in small crystalline tufts, with native antimony, stibnite, valentinite and senarmonite, in veins traversing argillite in the township of South Ham, Wolfe County, Province of Quebec.

143. LABRADORITE—Fine examples of this felspar occur in St. Jérôme, Morin—bluish, opalescent, cleavable—Abercrombie, and Mille Isles (Terrebonne Co.), also at Rawdon—as a bluish-white granular homogeneous rock—(Montcalm Co.), and Château Richer—as a pale bluish or greenish-grey rock, with red spots—(Montmorency Co.), in the Province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 478; G. C. Hoffman, Rep. Geol. Can., 1874-75, p. 316.

144. LA MONTITE—Is very abundant at Port George, where occasionally veins of three inches thickness are seen intersecting the sides of the cliff, and is also found at Margareville, where it occurs, colored green by copper, Annapolis County, Province of Nova Scotia. Anal., H. How, Am. Journ. Sci., 2 ser., vol. xxvi., p. 30, 1858.

145. LAZULITE—Has been found—massive, of a deep azure-blue color, in narrow veins traversing a greyish-white, in parts milk-white, subtranslucent quartz—three quarters of a mile east of the mouth of the Churchill River, district of Keewatin. Anal., G. C. Hoffman, Rep. Geol. Can., 1878-79, p. 2 H.

146. LEAD—NATIVE—Was observed by Prof. Chapman to occur, in the form of thin strings, in a colorless quartz from the vicinity of Dog Lake of the Kaministiquia, Thunder Bay, Lake Superior, Province of Ontario.

147. LEPIDOMELANE—Has been met with, as an associate of arsenopyrite, in the township of Marmora, Hastings County, Province of Ontario. (See under Addenda.)

148. LIGNITE—Of varying composition, but for the most part of very superior quality, of Cretaceous and Laramie age, is found over very extensive areas throughout the North-West Territories; there are also extensive Tertiary deposits, supposed to be of Miocene age, both on the coast and interior of British Columbia, which in many places contain lignites. For reference to analyses, see under "Mineral coal."

149. LIMONITE—Important deposits of this mineral are met with in Pictou and Colchester Counties, Province of Nova Scotia. As there met with, it occurs in the form of lustrous botryoidal or mammillary and stalactitic masses, which exhibit a fibrous structure when broken; also compact and lustreless, and at other times earthy. Analyses, B. J. Harrington and G. C. Hoffman, Rep. Geol. Can., 1873-74, pp. 231-234.—See also notes to "Bog Iron-Ore," "Iron-ochre."

150. LOGANITE—Occurs, in the form of short thick oblique rhombic prisms of a clove or chocolate-brown color in association with serpentine, phlogopite and apatite, in a white crystalline limestone at the Calumet Falls, Pontiac County, Province of Quebec. Analyses, T. S. Hunt, Geol. Can., 1863, p. 490.

151. LOUISITE—Honeyman, with analysis, Trans. N. S. Inst., vol. v., p. 15, 1879-82. (Needs further examination; free silica is very probably present—Dana, Min., App. 3, p. 70, 1882).

152. MAGNESITE—Has, so far, only been met with in rock masses, forming, in association with serpentine, dolomite and steatite, beds in the townships of Sutton and Bolton, Brome County, Province of Quebec.

153. MAGNETITE—Is found, often beautifully crystallized, in veins in the Triassic trap of King's and Annapolis Counties, in the Province of Nova Scotia. Occurs massive, or disseminated in crystals in dolomite and chloritic slate (sometimes constituting fifty-six per cent. of the mass) in the metamorphic strata of the Eastern Townships of Sutton, Bolton, Ascot, Leeds and Orford; in the Laurentian, in the township of Hull, etc.,—also, in the form of black sand (see note to iron sand), on the north shore of the Gulf of St. Lawrence,—in the Province of Quebec. Forms deposits, frequently of very great extent, among the Laurentian rocks, in the Counties of Frontenac, Hastings, Haliburton, Lanark, Leeds, Peterborough, Renfrew, etc., and is also met with in certain localities on Lakes Superior and Huron, Province of Ontario. Further west, important deposits occur in crystalline rocks, supposed to be of Carboniferous age, in the vicinity of Gillies Bay, south side of Texada Island, Province of British Columbia. Crystals pseudomorph after pyrite, E. B. Kenrick, Ann. Rep. Geol. Can., vol. iii., p. 58 T, 1887. Mineral associations of magnetite, B. J. Harrington, Rep. Geol. Can., 1873-74, p. 194. Analyses, by various analysts, ib., pp. 208-211.

154. MALACHITE—Has, so far, not been met with in characteristic specimens, but merely as an incrustation

on copper ores or in the form of stains and small earthy masses in copper-holding rocks. Of the numerous localities where it has been observed may be mentioned—Spanish River, where some of the quartz veins carrying chalcocite are stained throughout with green carbonate of copper; with galenite in a lode which crosses a long narrow island near the shore at Thunder Cape, Lake Superior, Province of Ontario. In the form of little fibrous masses, with sulphurets of copper, in a drusy calcite at the Black River mine, St. Flavien, Lotbinière County, Province of Quebec.

155. MALACOLITE (DIOPSIDE)—Large twin-crystals of white pyroxene, associated with cinnamon-colored garnets, are found in druses in a pale greenish pyroxene rock in the township of Orford (Sherbrooke Co.), and slender, pale greyish-green colored crystals, sometimes six inches in length, occur imbedded in limestone at the Calumet Falls (Pontiac Co.), Province of Quebec. Crystals of pale greyish-green pyroxene—often replaced on their acute lateral edges, and occasionally several inches in diameter—associated with crystals of dark green pargasite, and black tourmaline, are found at the High Falls and at the Ragged Chute in the township of Blythfield, Renfrew County, Province of Ontario. Analyses, T. S. Hunt, Geol. Can., 1863, pp. 467-468.

156. MANGANITE—Is frequently found associated with pyrolusite at Tenny Cape (Hants Co.) and elsewhere—often crystallized on that ore. It is abundant at Walton and Cheverie, and is met with at Douglas and Rawdon, in Hants County, Province of Nova Scotia. Also occurs on Amherst Island, Magdalen Islands, Province of Quebec.

157. MARCASITE—Has been obtained, by Prof. Chapman, from the walls of a vein holding galenite and chalcopyrite, in the township of Neebing, a few miles east of the Kaministiquia River, north-west shore of Lake Superior, Province of Ontario.

158. MAKEITE—Has been met with in the Triassic trap of North Mountain, Digby County, Province of Nova Scotia, and was also observed by Prof. Chapman in a gneissoid boulder from Bass Lake, a few miles north of Orillia, Simcoe County, Province of Ontario.

159. MELACONITE—Is recorded by Prof. Chapman as occurring, but in traces only, in some of the copper deposits of the Eastern Townships of the Province of Quebec.

160. MELANTERITE—Has been found in some heaps of shale and slack coal at the Glace Bay coal mines, in Cape Breton County, Province of Nova Scotia. Also occurs, in small quantities, in many of the ores from the mineral veins of Lake Superior, Lake Huron, and the Hastings region, Province of Ontario.

161. MENECHINITE—Is found, apparently in a vein-stone of quartz and dolomite, in the vicinity of Marble Lake, in the township of Barry, Frontenac County, Province of Ontario. Anal., B. J. Harrington, Trans. Roy. Soc. Can., vol. i., sec. iii., p. 79, 1882 and 1883.

162. MESOLITE—Occurs, in association with mesolite, in trap rock in the neighborhood of Port George, Annapolis County, Province of Nova Scotia. Anal., H. How, Ed. N. Phil. Journ., new series, vol. viii., p. 207, 1858.

163. MESOLITE—Is found at Port George, and is also said to be very abundant in the North Mountains, Annapolis County, Province of Nova Scotia. Analyses, H. How, Am. Journ. Sci., 2 ser., vol. xxvi. p. 32, 1858.

164. METEORIC IRON—A specimen of meteoric iron, weighing 370 pounds, was found, in 1854, on the surface of the ground, in the township of Madoc, Hastings County, Province of Ontario. Its shape is rudely rectangular and flattened on one side. The surface is irregularly pitted, and coated with a film of dark oxide. The iron is malleable, and highly crystalline in texture. A polished surface when etched by an acid exhibits the so-called Widmannstadt's figures. It contains 6.35 per cent. of nickel; small amounts of the phosphide of iron and nickel (Schreibersite) are disseminated through it, and in making a section of it, rounded masses of magnetic sulphide of iron (troilite?) were met with. Results of its examination by Dr. T. S. Hunt, Geol. Can., 1863, p. 508.

165. MICACEOUS IRON-ORE—Is found in veins in the Cobeguid Hills of Londonderry (Colchester Co.): constitutes an important deposit on the west side of the East River (Pictou Co.): is met with on Salmon River, at Melrose, Manchester, and Roman's Valley in Guysborough County, and at St. Peters, Richmond County, Province of Nova Scotia. Mingled with variable amounts of quartz and chlorite, it constitutes beds of a schistose rock in the townships of St. Armand (Missisquoi Co.), Brome and Sutton (Brome Co.); occurs in small beds in the township of Bristol (Pontiac Co.), and is also met with in the townships of Templeton and Hull (Ottawa Co.), and elsewhere in the Province of Quebec. Forms small beds in Potsdam sandstone in the townships of Bastard (Leeds Co.), and Ramsay (Ianark Co.), in the Province of Ontario.

166. CHROMIFEROUS MICA—Is found in several localities in the Eastern Townships of the Province of Quebec. Minute scales of it occur in the magnesite of

Sutton (Brome Co.), and it has also been observed, in larger plates and imperfect crystals, in a dolomite from Bolton, in the same county.

167. MICROCLINE—Is found in large cleavable masses, in association with quartz, muscovite, albite, etc., constituting a coarse pegmatite vein in the township of Villeneuve, Ottawa County, Province of Quebec.

168. MILLERITE—Is met with in small grains and prismatic crystals, together with minute grains and crystals of a bright green chromiferous garnet disseminated through a white cleavable calcite, in a vein on the east side of Brompton Lake, in the township of Orford (Sherbrooke Co.), Province of Quebec.

169. MINERAL COAL—See under "Anthracite," "Bituminous coal," "Cannel coal," "Lignite."

Analyses, E. Hartley, Rep. Geol. Canada., 1866-69, pp. 365-447—T. S. Hunt, ib., 1871-72, p. 98—B. J. Harrington, ib., 1872-73, pp. 76-81; ib., 1873-74, p. 63; ib., 1876-77, pp. 466-470—G. C. Hoffmann, ib., 1873-74, pp. 90-93 and 188-191; ib., 1875-76, p. 423; ib., 1879-80, pp. 8-14H.; ib., 1882-84, pp. 1-44 M.: Ann. Rep. Geol. Can., 1885, pp. 1-11 M.; ib., 1887-88, pp. 5-20 T.

170. MINERAL RESIN—Is not unfrequently very freely disseminated through some of the coals and lignites of the North-West Territory, in the form of small flattened grains and nodules of a yellow, yellowish-brown or brown color. The nodules do not generally speaking, exceed a quarter of an inch in diameter, but occasionally some of much larger denomination are met with. One from a coal seam on the Middle Fork of the Old Man River, Rocky Mountains (North-West Territory) was found to be a little over an inch and a-half in diameter, and three quarters of an inch thick.

171. MINERAL TAR—Is often seen exuding from the deposits of bituminous sand rock occurring along the banks of the Athabasca River (see note to "Asphaltum"), and in numerous places on the ground at the foot of either bank, or on terraces lower than their summits, this tar collects in pools, or flows in sluggish streams to lower levels. It also occurs at several localities on the shores of the western part of Great Slave Lake; at one or two places on Peace River, and elsewhere in this part of the North-West Territory.

172. MIRABILITE—Occurs at the Clifton gypsum quarry, Windsor, Hants County, Province of Nova Scotia; and, associated with epsomite, as an incrustation upon the cliffs of shale at Fort St. John, Peace River, Province of British Columbia. Anal., G. C. Hoffmann, Rep. Geol. Can., 1875-76, p. 421.

173. MOLYBDENITE—Is somewhat widely distributed, being found, although in most instances only in small quantities, in nearly all the provinces of the Dominion. Some of the most noteworthy localities of its occurrence are those in the Province of Quebec, as—near the mouth of the Quetachon River, in Manicougan Bay, on the north shore of the Gulf of the St. Lawrence, where it occurs disseminated in a bed of quartz six inches thick in the form of nodules from one to three inches in diameter, and in flakes which are sometimes twelve inches broad, by one-fourth of an inch in thickness; at Harvey Hill in the township of Leeds (Megantic Co.), occurring in small rounded masses of fine granular structure, in veins of quartz and bitter-spar; and the township of Aldfield (Pontiac Co.), where perfect and very handsome crystals have occasionally been found, and others, less perfect but of considerable dimensions are met with.

174. MOLYBDEITE—Has been met with in the form of an earthy yellow powder on molybdenite, in the township of Alleen (Pontiac Co.), in the Province of Quebec, and in the township of Ross (Renfrew Co.), in the Province of Ontario.

175. MONAZITE—In the form of a nodular mass, was found at the Villeneuve mica mine, in the township of Villeneuve, Ottawa County, Province of Quebec (Ann. Rep. Geol. Can., vol. ii., p. 11 T, 1886). Dr. F. A. Genth has recently made an analysis of a specimen from this locality, the results of which are given in Am. Journ. Sci., 3 ser., vol. xxxviii, p. 203, 1889.

176. MORDENITE—Occurs imbedded in trap, some two or three miles east of Morden or French Cross, in King's County, Province of Nova Scotia. Anal., H. How, Journ. Chem. Soc., new series, vol. ii., p. 100, 1864.

177. MORENOSITE—Is mentioned by Dr. Hunt as having been observed, as an efflorescence of minute acicular greenish-white crystals, on an ore of nickel from the Wallace mine, Lake Huron, Province of Ontario.

178. MUSCOVITE—Large plates and crystals of this species occur in a vein of graphic granite on Alumette Lake, at Montgomery's clearing, about five miles above Pembroke, Renfrew County, Province of Ontario. It is met with, in association with black tourmaline on Yeo's Island in the Upper St. Maurice (Portneuf Co.), and abundantly, and not unfrequently, in crystals of very large dimensions, in a coarse pegmatite vein (described in note to "Albite"), in the township of Villeneuve (Ottawa Co.), Province of Quebec. A rose-colored mica, closely resembling, if indeed not identical with,

the rose-colored muscovite of Goshen, Mass., has recently been met with by Mr. C. W. Willimott, in the township of Villeneuve (Ottawa Co., P. Que). It was associated with pale green muscovite, in a matrix composed of albite with a little white translucent quartz.

179. NAIL-HEAD-SPAR—Very fine specimens of nail-head-spar are found at Tenny Cape, Hants County, in the Province of Nova Scotia.

180. NATROLITE—Handsome specimens of this mineral are found at Swan Creek (Cumberland Co.), Cape Blomidon (King's Co.), and Gate's Mountain (Annapolis Co.), etc., in the Province of Nova Scotia. It occurs, associated with analcite, in some of the dykes cutting the Trenton limestone at the reservoir extension, Montreal (Hochelaga County.), Province of Quebec. Anal., B. J. Harrington, Rep. Geol. Can., 1874-75, p. 303.

181. NEPHELINE—Is stated, by Dr. Hunt, to occur in white crystals, with small grains of blue sodalite, in the nepheline syenite of Brome Mountain (Brome Co.), it also occurs, as a constituent of a similar rock, at Montreal (Hochelaga Co.), and Belœil (Rouville Co.), Province of Quebec. See also note to "Elaeolite."

182. NEPHRITE—This mineral has been found by Dr. G. M. Dawson, in the valley of the lower Fraser River (British Columbia), in the vicinity of Lytton, on the site of an abandoned Indian village, in small water-worn boulders, evidently derived from the beaches of the River, some having been merely more or less broken, whilst others had been or otherwise partly manufactured into implements (Can. Rec. Sci., vol. ii., p. 364, 1886-87.)

(To be continued.)

The Properties of Nickel Steel.

(Parisian Correspondence to the Ironmonger.)

The contemporaneous researches of English and French metallurgists—notably Mr. Riley, Glasgow, and M. Schneider, Creusot—upon the effect of nickel on steel have had results which seem likely to profoundly influence the future of steel-making. The extraordinary qualities of ferro-nickel have been brought prominently before the metallurgical world by the tests recently undergone in the United States by the Creusot nickel-steel armour-plates and as the outcome of that success it appears that the manufacture of nickel steel will at once be entered upon on an extensive scale. Now that the existence of enormous deposits of the metal has been demonstrated in Canada, the only difficulty is the economical and efficient reduction of the ores. This is claimed to be achieved by a French metallurgist, M. Garnier, who has elaborated a process by which sulphur is completely eliminated from the metal. M. Garnier has, it is stated, concluded a contract with the Canadian nickel mine owners to erect a large smelting works, in which this process will be practically carried on. In this aspect of the nickel-steel question, any information as to the actual composition and capacity of the alloy must be of interest. Such information has just been supplied by M. Charles Walrand, a well-known French steel-works engineer, who claims priority over M. Schneider for the idea of applying nickel to the constitution of armour-plates. The composition of M. Schneider's plates, as well as the special operations of tempering and annealing which are employed in their manufacture are, of course, a trade secret. But M. Walrand gives the composition of the material with which experiments were made, so far back as 1885, at the works of the Société des Forges de Montataire. These experiments were made with the idea that ferro-nickel might be used as a substitute for copper and "white metal" in nearly all its applications; and it was as the result of the information therein obtained that the employment of nickel steel in armour-plates, ordnance, &c., was suggested to the directors of the Ferro-nickel Company and the Creusot Works. The composition of the alloys from which specimens were rolled and tested at the Montataire Works was: carbon, '15 and '05 per cent.; phosphorus, '02 and '04; sulphur and silicon, traces; manganese, '50 and '04; nickel, 25'00; and iron, 74'00. From this metal results were obtained in the testing-machine which were quite foreign to the views up to then entertained upon the characteristics of steel. In round pieces of 6 inches, turned to 4¾ inches, a resistance of 197 lbs. and an elongation of 19 per cent. were obtained before tempering, while the results obtained after tempering were: resistance, 179 lbs.; elongation, 29'5 per cent. In flat pieces of 17 cm. by 6 cm. the resistance for both the tempered and non-tempered metal was less, but the elongation was 40 and 33 per cent. respectively. With round pieces of 10½ inches, turned to 4¾ inches, not tempered at all, the resistance was 196 lbs., and the elongation 43'5 per cent. Other round specimens of 4¾ inches, which were tested without being turned, showed resistance of 152 lbs. and 160

lbs., and elongation of 37 and 40 per cent. M. Walrand does not attempt to deprive M. Schneider of the merit of having pursued his own researches independently of those conducted by the Montataire Company. The main interest of his statement lies in the evidence which it gives of the peculiar properties of steel and nickel when combined in the proportions given above.

Mining Under the Sea in the North of England.—On the 23rd ult., in the presence of many directors and shareholders of the Hodbarrow Mining Company, the final and memorial block of a sea barrier was laid on the northern shore of the Duddon estuary, in the county of Cumberland, at a point where during the last twenty years an important mine, producing a large quantity of rich red hæmatite iron, has been worked. This mine is owned by the company, who are the proprietors of the land, the mineral rights being leased to them by the Earl of Lonsdale. The ore having been won as close to the sea margin as it has been possible to work without letting down the surface of the land and admitting the influx of the sea, thereby drowning the mine, the company have recently obtained a fresh lease from Lord Lonsdale, undertaking to construct a barrier to keep back the sea along that portion of the estuary in front of the mine, in order that they might win the ore from underneath some twenty-six acres of the sea bed. To effect this object a massive and substantial sea barrier has now been constructed. This great sea barrier is just two-thirds of a mile in length, and for about one-half of this length is fully 50 feet in height from the bottom of the foundation to the top of the parapet. The engineer of the work is Sir John Coode, and the contractors are the well-known firm of Messrs. Lucas and Aird. There is every reason to believe that the anticipation of the directors and shareholders of being able to continue the working of the iron ore over a further period of twenty-five years may be realized, thus giving employment during that time to about 1,500 men.

A Model Coal Shaft.—The new Standard shaft of the H. C. Frick Coke Company, which was visited by the members of the American Institute of Mining Engineers and their foreign guests, was built four years ago by Robert Ramsay, the present superintendent, and is considered the finest of its kind in the world. From its neat arches at the coal bottom to the self-acting tippie, more than 300 feet above, and from the five big batteries of boilers to the immense direct-acting engine there is an air solidity and strength about the whole thing that speaks louder than mere words about the ability of the designer and builder. In April last a test run was made at this shaft and the result was the breaking of the world's coal hoisting record that had been made some time before by the famous Nottingham shaft, near Wilkes-barre. This now famous hoist at the Standard began at 6 o'clock in the morning, and in eight and a half hours' actual running time 1,259 sixty-hushel waggons, or over 3,021 tons, were hoisted. These, more than 75,000 bushels, when turned into coke, would load 120 cars, allowing seventeen tons to the car. Throughout the entire mine the working of the men is systematized to the minutest degree, and every precaution is taken for the safety of the toilers. That Mr. Ramsay's efforts to have a safe mine have met with success is proved by the very small number of accidents that have occurred in it. The immensity of the work and its completeness of detail brought forth words of highest praise from the visiting party.

Gold Mining Supplies.

The principal depot in Nova Scotia, carrying the most complete assortment of first class goods, is

H. H. Fuller & Co's,

41 to 45 Upper Water St., Halifax, N.S.

Our line comprises Explosives, Fuse, American and English Mill and Hammer Steel, Bar and Bolt Iron, Steel Wire Hoisting Rope, Hemp and Manilla Rope, Rubber and Leather Belting, Miners' Candles, Oils and Lamps, Miners' Tools, Machinists' Tools, Blacksmiths' Tools, and every requisite for the gold miner.

H. H. FULLER & CO.,
Halifax, N.S.

\$6000.00 a year is being made by John R. Goodwin, Troy, N.Y., at work for us. Reader, you may not make as much, but we can teach you quickly how to earn from \$5 to \$40 a day at the start, and more as you go on. Both sexes, all ages. In any part of America, you can commence at home, giving all your time, or spare moments only to the work. All is new. Great pay \$1 RE for every worker. We start you, furnishing everything. EASILY, STEADILY learned. PARTICULARS FREE. Address at once, STINSON & CO., PORTLAND, MAINE.

MONEY

can be earned at our NEW line of work, rapidly and honorably, by those of either sex, young or old, and in their own localities, wherever they live. Any one can do the work. Easy to learn. We furnish everything. We start you. No risk. You can devote your spare moments, or all your time to the work. This is an entirely new lead, and brings wonderful success to every worker. Beginners are earning from \$25 to \$50 per week and upwards, and more after a little experience. We can furnish you the employment and teach you FREE. No space to explain here. Full information FREE. TRUE & CO., AUGUSTA, MAINE.

\$3000

A YEAR! I undertake to briefly teach any fairly intelligent person of either sex, who can read and write, and who, after instruction, will work industriously, how to earn Three Thousand Dollars a Year in their own localities, wherever they live. I will also furnish the situation or employment, at which you can earn that amount. No money for me unless successful as above. Easily and quickly learned. I desire but one worker from each district or county. I have already taught and provided with employment a large number, who are making over \$3000 a year each. It's NEW and SOLID. Full particulars FREE. Address at once, E. C. ALLEN, Box 420, Augusta, Maine.

Snug little fortunes have been made at work for us, by Anna Page, Austin, Texas, and Jno. Dunn, Toledo, Ohio. See cut. Others are doing as well. Why not you? Some earn over \$500.00 a month. You can do the work and live at home, wherever you are. Even beginners are easily earning from \$5 to \$10 a day. All ages. We show you how and start you. Can work in spare time or all the time. Big money for workers. Failure unknown among them. NEW and wonderful. Particulars free. H. Hallett & Co., Box 880 Portland, Maine.

Sudbury Nickel Deposits

The January issue of the Canadian Mining Review will contain verbatim the report by COMMANDER WM. M. FOLGER and LIEUTENANT H. H. BUCKINGHAM to the Hon. B. F. TRACEY, Secretary to the United States Navy, Washington, on the Sudbury Mines and Nickel Deposits.

Parties desiring extra copies of this special number must order them in advance. Price per copy, 15 cents.

GEO. A. SPOTSWOOD, C.E.,

Mining Engineer,
KINGSTON, ONTARIO, CAN

Mines and Mineral Properties Examined
and Reported on or Negotiated.
Explorations and Exploitations Conducted.

SPECIALTIES:
IRON, NICKEL AND PHOSPHATE.

Money Orders.

MONEY ORDERS may be obtained at any Money Order Office in Canada, payable in the Dominion and Newfoundland; also in the United States, the United Kingdom, France, Germany, Austria, Hungary, Italy, Belgium Switzerland, Portugal, Sweden, Norway, Denmark, the Netherlands, India, Japan, the Australian Colonies, and other countries and British Colonies generally.

On Money Orders payable within Canada the commission is as follows:

If not exceeding \$4	2c.
Over \$4, not exceeding \$10	5c.
10, " "	20c.
20, " "	40c.
40, " "	60c.
60, " "	80c.
80, " "	100c.

On Money Orders payable abroad the commission is:

1 not exceeding \$10	10c.
Over \$10, not exceeding \$20	20c.
20, " "	30c.
30, " "	40c.
40, " "	50c.

For further information see OFFICIAL POSTAL GUIDE.

Post Office Department, Ottawa.
1st November 1889.

North-West Mounted Police.

RECRUITS.

APPPLICANTS must be between the ages of Twenty-two and Forty, active, able-bodied men of thoroughly sound constitution, and must produce certificates of exemplary character and sobriety.

They must understand the care and management of horses, and be able to ride well.

The minimum height is 5 feet 8 inches, the minimum chest measurement 35 inches, and the maximum weight 175 pounds.

The term of engagement is five years.

The rates of pay are as follows:—

Staff-Sergeants \$1.00 to \$1.50 per day
Other Non-Com. Officers.. 85c. to 1.00 "

	Service pay.	Good conduct pay.	Total.
1st year's service,	50c.	—	50c. per day
2nd "	50	5c.	55 "
3rd "	50	10	60 "
4th "	50	15	65 "
5th "	50	20	70 "

Extra pay is allowed to a limited number of blacksmiths, carpenters and other artisans.

Members of the force are supplied with free rations, a free kit on joining and periodical issues during the term of service.

Applicants may be engaged at the Immigration office, Winnipeg, Manitoba; or at the Headquarters of the Force, Regina, N.W.T.
